Undoubtedly the air-supply for the water must be attended to. Fish and other aquatic creatures require air just as we do ourselves, excepting that they extract it from the water by means of their gills, while we breathe it by the aid of lungs. If a fish were to be placed in a small vessel of water, and no care be taken to replenish the air-supply at frequent intervals, he would shortly die of suffocation, just as we should were we enclosed in an air-tight chamber, for, the oxygen once exhausted, he would be unable any longer to breathe. I dare say that many of us have noticed that fish, when kept in captivity, seldom remain absolutely still for more than a few moments together, but constantly swim slowly along in order that the water may flow over their gills, and so enable them freely to respire. For the same reason you will always find that fish in small rivers, etc., lie with their heads directed up stream, thus meeting, as it were, the flow of water.

As the contents of your tank, however, must necessarily be still, you must have recourse to some system of artificial aeration. A certain quantity of air will be sucked up by the water, and the greater the surface exposed, the greater, of course, will be the amount thus absorbed. Air, you know, sucks up a good deal of water, so water returns the compliment and sucks up the air. If your

tanks have many inmates, however, this will be by no means sufficient, and you must arrange for a further supply.

This you can do in two ways.

The first, and least troublesome, is by keeping a certain amount of seaweed in each of your vessels, which will purify the water in a most wonderful degree. The fact is that plants breathe just as do animals, with this difference—that whereas the latter inspire oxygen and expire carbonic acid gas, the former exactly reverse the process, absorbing the deleterious gas and giving out the beneficial. If you examine the leaves of any aquatic plant you will see upon them a number of small bubbles, some of which occasionally rise to the surface and burst in order to make way for others. These bubbles consist of the oxygen gas which is continually being given off by the plants, and a large proportion of which is absorbed by the water as it ascends to the surface.

(To be continued.)

OUR PRIZE COMPETITIONS.

(SEVENTH SERIES.)

II.—Illumination Competition.

(Continued from page 575.)

SENIOR DIVISION (ages 18 to 21).

IN this Division the First Prize is increased in amount, and divided between two competitors who are equally meritorious in their different styles, the one working on a bold design in oils, and the other skillfully executing an illumination in water-colours:—

Prizes—25s. each.

HARRY SYDNEY TURK (aged 19), Burlington Cottage, New Winstead, Essex.

EDWIN H. PRATT (aged 19), Town Street, Horsforth, near Leeds.

Extra Prizes—10s. 6d. each.

HAROLD FREEMAN POOLE (aged 18), 18, Egerton Road, Greenwich.

WM. CADENHEAD SMITH (aged 18), 74½, Constitution Street, Aberdeen.

Certificates.

EDWD. C. COCKING, 192, Friern Road, East Dulwich, S.E.

WILLIAM MURAS, JUN., care of Mr. John Dawson, 14, Grainger Street, Newcastle-on-Tyne.

ALFRED HOWELL, 70, Lord Street, Sandford Hill, Longton, Staffs.

CHAS. E. THORPE, 75, Macklin Street, Derby.

J. T. HANSON, 11, Violet Street, Pellon Lane, Halifax.

ARTHUR MAXEY, 14, Brincliffe Edge Road, Nether Edge, Sheffield.

EDMUND T. MAIDMENT, 6, George Street, Warminster, Wilts.

JAMES SORLIE, 216, High Street, Perth, N.B.

NORA FAIRFAX, Fairfax House, Witkington, near Manchester.

L. A. EVANS, 100, Lloyd Street, Greenheys, Manchester.

J. W. CONSTANTINE, 15, Milton Place, Halifax.

LOT RAMSDEN, 1, Kearsley Terrace, Nursery Mount Road, Hunslet Carr, Leeds.

L. J. GLENDENNING, Bourne, Lincolnshire.

FRANK ALLIBON, 122, High Street, Ryde, I.W.

ERNEST E. DENNEY, 110, Avondale Square, Old Kent Road, S.E.

W. A. NORTON, 4, Ebor Terrace, Woodhouse Hill, Hunslet, Leeds.

W. E. BRINX, 33, West Street, Harwich, Essex.

JAMES J. NEWMAN, 59, Gayhurst Road, Lansdowne Road, Dalston.

EDGAR BOARD, 189, High Street, Cheltenham.

J. P. EWING, 24, West End Park Street, Glasgow.

BENJAMIN SHONE, 29, Pocock Street, Blackfriars Road.

JAMES H. BAKES, 68, Micklegate, York.

THOS. OAKLEY, 9, Spring Garden Place, Stepney.

G. H. DOUTHWAITE, 9, Crescent King Street, Leicester.

CHARLOTTE E. ATTREE, Picardy House, Belvedere, Kent.

W. MOUNTON, care of Mrs. Sabberton, Thorpe St. Andrew, near Norwich.

FRANK WASSNER, 21, St. Ann's Terrace, Acacia Road, St. John's Wood, N.W.

FREDK. J. T. GUNN, 24, Scotland Street, Edinburgh.

WALTER HADLEY, Cambridge Road, Moseley, near Birmingham.

A. H. W. MANNING, 31, Alma Street, Taunton.

RICHARD SHAW, 34, Dilton Grove, Jamaica Level, Bermondsey.

H. C. WINNER, Lactaville, Cloudesley Street, Barnsbury, N.

Correspondence.

Churchill, of Sun Street, Finsbury. You cannot expect to get rid of a machine unless at a loss of at least a third.

THETA.—You can get the model and the scenery from Webb, of 146, Old Street, St. Luke's; or Murray, of Great Queen Street, Long Acre.

ANXIOUS FATHER.—We never answer such medical questions. The subject is one for a doctor.

W. T. SAYER (Majorca).—The reason is that the quality of glue varies so much. The finer the article the more constant the quality, hence glycerine is always more trustworthy than glue. The properties of baryt. nit. are quite different from those of the sulphate, and a failure could only be expected. Graph mixtures are very much of a lottery, but if the materials are used pure and in exact quantity the failures are few.

T. BARNARD.—You buy solder ready-made. For a shilling you can get from your ironmonger a card with solder, tool, and directions, all complete.

GUILLAUME (Wellington, N.Z.).—So long as your pigeons are under shelter it matters little, but the more weatherproof your house is the better.

BARDIK.—You do not keep the rat clean enough. Give no meat and more grain. Clean soft dry hay and sawdust.

TOMMY.—We cannot at present spare Dr. Gordon to go so far as Jamaica to see your poor Polly, though he himself would, he says, "go like a shot." Give the bird nothing but seeds, grain, and nuts, with now and then a chilli. Rub the sore places with vaseline; give a bath. Yes, a fowl put in solitary confinement for a time in the dark will go off the "cluck."

G. E. ABBOT.—There, we have put your name in full as you desire. Looks pretty in print, doesn't it? Read reply to TOMMY, and feed in the same way.

H. V. B.—There is no limit of age for apprentices in the merchant service; the limit is that fixed by particular firms. You may be too old for one firm and yet be admissible by another. At the same time few respectable shipowners will have anything to do with lads under fourteen or over eighteen.

J. GUNSON.—In the event of your finding a part wrongly bound, you have only to take it back to the shop you bought it from and exchange it. Your idea that the whole issue was necessarily wrong is delightful.

JACK FIDD.—1. To find the centre of a mainsail—that is, of a trapezium—join its opposite corners so as to divide it into four triangles, and find the centre of each triangle. To find the centre of a triangle bisect each of its sides, and draw lines from the points of bisection to the opposite angles. The centre of the centre is where the three lines meet. Having found the centres of each of the four triangles in your mainsail, join those centres, and where the two joining lines cross you get the centre of the sail. 2 The "emersed wedge" is that portion of the boat which is taken out of the water as the vessel heels. The "immersed wedge" is that portion which enters the water as the vessel heels.

R. D.—1. Optical instruments requiring to be lacquered are first of all as highly finished and polished as possible, and then kept warm while the lacquer is applied. In lacquering always use a camel-hair brush, and always go over the article in one direction. 2 The black is either nitrate of silver, or, more probably, nitrate of copper, made by dissolving copper wire in nitric acid.

C. HENDERSON.—1. You could get the indiarubber from almost any indiarubber shop in Southampton. If you have to write to London, try Cow, Hill, and Co., of Cheapside; Macintosh, of St. Bride Street; or the North British Company, of Cannon Street. You only require a couple of ounces. 2 Keep to Physics and Mathematics until you are article.

J. FERGUSON and MILITARY.—In 1880 there were ten promotions of men from the ranks to be commissioned officers; in 1881 there were thirteen; in 1882 there were thirteen; in 1883 there were nine; in 1884 there were thirteen. The ages at the date of commission ranged from twenty-one to thirty-eight. This does not take into account the quartermasters, riding-masters, Coast Brigade officers, Army Hospital Corps officers, men who gained commissions for bravery in the field, or the sub-inspectors of Army schools, all of whom of course "rose from the ranks."

OLD RED SANDSTONE.—Pennell's "Field Geology" is published by Baillière, price seven shillings and sixpence.

H. H. P.—The pseudo-Shakespearean plays, "Yorkshire Tragedy," etc., are in the old editions of the works found only occasionally. Your best plan would be to advertise in the "Bookseller" or "Publishers' Circular."

W. SMART.—There is no book at present specially treating of the Indian Civil Service. Refer to our articles.

A. C. D. B. E.—Refer to our Fishing Tackle articles in the third volume. The branding is marked from head to tail with alternate bars of red and yellow; when handled there exudes from it a yellow fluid of a very nasty smell; it is found in old dung-heaps, and almost in any old heap of decaying vegetable matter.

T. B. (Hampshire).—Try a quarter of an hour's practice with the dumb-bells each morning after having your bath.

AUTOLYCUS.—1. Never reef a sail in a model yacht if you can help it; rather shift the mainsail for a smaller one. The fewer wrinkles, folds, and tackles you have flying about the better. Large vessels only have them because they cannot help it. Reefs, blocks, and rigging were not invented for beauty and speed, but for use, and only such are retained as are absolutely necessary. 2 The pennant is the old whip. When the Dutchman hoisted the broom as a sign that he would sweep the English from the sea, the English admiral ran up the whip as a sign that he would whip the Dutch till they stayed ashore. The broom got the worst of it, and to this day, when from unavoidable circumstances a vessel is of no further use to the owner, up goes the broom to the masthead, in token that she is for sale!

NIL DESPERANDUM.—1. Post-office orders are for any exact amount up to £10, and are made payable to a particular person at a particular place at the time of issue. Postal orders are for 1s., 1s. 6d., 2s. 6d., 5s., 7s. 6d., 10s., 12s. 6d., 15s., 17s. 6d., and £1 only, and can practically pass from hand to hand as Government notes for those amounts, and are payable at any post-office to any person without any question of identification. 2 Chickamauga was one of the battles in the American War. 3 Each cartridge is a round.

AN ENTHUSIASTIC READER.—For a list of arms-bearing families you must consult Burke's "General Armory," or works of that sort. There are no cheap publications that would give you the information.

CABBAGE STUMPS.—In "Harper's Magazine" for February and March, 1885, you will find an article on the House of Orange that may assist you. William the Silent was assassinated in 1584.

T. M.—The title-page and index to each volume costs one penny, or three-halfpence post free.

SUBSCRIBER (Newfoundland).—We cannot undertake the responsibility of guaranteeing the trustworthiness of any tradesman. You must consult advertisements and choose for yourself.

F. G. T.—The articles on "How to lay out a Garden" began in November, 1883, and ended in April, 1884.

A CRICKETER.—Photographs of cricket celebrities are now kept in stock at every cricket warehouse. Try Lillywhite, Frowd, and Co., or James Lillywhite, or Wisden. Any directory will give you full addresses.

T. JEDDART.—A Roman road was an elaborate engineering work. It had a foundation of hard earth, a bed of large stones, two or more layers of stones and mortar, and gravel, lime, and clay, and a causeway fifteen feet broad paved with stones. Watling Street ran from London to Wroter, with continuations from London to Dover, and from Wroter into Wales. The Foss ran from Seaton in Devonshire to Lincoln, and under the name of High Street to the Humber. The Icknield Way went from Icklingham, near Bury, to Wantage, Cirencester, and Gloucester. Ermine Street ran through the Fens from Lincoln to London. Besides these, there were many cross streets. One great road ran from Exeter to the Land's End, and another went from St. David's to Carnarvon.

R. HARRIS.—1. The author of "Thaddeus of Warsaw" was Miss Jane Porter, who also wrote the "Scottish Chiefs." 2 The origin of the flute is wrapped in mystery from the days of Marsyas upwards. It is much too old for its inventor's name to have been preserved. "The world knows nought of its eminent men in those pre-alphabetical days."

F. E. and J. C.—Has not Barlow a cricket warehouse in Manchester? If so, apply there. As a rule all cricket warehouses are agencies for gymnastic and athletic apparatus.

TEBO.—Such glasses are called lenses, but to explain their action would be to give you a lesson in optics, which we have no space here to do. See our articles on the Microscope in the first volume, and on the Telescope in the sixth.

R. P.—We decline to answer party questions. At the same time we think a little more thought would lead you to see the absurdity of inveighing on one page against Government "extravagance," and on the other proclaiming your intention of entering the Civil Service, "where the salaries are so good and there is a pension" !!! Surely in a question, as you put it, of "robbing taxpayers," the receiver would be as bad as the thief.

MUSICS.—The bottles are the same as the musical tumblers, and are tuned by pouring water into them, in the same way as described in our article on Musical Glasses in the March part for 1885.

D. M. T.—It is possible for a private soldier to obtain a commission; and in cases where he does so the Government makes him a small grant, which, we believe, about covers the cost of his new uniform. The Government is never very extravagant in what it gives its soldiers.

J. L. C.—We cannot spare room for eighteen answers concerning old City churches. Refer to Thornbury's "Old and New London," published by Cassell and Co., Limited.

F. VARLEY.—"The Angler's Diary," post free one shilling and eightpence from the "Field" Office, 346, Strand, has a list of the rivers of Great Britain; but your neighbourhood is notoriously poor in fishing stations.

T. F.—Not necessarily. There is an ostrich farming company in South Australia, with a capital of £20,000; and in New South Wales ostrich farming has also been introduced with success.

Z. B. S. E.—1. A hickory rod is the better of the two. You ought to get a very good one for six shillings. 2. Leave it to dull down. 3. A pike will take anything.

JUMBO.—A vessel's registered tonnage is the amount of her cargo space measured up under the official rule, which assumes that all vessels are of similar curves and proportions. Her burthen tonnage is what she actually carries, counting every forty cubic feet as one ton. Her displacement is really what she weighs, it being simply the amount of water she displaces when loaded down to her Plimsoll mark.

MARLBOROUGH.—You can kill grouse and ptarmigan from August 12 to December 10; black game or heath fowl from August 20 to December 10, except in the south of England, where the shooting begins on September 1; partridges from September 1 to February 1; pheasants from October 1 to February 1; and bustards from September 1 to March 1.

R. S. J. N.—The MS. must be sent to the editor, and if deemed suitable it will be retained, eventually published, and paid for.

No. 336.—Vol. VII.

SATURDAY, JUNE 20, 1885.

Price One Penny.

REGINALD CRUDEN: A TALE OF CITY LIFE.

BY TALBOT BAINES REED,
Author of "My Friend Smith," etc., etc.

CHAPTER XII.—HORACE LEARNS AN ART, PAYS A BILL, AND LENDS A HELPING HAND.

"I SAY, Cruden," said Waterford to Horace one morning, shortly after Reginald's departure from London; "I shall get jealous if you don't pull up."

"Jealous of me?" said Horace. "Whatever for?"

"Made a desperate rush at him just as he reached the door."

"Why, before you came I flattered myself I was a bit of a dab at the scissors-and-paste business, but you've gone and cut me out completely."

"What rot!" said Horace, laughing. "There's quite enough cutting out to do with the morning papers to leave any time for operating on you. Besides, any duffer can do work like that."

"That's all very well," said Waterford. "There's only one duffer here that can do as much as me and Booms put together, and that's you. Now, if you weren't such a racehorse, I'd propose to you to join our shorthand class. You'll have to learn it some time or other, you know."

"The very thing I'd like," said Horace. "That is," he added, "if it won't take up all a fellow's evenings. How often are the classes?"

"Well, as often as we like. Generally once a week. Booms' washerwoman—"

"Whatever has she to do with shorthand?" asked Horace.

"More than you think, my boy. She always takes eight days to wash his collars and cuffs. He sends them to her on Wednesdays and gets them back on the next day week, so that we always practise shorthand on the Wednesday evening. Don't we, Booms?" he inquired, as the proud owner of that name entered the office at that moment.

"There you are," sighed he. "How do I know what you are talking about?"

"I was saying we always worked up our shorthand on Wednesday evenings."

"If you say so," said the melancholy one, "it must be so."

"I was telling Cruden he might join us this winter."

"Very well," said the other, resignedly; "but where are you going to meet? Mrs. Megson's gone away, and we've no reader."

"Both you, Booms, for always spotting difficulties in a thing. You see," added he, to Horace, "we used to meet at a good lady's house who kept a day school. She let us go there one evening a week, and read aloud to us, for us to take it down in shorthand. She's gone now, bad luck to her, and the worst of it is we're bound to get a lady to take us in, as we've got ladies in our class, you see."

At the mention of ladies Booms groaned deeply.

"Why, I tell you what," said Horace, struck by a brilliant idea. "What should you say to my mother? I think she would be delighted, and if you want a good reader aloud she's the very woman for you."

Waterford clapped his friend enthusiastically on the back.

"You're a trump, Cruden, to lend us your mother; isn't he, Booms?"

"Oh, yes," said Booms. "I've seen her, and—here he appeared to undergo a mental struggle—"I like her."

"At any rate I'll sound her on the matter. By the way, she'll want to know who the ladies are."

"It'll only be one this winter, I'm afraid," said Waterford, "as the Megsons have gone. It's a Miss Crisp, Cruden, a friend of Booms's, who—"

"Whom I met the other night at the Shucklefords?" said Horace.

Booms answered the question with such an agonised sigh that both his companions burst out laughing.

"Dear old Booms can tell you more

about her than I can," said Waterford. "All I know is, she's a very nice girl indeed."

"I agree with you," said Horace; "I'm sure she is. You think so too, don't you, Booms?"

"You don't know what I think," said Booms, which was very true.

One difficulty still remained, and this appeared to trouble Horace considerably.

He did not like to refer to it as long as the melancholy masher was present, but as soon as he had gone in to fetch the papers Horace inquired of his friend,

"I say, Waterford, do you mean to say he chooses the very night he hasn't got a high collar to—"

"Hush!" cried Waterford, mysteriously, "it's a sore question with him; but he couldn't write if he had one. We never mention it, though."

It is needless to say Mrs. Cruden fell in most cordially with the new proposal. She needed little persuasion to induce her to agree to a plan which meant the bright presence of her son and his friends in her house, and it gave her special satisfaction to find her services on such occasions not only invited, but indispensable; and it is doubtful whether any of the party looked forward more eagerly to the cheery Wednesday evenings than she did.

It was up-hill work, of course, for Horace, at first; in fact, during the first evening he could do nothing but sit and admire the pace at which Miss Crisp, followed more haltingly by Booms and Waterford, took down the words of "Ivanhoe" as fast as Mrs. Cruden read them. But, by dint of hard, unsparing practice, he was able, a week later, to make some sort of a show, and as the lessons went on he even had the delight of finding himself, as Waterford said, "in the running" with his fellow-scholars. This success was not achieved without considerable determination on the boy's part; but Horace, when he did take a thing up, went through with it. He gave himself no relaxation for the first week or two. Every evening after supper he produced his pencil and paper, and his mother produced her book, and for two steady hours the work went on. Even at the office, in the intervals of work, he reported everything his ears could catch, not excepting the melancholy utterances of Booms and the vulgar conversation of the errand-boy.

One day the sub-editor summoned him to the inner room to give him some instructions as to a letter to be written, when the boy much astonished his chief by taking a note of every word, and producing the letter in a few moments in the identical language in which it had been dictated.

"You know shorthand, then?" inquired the mild sub-editor.

"Yes, sir, a little."

"I did not know of this before."

"No, sir; I only began lately. Booms and Waterford and I are all working it up."

The sub-editor said nothing just then, but in future availed himself freely of the new talent of his juniors. And what was still more satisfactory, it was intimated not many days later to Horace from headquarters, that as he appeared to be making himself generally useful, the nominal wages at which he had been admitted would be increased henceforth to twenty-four shillings a week.

This piece of good fortune was most opportune; for now that Reginald's weekly contribution was withdrawn, and pending the payment of his first quarter's salary at Christmas, the family means had been sorely reduced, and Horace and his mother had been hard put to it to make both ends meet. Even with this augmented pay it might still have been beyond accomplishment had not their income been still further improved in a manner which Horace little suspected, and which, had he known, would have sorely distressed him.

Mrs. Cruden, between whom and the bright Miss Crisp a pleasant friendship had sprung up, had, almost the first time the two ladies found themselves together, inquired of her new acquaintance as to the possibility of finding any light employment for herself during the hours when she was alone. Miss Crisp, as it happened, did know of some work, though hardly to be called light work, which she herself, having just at present other duties on hand, had been obliged to decline. This was the transcribing of the manuscript of a novel, written by a lady, in a handwriting so enigmatical that the publishers would not look at it unless presented in a legible form. The lady was, therefore, anxious to get it copied out, and had offered Miss Crisp a small sum for the service. Mrs. Cruden clutched eagerly at the opportunity thus presented. The work was laborious and dreary in the extreme, for the story was long and insipid, and the wretched handwriting danced under her eyes till they ached and grew weak. But she persevered boldly, and for three hours a day pored over her self-imposed task. When Horace returned at evening no trace of it was to be seen, only the pale face and weary eyes of his mother, who yet was ready with a smile to read aloud as long as the boy wished, and pretend that she only enjoyed a labour which was really taxing her both in health and eyesight.

Reginald had written home once or twice since his departure, but none of his letters had contained much news. He said very little either about his work or his employers, but from the dismal tone in which he drew comparisons between London and Liverpool, and between his present loneliness and days before their separation, it was evident enough he was homesick. In a letter to Horace, he said—

"I get precious little time just now for anything but work, and what I do get I don't know a soul here to spend it with. There's a football club here, but of course I can't join it. I go walks occasionally, though I can't get far, as I cannot be away from here for long at a time, and never of an evening. You might send me a 'Rocket' now and then, or something to read. What about young Gedge? See Durfy doesn't get hold of him. Could you ever scrape up six-and-six and pay it for me to Blandford, whose address I give below. It's something he lent me for a particular purpose when I last saw him. Do try. I would enclose it, but till Christmas I have scarcely enough to keep myself. I wish they would pay weekly instead of quarterly. I would be awfully obliged if you would manage to pay the six-and-six somehow or other. If you do, see he gets it and knows it comes from me, and send me a line to say he has got it. Don't

forget, there's a brick. Love to mother and young Gedge. I wish I could see you all this minute."

Horace felt decidedly blue after receiving this letter, and purposely withheld it from his mother. Had he been sure Reginald was prosperous and happy in his new work this separation would not have mattered so much, but all along he had had his doubts on both these points, and the letter only confirmed them.

At any rate he determined to lose no time in easing his brother's mind of the two chief causes of his anxiety. The very next Saturday he appropriated six-and-six of his slender wages, and devoted the evening to finding out Blandford's rooms and paying him the money.

Fortunately his man was at home, an unusual circumstance at that hour of the night, and due solely to the fact that he and Pillans, his fellow-lodger, were expecting company; indeed, the page-boy (for our two gay sparks maintained a "tiger" between them) showed Horace up the moment he arrived, under the delusion that he was one of the guests. Blandford and his friend, sitting in state to receive their distinguished visitors, among whom were to be the real owner of a racehorse, a real jockey, a real actor, and a real wine merchant, these open-hearted and knowing young men were considerably taken aback to find a boy of Horace's age and toilet ushered into their august presence. Blandford would have preferred to appear ignorant of the identity of the intruder, but Horace left him no room for that amiable fraud.

"Hullo, Bland!" said he, just as if he had seen him only yesterday at Wilderham, "what a jolly lot of stairs you keep in this place. I thought I should never smoke you out. How are you, old man?"

And before the horrified dandy could recover from his surprise, he found his hand being warmly shaken by his old schoolfellow.

Horace, sublimely unconscious of the impression he was creating, indulged in a critical survey of the apartment, and said—

"Snug little crib you've got—not quite so jolly, though, as the old study you and Reg had at Wilderham. How's Harker, by the way?"

And he proceeded to stroll across the room to look at a picture.

Blandford and Pillans exchanged glances. Wrath was in the face of the one, bewilderment in the face of the other.

"Who's your friend?" whispered the latter.

"An old schoolfellow who—"

"Nice lot of fellows you seem to have been brought up with, upon my word," said Mr. Pillans.

"I suppose he'll be up for Christmas," pursued Horace. "Jolly glad I shall be to see him, too. I say, why don't you come and look us up. The *mater* would be awfully glad, though we've not very showy quarters to ask you to. Ah! that's one of the prints you had in the study at school. Do you remember Reg chipping that corner of the frame with a sin-lestick?"

"Excuse me, Cruden," began Blandford, in a severe tone; "my friend and I are just expecting company."

"Are you? Well, I couldn't have stayed if you'd asked me. Are any of the old school lot coming?"

"The fact is, we can do without you, young fellow," said Mr. Pillans.

Horace stared. It had not occurred to him till that moment that his old schoolfellow could be anything but glad to see him, and he didn't believe it now.

"Will Harker be coming?" he inquired, ignoring Mr. Pillans' presence.

"No, no one you know is coming," said Blandford, half angrily, half nervously.

"That's a pity. I'd have liked to see some of the old lot. Ever since we came to grief none of them has been near us except Harker. He called one day, like a brick, but he won't be up again till Christmas."

"Good night," said Blandford.

His tone was quite lost on Horace.

"Good night, old man. By the way, Reg—you know he's up in the north now—asked me to pay you six-and-six he owed you. He said you'd know about it. Is it all right?"

Blandford coloured up violently.

"I'm not going to take it. I told him so," said he.

"Oh yes, you are, you old humbug," said Horace, "so catch hold. A debt's a debt, you know."

"It's not a debt," said Blandford. "I gave it to him, so good night."

"No, that won't do," said Horace. "He doesn't think so—"

"The fact is the beggar couldn't pay for his own dinner, and Blandford had to pay it for him. He managed it very neatly," said Mr. Pillans.

Horace fired up fiercely.

"What do you mean? Who's this cad you keep about the place, Blandford?"

"If you don't go I'll kick you down the stairs," cried Mr. Pillans, by this time in a rage.

Horace laughed. Mr. Pillans was his senior in years and his superior in inches, but there was nothing in his unhealthy face to dismay the sturdy schoolboy.

"Do you want me to try?" shouted Mr. Pillans.

"Not unless you like," replied Horace, putting the money down on the table and holding out his hand to Blandford.

The latter took it mechanically, too glad to see his visitor departing to offer any obstacle.

"I'll look you up again some day," said Horace, "when your bulldog here is chained up. When Reg and Harker are up this Christmas we must all get a day together. Good night."

And he made for the door, brushing up against the outraged Mr. Pillans on his way.

"Take that for an impudent young beggar!" said the latter as he passed, suiting the action to the word with a smart cuff directed at the visitor's head.

Horace, however, was quick enough to ward it off.

"I thought you'd try that on," he said, with a laugh; "you're—"

But Mr. Pillans, who had by this time worked himself into a fury by a method known only to himself, cut short further parley by making a desperate rush at him just as he reached the door.

The wary Horace had not played football for three seasons for nothing. He quietly ducked, allowing his unscientific assailant to overbalance himself and topple head first on the lobby outside, at the particular moment when the real owner of the racehorse and the real wine merchant, who had just arrived, reached the top of the stairs.

"Hullo, young fellow!" said the sporting gentleman; "practising croppers, are you? or getting up an appetite? or what? High old times you're having up here among you! Who's the kid?"

"Stop him!" gasped Pillans, picking himself up; "don't let him go! hold him fast!"

The wine-merchant obligingly took possession of Horace by the collar, and the company returned in solemn procession to the room.

"Now then," said Horace's captor, "what's the row? Let's hear all about it. Has he been collaring any of your spoons? or setting the house on fire? or what? Who is he?"

"He's cheeked me!" said Pillans, brushing the dust off his coat. "Hold him fast, will you, till I take it out of him?"

But the horse-racer was far too much of a sportsman for that.

"No, no," said he, laughing, "make a mill of it and I'm your man. I'll bet two to one on the young un to start with."

The wine-merchant said he would go double that on Pillans, whereupon the sporting man offered a five-pound note against a half-sovereign on his man, and called out to have the room cleared and a sponge brought in.

How far his scientific enthusiasm would have been rewarded it is hard to say, for Blandford at this juncture most inconsiderately interposed.

"No, no," said he, "I'm not going to have the place made a cock-pit. Shut up, Pillans, and don't make an ass of yourself; and you, Cruden, cut off. What did you ever come here for? See what a row you've made."

"It wasn't I made the row," said Horace. "I'm awfully sorry, Bland. I'd advise you to cut that friend of yours, I say. He's an idiot. Good-bye."

And while the horse-racer and the wine-merchant were still discussing preliminaries, and Mr. Pillans was privately ascertaining whether his nose was bleeding, Horace departed in peace, partly amused, partly vexed, and decidedly of opinion that Blandford had taken to keeping very queer company since he last saw him.

The great thing was that Horace could now write and report to Reg that the debt had been paid.

His way home led him past the "Rocket" office. It was half-past ten, and the place looked dark and deserted. Even the lights in the editor's windows were out, and the late hands had gone home. Just at the corner Horace encountered Gedge, one of the late hands in question.

"Hullo, young un!" he said. "Going home?"

"Yes, I'm going home," said young Gedge.

"I heard from my brother yesterday. He was asking after you."

"Was he?" said the boy, half sarcastically. "He does remember my name, then?"

"Whatever do you mean? Of course he does," said Horace. "You know that well enough."

"I shouldn't have known it unless you'd told me," said Gedge, with a cloud on his face; "he's never sent me a word since he left."

"He's been awfully busy—he's scarcely had time to write home. I say, young un,

what's the row with you? What makes you so queer?"

"Oh, I don't know," said the boy, wearily; "I used to fancy somebody cared for me, but I was mistaken. I was going to the dogs fast enough when Cruden came here; I pulled up then, because I thought he'd stand by me; but now he's gone and forgotten all about me. I'll—well, there's nothing to prevent me going to the bad; and I may as well make up my mind to it."

"No, no," said Horace, taking his arm kindly; "you mustn't say that, young un. The last words Reg said to me when he went off, were, 'Keep your eye on young Gedge, don't forget,' the very last words, and he's reminded me of my promise in every letter since. I've been a cad, I know, not to see more of you; but you mustn't go thinking that you've no

friends. If it were only for Reg's sake I'd stick to you. Don't blame him, though, for I know he thinks a lot about you, and it would break his heart if you went to the bad. Of course you can help going to the bad, old man; we can all help it."

The boy looked up with the clouds half brushed away from his face.

"I don't want to go to the bad," said he; "but I sort of feel I'm bound to go, unless some one sticks up for me. I'm so awfully weak-minded, I'm not fit to be trusted alone."

"Hullo, I say," whispered Horace, suddenly stopping short in his walk. "who's that fellow sneaking about there by the editor's door?"

"He looks precious like Durfy," said Gedge; "I believe it is he."

"What does he want there, I wonder—

he wasn't on the late shift to-night, was he?"

"No, he went at seven."

"I don't see what he wants hanging about when everybody's gone," said Horace.

"Unless he's screwed and can't get home—I've known him like that."

"That fellow's not screwed, though," he added; "see, he's heard some one coming and he's off steady enough on his legs."

"Rum," said Horace. "It looked like Durfy, too. Never mind, whoever it is, we've routed him out this time. Good night, old man; don't go down on your luck, mind, and don't go abusing Reg behind his back, and don't forget you're booked to come home to supper with me on Monday, and see my mother. Ta-ta."

(To be continued.)

IVAN DOBROFF: A RUSSIAN STORY.

BY PROFESSOR J. F. HODGETTS,

Late Examiner to the University of Moscow, Professor in the Russian Imperial College of Practical Science,

Author of "Harold, the Boy-Earl," etc.

CHAPTER XXIII.—TIUMEN.

ON arriving at this remarkable town, half prison, half market, Madame Steinfeldt had very little inclination to look about her. The streets are broad and not unhandsome, though many of the houses—in fact, most of them—are low wooden structures of no pretensions to beauty, save that some of them are painted blue or red, while others remain of the dirty brown of the logs.

There is a long, low, wooden colonnade with a thatched roof on the left hand of the chief street on entering, after passing through the wall of the town by a gate. And here Frau von Steinfeldt was told she had better remain, as the building to her right was the most splendid hotel in Tiumen. Here she hired rooms, and took care to have it known that she was travelling with her two children to see a relative in some part of Siberia. Her letters of introduction procured her attention from the highest functionaries. The mayor came to see her, so did the governor, which latter official promised to do all in his power to aid her. After the visit of this functionary the clever German woman called the sergeant and the troopers to her, and made them this pretty speech:

"My brave defenders and friends, but for your courage and devotion I and my children would long ere this have been whitened skeletons hidden under the whiter snow of this cruel region. I shall mention your names in the highest circles to which I may have access, and for this purpose I request Sergeant Gabrielloff to furnish me with a list. Further, I wish him kindly to accept from me this small offering of one hundred roubles, to be used by him as occasion may require. To my other friends of this journey I present (with the permission of the sergeant) the sum of twenty-five roubles each."

Here the enthusiasm of the men got the better of discipline, and expressed itself in loud hurrahs.

"May you prosper in the service you adorn, and may God bless you for your kindness to a lone woman and her children in trouble."

Here the men took off their caps (they had come in without bashliks), and falling on their knees, crossed themselves devoutly, and then rising, begged the sergeant to express *their* opinion.

"I have now a few words to say," the lady continued. "You will be asked questions about my children. Say something good about them if you can honestly do so. You have not seen much of my darling Olga. She will come presently, and thank you in her own name for all you have done. And if they should ask about her you can say that she is sixteen years old, though very small for her age." At this the men, standing bolt upright in true military guise, saluted and uttered a short, sharp "hurrah!" that was like a bark. Ivan was then brought in with his hair nicely parted, and with a charming little white Astrakan cap on his head, to which was affixed a perfect cataract of magnificent black hair, which hung down below his waist (and which had been supplied by the Court hairdresser before they left Moscow). He wore an exquisitely-made blue velvet dress trimmed with white Astrakan fur of the crispest curl, long gloves with five-and-twenty buttons, each buttoned over the tight-fitting sleeves.

The hope of benefiting Annie had given him confidence in his part, and imparted a certain amount of grace that delighted the troopers.

"We are most grateful to you, sergeant, for all your efforts in our service," was what he said.

The soldiers stood at the salute all the time he was speaking. As he concluded, the sergeant gave the word, and the men faced round and filed off from the room in military order without a word.

When they were gone, Ivan said,

"Splendid fellows, aren't they? Don't

blame me for wishing to serve in the cavalry. I would rather be Sergeant Gabrielloff than the richest merchant in the world."

On the third day of their stay at Tiumen the governor called in state, but without his aide-de-camp, and was admitted to a private audience. He told Frau von Steinfeldt that the inquiries he had made had proved so far successful that he had discovered the person she required. It appeared that Annie was under sentence of exile, but not of hard work, nor of loss of civil rights, inasmuch as she had been concerned with others in some Nihilistic plot, but was not a leader. It seemed, however, that her father was what is called a "Black Nihilist," who had been at the head of a very dangerous society, and that the girl had in all probability acted under his orders. The father had been sent already to Kara, among the murderers and worst kind of criminals, to work in the gold mines there, with the loss of all social rights and of all hope. She was to be retained in Western Siberia, though it was not yet decided what should be done with her, but in a few days she would certainly be sent off somewhere.

"There will be some difficulties, of course," he continued, "in the way of your application, but I will do my best. I cannot promise that she shall be freed from prison to come to you, but I will tell the governor of whatever prison it is to allow you access whenever you please; and further, that your children—as you wished—may have free access to her cell."

When the Frau von Steinfeldt offered the governor a *trifle* to arrange this matter for her, the trifle consisted of ten new hundred-rouble notes. A thousand roubles is a large sum of money in Siberia, and to hear it called a "trifle" was worth something, but to *receive* it as a trifle was worth a good deal more. He was a Russian official, and they are so badly paid as a rule that any little extra help in the way of "fees" never comes amiss.

And therefore he unhesitatingly took the bribe with unfeigned delight.

The next day, at the same hour, he called and asked to see Marie Feodorovna. She accompanied the governor to the director of the chief prison of detention, where prisoners have to remain pending the final examination and verification of the sentence. Those who are to be severely punished are very often put in

the governor, with some pride, introduced Frau von Steinfeldt into a cell where there were only four prisoners, all women, in the room. This cell was provided with two lounging boards like those seen in barracks, each capable of holding two. Over each board was a shelf containing the various possessions of the prisoners—respectively a comb, a spoon, the sacred picture of her saint, the missal

round her neck, exclaiming in Russian, "Ach Tëtka" (pronounced Akh Tyotka), "Tëtka," burst into a flood of tears and fainted away.

The governor was much moved at the warm affection existing between aunt and niece, and gave directions to the keeper of the ward to allow this lady, either alone or in company with her son or daughter, or both, to see the prisoner

"We are most grateful to you, sergeant,
for all your efforts in our service."

solitary cells; others, again, are put into large rooms where as many as a hundred are confined together. Amongst those who have not been sentenced to loss of privileges and rights of citizenship there are distinctions made, according to position in society and education. Occasionally these persons are treated with considerable kindness, the women not being flogged, and being allowed cells, where two or three can live together. Annie was among this favoured number, and

of the Greek Church, and one or two trifling articles of personal property.

There was in the corner the regulation ikon of the prison, which was the only ornament. But the stove was heated and the double windows were well closed, so that there was a very agreeable amount of heat in the place, contrasting favourably with the cold outside.

As soon as Annie saw her aunt she stared at her for a moment wildly, then rushing up to her she flung her arms

at any time between sunrise and sunset on any day she pleased; also to allow this lady to pass out of the prison with her son or daughter or both, whenever she chose during the day—i.e., from sunrise to sunset.

Very sweet was the communion of those true-hearted women during that brief conference. And when Frau von Steinfeldt left the prison it was with a lightened heart. She was driven home in the governor's own sledge, accompanied

to the door of the inn by the governor himself, who promised to obtain for Anniesie the privilege of having a room to herself at the proper charge and expense of her aunt. Nor was it long before this promise was performed.

As soon as Anniesie had a room allowed her to herself her aunt brought Ivan to see her. The meeting was too touching for description. She, poor girl, had suffered greatly from the effects of her exile and the extreme severity with which she knew her father had been treated. She was to a certain extent dazed and not half the girl she had been. Ivan cried like a baby from sheer sympathy. He listened with great eagerness to her story of the march. It seems that for more than two months she had never been without the presence of a gendarme.

We refrain from harrowing our readers with a repetition of the horrors which she related. Nor need we dwell minutely on the plan of escape arranged upon. Suffice it to say that the little party did not avail themselves of the permission given that Anniesie should visit Frau von Steinfeldt and her children. This brave lady visited the prisoner every day, bringing constant presents for the keeper of the ward, the master of the prison, and all the officials connected with it, to gain for her niece their goodwill and aid. It was known that she only intended to bring one of her children each day, one day Olga and another day Ivan. And by this means the escape was effected.

The rich velvet dress with Astrakan trimmings had been made with a very long skirt to conceal Ivan's trousers and boots, but another body had been made in Moscow to fit Frau von Steinfeldt. This the two women had carefully altered to fit Anniesie exactly. When this and certain other preparations had been made, Frau von Steinfeldt sent Ivan to the governor-general with a request to have her passport signed by him, and that he would also see that those of her son and daughter were in order, signed, stamped, and sealed by him and ready for her departure in three or four days.

He was only too glad to aid her in every way, and without any further difficulty he signed, sealed, and stamped her official papers, and gave Ivan an open circular letter to all mayors, governors, and prefects on the route to afford Marie Feodorovna Frau von Steinfeldt, with her daughter Olga Ivanovna and her son Ivan Ivanovitch, travelling to Moscow, all possible aid and facility on their journey, to see them properly provided with horses, to give them all protection, and to remove, as far as in them lay, all difficulties in their progress. This letter he promised Ivan to bring himself.

It has been stated that it had been arranged for Anniesie's assuming the dress of "Olga," for which purpose time had been consumed in altering the body, which did not quite fit. The dress was at last finished, and the aunt the morning after the receipt of the passports called at the prison with Ivan disguised as "Olga." A short time after, the coachman being sent away, Olga left to return by a hired sledge to their ordinary lodging, and time was then allowed for the change of guard to take place, an hour after which time the carriage-sledge was to call. The man was not surprised at taking back Ivan and not Olga, because

he knew that they were constantly relieving each other, though never visiting together. Very often Ivan would go home in a hired sledge and send back Olga, so the man was used to it, and Anniesie as Olga had been shown how to unlock the door and get into the rooms. A letter had been left in Anniesie's room addressed to the governor, in which she told him that, unable to bear the departure of her aunt, she had taken advantage of his kind permission to visit the house where her aunt was staying, but that instead of returning to her room she had resolved to escape to her father at Kara and share his exile there.

The permission given by the governor for Anniesie to visit her aunt, and the constant coming and going of her friends, rendered the warders and prison officials less strict than usual, and, in fact, the letter was not found for two days after her departure.

The good aunt had now a curious task to perform before Anniesie could be seen as her daughter, which was to dye her hair. Ivan's eyebrows and hair were black. We have before stated that Anniesie had a profusion of golden locks that made her look most sunny, and thinking that the contrast would be greater if she dyed Anniesie's hair black than if she changed Ivan's coal-black hair to gold, she had provided herself at Brocard's, in Moscow, with a dozen boxes of hair-dye. As soon as Anniesie, therefore, finally left her prison the aunt commenced operations, and by the next morning the golden locks had all assumed the hue of the raven's wing. Standing in the blue velvet dress trimmed with white Astrakan fur, wearing the little white Astrakan fur cap to match, and allowing her hair to fall behind her, Anniesie presented so completely the same appearance that Ivan had presented on his introduction to the governor as Olga, that no person could have doubted the identity of the figure.

The day before the departure the governor, the mayor, and the prefect of the police called to take leave of their agreeable and profitable visitors, and they were much gratified by the munificent gifts made to the prisons, the town, and themselves. A handsome guard of cavalry had been ordered to attend them to Ekaterineburg, and, what is very curious, that very day the governor received a letter from the prefect of Moscow, thanking him for the great care he had taken of Frau von Steinfeldt and her family, and requesting him to continue his exertions and to facilitate her departure. This was written on official paper, and all through in his own hand.

The high and mighty officials were much impressed by the sight of the whole family. They were very graciously received by the three, and a charming interview was terminated by the presentation of the officer who was to conduct them back to Ekaterineburg with a party of picked gendarmes.

When the day came the party was accompanied to the gate by the governor and his lady, the mayor and his wife, the prefect of police, the governor of prisons, the keeper of the house of detention, and an illustrious body of officials in sledges and on horseback. The governor himself placed Frau von Steinfeldt in her sledge, and helped Anniesie to a seat beside her "mother." Ivan was helped in last, and squeezed himself com-

fortably into the space between them. All three were very anxious until the final good-bye was said, and then—Away—away—away! over the snow, the merry bells jingling and jangling as they went. The governor and his party went slowly back to their respective homes, sad at heart to lose such golden guests.

As we have before intimated, the inferior officials of the prison were not alarmed at the disappearance of Anniesie. They went regularly with her meals, but knew that she had far better food where her aunt was staying. They thought, after the orders of the governor, that they ought not to disturb him about it. In fact it was generally supposed that the escape was winked at by the authorities, but when Anniesie's letter to the governor was brought to him on the afternoon of the second day after the departure of Frau von Steinfeldt he was (or pretended to be) very angry with them for their remissness, and drove off to consult with the prefect and the mayor as to what steps ought to be taken in respect of the runaway.

"You see, gentlemen," said the governor, "we are in a difficulty. I myself saw the Fraulein Olga into the sledge. She was as unlike the prisoner Anastasia von Hohenhorst as possible. You have both of you seen the ladies; now tell me, was there the slightest resemblance between them?"

"Not the slightest," said the prefect.

"Not the slightest," echoed the mayor.

"Not the least in the world," exclaimed the governor of prisons.

"It is impossible for them to have taken her. I had the sledges packed, lined, and prepared by my own people, who never left them until I came up and handed the ladies in. There was no room for a fourth party."

"And the fourth party," said the prefect, "has no passport, so she will be stopped at the first station and sent back."

"Could Fraulein Olga, the young Serene Highness, have changed clothes with Anastasia von Hohenhorst? That is a common trick," said the mayor.

"But changing faces is impossible," said the governor of prisons, "and any one who had ever seen the faces of Anastasia and Olga could never mistake them. One was blonde, the other brunette. The expressions were as different as possible."

"Besides," said the governor-general, "where could they have put Olga if the third in the sledge be Anastasia? No; I like sagacity. I like my people to be on the *qui vive*, but—beg your pardon, gentlemen—the theory of substitution is downright silly. It is not as if we did not know the two girls."

"Then where in the name of wonder is Anastasia? Either she has really gone towards Kara to see her father, for which purpose she will be well provided with money, or she has contrived some means of hiding herself until she can induce some pardoned person to sell her ticket of freedom. Money she will have, of that there is no doubt; and whether she gets away to her father or has some means of escape to Moscow, we cannot suffer. We have done our best. We have offered no opposition to the departure of the Steinfeldts; we have given them every possible facility for coming, going, and seeing their friend. We can not get into trouble."

"At all events," said the governor of prisons, "I should strongly advise the governor-general to send this letter by special messengers to the police prefect of Moscow, Ivan Petrovitch Kakaroff."

"An excellent idea!" cried the governor-general. "We must do so at once. But the messengers are not to interfere with the progress of the party."

"Certainly not; that would spoil all."

This was unanimously agreed on. A formal search was made for Annie, but the theory of escape was staggered by the discovery of several articles of clothing belonging to her in the snow five versts from Tiumen on the road to Kara. When we reflect what money will do everywhere, and especially in Russia, we need not feel surprise at this discovery by a poor man who had been employed by Frau von Steinfeldt in

sundry ways, nor at the fact that after this discovery the man's condition seemed greatly improved. He bought a house and some furniture, and "lived happy ever after."

The letter to Kakaroff containing Annie's letter was never acknowledged, but the governor of Tiumen was shortly after promoted in rank, and died a rich man (for an official) at a good old age.

(To be continued.)

ON SPECIAL SERVICE: A NAVAL STORY.

By GORDON STABLES, M.D., R.N.,

Author of "The Cruise of the Snowbird," "Stanley O'Grathame," etc.

CHAPTER XI.—A TRIP TO SIERRA LEONE—A "HIGH OLD TIME OF IT" ON SHORE.

"THERE is nothing certain in this world," said a wise man once, "except the unforeseen."

"There is nothing impossible or improbable at sea," said the greatest sailor-warrior that ever sailed the ocean.

And yet, when on that same evening Colin McLeod came on board his own ship, and going to his friend Mildmay's cabin, informed him that there was found among the wounded an Arab of the name of Golava, who knew Mildmay, and had expressed a wish to see him, that officer sat right up in his cot, and opened his eyes much wider than he had done since the Theodora left old England.

"Golava here!" he exclaimed. "There was mutiny of some kind on board, I've been told. I hope Golava fought with and not against the slaves and Kroomen. But I need hardly ask; he was ever faithful to British interests."

"He fought on the side of the mutineers, sir," said Colin—"if indeed you can call men mutineers who fight as slaves for the freedom which I believe is the birthright of all."

"Well spoken, boy—well spoken! But this Golava, he was our interpreter in the old Spartan, and a capital fellow he was, and doubtless is. Has he come on board with you?"

"He is outside."

"Bring him in. But stay. Where is Captain Blunderbore?"

"On the main deck, sir. He is talking to Dr. McGee."

"Stand near them and wait till they have finished, then present my compliments, and say I should like to speak with Captain Blunderbore in my cabin."

In a few minutes Mildmay's screen was drawn back by Colin, and the captain ushered in.

He shook hands kindly with Mildmay, and took a seat.

"Ha! ha!" he said, laughing; "so you see I'm better, and about before you. Sorry, though, to see you still in bed."

"Oh, I expect to be allowed to go to duty in a day or two."

"Mind you, Mr. Mildmay, I won't hear of your coming to duty one day before you are thoroughly well. I need hardly say," he added, "that I have caused my clerk, Mr. D'Austin—a capital fellow, and come of good old stock—to make a report of your gallant attempt to save my poor man's life."

"Thank you," returned Mildmay, with a slightly heightened colour. "But," he

continued, "a singular thing has occurred. On board that slaver Mr. McLeod has discovered an old shipmate of mine."

"You surprise me."

"It is true. Poor Golava! He is well known on the east coast, and has acted as interpreter for many years, and done much good to British interests out there."

"Where is he, Mr. Mildmay? Have him in. I would like to see him."

"One moment, sir, if you please. Mark me, I can vouch for his former life and faithfulness, he himself must explain how he came on board this slaver, or what he is doing on this coast at all."

"True, true."

"You see I don't doubt him, sir, but it is best to have everything fair and above board."

"That's so."

"Mr. McLeod," cried Mildmay, and Colin appeared, "bring Golava."

"He is here."

Colin drew the curtain right back, and Golava stood for a moment in the doorway as if hesitating to enter. His eyes were fixed on Captain Blunderbore, and at first he did not observe Captain Mildmay in his cot.

Let me try to describe him. A little, fat, pleasant-faced Arab, almost as brown as a brick; so fat was he in face that his eyes seemed to wear a perpetual smile, although in body he was not what you might term inconveniently stout, simply dapper. His dress was peculiar. I always had an idea that Golava's dress was one of his own choosing entirely, and that to some extent he affected the uniform of the British naval or marine officer. It was evident at all events that he had an eye for the beautiful, and for bright colours. Some parts of the Arab dress Golava had discarded, others retained. The big turban, for instance, would be found unhandy on board ship. Golava had left his on shore, and substituted a small black straw skull cap with a band of gold lace round it. The Arab's cloak he had also discarded, and wore a white cutaway jacket richly braided with crimson and gilt. This was worn loose and open, all the better to show off a very splendid affair in waistcoats. This vest was of a bright scarlet plush, and had gold braid all round the pockets and all up the edges. Had Golava worn a shirt it would have made a fine finish to his upper man, but as he did not, the naked brown chest appearing

above the waistcoat, where shirt-front should have been, looked somewhat eccentric at the very least. Then Golava's lower garments were wide white pan-jamas that ended a little below the knee, all the rest of him was brown legs and feet, except the portion that the sandals covered. He had a belt round his waist, beneath the waistcoat. Oh, Golava would never have consented to hide an inch of that waistcoat of his. Attached to the belt was a dagger which had once done duty as a midgy's dirk, but the scabbard of which was now studded with more gems and precious stones than most midshipmen are worth.

Golava's eyes soon fell on Mildmay.

He passed Captain Blunderbore with a polite and respectful salute, then at once threw himself on his knees before the cot.

"My good Golava," said Mildmay, extending his hand, "I am really pleased to see you."

"And I," said Golava, "in grief to meet you. What ails my friend?"

As he spoke he pressed Mildmay's hand to his brow, and as he lowered it it was damp with tears.

"Sit down now, old friend," said Mildmay. "Yonder is our captain. He will be glad to hear your story."

"Poor man!" said Captain Blunderbore. "I perceive you are wounded in the shoulder."

"Only a scratch from a dagger," said Golava, though the wound was really far more serious. "Only a scratch. Now I tell you all my story. It is not long. It is true. My old friend Mr. Mildmay know right well I never tell a lie."

"I have never heard a lie from that man's lips, Captain Blunderbore," said Mildmay, solemnly.

"Good, good; go on, Mr. Golava."

"After you leave the coast, Mr. Mildmay," Golava continued, "I serve the Queen in several ships. They did catch plenty slaver. I was twice wounded; I was shot through the arm in a brush on shore capturing a barracoon, and another time, in boarding an Arab northern fighting dhow, I was stabbed with a spear in the chest. My people—the Arabs—hate me."

"They have some little cause, Golava; but go on."

"Presently, gentlemen, I get tired of fighting. I cannot live in peace, though, at Zanzibar, so I beg my captain to give me and three of my wives passage to

Sierra Leone and land me there with the Krooman, to live in peace and quiet for the remainder of my days. I have plenty of money. So my good captain do so, and I happy for once. I have a big boat and a crew of Krooman. I take long voyages down the coast, I hunt, I fish, I do altogether the gentleman. And when I from home my wives look after my little farm, plant the turmeric, and

"That is all. Here I am. Alas! gentlemen, I must never perhaps see my poor wives again!"

* * * *

All next day the two ships, the man-o'-war and the slaver, lay near each other. The slaves, to the number of four hundred, were had up, and a mournfully pitiable lot they looked. It really seemed

Cuba they would have made a good thing of it.

It was a bad day's work, however, their picking up Golava and his bold Kroomans.

"They were not wise enough," said Golava, laughing, when explaining how the rising was effected. "They think they make my Krooman work and me do cooking, because I can make a good curry.

Ha, ha! my Krooman and I did make a good curry, but we made it too hot for those blackguards. We put arms in the hands of the slaves, and when all ready we make the rush. They turned the gun on us, but we spoiled the sailing of the barque. Beaten back we were 'tis true, but all the same the British ship come. Fine vessel your Theodora, Captain Mildmay, but not so fast as the barque."

"You mustn't call me Captain Mildmay, though; there is but one captain on a ship-of-war."

Benbow and M'Gee did all they could to make the slaves comfortable, and so did Barclay. He managed to make himself understood among them with the help of Golava's Kroomans, and I think the poor wretches must have

"Threw himself on his knees before the cot."

make cocoanut-oil. Oh, I 'ssure you, gentlemen, I was quite happy.

"But one day, when three hundred miles from home, on a low, wooded coast, I see this vile Portuguese scoundrel sail out from the woods in his barque. I don't like the look of him. I smell a rat, and clap on plenty sail, and away I go. Ah! but they make sail, and that barque is swifter than the wind. They soon come up with me; they fire, they shoot three men; they sink my lovely boat, and take me and my crew prisoners.

as though, having suffered so much and suffered so long, they cared but little now how soon their misery ended. It was sad to see some of these poor wretches in so worn and emaciated a condition, that their shoulder-blades were almost cutting the skin. The particular part of the coast they had come from even Barclay could not discover.

However, it was evident enough that so far these Portuguese fellows had worked the matter well, and that had they succeeded in runing their cargo to

taken the honest gunner for a kind of an angel, or some being from a better world.

The Theodora and the barque parted company in a day or two, the former going on her voyage to Ascension, where she had despatches to leave, the barque bearing up for Sierra Leone, with orders to follow the man-o'-war to the Cape as soon as the slaves were disposed of and the barque condemned.

Twenty picked men accompanied Benbow, who was put in command of the slaver, with Colin as his second officer.

Golava went along, and Duncan Robb was corporal of the few marines, and a very proud young man he was in consequence.

Sierra Leone was then about four hundred and fifty miles west and south of them.

The wind was fair, however, and they hoped to reach this town within three days. The weather was fine too, for the rainy season had just given place to what we may call the cool, if there be any cool within ten degrees of the equator.

Benbow felt in his glory now walking on his own quarter-deck, and Colin also enjoyed the change.

"It is glorious," said Colin, the first morning. "Is the weather always as bright and beautiful in these regions? Is the sea always as blue, and are those shoals of flying fish and dancing dolphins always—"

"Stop, stop, my boy, don't get romantic. No, lad, if you'd been here two months ago you would have found matters very different. The sky overcast with grey and black gloomy-looking clouds, the horizon close on board of us, the rain coming down steadily, constantly, and in buckets, the only variation being an occasional thunderstorm, with lightning more vivid than any I have ever seen except going round the Cape."

"Well," said Colin, "I'm glad I wasn't here then; but isn't this a fine little barque!"

"Something like a clipper, Colin. Now I can tell you between our two selves, if the Spaniards or Portuguese always went to the expense of having a water-witch like this, it isn't three of our six-knot cruisers that could capture one of them."

"But then our cruisers have the steam."

"And do about eight knots then. Granted; but these fellows know better than to come anywhere near a cruiser when the wind isn't blowing."

"I dare say," said Colin, laughing, "the slavers took us for a collier."

"Well, we're not so bad-looking as that, though I've seen some smart colliers too in my time. The Theodora is fast for a cruiser even; but, dear boy, our Admiralty Lords, with all due respect to them, must make cruisers twice as fast as she is if England means to remain what she has ever been—"mistress of the seas."

"Hullo! Golava; come up here and look about you."

Golava ascended to the poop and saluted.

"Yambo," he said, bowing low.

"Yambo sana," said Benbow, returning the salute.

"Breakfast is all ready," said Golava. "And you yourself have made the curry?"

"Yes, sir, and a good one you'll find it."

"Well, my worthy Golava, the cook in this case must even sit down and share it with us. But tell me, good Golava, doesn't your heart bound with delight at the prospect of so soon being once more in the arms—three pairs, Colin—of your beloved wives?"

"Not much," said Golava, laughing till his eyes quite disappeared.

"You undutiful dog, you," said Benbow; "but come along, we'll all descend to breakfast. Keep her full, Mr. Barclay."

"Ay, ay, sir."

* * * * *

Benbow in his water witch crept up to Sierra Leone with a light evening breeze, and cast anchor in the river.

Next morning Colin was early astir; but long before he was awake he was partially sensible of a row of some kind going on alongside, of many strange voices jabbering, and of boats and canoes thumping and rasping against the barque's side.

"There is a fight of some sort going on," he said to himself as he dressed.

It was merely, however, the native boatmen squabbling among themselves, and at times even coming to blows. There was quite a crowd of canoes and boats hovering round the ship, and many a sturdy negro had climbed on board, and was busy selling fruit, yams, and sweet potatoes to the white sailors.

The barque was an object of very great attraction to the inhabitants of Free-town, both whites and natives, and became quite a show ship when it was rumoured about that she was a captured slaver.

The first thing Benbow did was to pay a visit of ceremony to the governor. He took one Krooman with him besides Golava, and Colin was left in charge of the vessel. There would be little or no difficulty in effecting the condemnation of the ship, Benbow found; only a few weeks would elapse before the Court could sit, for red tape rules the roast in everything connected with the service.

There would be little difficulty either, so Colin soon found out, in spending those few weeks with a great deal of pleasure. He had never been in so wild and beautiful a country before in his life. Golava himself became his guide, with a couple of negroes to carry guns and fishing-rods; so the woods and forests were explored and plenty of sport was obtained. Colin felt sorry one moment that he was not an artist, next moment he would have given all he pos-

sessed to be a poet, but as Colin was neither he had to be content with simply gazing and admiring.

Of course he was invited to Golava's house. It stood in the outskirts of Free-town, in a quiet, retired compound, amid most charming tropical foliage and rare and beautiful flowers.

It was towards the afternoon of a very hot day when Colin and Golava arrived. They were evidently expected, and were ushered into Golava's best room. Fruits and sherbet were placed before Colin, and there was a prevailing odour of delicious curry wafted through the air by the quickly-moving punkah that told Colin something more substantial and satisfying would soon follow the fruit.

But Golava, the lord and master of this domain, must seat himself in an easy arm-chair, made of straw, and for a time give himself all the airs of a king.

One of his wives hastened to remove his sandals, the other took off his turban, exposing his bare round nut of a head, which was as destitute of hair as a billiard-ball.

Then one wife shampooed and dried and powdered his skull, while at the same time another wife did the same kind office by his feet.

Sitting there, in his easy-chair, enjoying these attentions, with a radiant smile of satisfaction all over his round, fat face, he looked so funny and so ridiculous that Colin was obliged to laugh. He apologised to Golava for being so excessively rude as to laugh, but candidly confessed that for the life of him he couldn't help it. Golava was in no whit offended, but continued to smile in the same blissful, self-satisfied way until the ceremonies were all over.

But when the curried Guinea-fowl came in, and the dishes of snowy rice, and the wonderfully-cooked and strange-looking fishes, and the piles of splendid fruits, then Colin and his guide sat down to table, and it was his—Colin's—turn to smile in a blissful way, and feel all over at peace with himself and all mankind.

At long last the Waterwitch was condemned, the slaves were freed, and the prisoners thrown into prison to await a trial with which our story has nothing whatever to do.

But when the Waterwitch was wafted once more seawards on the wings of the land breeze, and evening fell and found them far at sea, then both Benbow and Colin confessed to each other that Sierra Leone was not "half a bad place," and that they had enjoyed what the Yankees call "a high old time of it," and hoped to return to that country on some not distant day.

(To be continued.)

THE SALT-WATER AQUARIUM.

By THEODORE WOOD,

Author of "Our Insect Allies," etc.

(Continued from page 591.)

If any of my readers have a turn for chemistry they can prove this fact for themselves in a very simple manner. All that need be done is to take a wide-mouthed phial, plunge it beneath the surface of the water, allow the contained air to escape, and then hold it, while still submerged, in an inverted

position over the bubble-covered leaves. As the bubbles ascend into the bottle a corresponding bulk of water will be displaced, until, if you have perseverance enough to continue the operation for a sufficient length of time, the entire bottle will be filled with gas. Cork while still beneath the water, re-

move the bottle, and apply any of the ordinary tests for oxygen, when the nature of the contents will be readily ascertained.

In selecting the seaweeds, which are not only to adorn your aquarium, but to render themselves useful as well, you must exercise some little discrimination. All the red

species, for instance, must be ruthlessly rejected in spite of their wonderful beauty, for, although they may seem to flourish just at first, they are sure to break up and decay in the course of a few days. The majority of the brown varieties also will be far too large for a confined space, and the aquarium-keeper therefore will be obliged to fall back on those pretty green weeds which are to be found so plentifully upon every rocky coast, and which will answer the required purposes in the most admirable manner. Do not overload the aquarium with these, however. You will not require very many, and they will begin to multiply so rapidly after you have had them for a week or two that you will probably be obliged to clear the glass sides of the vessel every now and then, in order to obtain even a glimpse of the inmates. For this purpose nothing is better than a small piece of sponge fastened to the end of a short stick.

The second method of aerating the contents of your aquarium is equally simple, but far more troublesome, and consists in splashing water from some little height into that contained in the vessels, in order that air may be carried down and absorbed. This you must do several times in succession by means of a teacup, or similar receptacle, and

you will have to repeat the process at intervals during the day. Or, if you prefer it, you may procure a small glass syringe, and inject water by its aid as often as required. An ordinary metal squirt will poison the water.

A prettier plan, provided that you could only carry it out, would be to provide your tank with a small self-acting fountain, which would save you all further trouble in this direction. There are many difficulties in the way, however, before such an institution can be brought into working order.

Now there is another point to which I wish to call your attention, and one of a very important character indeed. Water, of course, is liable to evaporate, and that of your aquarium will prove no exception to the rule. So you must be prepared, in the course of a few days, to find that the contents of the vessels have sunk below their former boundaries, and at once to replace deficiencies by adding fresh water. The best plan that you can adopt is to make a "high-water mark" in each vessel, and never to allow the supply to fall below that point.

Perhaps a word as to the character of the water which you employ may not be out of place.

Many persons, upon finding the contents of

their aquarium daily diminishing in volume, would unthinkingly proceed to add salt water, and, in the course of a week or two, would find themselves the unconscious cause of a terrible series of catastrophes. For, although the water itself evaporates, the salts, etc., which were dissolved in it do not, and would consequently accumulate to such a degree as speedily to cause the death of every captive. By far the best water which you can obtain for making the necessary additions is rain-water, or, if such cannot be procured, that from a clear stream will do almost as well. Ordinary drinking water is simply poison. Pour the water into the tank gently, and by slow degrees. There is no need to stir it, for it will very soon mingle with the rest without assistance of any kind.

Next as to food.

Some of your captives are almost sure to prey upon one another. That you cannot help until you have learnt something of the habits of the different creatures with which you may happen to meet. After a little experience you will be able to separate the cannibals from their victims, and so to keep in the same vessel only those which can live together in harmony.

(To be continued.)

TOM STANTON: A STORY OF COUNTRY LIFE.

CHAPTER IV.

BUT morning light brings fresh courage, and as the doctor's skill soon cured the wounded hand, in a few days Tom was going about much as usual. It seemed to have been agreed that nothing more was to be said about the mysterious disappearance of Snap, and on his part Tom would have been glad to forget as soon as possible his share in the poor dog's fate. But a restless uneasy feeling drew his thoughts always to the old tree, and at length he took advantage of an opportunity to go down there alone. The place seemed as lonely as ever, but in Tom's present frame of mind it was hardly a surprise to see the ugly head of Mr. Bart appear from behind the hollow trunk as if looking out for him.

With a nod Tom would have passed on, but something in the man's face made him pause. Bart touched his cap with an air of habit rather than of respect, and drawing near, said,

"I have been trying to see you for some little time, sir, but you weren't about."

"No," said Tom, "I haven't been well."

His heart sank as he saw the man's cunning familiar grin, and he wondered what was coming.

"Well, here you are now, at any rate, and, to lose no time, I should be glad to know what's going to be done about that little matter between us."

Tom's face got hot, and he looked up angrily.

"If you are going to bother about that," he said, "I'll go and ask my uncle for the money at once, and you'll be forbidden to come about the place any more."

"Not so fast, not so fast, sir, if you please. There's more than that to be settled, and I doubt if you will speak up

so bold when you've heard all I've got to say. Mr. Jack's sorry about his dog, I suppose?"

"Yes, of course. How did you hear about it?"

"Hear about it? Why, bless your heart, you would wonder to know of all the things I hear—aye, and see too—things that surprises me, that they do!"

"Well, go on. What has this got to do with me?" said Tom, impatient to be gone.

"The squire perhaps will be offering a reward for the terrier?" asked Bart.

"No, not a chance of it. What would be the use when the dog is dead?"

"And you think he's dead, do you, sir?"

"I suppose so," said Tom, looking away uneasily.

"'Twould be a cruel death for a dog, any way," said the man, musingly.

"What do you mean?" said Tom, looking suddenly up and away again, while his heart beat quickly.

Bart had begun to fumble in his pockets, and, bringing out a handful of odds and ends, selected something carefully folded up, which, with some parade, he spread out for Tom's inspection.

"Why, that is one of my handkerchiefs!" said the boy, putting out his hand for it, while the holder, withdrawing it, began carefully to fold it up again.

"Yes, sir; yours sure enough, and plainly marked, but found by me—and in a curious place too!"

"Found! Where?"

Bart assumed a narrative style while apparently occupied with the handkerchief, and said, "I was couching in the long grass nigh about here not so many days back. 'Twere a warnish afternoon, and 'most asleep I was, when the sound

of running feet aroused me. Shall I go on, sir?"

"No," said Tom, half choking. "So you were here, then?"

In desperation he stood looking at the ground. It was his bad luck, he thought, that seemed to force him into this man's power. Just when he was hoping that everything had blown over, and when he had meant to begin afresh and do so much better for the future, the past seemed to rise against him, and he was in a worse case than ever.

What could he do? What was to be done now?

"And the little dog, sir—" continued Bart.

"What do I care about the dog?" said Tom, savagely, turning away.

"I was just about to tell you, sir, that the dog is at my place, as well as ever he was in his life. Mr. Jack would give something to see him again, wouldn't he?"

"I dare say. But he must never know about this."

"That's as you may please, sir. I don't mind doing my part if you will do yours."

"What do you mean? Am I not doing as much as I can?"

"Well, sir, it has been mostly promises on your side, so far. A man can't live on them, you know, and my best ferret gone, and everything agen one."

"Speak out, can't you? What more do you want me to do?"

"Well, as I was saying, we must all live, and the beasts can't thrive on nothing. A bit of grain does them a powerful lot of good now and then; but what's a man to do with hardly a penny in his pocket for his own vittles, and things so cruel dear? In a big place like that up yonder there's a deal of waste,

and my lot could feed hearty on what's being thrown away every day, so to speak."

Tom looked puzzled.

"I don't understand you," he said.

Bart coughed, and began again.

"Well, no, sir; them as don't suffer can't be expected to know what it is to be spied after here, and ordered off there, and hardly dare to show one's nose even when there's vermin to be trapped. Mr. Richards now, he's sharp and short enough with me, though it's not more of his corn I've had than a man could carry in one hand."

Tom was silent, and after a furtive look at him, his companion continued,

"The granary locked, too! as if the rats don't take more in a night than my little lot could want in a month. I despise such mean ways myself. Why, one would think 'twas his own stuff as the man was saving! What good does it do him? Suppose, now, one could get round him without his knowing anything about it, wouldn't that be a lark? The key is left hanging somewhere about, I dare say. I'll be bound you know where it's kept well enough, sir—don't you?"

Tom nodded, but said nothing.

"Well, supposin', for the fun of the thing, you let me have a look at that key for a minute or two some day. 'Twould only be a joke to pay Mr. Richards out a bit, and no harm done either, and 'twould make things more equal atween you and me."

Tom was looking at the ground gloomily, but shook his head.

"Well, of course you know best, sir, what you can do. If you could have obliged me I would have been glad to oblige you by promising to say no more about the ferrets; but now perhaps I had better go straight to the squire. He'll see as I'm not wronged, and he won't expect a man to put himself to inconvenience for them as won't do nothing in return. Good day to you, sir. I'm sorry I can't shield you any more; but a man can't do everything for nothing in this world, you know."

"Come back, Bart," cried Tom, as the man moved away. "What good would it do you to see the key. Even if I did get hold of it I should have to take it back again at once, or it would be missed."

"You leave that to me, sir; I know my own business. If you was to get the key, say to-morrow in Mr. Richards's dinner-hour, and brought it and laid it in the long grass just under the elder-bush outside the stable-yard, why, in another quarter of an hour you could come and fetch it back, and no word said on either side, nor any chance of your being seen in my company. And as for the ferret, I don't mind saying as you should hear no more about it from me."

"That would be a good thing," said Tom, as if to himself.

"Yes," said the man, watching him keenly, "'twould be all one as if you had never been out with me at all."

"I should feel free again," said Tom. "Well, come to-morrow; you shall have the key if I can manage it."

And without further words the two separated.

By this time Tom's feelings were sufficiently blunted for him not to feel very acutely the dishonour of becoming a mere tool in the hands of a man like

Bart. Public disgrace he dreaded and shrank from, but to the self-respect which withholds from secret faults he was a stranger. His pride was the vanity which would make a brave show, rather than that nobility of nature which fears no blame while conscious of right. To be released from present difficulty he would take this one step more on the downward path; afterwards, when he was free again, it would be easy enough, he thought, to turn round and walk in future on the upward way, with all his former sins hidden and forgotten. So after having obtained the key for Bart as arranged, he did his best to ignore his share in the business, and, true to his resolution, began to show an amiability and desire to please which drew forth his uncle's approbation, and caused him to write encouraging accounts to the father in India of his boy's rapid improvement under the influences of home life.

And brightly and happily Tom's life would have passed now, if it had not been for the occasional pin-prick of an unpleasant reminder when after some time the boys began to speak of Richards's suspicions that his corn was being tampered with.

"He says he is sure of it now," said little Bertie, with eager sympathy; "but as he hasn't any proof yet, he is going to set a trap for the thief, whoever it is."

"Perhaps he imagines it," said Tom, carelessly, and turned the conversation to something else.

But not many nights after, as they were all sitting quietly enough in the drawing-room, after dinner, a noise of voices and shouting outside made the boys start up just as James, the footman, entered the room hurriedly, exclaiming, "Oh, please sir, they say there is something on fire down by the stables!"

Mr. Stanton was on his feet in a moment, while Mrs. Stanton cried anxiously, "Oh, boys, won't you stay here with me?"

"Let them come, Mary," said her husband, turning at the door. "I don't think they will get into mischief, and they may be of use;" and in another moment they were all running in the direction of the stables.

There was no moon, and the night would have been dark but for a curious glow of reflected light, which struck the boys as strange, until, turning a corner, they came upon a sight which they remembered all their lives.

Were these the buildings which they were accustomed to see in the quiet light of every day? And that volcano spouting fire and smoke—could that be the familiar granary? What a transformation was here! From every part men came running in, all willing to help, but crowding in each other's way, and sadly wanting guidance. Richards and his helpers were too much occupied in getting out the horses to think of giving any directions as to preventing the spread of the fire, and Mr. Stanton's appearance was hailed with relief by all. Promptly his quiet directions were obeyed, and soon a stream of water was being thrown on the blazing roof, while men were hastily endeavouring to cut off the fire from spreading to the neighbouring buildings. Sparks and burning fragments were flying in all directions; clouds of smoke waved here and there

as the wind caught them, and soon the boys were almost unrecognisable, as, with blackened faces and drenched clothes, they stood passing buckets or ran to carry a message.

In the excitement of the scene they had almost forgotten the danger and loss, when a poor fellow was carried by with a broken leg, caused by a fall from a roof, and Mr. Stanton's voice could be heard calling to some men to come down from a perilous position, as they were going to try to get at the fire from below.

Tom was standing near when the men, using a long post as a ram, succeeded in driving in the heavy door of the granary. A blinding rush of smoke escaped when the door fell in, followed by comparative clearness as the draught made the flames shoot higher.

"What's this?" said a man, peering in through the doorway and dragging out from somewhere near the entrance what appeared to be a lifeless human form.

"Ah! dead, poor soul!" said another. "How did he get in there, I wonder?"

"'Tis Bart the ratcatcher," said a boy. "See to the clothes of 'un! I'd know him anywheres by them alone."

"What is it?" asked Mr. Stanton, advancing.

"'Tis a man they've found in here, sir."

"Is he living?"

"Well, it seems doubtful somewhat."

"Carry him into the house; they'll do all they can for him there. And now to work, men."

Trembling with excitement and dread, Tom stood by watching while the heavy unconscious figure was borne away by the men. All his eagerness to help was over now, and idly he stood aside while the fire was being attacked in its stronghold.

Was Bart really dead? he wondered; and how had he been caught there, like a rat in a trap, while the fire was raging? Would he recover, and would he speak? Surely not, for his own sake. But he must give some reason for being there, and what might he not say to excuse himself?

Unable to bear the suspense, Tom made his way through the crowded yard and returned to the house. Going in by the back way, he stood a minute to listen. The place seemed quiet and deserted after the tumult outside, only somewhere in the distance he could hear women's voices.

Uncertainly he stood listening till one of the maids passed and saw him. She screamed first and then seemed angry with him, for "standing there like a ghost and frightening people."

He asked for Mrs. Stanton, and was told that she was busy seeing after the men. Then hurriedly he asked if the man last brought in were dead, and could only hear, "No, coming round," as his informant whisked out of sight.

"Coming round!" That meant that Bart would soon be himself again, and ready to say all he could to excuse himself at any risk of blame to others. A shiver of horror and dread chilled Tom's blood as he thought of the disgrace which might be in store for him. In vain he tried to harden himself; the unusual work and the excitement seemed to have taken all the strength out of him, and he felt a terror which he had never experienced before.

Oh, if he were only back with his own father in India! There he had never known what it was to be wretched like this. People were ready to make excuses for him there, and did not always expect him to do what was right. His cousins seemed to find it easy enough to keep out of scrapes; but they were used to this sort of life, and he was not. How they would despise him when they knew all, Jack particularly, whose dog he had tried to kill. He could not stay to see their altered faces; he must go away somewhere. Oh, if he could only get to India!

And why not? Supposing he ran away and got down to the sea, he might find a ship going to India, and get taken on board as cabin-boy, or something of that sort. They must not know, though, that he was a gentleman, or he might be sent back. Where could he get other clothes?

The sound of footsteps on the stairs made him start guiltily, and he went quietly out again, looking as if he feared

that his thoughts might be read in his face. As he wandered down the path on the way to the stables some one came up from behind him. It was a woman with a shawl thrown over her head. She spoke to him in passing, and he saw that it was the gardener's wife from the lodge.

She couldn't rest any longer, she said, without seeing how her man was getting on. Her boy Sam was poorly too, but he had dropped off to sleep now, and she had run up for a little just to ease her mind a bit. Had Mr. Tom seen her husband?

Tom said "Yes," and told her where the gardener was helping, and the woman ran on.

In the meanwhile Tom had turned, and was walking quickly in the opposite direction. His trembling fit was over now, and with a flushed face and

dazzled his eyes, and he felt that he could go through anything to accomplish his purpose.

His pace had quickened into a run, but as he neared the lodge he slackened his speed, and, stepping lightly, went towards a low window from which came a feeble glimmer of light. The window was open to the sultry air, and, looking in, Tom saw the boy Sam lying with a flushed face on a little bed asleep. Listening for a minute to the heavy, irregular breathing, Tom climbed quietly in through the window, and hurriedly collecting the boy's rough suit of clothes, carried them out into the darkness.

Now he knew exactly what he had to

"Why, that is my handkerchief," said the boy.

throbbing brow he was making up his mind to escape. Not much time did he give himself to think. Relief from present embarrassment, with a bright prospect of home in the distance,

do. Opening one of the heavy gates, he slipped out, and closing it cautiously after him, began to run quickly along the dusty high road.

(To be continued.)

GREAT SHIPWRECKS OF THE WORLD.

THREE BRIGS.

As a companion to the rescue of the crew of the *Aurora Borealis*, let us go to the West of England and take our example before the lifeboat days. Let us stand on the Land's End, see the sun sink into the ocean, and watch the stars shine over the waters, while the lights gleaming and twinkling from the Longships, the Wolf, the Bishop, and the Seven Stones, seem to protest that men, though silent as the night, may be sleepless as the sea. Like all others who have found their way to England's westernmost cape, let us feel the majesty of that wondrous mass of ragged granite which from every point and in every light, and under ever phase of storm or sunshine, is the Land's End as we thought the Land's End would be. "The wildest, most impressive place," wrote Thomas Carlyle, "I ever saw on the coast of Britain. A lighthouse rises on a detached rock some considerable space ahead; many detached rocks, of a haggard skeleton character, worn haggard by the wild sea, are scattered about between the lighthouse and end of the firm cliff; that cluster where the lighthouse is had seemed to me like the ruins of a cathedral for some time. Very wild and grim, impressive in itself and as the notableness of British capes. A boat or two, poor specks of piscatory human art, were seen rocking and paddling among the angry skeleton rocks in these ever-vexed waters; where they were to land, or how get

up to 'First and Last,' one didn't well see. But here at last is the spectre of the mixed cathedral—a lighthouse among haggard sea-beat rocks, namely; and we are round the Land's End, getting round towards the western side of it. The sunshine now went out, angry breeze blew colder from dark cloudy skies—baddish night, probably?"

And when the "baddish night" grows worse, the ocean comes swinging in with a force and fury to which the rage of the seas on the Goodwins is but child's-play. A landsman can have no more awful experience than that of a stormy night on the western Cornish coast; and when all is calm and bright, there is no more wildly beautiful spot in Britain. Its gem is that lovely Whitesand Bay which runs north from Sennen Cove to Cape Cornwall—Sennen straggling at the foot of the hill, then the wide sweep of the silver sand fringed by the Atlantic rollers in every tint of lucid green from beryl to emerald, and then the lofty ridge of the cape to form the picture, the bowstring broken by the islets off the cove and the rocks off Vellandreath, while away this side of Cape Cornwall and a mile from its precipices there rises the plume of spray as the waves leap over the Brisons. On the bright August morning how quiet it all seems, but think of a foggy winter's night, when the south-west gales prevail, as when our luckless vessel met her doom!

The *New Commercial* was a brig of 250 tons, bound from Liverpool to the Spanish Main. Early on Saturday morning, the 11th of January, 1851, she struck upon the ledge that runs between the Great and Little Brison. There was a fresh breeze blowing from the south-south-west, and the sea was running very high. The vessel immediately went to pieces. The crew got on to the ledge; with them was the wife of the captain, Samuel Sanderson.

As soon as day broke the ten castaways were discovered from the shore, but no help could then be rendered them owing to the violence of the sea. About nine o'clock a tremendous wave broke over the rock and swept them all away. Seven were drowned; two, the master and his wife, were washed upon the peaked head of the Little Brison; and the third, a mulatto named Williams, managed to cling to a portion of the floating wreck. Williams remained for hours drifting about in the furious sea, and at last the Sennen fishermen at the other end of Whitesand Bay resolved to make an effort to save him. Five of them got their boat, the *Grace*, out through the breakers, and after a severe struggle put her alongside and rescued him.

The news of the wreck had spread, and Captain Davies, of the Coastguard, sent for the Revenue cutter *Sylvia* to take off the survivors. Just as the mulatto was being

rescued the cutter rounded the Land's End, and came up through the bay to the rocks. Mr. Forward, her commander, launched a boat, and with four men tried to get near the Little Brison, on which the captain and his wife were still clinging, with the waves foaming round them and threatening each instant to sweep them off. The attempt was fruitless; the rock could not then be approached, and the boat with great difficulty regained the cutter. Night was coming on, and all that could be done was to lay-to; so up went the cutter's colours to encourage the wretched couple on the Brison, and all that night, without food or shelter, in the wind and the rain and the raging sea, they were left there to suffer and to pray for help.

On Sunday morning the wind happily drew a little to the south-east and the sea slightly abated. On the Saturday there had been many spectators along the cliffs, and on the Sunday at daybreak hundreds came out to see the end. The man and woman were still on the rock; the cutter was still in the bay. Towards noon the sun broke through the clouds, and lighting up the coast added to the feverish interest of the scene.

The morning was spent in preparation. At one o'clock three of the fishing-boats and the Coastguard boat came up from Sennen, and Captain Davies in another boat from Pen-deen arrived with some rockets he had brought with him from Penzance. The cutter's boat, under Mr. Forward, was also launched; so that six boats were ready to take part in the danger. For the sea was still running so high that no boat could venture within a hundred yards of the rock. That far, and no farther, could they get.

Thus the only way to effect the rescue was by means of the rocket apparatus, and that had never been tried on this coast before, nor had it anywhere been tried from a boat. And the boat was only an ordinary galley, twenty-six feet long by five wide. The printed instructions said that the person firing the rocket should be fifty feet in the rear to be free from danger, and these conditions could not be complied with in such a craft. One of the men who had never seen a rocket in use volunteered to fire it, but Captain Davies resolved to proceed systematically and take the risk himself. Driving his boat up as close as he could to the rock, he anchored her. He then erected the triangle or rocket-frame, and placed another boat astern to train his, and then he ordered his crew out into one of the Sennen boats while he remained alone to fire the nine-pound Demmett.

These manœuvres having been successfully accomplished, he discharged the rocket, and for an instant was wrapped in a sheet of flame from the back fire. He sustained no injury, but the line shot well over the rock, happened to fall on a sharp ridge, and was instantly cut in two.

When the boats fell back and left the captain alone the excitement of those on the cliffs rose to fever pitch, and when the line was seen to break and the end slip back into the sea the disappointment showed itself in a long moan of alarm. Soon, however, another rocket was procured, and again, with the boat behind training the galley, the captain fired it clean over the rock.

As the rope dropped beside her the woman raised her clasped hands to heaven in sign of gratitude, and the sun again shot out from behind the clouds and lit up the group of boats, and in the bright sunlight the man was seen to tie the line round his wife's waist and encourage her to take the fearful leap, whilst she lingered hesitating to jump into the white, frothing waters, which, now the tide had turned, were a dozen feet below her. At length his persuasions prevailed, and after a last embrace she made the plunge for life or death. As she left the rock the clouds rolled up again, and three immense waves broke in rapid succession, imperilling the safety of all on the

scene. For a time the boats were entirely hidden from the view of the spectators, and a loud cry broke forth, "They are gone!" and the women turned away their heads towards the land and shrieked aloud.

Soon, however, the boats appeared on the crest of the waves, and then the cheering broke forth anew as slowly the line drew home. Alas! so fierce had been the sea that the woman had been under water all the three minutes she was being dragged to the boat, and when she reached it she was almost lifeless. All was done that could be done, but before the boat could reach the shore her spirit had fled. The captain did not remain on the rock long after his wife. He tied the line round him, and was safely hauled to the galley after having been on the Brison over thirty-six hours.

Considering that this service was performed in ordinary open boats, not lifeboats, it deservedly ranks as one of the most daring in the records of our coast. The Captain Davies, R.N., who superintended the rescue was a noted saver of life from shipwreck, held several medals, and was afterwards Inspector of Lifeboats to the National Institution.

Although it hardly comes within our province to dwell on disasters occurring to small vessels, yet there are two other wrecks of brigs associated with such curious circumstances that they may well find a place here. For a ship to turn and remain keel upwards is of itself a very rare occurrence, but for its crew to find their safety in straddling the keel or hanging on to the kelson is almost strange enough for an extravaganza. The facts, however, are fully authenticated, and even lately one of the wrecks, that of the *Nerina*, has been described at length in Dr. Macaulay's admirable "True Tales of Travel and Adventure," with a copy of the official certificate of the Lloyd's agent who took the depositions.

On August 8th, 1767, then, the brig *Sally*, while crossing the Atlantic, was blown on her beam ends during a storm, and after five minutes or so turned keel upwards. There were on board of her Anthony Tabry, the master, Mars, the mate, and nine men. The master, mate, and three of the seamen were washed away, but the six survivors swam to the topmast, which floated alongside, tied it to the stern, and clung to it for seven hours. The cabin-boy then swam to the hull, seized a rope, and clambered up on to the bottom of the ship. He then threw the rope to the men, so that they could follow him, and in the heavily rolling sea these six unfortunates sat themselves astride of the vessel's keel and waited for daylight.

When the sun rose they found that the mainmast, with all the rigging—the lanyards having been cut away—was floating alongside. They got down to it and removed the wreath (the square hoop which binds the head of the mast), and with it and a bolt a foot long they went to work to scrape through the brig's bottom, so as to get at some food. While they were engaged in this wearisome task they kept their mouths moist by chewing the accumulations on the wood, and eating the lead that happened to be on her bow.

Their sufferings were terrible. In four days five of the men died, raving for drink, and yet, great as was the temptation to feed on it, the corpse was thrown off into the sea. Without food of any description, the men worked steadily on with the wreath and the bolt, scraping their way through the brig's timbers. They had neither meat nor drink nor sleep, as they dared not lie down for fear of falling off.

On the sixth day came a change. They got through into the vessel's hold, and lighted immediately upon a barrel of bottled beer. This they drank very greedily, and then, finding more beer and a barrel of pork, proceeded to allowance themselves. Day and night they worked at the cargo, endeavouring

most of all to get at the casks of water, which were a long way out of their reach.

"As to sleep, as soon as they got a hole through the vessel's bottom they pulled out a great number of staves and shingles, and made a platform in the same place, but so small it was that when they wanted to turn they were obliged to wait till the sea hoisted the vessel; and when she fell again with the sea they were almost frozen to death. Thus did these poor miserable fellows live for thirteen or fourteen days. After they got the pork they made a kind of net with a hoop, some shingles, and ropes, which they got from the mast. This they let into the sea, with some pork, and caught a few small fish, which, with two or three mice they caught on board the brig, afforded them several most delicious repasts, raw as they were. They lasted but a few days, as they could not catch any more, and then they were obliged to return to their pork, which had become quite putrid by the salt water getting into it."

At last, on the 1st of September, in 26 N., 70 W., the *Norwich* caught sight of the capsized hull with its curious freight, and bore down to the rescue. She was only just in time. That morning the last bottle of beer had been shared, and a despairing effort was made to reach the water and the stores. It had proved in vain, and the five were huddled together round the little platform considering what should next be done, when the boy, looking up, caught sight of the sails of the *Norwich*.

In this case the crew were outside the capsized hull; in that of the *Nerina* they were *inside*!

The *Nerina*, in November, 1840, was sixteen days out from Dunkirk, bound for Marseilles, with a cargo of oil and canvas, when she was hoisted in a heavy gale about thirty miles south of the Scilly Islands, and after buffeting about for four hours suddenly broached-to and capsized. She was commanded by Captain Everard, who had with him, as cabin-boy, his nephew Nicholas—a lad of fourteen—and a crew of five ordinary seamen. When the disaster occurred all were below except the helmsman, and he seems to have been at once swept overboard. The captain, mate, and boy were in the cabin, and the three men in the fore-castle. When they found the brig turning turtle the men forward rushed downwards, or rather upwards, to the kelson. Two of them succeeded in keeping their heads above water, but the third got entangled among a coil of ropes and was drowned. The cargo had been shifted by the shock, and dropped on to the deck; and up along the ship's bottom there was left an empty space in which the imprisoned air kept back the water.

In the cabin the mate tore down the hatch in the deck, scrambled into the lazaretto, and rolled the casks away that were there stored. The captain caught the boy in his arms, helped him up, and then, as the water came rushing in, followed him through the hatchway. They were thus in the same position against the kelson as the men were, and in about an hour's time they were joined by the crew, who, hearing their voices, crept aft to them.

So shallow was the air space that they had to sit up to their waists in water. As they could not sit upright they had to take it in turns to stretch themselves along the casks with their bodies squeezed close to the vessel's timbers. And all the time the ship laboured and rolled and threatened to swing over and founder.

The night passed and the morning came, and they saw the light striking down into the sea and reflected upwards to them through the cabin skylight and the open lazaretto hatch.

"The day and night of Tuesday the 17th and the day of Wednesday the 18th passed without food, without relief, and almost without hope; but still each encouraged the

others when no one could really entertain hope for himself. They endeavoured to assuage the pangs of hunger by chewing the bark stripped off from the hoops of the casks. Want of fresh air threatening them with death by suffocation, the mate worked almost incessantly for two days and a night in trying with his knife to cut a hole through the hold. Happily the knife broke before he had succeeded in accomplishing his object, the result of which must have proved fatal, as the confined air alone preserved the vessel in a sufficiently buoyant state."

In the afternoon of the Wednesday the wreck was fallen in with by a couple of pilot-boats, who took it in tow for some time, ignorant, of course, that any living thing was within it. The ropes, however, broke, and night closed in and the weather looking ugly they sheered off and left it to its fate. Their interference was important, for they towed it into the set of the current on to the islands, and when they left it with its keel barely showing above water it was being slowly but surely carried towards St. Mary's.

During the Wednesday night the Nerina suddenly struck and reeled. Then she struck again, and seemed to be going to pieces. Then she struck a third time, and the after part dropped so much in the water that the men had to creep towards the bow, and in attempting to do so one of them dropped through the hatch into the cabin and was drowned.

Finding the vessel ashore and the water ebbing, the other man soon afterwards entered the cabin, and while searching for the axe usually kept there was nearly washed out by the sudden inrush of the sea. As the darkness passed away a rock was found to

have been thrust into the broken skylight, and the prisoners saw to their intense relief that they were securely aground.

It was about seven o'clock in the morning. The captain got down into the cabin and found the quarter stove in. Through a crack he caught sight of a man on the beach. The man approached and thrust in his hand. The captain seized it. The man's terror may be imagined. He thought he had been clutched by some monster of the sea!

The alarm was given. The place was Port-helick. The people in the neighbourhood were soon collected and cut their way into the ship's side, and the four survivors were liberated from their floating sepulchre after an entombment of three days and nights in the mighty deep.

When in April of last year the State of Florida went down in the Atlantic, one of her survivors was picked up from underneath a capsized boat in which he had laid himself on the bottoms of the thwarts. A great deal of fuss was made about the affair at the time, and the fact of a man being under a boat for so many hours was said to be unexampled. Perhaps it was.

But there is a still later escape of a similar kind.

On the 13th of May last a keel bound from Grimsby to Leeds was driven against a sand bank and capsized, and it was supposed that all on board—the master, his wife, and three children—had perished. The day after, about ten o'clock, the captain of a steam-tug was passing the spot where the accident happened, and saw the keel floating bottom upwards on the edge of the sand bank. He got as near to it as he could, and presently heard sounds of knocking coming from the cabin end. The

crew concluded that some one was on board, and energetic steps were taken to get the keel in such a position as to effect a rescue. After several hours' labour this was accomplished, and a hole having been cut through the bottom of the vessel, the captain's wife, Mrs. Snowden, and one of her children were rescued alive, after an agonising suspense of nearly seventeen hours.

The water had nearly filled the cabin where the woman and her three children were sleeping; but there was just space left for her to keep her head and those of her little ones above the water, which ultimately reached up to the mother's throat. When they were aroused by the sinking of the keel and the inrush of the water, she contrived to get hold of the children, who all held on by the hair of her head, and in that way for some time all of the little ones were kept alive, but during the day two of them died. Just as the man who rescued them got into the cabin, the water flowed in and reached to the woman's mouth. All the children were still clinging to her hair, and she and the live child were in a terribly exhausted condition. The mother's hands were raw with knocking at the side of the keel.

The survivors were taken on board the tug and carefully tended. At the moment of the keel capsizing, what is known as the horse-line twisted round the captain, and carried him down amongst the rigging, which appeared to have remained under water even when the keel was being rolled over by the force of the tide. But strange as was his adventure, it is as nothing compared to the escape of the Nerina's crew in their fifteen inches of compressed air, or that of the Sally's men during their three-and-twenty days astride the keel of the capsized brig.

IBES.—The black india-rubber is the undressed caoutchouc as it comes from the tree.

ROMULUS.—1. For the in-

formation you must apply to the Herald's College, and pay a fee. 2. For the employment you should apply to the chief fashionable stationers or coach-makers.

M. S. GORDON.—Send sixpence to the Secretary, Science and Art Department, South Kensington, for the Science Directory. It will give you a syllabus and list of books. There is no reason why you should not work up the subject for yourself, but you will never do any good without apparatus and a practical acquaintance with the experiments, which in most cases you can only gain by attending a good class.

D. S.—A change owing to the little language of childhood. Mary = Mally = Molly = Polly. So Sarah = Sally; Dora = Dolly; Harry = Hally = Hal. With regard to the change to the P, where Molly = Polly, so Maggie = Meggie = Peggy, and Martha = Matty = Patty. Richard = Richy = Ricky = Ticky = Dick!!

THE OLD ASTRONOMER.—We must give the subject a rest for a time. Although the Stars of the Month were much liked we could not well continue without a change, though we should give the preference to the same hand. There are so many tastes to study that variety is essential.

CHARLES LOVE.—1. You can obtain the questions to all examinations conducted by the Civil Service Commissioners on application to the Queen's Printers. They are given in the Blue Books. A selection is always annexed to the various Guides to the Civil Service, of which so many exist. 2. The headquarters of the Honourable Artillery Company is in Finsbury. Apply to the adjutant.

A POLISHER EAGER TO LEARN.—To stain dead walnut try boiling Cassel brown in a lye of soft soap and soda; or, what is easier, try a decoction of green walnut shells in a lye of soft soap and soda; or try a decoction of walnut-peel made by boiling the peel in soft water. Wait till the wood is half-dry after using it, and then brush it over with a solution of an ounce of bichromate of potash in five ounces of boiling water; or mix together burnt umber, rose pink, and vandyke brown. There is a sixpenny book, "The French Polisher's Manual," published by Spon and Co., that you might find very useful.

ADONIS MULTA ORANS.—The Fishing Tackle articles ran through the third volume.

W. H. B. (Cheltenham.)—We have not given the wreck of the Royal George, and it is hardly worth while doing so. She was being careened at Spithead with her lee ports left carelessly open, when an extra list let in the water and down she went with all hands, June 28th, 1782. The wreck was surveyed by the diving-bell in 1807; it was removed by Colonel Pasley in 1844. Admiral Kempenfeldt, who went down with the ship, was one of the inventors of our systems of signalling.

ANXIOUS TO KNOW.—You must get the paint off the wood before you can begin to stain. The best way to get it off would be by burning it with a gas jet from a piece of flexible tubing attached to the passage lights. The job will be an odoriferous one. Watch a man cleaning off a street-door or a shop-front before you attempt to tackle it.

R. COURTNEY.—It is a well-known dispute among philologists. You can choose for yourself between bonfire—a good fire, or bonfire—a banfire (where ban is the Welsh for beacon), or bonfire—a bonfire from the old fires of bones that used to be lighted on Midsummer Day in honour of St. John. Yet another derivation is from the old fires of bones that used to be made on Ascension Day in survival of our old custom of burning the dead, and which custom, according to Leland's Collectanea, was still existing in some parts of Lincolnshire in 1550.

EDDIE GREEN.—Apply to Pigott, of Bishopsgate Street; or Edgington, of London Bridge. An advertisement in one of the papers would procure you a second-hand tent with the least trouble. Try the "Exchange and Mart," 170, Strand.

ALFRED HORTON.—Sail-cloth for model yachts can be obtained for about sevenpence per yard from Messrs. Frisby, Dyke, and Co., of Lord Street, Liverpool. It was made to the order of the Liverpool Model Yacht Club by Messrs. Horrocks, Miller, and Co., and the smallest quantity that could specially be turned out was a couple of thousand yards. As a general rule, you would find Horrocks's "M." suitable for most boats. You should take in the "Model Yachtsman," price twopence-halfpenny a number post free from T. Grassam, 161, High Street, Hull; or Marlborough and Co., 51, Old Bailey, London, E.C.

JEM.—The country wants no lame ducks for her servants. If you are not thoroughly sound in wind and limb, eyesight, hearing, and articulation, give up all thoughts of serving the country civilly or otherwise.

PETER HEAD.—The weight of the cargo varies, of course, with the specific gravity. Thus a ship full of lead would weigh more than one full of tea. The argument, however, does not affect the fact that a vessel carries more than her measurement, nor the other fact that she was specially built to do so. As an example, take the famous tea clippers. The Taeping was of 767 tons, and she carried 1,108,709lb. of tea; the Ariel was of 853 tons, and she carried 1,230,900lb.; the Serica was of 708 tons, and she carried 954,236lb.; the Fiery Cross was of 689 tons, and she carried 854,236lb.; the Taitsing was of 815 tons, and she carried 1,093,130lb. These are the cargoes of the great race year, 1866, when nine clippers started, and the Taeping was the winner, after racing the Ariel neck-and-neck up Channel. The other starters were the Ada, 686 tons; the Black Prince, 750 tons; the Chinaman, 688 tons; and the Flying Spur, 731 tons. It may interest you as an Aberdonian to know that, with the exception of the Fiery Cross, built at Liverpool, the clippers were all of Scotch birth—one, the Taiping, hailing from Glasgow; four, the Ariel, Chinaman, Serica, and Taeping, hailing from Greenock; and three, the Ada, Black Prince, and Flying Spur, hailing from Aberdeen—and all the captains were Scotsmen.

MONTÉ CRISTO.—1. It particularly states in the article that the charge is proportionate to the area, and as the area must be proportionate to the size, the larger the jar is the greater must be the power. 2. The bottom is coated inside and out. 3. It would require an article to give a list of experiments.

F. W. SMALL.—Get the January part for 1884, and refer to the article on Æolian Harps.

TOWERS.—Get the May part for 1881. It has an article on Silkworms that answers all your queries.

C. SMART.—Off Swanage you get pollack, mackerel, and bass; and so you do round Peveril Ledge and Durlstone Head, although the mackerel there are few. In the brook you can get eels for bait. In the Solent you get bass at the mouths of all the rivers, flat fish and grey mullet up the harbours, and whiting; pout near the Brambles. There is not much done in the fishing way in the Solent except in the autumn.

CRYSTAL.—1. Crispin and Crispianus were two brothers, who journeyed from Rome to Soissons in France, preaching the Gospel, and mending boots and shoes to support themselves while doing so. The Governor of Soissons eventually beheaded them, and they became the tutelary saints of the trade they had followed. 2. Pinchbeck is so called from the name of its inventor, a musical-clock maker at Birmingham. 3. Scot free is tax free, scot having been the name for a general tax, as lot was for an individual one. Hence "Scot and Lot."

A GERMAN READER.—The articles on Birds' Eggs were in the April, May, June, and July parts in 1880. They were by the Rev. J. G. Wood, and with one of the parts we gave away a coloured plate.

L. MCKINNON.—The lowermost kite need not be more than a couple of hundred yards in the air. A twelve-footer, with a nine-feet pilot, ought to be sufficient to drag the boat. For the tow-rope use cod-line.

G. LUNDBORG.—1. The metal is iridium, which is found associated with platinum in the Ural, and with gold in California. It is used for chemical balances, pen tips, and surgical needle tips. 2. Mere quotation of quaint sayings and old proverbs is a cheap sort of wit that is best left alone. Be original, the proverb you quote is in nine cases out of ten only applicable to the special circumstances of the case at the time it was first uttered. Such things are so easily capped. Take the instance of the little boy: "Use your fork, Johnnie. Have you forgotten so soon what I told you about using your fingers?" "Well, mamma, fingers were made before forks." "Yes, they were, but not yours, my son."

S. C. (Denver.)—As you are so pressing for us to be candid we will be so. We only looked at one page, and we can assure you that you are not a shining light at verse. Your twinkle is but feeble, and occasionally drops into darkness—in fact, the light fails owing to the unsatisfactory condition of the meter. Apart from the anachronism, blunderbuss is not admissible as a rhyme to Columbus.

W. M. P.—Clean the brass with a mixture of an ounce of oxalic acid, six ounces of finely-powdered rottenstone, an ounce of sweet oil, and sufficient water to form a paste. A very little of this mixture will go a long way. Rub the brass dry with a leather.

ANDREW HODGE.—The relic is probably a badge off a helmet.

VIEILLE FEMME.—1. The "Austrian Army Awfully Arrayed" was given in the August part for 1884. 2. The gin is the ordinary rat-trap sold by all ironmongers, and is therefore too well known to need special description.

O. C. B.—1. The shadow in the circle is owing to there being either a flaw in the lens or else something wrong in the way the lens is fastened, and which you could probably put right with your knife. 2. There are transfer pictures, but we have not heard of any working properly. 3. April. 4. For frame-making it is better to buy the moulding in lengths, and then all you want is a mitre-board, a tenon-saw, a hammer, and a glue-pot.

T. MCFIE.—Buy Gordon and Gotch's "Australian Handbook," or some similar work, before you go, and read it up. At the same time refer to a handbook or gazetteer of Scotland, and see how the towns and districts you know figure therein. You will thus discover how different things read to what they seem in your judgment to be, and you will obtain a scale by which to measure the Australian statements. Reason, in fact, from the known to the unknown. Distance often lends enchantment to the view; and "How it strikes a statist" is not always "How it strikes a resident." You will be surprised at the wonders of your native town.

E. FAIRLING.—1. The usual thing is to dilute muriatic acid with four times its bulk of water, and wash the deck with the solution, taking care to swirl it well off with clean water. 2. The Alarm won the Queen's Cup four times, once as a cutter of 193 tons, and three times as a schooner of 248. Mr. Weld's other yacht, the Lulworth, cutter, won the cup in 1857. The "Alarm years" were 1844, 1854, 1858, 1861. 3. There are about two thousand five hundred yachts on the register, and their tonnage amounts to over one hundred and twenty thousand. 4. We cannot speak from experience. We have been informed, however, that the sensation of racing in a three-tonner is extraordinary. "It is like that of a merry-go-round, a giddy coach, a rocking-horse, and a diving-bell, all mixed up together, and life below in one is pretty nearly as tight a fit as Mr. Paul Boyton's life-saving dress."

A. E. HANDS.—Your chemist must be a funny fellow. Muriatic acid is hydrochloric acid, or rather the solution of hydrochloric acid gas in water. It usually contains about 32.6 per cent. of real HCl, and has a specific gravity of 1.16; the saturated solution of the gas has a specific gravity of 1.21, and contains about 42.4 per cent. of HCl. The pure acid is colourless, but the crude acid of commerce is always yellow from the presence of iron and other impurities. See Meldola's Inorganic Chemistry, price eighteenpence, published by Murby, Ludgate Circus. Nitric acid is a different thing altogether, and a man who would mistake one for the other should not be trusted to sell drugs.

B. C. (Dublin.)—Covers for binding the paper in annual volumes can be obtained through any bookseller. Their sale price is two shillings.

No. 337.—Vol. VII.

SATURDAY, JUNE 27, 1885.

Price One Penny.

REGINALD CRUDEN:

A TALE OF CITY
LIFE.

BY

TALBOT BAINES REED,

Author of "My Friend Smith,"
etc., etc.

CHAPTER XIII.—THE NEW
SECRETARY TAKES THE
REINS.

IT is high time to return to Reginald, whom we left in a somewhat dismal fashion, straining his eyes for a last sight of his mother and brother as they waved farewell to him on the Euston platform.

"Clean and haired . . . I've step' in it myself."

If the reader expects me to tell him that on finding himself alone our hero burst into tears, or broke out into repentant lamentations, or wished himself under the wheels of the carriage, I'm afraid he will be disappointed.

Reginald spent the first half-hour of his solitary journey in speculating how the oil in the lamp got round at the wick. He considered the matter most attentively, and kept his eyes fixed on the dim light until London was miles behind him, and the hedges and grey autumn fields on either hand proclaimed the country. Then his mind abandoned its problems, and for another half-hour he tried with all his might to prevent the beat of the engine taking up the rhythm of one of the old Wilderham cricket songs. That too he gave up eventually, and let his imagination wander at large over those happy school days, when all was merry, when every friend was a brick, and every exertion a sport, when the future beckoned him forward with coaxing hand. What grand times they were! Should he ever forget the last cricket match of the summer term, when he bowled three men in one over, and made the hardest catch on record in the Wilderham Close? He and Blandford—

Ah, Blandford! His mind swerved on the points here, and branched off into the recollection of that ill-starred dinner at the "Shades," and the unhealthy bloated face of the cad Pillans. How he would have liked to knock the idiot down, just as he had knocked Durfy down that night when young Gedge—

Ah, another point here and another swerve. Would Horace be sure and keep his eye on the young un, and was there any chance of getting him down to Liverpool?

Once more a swerve, and this time into a straight reach of meditation for miles and miles ahead. He thought of everything. He pictured his own little office and living-room. He drew a mental portrait of the housekeeper, and the cups and saucers he would use at his well-earned meals. He made up his mind the board-room would be furnished in green leather, and that the Bishop of S— would be a jolly sort of fellow and fond of his joke. He even imagined what the directors would say among themselves respecting himself after he had been introduced and made his first impression. At any rate they should not say he lacked in interest for their affairs, and when he wrote home—

Ah! this was the last of all the points, and his thoughts after that ran on, on the same lines, till the train plunged into the smoke and gloom of the great city which was henceforth to extend to him its tender mercies.

If Reginald had reckoned on a deputation of directors of the Select Agency Corporation to meet their new secretary at the station he was destined to be disappointed. There were plenty of people there, but none concerning themselves with him as he dragged his carpet-bag from under the seat and set foot on the platform.

The bag was very heavy, and Shy Street, so he was told, was ten minutes' walk from the station. It did occur to him that most secretaries of companies would take a cab under such circumstances and charge it to "general expenses." But he did not care to spend either the Corporation's money or his own

for so luxurious a purpose, and therefore gripped his bag manfully and wrestled with it out into the street.

The ten minutes grew to considerably more than twenty before they both found themselves in Shy Street. A long, old-fashioned, dismal street it was, with some shops in the middle and small offices at either end. No imposing-looking edifice, chaste in architecture and luxurious in proportions, stood with open doors to receive its future lord. Reginald and his bag stumbled up a side staircase to the first-floor over a chemist's shop, where a door with the name "Medlock" loomed before him, and told him he had come to his journey's end.

Waiting a moment to wipe the perspiration from his face, he turned the handle and found himself in a large, bare, carpetless room, with a table and a few chairs in the middle of it, a clock over the chimney-piece, a few directories piled up in one corner, and a bundle of circulars and wrappers in another; and a little back room screened off from the general observation with the word "private" on the door. Such was the impression formed in Reginald's mind by a single glance round his new quarters.

In the flutter of his first entrance, however, he entirely overlooked one important piece of furniture—namely, a small boy with long lank hair and pale blotched face, who was sitting on a low stool near the window greedily devouring the contents of a pink-covered periodical. This young gentleman, on becoming aware of the presence of a stranger, crumpled his paper hurriedly into his pocket and rose to his feet.

"What do yer want?" he demanded.

"Is Mr. Medlock heré?" asked Reginald.

"No fear," replied the boy.

"Has he left any message?"

"Don't know who you are. What's yer name?"

"I'm Mr. Cruden, the new secretary."

"Oh, you're 'im, are yer? Yes, you've got to address them there envellups, and e'll be up in the morning."

This was depressing. Reginald's castles in the air were beginning to tumble about his ears in rapid succession. The bare room he could excuse on the ground that the Corporation was only just beginning its operations. Doubtless the carpet was on order, and was to be delivered soon. He could even afford not to afflict himself much about this vulgar, irreverent little boy, who was probably put in, as they put in a little watch-dog, to see to the place until he and his staff of assistants rendered his further presence unnecessary. But it did chill him to find that after his long journey, and his farewell to his own home, no one should think it worth while to be here to meet him and install him with common friendliness into his new quarters. However, Mr. Medlock was a man of business, and was possibly prevented by circumstances over which he had no control from being present to receive him.

"Where's the housekeeper?" demanded he, putting down his bag and relieving himself of his overcoat.

"'Ousekeeper! Oh, yus," said the boy, with a snigger; "no 'ousekeepers 'ere."

"Where are my rooms, then?" asked Reginald, beginning to think it a pity the "Corporation" had brought him

down all that way before they were ready for him.

"Ain't this room big enough for yer?" said the boy; "ain't no more 'sep' your bedroom—no drowing-rooms in this shop."

"Show me the bedroom," said Reginald.

The boy shuffled to the door and up another flight of stairs, at the head of which he opened the door of a very small room, about the size of one of the Wilderham studies, with just room to squeeze round a low iron bedstead without scraping the wall.

"There you are—clean and haired and no error. I've slep' in it myself."

Reginald motioned him from the room, and then sitting down on the bed, looked round him.

He could not understand it. Any common butcher's boy would be better put up. A little box of a bedroom like this, with no better testimonial to its cleanliness and airiness than could be derived from the fact that the dirty little watch-dog downstairs had occupied it! And in place of a parlour that bare gaunt room below in which to sit of an evening and take his meals and enjoy himself. Why ever had the "Corporation" not had the ordinary decency to have his permanent accommodation ready for him before he arrived?

He washed himself as well as he could without soap and towel, and returned to the first floor, where he found the boy back on his old stool, and once more absorbed in his paper.

The reader looked up as Reginald entered.

"Say, what's yer name," said he, "ever read 'Tim Tigerskin'?"

"No, I've not," replied Reginald, staring at his questioner, and wondering whether he was as erratic in his intellect as he was mealy in his countenance.

"'Taint a bad un, but 'tain't 'arf as prime as 'The Pirate's Bride.' The bloke there pisons two on 'em with prussic acid, and wouldn't ever 'ave got nabbed if he 'adn't took some hisself by mistake, the flat!"

Reginald could hardly help smiling at this appetising résumé.

"I want something to eat," he said. "Is there any place near here I can get it?"

"Trum's, but 'is sosseges is off at three o'clock. Better try Cupper's—he's a good un for bloaters; I deals with 'im."

Reginald felt neither the spirit nor the inclination to make a personal examination into the merits of the rival caterers.

"You'd better go and get me something," he said to the boy; "coffee and fish or cold meat will do."

"No fear; I ain't a-goin' for nothing," replied the boy. "I'll do your errands for a tanner a week and your leavings, but not no less."

"You shall have it," said Reginald. Whereupon the boy undertook the commission and departed.

The meal was a dismal one. The herrings were badly oversmoked and the coffee was like mud, and the boy's conversation, which filled in a running accompaniment, was not conducive to digestion.

"I'd 'most a mind to try some prussic in that coffee," said that bloodthirsty young gentleman, "if I'd a known where the chemist downstairs keeps his'n. Then they'd 'a said you'd pisoned yourself 'cos you was blue coming to this 'ere

"ole. I'd 'a been put in the box at the inquite, and I'd 'a said yes, you was blue, and I thought there was a screw loose the minit I see yer, and I'd seen yer empty a paper of powder in your corfee while you thort nobody wasn't a-looking. And the jury'd say it was tempory 'sanity and sooiside, and say they considers I was a honest young feller and vote me a bob out of the poor-box. There you are. What do you think of that?"

"I suppose that's what the man in 'The Pirate's Bride' ought to have done," said Reginald, with a faint smile.

"To be sure he ought. Why, it's enough to disgust any one with the flat when he goes and takes the prussic hisself. Of course he'd get found out."

"Well, it's just as well you've not put any in my corfee," said Reginald. "It's none too nice as it is. And I'd advise you, young fellow, to burn all those precious story-books of yours, if that's the sort of stuff they put into your head."

The boy stared at him in horrified amazement.

"Burn 'em! Oh, Walker!"

"What's your name?" demanded Reginald.

"Why, Love," replied the boy, in a tone as if to say you had only to look at him to know his name.

"Well then, young Love, clear these things away and come and make a start with these envelopes."

"No fear. I ain't got to do no envellups. You're got to do 'em."

"I say you've got to do them too," said Reginald, sternly; "and if you don't choose to do what you're told I can't keep you here."

The boy looked up in astonishment.

"You ain't my governor," said he.

"I am, though," said Reginald, "and you'd better make up your mind to it. If you choose to do as you're told we shall get on all right, but I'll not keep you here if you don't."

His tone and manner effectually overawed the mutinous youngster. He could not have spoken like that unless he possessed sufficient authority to back it up, and as it did not suit the convenience of Mr. Love just then to receive the "sack" from any one, he capitulated with the honours of war, put his "Tim Tigerskin" into his pocket, and placed himself at his new "governor's" disposal.

The evening's work consisted in addressing some two hundred or three hundred envelopes to persons whose names Mr. Medlock had ticked in a directory, and enclosing prospectuses therein. It was not very entertaining work; still, as it was his first introduction to the operations of the Corporation it had its attractions for the new secretary. A very fair division of labour was mutually agreed upon by the two workers before starting. Reginald was to copy out the addresses, and Master Love, whose appetite was always good, was to fold and insert the circulars and "lick up" the envelopes.

This being decided, the work went on briskly and quietly. Reginald had leisure to notice one or two little points as he went on, which, though trivial in themselves, still interested him. He observed for one thing that the largest proportion of the names marked in the directory were either ladies or clergymen, and most of them residing in the south of England. Very few of them

appeared to reside in any large town, but to prefer rural retreats "far from the madding crowd," where doubtless a letter, even on the business of the "Corporation," would be a welcome diversion to the monotony of existence. As to the clergy, doubtless their names had been suggested by the good Bishop of S—, who would be in a position to introduce a considerable connection to his fellow-directors. Reginald also noticed that only one name had been marked in each village, it doubtless being assumed that every one in these places being on intimate terms with his neighbour, it was unnecessary to waste stamps and paper in making the Corporation known to two people where one would answer the same purpose.

He was curious enough to read one of the circulars, and he was on the whole pleased with its contents. It was as follows:—

"Select Agency Corporation, Shy Street, Liverpool.—Reverend Sir" (for the ladies there were other circulars headed "Dear Madam"), "The approach of winter, with all the hardships that bitter season entails on those whom Providence has not blessed with sufficient means, induces us to call your attention to an unusual opportunity for providing yourself and those dear to you with a most desirable comfort at a merely nominal outlay. Having acquired an enormous bankrupt stock of *winter clothing* of most excellent material, and suitable for all measures, we wish, in testimony to our respect for the profession of which you are an honoured representative, to acquaint you *privately* with the fact before disposing of the stock in the open market. For £3 we can supply you with a complete clerical suit of the best make, including overcoat and gloves, etc., etc., the whole comprising an outfit which would be cheap at £10. In *your* case we should have no objection to meet you by taking £2 with your order and the balance *any time within six months*. Should you be disposed to show this to any of your friends, we may say we shall be pleased to appoint you our agent, and to allow you ten per cent. on all sales effected by you, which you are at liberty to deduct from the amount you remit to us with the orders. We subjoin full list of winter clothing for gentlemen, ladies, and children. Money orders to be made payable to Cruden Reginald, Esq., Secretary, 13, Shy Street, Liverpool."

"Hullo!" said Reginald, looking up excitedly, "don't fold up any more of those, boy. They've made a mistake in my name and called me Cruden Reginald instead of Reginald Cruden. It will have to be altered."

"Oh, ah. There's on'y a couple of billions on 'em printed; that won't take no time at all," said Master Love, beginning to think longingly of "Tim Tigerskin."

"It won't do to send them out like that," said Reginald.

"Oh yes it will. Bless you, what's the odds if you call me Tommy Love or Love Tommy? I knows who you mean. And the governor, 'e is awful partickler about these here being done to-night. And we sent off millions on 'em last week. My eye, wasn't it a treat lickin' up the envellups!"

"Do you mean to say a lot of the circulars have been sent already?"

"Undreds of grillions on 'em," replied the boy.

Of course it was no use after that delaying these; so Reginald finished off his task, not a little vexed at the mistake, and determined to have it put right without delay.

It was this cause of irritation, most likely, which prevented his dwelling too critically on the substance of the circular so affectionately dedicated to the poor country clergy. Beyond vaguely wondering where the Corporation kept their "bankrupt" stock of clothing, and how by the unaided light of nature they were to decide whether their applicants were stout or lean, or tall or short, he dismissed the matter from his mind for the time being, and made as short work as possible of the remainder of the task.

Then he wrote a short line home, announcing his arrival in as cheerful words as he could muster, and walked out to post it. The pavements were thronged with a crowd of jostling men and women, returning home from the day's work; but among them all the boy felt more lonely than had he been the sole inhabitant of Liverpool. Nobody knew him, nobody looked at him, nobody cared two straws about him. So he dropped his letter dismally into the box and turned back to Shy Street, where at least there was one human being who knew his name and heeded his voice.

Master Love had made the most of his opportunities. He had lit a candle and stuck it into the mouth of an ink-bottle; and by its friendly light was already deep once more in the history of his hero.

"Say, What's yer name," said he, looking up as Reginald re-entered, "this here chap 'as scuttled a ship, and drowned twenty on 'em. 'E was a cute un and no error. He rigs hisself up as a carpenter, and takes a tile off the ship's bottom just as the storm was a coming on; and in corse she founders and all 'ands."

"And what became of him?" asked Reginald.

"Oh, in corse he stows hisself away in the boat with a lifebelt, and gets washed ashore; and he kills a tiger for 'is breakfast, and—"

"It's a pity you waste your time over bosh like that," said Reginald, not interested to hear the conclusion of the heroic Tim's adventures; "if you're fond of reading why don't you get something better?"

"No fear—I like jam; don't you make no error, governor."

With which philosophical albeit enigmatical conclusion he buried his face once more in his hands, and immersed himself in the literary "jam" before him.

Reginald half envied him as he himself sat listless and unoccupied during that gloomy evening. He did his best to acquaint himself, by the aid of papers and circulars scattered about the room, with the work that lay before him. He made a careful tour of the premises with a view to possible alterations and improvements. He settled in his own mind where the directors' table should stand, and in which corner of the private room he should establish his own desk. He went to the length of designing a seal for the Corporation, and in scribbling, for his own amusement, the imaginary minutes of an imaginary meeting of the directors. How would this do?

"A meeting of directors of the Select Agency Corporation"—by the way, was it

"Limited"? He didn't very clearly understand what that meant. Still most companies had the word after their name, and he made a note to inquire of Mr. Medlock whether it applied to them—"was held on October 31st at the company's offices. Present, the Bishop of S— in the chair, Messrs. Medlock, Blank, M.P., So-and-So, etc. The secretary, Mr. Cruden, having been introduced, took his seat and thanked the directors for their confidence. It was reported that the receipts for the last month had been (well, say) £1,000, including £50 deposited against shares by the new secretary, and the expenses £750. Mr. Medlock reported the acquisition of a large bankrupt stock of clothing which it was proposed to offer privately to a number of clergymen and others as per a list furnished by the right reverend the chairman. The following cheques were drawn:—Rent for offices for a month, £5; printing and postage, £25; secretary's salary for one month, £12 10s.;

ditto, interest on the £50 deposit, 4s. 2d.; office-boy (one month), £2; Mr. Medlock for bankrupt stock of clothing, £150; etc., etc. The secretary suggested various improvements in the offices and fittings, and was requested to take any necessary steps. After sundry other routine business the Board adjourned."

This literary experiment concluded, Reginald, who after the fatigues and excitement of the day felt ready for sleep, decided to adjourn too.

"Do you stay here all night?" said he to Love.

"Me? You and me sleeps upstairs."

"I'm afraid there's no room up there for two persons," said Reginald; "you had better go home to-night, Love, and be here at nine in the morning."

"Go on—as if I 'ad lodgin's in the town. If you don't want me I know one as do. Me and the chemist's boy ain't too big for the attic."

"Very well," said Reginald, "you had better go up to bed now, it's late."

"Don't you think you're having a lark with me," said the boy; 'tain't eleven, and I ain't done this here Tigerskin yet. There's a lump of reading in it, I can tell you. When he'd killed them tigers he rigged hisself up in their skins, and—"

"Yes, yes," said Reginald. "I'm not going to let you stay up all night reading; that rot. Cut up to bed now, do you hear?"

Strange to say, the boy obeyed. There was something about Reginald which reduced him to obedience, though much against his will. So he shambled off with his book under his arm, secretly congratulating himself that the bed in the attic was close to the window, so that he would be able to get a jolly long read in the morning.

After he had gone, Reginald followed his example and retired to his own very spare bed, where he forgot all his cares in a night of sound refreshing sleep.

(To be continued.)

IVAN DOBROFF: A RUSSIAN STORY.

BY PROFESSOR J. F. HODGETTS,

Late Examiner in the University of Moscow, Professor in the Russian Imperial College of Practical Science,

Author of "Harold, the Boy-Earl," etc.

CHAPTER XXIV.—RETURN.

GREAT were the rejoicings in the household of the Frau von Steinfeldt when she appeared at her own home accompanied by Ivan and Anastasia. Her husband ordered a day's extra pay to be given to all the workpeople connected with his factory, and besides that a day's holiday. He could afford it, for his factory was perhaps the most renowned in the whole length and breadth of Russia, and he was known for the humane and kind treatment of those who were under his rule.

It was still winter, but the grim cold had passed away, though the snow lay thick upon the ground, affording an agreeable medium for the passage of the sledges. There were no flowers in sufficient quantity to strew them in the path of the returning wanderers, but a band of factory girls in warm schubas, and with handkerchiefs and shawls of all the colours of the rainbow round their heads, came to the sides of the sledge, each armed with a large bouquet sent on purpose from Kursk that morning. Many of the townspeople of Kursk came to be present at the return, and many were the flags and banners prepared to do honour to the good people who were doing so much to rescue the peasantry and reform their manners without interfering with their religious prejudices, a point on which the Russians are most jealously sensitive.

But Steinfeldt was not alone in his reception of his wife. He was accompanied by no less a person than Mr. Smirnoff, who had contributed very largely to the expenses of the journey. He was very curious to see Annie, but was a little disappointed; having expected a fair beauty, he was not prepared for a lady with blue eyes and black hair and eyebrows. The affection with which Ivan

regarded her was a very holy thing in his eyes, and he felt personally grateful to her for the good she had done the boy.

There were children in the family too, and Ivan was a great wonder to them. How a boy like that could have braved so many dangers was a mystery, and the eldest son of the house, a boy of eleven, told his sisters that if he had undertaken the journey he should not have required the aid of the gendarmes against the wolves. Nevertheless, when the children were all alone together they made Ivan tell his story of shooting the wolves over and over again. On one of these occasions Ernst plucked up courage to dispute the way in which the first wolf had been slain.

"Did you shoot him in the eye, Ivan?"

"Yes, of course I did. Why do you ask?"

"I should have shot at his heart."

"How would you have got at it?"

"By feeling his side, as the man in India did with the tiger."

"Don't talk nonsense. How could I feel his side when his face was all I could get at? Look here, Ernst, if you know so much about it, the next time the wolves come out about Kursk you and I will go out together, and you shall give me a lesson in wolf-shooting."

Why this was received with a roar of laughter by the other children Ivan did not then know, but it came out afterwards that there had been an alarm of a wolf in their neighbourhood some days before Ivan's arrival, and Ernst had retreated to his bedroom, locked the door, crept into bed, covered himself with the bedclothes, and refused to get up until he was assured that the danger had passed away.

Steinfeldt was delighted with Ivan, whom he had always liked since he saw

him swim the pond to get rid of the girlish attire that had annoyed him so, and now he found some malicious pleasure in twitting him on his return to female habiliments.

During the next day Steinfeldt went for a talk with Smirnoff, who, however, was nowhere to be found. Descending to the lower floors, he put on his schuba and high boots to look at the horses in his stable, and there he saw Ivan before him bound on the same mission. He slackened his pace, and turned into one of the outbuildings to ask some question of a groom who lived there, when all of a sudden he was startled by seeing Ivan in a little sledge which he had himself given him the day before, with a fiery black pony harnessed to it, tearing through the snow at a most reckless pace. The sledge was driven by one of Steinfeldt's steadiest drivers, who, however, was urging the little horse in a frantic manner. Steinfeldt could do nothing; he only stared in stupid astonishment as Ivan flashed past. In another moment horse, sledge, driver, and Ivan had vanished. A groom came out of the building, to which Steinfeldt now hastened, and from him he learnt that Smirnoff had suddenly taken it into his head to have Vaska harnessed to a sledge and drive out to Kursk.

"Not Vaska surely! How could you let him have an unbroken horse, as wild as a mad dog?"

"There's no denying him anything," answered the groom; "and then he understands horses."

"Not a wild Ukrain full-breed desert horse. Who is with him?"

"He would not take anybody with him, and he has been gone nearly an hour."

"What is that Ivan up to?"

"He has gone after him to aid him if possible."

"Are you all mad to allow such things?" roared Steinfeldt. "Saddle Mieschka. I will ride to Kursk and see what these wild pranks have ended in. Stay; get the dark-blue sledge ready, and let Stefan drive me."

from a point far out of the beaten track.

"Hurry on," said Steinfeldt, "only be in time, something has gone wrong."

They left the beaten track, and soon they found the marks of horses and sledges in the snow. The shouting increased as they approached the spot, and

of the harness cut away from the wreck as well as possible. Smirnov was standing with his schuba off, holding the horse on one side while the coachman who had driven Ivan held him on the other. The animal was trembling with fear—and where was Ivan? Lying a senseless mass upon the snow huddled up in his own

"Ivan sprang up at the rein and headgear of the unmanageable horse."

It was some time before this order could be carried into effect, but when all was ready Steinfeldt mounted, and exclaimed to his driver, "Now then, drive as if the wolves were out!"

The man understood the order, and away they went over the snow at a splendid pace. Away—away—away! What is so exhilarating as a tearing drive over the snow in a Russian sledge? His temper was improving with the pace, and his good-humour was almost restored to its accustomed height, when a shout seemed to reach him from the distance, but not on the road! The sound came

they recognised other voices, among them that of Smirnov. Steinfeldt urged his driver to use the utmost speed, when suddenly the man stopped short, exclaiming, "Why! this leads to the 'Devil's Drop,' the most dangerous precipice in all Russia!"

A few minutes more sufficed to bring them to the scene of action, and a terrible sight met their gaze. The sledge in which Smirnov had started lay overturned and wrecked in the snow; the splashboard (behind which a driver half sits, half stands) was literally smashed to atoms; the traces had been cut, the *duga* or bow cut from the shafts, and the rest

schuba and covered with Smirnov's. The coachman and Smirnov were shouting, and when they saw Steinfeldt drive up they called out,

"Mind the boy! Mind Ivan! Drive gently!"

Steinfeldt sprang out in an agony. "Is he dead?" he cried.

"I think not," said Smirnov. "Have you a wide sledge? That's all right. Now let this man and Stefan hold this brute here, or bring him back to your place. Take Ivan and me into your sledge, drive home, and on the way I will tell you how this happened."

Smirnoff now went to where the poor boy lay, removed his own schuba, then lifted the lad and placed him in the sledge.

In the meantime the grooms, drivers, dvorniks, stablemen, mujiks, and so forth, had got an inkling of danger somewhere, and Steinfeldt had not driven more than three or four versts (a verst is about four-fifths of a mile) when he saw coming towards him a number of his own people in sledges and sledge-carts. To these he gave directions to proceed to the "Devil's Drop" and assist in bringing the other men and the horse.

"But," cried one of the drivers, "where is Master Ivan's blood pony?"

"Dashed to pieces at the foot of the Drop!" was Steinfeldt's reply. "Help to bring Vashka and Stefan home as quickly as you can, and by that time the whole of this story will be known."

Away drove Steinfeldt, Smirnoff, and Ivan towards the house, and away scampered the rest towards the fatal spot.

The boy had been nearly crushed to death, and his senseless condition had been a merciful amelioration of his fate, inasmuch as he could not feel his wounds. But, on the other hand, it was dangerous in that climate, and the first thing to be done on getting home, was to remove his clothes, and restore animation by administering strong stimulants and placing him in a warm bath. Then he was got to bed, and the story was told.

"From all I can gather," said Steinfeldt, "the matter seems to be briefly this: Smirnoff took it into his head to drive Vashka. The men tried to talk him out of it, but without success. Without a driver he took this horse to drive over to Kursk! By the merest chance it would seem (if there be such a thing as chance in the world) Ivan strolled in amongst the horses just after Smirnoff's departure, and as soon as he heard what horse had been taken, without pausing a moment, he ordered his pony to be harnessed to a sledge, and got one of the men to drive him, and started in pursuit, taking the road to Kursk and tracing Smirnoff's course in the snow. All at once the traces led off from the track and bore to the right. With horror it flashed across the driver's mind that in a few minutes they must come to the Drop, a hideous precipice, at the bottom of which is a frozen lake. The side of the hill is perpendicular, and the top surface projects a foot perhaps over this perpendicular fall, because snow is held there by some shrubs and underwood, which of course give no support to great weights. Ivan seemed at once to grasp the full danger of the situation, and begged the driver to urge the animal to his wildest speed. The peasantry believe that when a horse comes within a certain number of feet of this precipice the evil spirit of the place urges the animal to throw itself headlong down. Ivan begged all the more to have the pony urged to a desperate pace.

"And sure enough they soon overtook Smirnoff, who was being hurried on to destruction by his maddened steed, which he could no more control than he could chain a torrent or stop a hurricane. He was holding in bravely and tugging at the reins with main force, while Ivan urged his pony on to continued fresh exertions, and only just in time the pony shot ahead of the somewhat retarded horse. Ivan flung himself out on the

snow and sprang up at the rein and head-gear of the unmanageable horse, the driver sprang out on the other side, and the maddened pony, bearing out the superstition of the place, flew over the precipice and was dashed to pieces. Meanwhile Ivan hung on to the horse, which, embarrassed by this new attack, reared up on its hind legs, shaking Ivan off. A dexterous pull from Smirnoff, aided by the driver of the pony sledge (who flung his schuba over the horse's head), resulted in bringing the animal round with his head from the precipice; but striking out furiously with his hind legs, he shattered the splashboard, wrecked the sledge, and, most unfortunately, as Ivan again rose, struck out at him, kicking him heavily in the thigh, breaking the right leg and left arm fearfully. Nor was this all. Smirnoff had been able to jump out while the shower of kicks was wrecking the sledge, but he still held the reins, while the man held the horse's head in the most desperate manner, when suddenly the beast slipped and fell, rolling over on poor little Ivan, already crushed and bleeding. When the horse was raised he was as gentle as a lamb and trembling in every limb—a child could have held him; but Ivan was senseless, and Smirnoff, fearing a chill, had taken off his own schuba to cover the boy, when I arrived with the big sledge and brought them on home."

The ladies watched Ivan through the night. The nurses were most afraid of inflammation from exposure to the cold after the wounds had been received. But the tender care of Smirnoff had prevented this when he wrapped the shattered form of the boy in his own schuba.

It was noon of the following day before the train arrived which brought Dr. Strammeller and Tenterton to the factory. The enormous size and strength of frame shown by the Prussian doctor were assuring, coupled as they were with an expression of calm confidence in himself and in his own skill. He was looking better and happier than when we saw him at Berozova, or when he came to Moscow with the Abrazoffs, whose defeat had not much affected him, inasmuch as his talents had raised him to a very high position in the medical profession at Moscow.

Tenterton had been at the Kremlin when the telegram reached him, but the count sent him off in one of his own carriages to catch the train, and sent another for the doctor, so that they were able just to be in time.

But the treatment of our hero was a slow and painful affair. The doctor from Kursk said that Strammeller was killing the boy by inches, and Steinfeldt said that he knew nothing about it or he would not talk such nonsense. This produced a coolness between them which was never got over. Strammeller was much interested in the wonderful affection existing between Annie and the boy, "which," he said, "spoke volumes for both of them." She was an excellent nurse, and never shirked her duty. Poor Ivan's leg had been cruelly shattered, and for its more perfect recovery a cradle of gypsum had to be made and applied. The arm too was broken in two places, and three of his ribs were injured. But thanks to the kind nursing of the two good women who owed him so much, the boy began to recover just as they had begun to despair of his ever

looking bright again. Then came convalescence, with a wonderful couch on Strammeller's principle to aid in his recovery. And when the snow and ice had left the face of nature, gloom and sadness departed from the Steinfeldt mansion; and when the warm air of summer came, then the sunshine of hope grew stronger, and the family of the Steinfeldts became happier than ever. Ivan's ringing laugh was heard again, and it was difficult to say which was the pleasantest sound to hear, the song of the birds in that sweet summer time or the songs of the children led by Ivan as he walked with them upon the terrace. Tenterton by arrangement remained with the little invalid in whose history he had already manifested so great an interest. Let us give one of their conversations.

"I have often thought over what you told me about lying, Mr. Tenterton, and I made up my mind never to tell any more lies, not for fear of the consequences, but because I knew—I *felt*—that what you said was true about lying being so opposed to God's nature, that by committing the sin we turned ourselves more and more from Him, and became more and more evil. Then came a great temptation: the dearest and best friend I had, Annie, you know—she was in her dreadful peril, and I *had* to help her. There was not time to stop, to hesitate, or think, I had to act."

"Don't you feel that you acted rightly?" "Sometimes I feel as if it were all right, and then again I think what an awful lie the whole adventure was! Pretending to be the son of Marie Feodorovna—then to be her daughter! then the tricks and the little meannesses! Oh! sometimes I was very sick of it! and then again, how I enjoyed the fun of it! Do you think I was wrong in taking this journey under these circumstances, Mr. Tenterton?"

"It is difficult to justify falsehood, nor will I do it for a moment. In your case, however, you were led by others more experienced and better able to judge than you, so that, at all events, there is not the same blame attaching to you, Ivan."

"No, I don't think there is, because you see I obeyed Mr. Smirnoff as well as my own conscience; but what you said about *truth* made me uneasy. I have often wished that I could have managed without all the deception we had to practise. I always feel miserable when I think of it."

"But then your motive was good, Ivan."

"That's what the priest says, but it does not satisfy me. It cannot be right to do wrong that right may come of it; in that case we may explain away all the ten commandments if we are allowed to judge whether we may break them or not! No, you are either right or wrong, and if you are right I have been very wicked, and I cannot see how you could be wrong."

"Now look here, Ivan, I am right glad to hear you say that. Confess that part of your action which you feel was evil to Him who alone can forgive. Do not dissemble or excuse the evil, but frankly ask pardon; you will receive pardon for the past, and strength never to commit the like again, if you ask it humbly and trustingly."

(To be continued.)

BOY LIFE AFLOAT.

BY CAPTAIN H., LATE R.N.

III.—MAN OVERBOARD.

THIS is one of the most startling and distressing incidents likely to occur in Boy Life Afloat. Many a time a gloom has been cast over the recollection of an otherwise happy voyage by the accident of which we are writing.

Nobody, except one who has been personally through it, can imagine the agony of mind caused by seeing a shipmate—perhaps a dearly-loved friend—drifting away to leeward, close enough for the expression of mingled terror and supplication to be perceived on his countenance, and yet too far off to render the needed assistance.

This is one point in which the Royal Navy has a decided advantage over the mercantile marine. In the latter the lifebuoy generally used is the old-fashioned circular form of painted canvas filled with cork shavings, and the buoys are generally lashed to the bridge, or wherever they may be kept, thus causing a loss of precious time when their services are most needed; and finally these lifebuoys are perfectly useless on a dark night. The same complaint may be made of the boats in the merchant service. It is very seldom you come across one that can be emptied of rubbish, cast loose from the gripes, have the canvas cover unlaced, be swung outboard, lowered from the davits, and manned in less than ten or twelve minutes, which to an indifferent swimmer in a heavy sea, and lumbered with pea-jacket and sea-boots, means of a necessity—*death*!

Now let us look on the other side of the picture. The lifebuoy used in the Navy consists of two hollow iron balls, joined together by an iron tray, which contains a portfire timed to burn a quarter of an hour. This lifebuoy hangs over the stern, and can be dropped overboard by pulling a handle like a bell-pull.

At night a catch is made fast to the port-fire, and the latter is lighted by a friction tube simultaneously with the fall of the lifebuoy, thus enabling the man overboard to find the buoy, and the lifeboat's crew to find the man, however dark the night may be. There is a marine stationed at the stern during the night, whose duty it is to let go the buoy in case of accidents.

We remember a laughable incident in connection with this that occurred some years ago in Sheerness Harbour.

We were on board H.M.S. D—n at the time, and one afternoon chanced to be in charge of the watch during the absence of the lieutenant. That morning an assistant-surgeon had joined, and he was very green, the D—n being the first vessel he had ever seen larger than a duck-punt.

We were pacing the quarter-deck when the medico came up and somewhat abruptly stated his desire of interviewing the captain. We replied that the captain was in his cabin.

The doctor, with the same unpleasant, overbearing manner, then inquired how he could get to the cabin or let the captain know that he wished to see him.

Just then our eyes fell on the pull of the lifebuoy, and, seized with an irresistible temptation in the shape of the spirit of mischief, we led him aft to the taffrail. Then, pointing to the handle, we suggested that he should try the visitors' bell.

In a moment the doctor gave it a vigorous pull, and the lifebuoy was quickly drifting out to sea. A boat had to be lowered to pick it up, and we incurred a justly-earned rebuke, though the doctor never heard the last of the visitors' bell to the cabin.

But the cruellest cases are when a man falls overboard, as is not unfrequently the case, in broad daylight during a heavy gale.

If he is a good swimmer he may be in sight perhaps for an hour or more, and yet it may be impossible to assist or save him. A boat cannot be lowered, and it would hazard the safety of the ship to heave-to, and so the unfortunate man has to be sacrificed and allowed to drown before the eyes of his shipmates. Some captains have very funny ideas as to the respective values of a seaman's life and a man-of-war's spars, as the following incident will show.

H.M.S. J— was on the China station, and during one of her cruises a man happened to fall overboard. A senior midshipman, whom we will call Meter, was in charge of the watch in consequence of the lieutenant having gone below to dinner.

Directly the well-known cry was heard Bob Meter shouted out, "Let go the lifebuoy! Hard down with the helm!"

The man at the wheel obeyed his orders, the helm was put down, and the ship brought suddenly up into the wind, thus immediately stopping her way. But in consequence of the suddenness with which this was done a topmast studding-sail boom carried away and snapped short off like a carrot.

The lifeboat was lowered, and the captain came on deck almost at the same moment. He looked at the man just visible in the distance, and then at the broken studding-sail boom, and then he spoke.

"What do you mean, Mr. Meter? I've a great mind to stop it out of your pay! Do you see what you have done, sir? Never let it happen again, or you shall repent it."

The man was picked up, the boat hoisted, and sail made.

As ill-luck would have it, about three months later Bob Meter was again in charge of the watch when a seaman fell overboard from aloft. But on this occasion studding-sails were set on both sides alo and aloft, and the J— was going through the water like a marine racehorse.

For a moment the midshipman hesitated. It was the studding-sail booms against the man's life, for if he stopped to shorten sail before heaving-to, the man must sink, as he had not succeeded in getting hold of the lifebuoy.

Bob decided in favour of the man's life, and sang out,

"Down with the helm! Jam it down!"

In a few moments "snap! snap!" and the thin, light spars were breaking all over the ship.

The captain came on deck infuriated, and Meter was placed under arrest; the seaman was picked up, but very exhausted, and it would have been impossible for him to have kept up another five minutes.

The following day Meter was brought before the captain, and the latter offered him his choice of paying for the booms or being tried by court of inquiry. The value of the booms would be about eighty pounds, and knowing that his friends could ill-afford such a call upon them, he chose the latter.

The court of inquiry was duly called, the evidence heard, and Mr. Meter reprimanded and also sentenced to lose six months' sea time.

Five minutes after the court had broken up the admiral of the station, who had been president of the court, shook the midshipman by the hand, and asked him if he would like to join his ship, as he would be pleased to have such a youngster serving under him.

But Bob respectfully declined, and rejoined the J—, which turned out lucky in the end, for the loss of the six months' time was only marked in pencil, and before they paid off the captain erased it, and gave him the time back.

For ourselves we must say that we agree with the hero of the above anecdote, and should certainly hold with what he said when on his defence before the court of inquiry.

"I am very sorry that it was necessary to disobey the captain, and destroy her Majesty's stores; but, gentlemen, if the booms had been worth eight hundred pounds instead of eighty, I should consider that a man's life was the more valuable of the two, and should I be placed in the same position again I should act in precisely the same manner."

THE TROUT, AND HOW TO CATCH IT.

BY J. HARRINGTON KEENE,

Author of "The Practical Fisherman," "Fishing Tackle, and How to Make It," etc.

PART IX.

AN ingenious spinner, brought out in England by Mr. R. B. Marston, is shown in Fig. 6. It consists of (A) a swivel, (B) a fan-like spinner, which, being shaped somewhat like the screw of a steamer, turns the bait with great regularity and swiftness; C, a loose single hook; D, a lead core, terminating in a brass pin; E E E, triplet-hooks, which are hooked into the bait or fly loose according to the fancy of the user. This is how you

bait it. Take your minnow and thrust the lead core (D) down its throat, so that the wire continuation runs down the backbone and the lead remains in the stomach. Now take C, the loose hook, and run it deeply in the back of the fish, so that it braces the latter up close to the spinner. You now have a bait with a sort of metal frill or ruff round its mouth. The swivel is then attached to the trace, and "there you are again!" as Mr. Merriman

would say. The action of this little spinner is very pretty, and if three out of the nine hooks left free be inserted "judgmatically," it forms as complete a specimen of spinning tackle and as taking a one as you need desire to have in your tackle-box.

The last device for the purpose of utilising the natural minnow that I shall touch on has nothing to do with spinning proper, though the bait does in a modified way spin, and in

a very certain and effective way catch fish,

Fig. 6.

too, if used with judgment. Fig. 7 shows it.

Fig. 7.

It simply consists of a conico-cylindrical piece of lead wrapped on the shank of a hook. The method of baiting is extremely simple. The line at A is attached to a baiting-needle and passed from mouth to tail of a minnow, the hook, of course, coming out at the side of the mouth. This bait is used in the manner of a gorge-hook. You throw out, and, with an alternate movement of sink and draw, you wait till a fish takes it; then count ten, and strike. The result is disastrous—to the fish. This is rather a nasty way of fishing, however, and should not be resorted to unless it is freely allowed by the proprietor of the water or the exigencies of the stream do not admit of any other method.

(To be continued.)

Our Camp.

[From the "BOY'S OWN SUMMER NUMBER."]

AH! now is the time for a week on the river!
O'er meadows and roads you can see the heat quiver,
But here you can lie in a cool, shady nook,
Refreshing your mind with a not-too-deep book
Till warmed by a growing sensation of cramp
You push off your boat and pull to the Camp.

There comes up the Swan, with four good fellows in her,
All eager for work and more eager for dinner:
Jones has promised a salad; he pulls out his knife
And slices up lettuce and egg for his life;
Smith is cooking to-day, so we hope for a treat,
For Smith as a cook isn't easy to beat.

Now dinner is over, so put on the kettle,
(Hot water is best to take grease off the metal;)
A final cold plunge, next a row to the lock,
Then back before ten by the old village clock.
One glee round the fire and then out with the lamp,
A hearty good night; then all's still in Our Camp.

ON SPECIAL SERVICE: A NAVAL STORY.

By GORDON STABLES, M.D., R.N.,

Author of "The Cruise of the Snowbird," "Stanley O'Grathame," etc.

CHAPTER XII.—AT SIMON'S TOWN—A DESPATCH FROM THE ADMIRALTY—A PIRATE AFLOAT.

"There was a knock at the door, and the Marine Officer entered."

THAT stern old Highland chieftain, McLeod, the father of Colin, was not a demonstrative man by any means, but when one morning he opened his daily paper—an exceedingly Conservative one—and read therein his son's name specially mentioned with that of other officers in a brief article under the somewhat sensational headings of

CHASE AND CAPTURE OF A PIRATICAL SLAVER.

RELEASE OF 500 SLAVES.

GALLANT CONDUCT OF BRITISH OFFICERS,

then, it must be confessed, it was with some degree of pardonable pride that he handed the paper across the table to Captain Peter.

Now, there is no journalism in all the wide world so fair and just as that of our own land. When we read extracts from French or Russian papers descriptive of their battles in other lands we are often obliged to pause and wonder, to place the morsel of buttered toast or the cup of tea we were raising to our lips back upon the table again un-

touched, as items like the following meet our view:

"Five hundred of the enemy killed!

"Our loss trifling—a sergeant and five men wounded."

The relation of such doughty deeds requires a deal of salt before it can be swallowed. Again, when some foreign nations lose a battle—I will not say the French or the Russians this time, because they, of course, never lost a battle—their journalists describe it as a brilliant engagement, in which the enemy lost heavily, and "our forces for strategic purposes took up a position fifteen miles farther to the rear."

People who can read between the lines know the real meaning of this. They can see "our forces" attacking the enemy in great force in the morning, fighting bravely and well, perhaps, but obliged at last to flee. Flee? Ay, boys, there is no other name for it; flee, and that fifteen miles is left strewn with their dead and dying. The position they take up at last "for strategic purposes" is taken up because they cannot flee any farther, the enemy being too tired to follow them, or darkness has come on and put an end to the carnage. And,

oh! that dreadful huddling together of a beaten army on the night after a battle. The cold, the misery, the hunger, the confusion, the absence even of discipline, and the frequent alarms that render any attempt at sleep impossible. May no lad who reads these lines ever experience the like!

But British troops have been beaten in fair fight, and whenever they were our home journals have boldly stated the facts. We must all do our best in this world, and leave the rest with Him who rules the destinies of the world. Having done our duty, I do not see that we need be ashamed to hold up our heads if misfortune follows. The race is not always to the swift, nor the battle to the strong.

But here in the account of the capture of the slaver, as described in the Highland chief's newspaper, there was just a trifle of exaggeration.

The fact is, D'Austin, the aristocratic clerk, drew up the report and then read it to his commander. The main facts of the case were stated, and though there might be a little too much varnish, still it would be a pity to cut down so much fine writing; therefore it was sent.

So Colin's father read it all over, not

once only, but twice, for he really loved his son, and he said, as he passed the paper to Captain Peter,

"It isn't so bad of the youngster, is it? Eh?"

That worthy must needs strike it with his hand a ringing smack that made old Raoul, the servant-man, jump, and set all the colliers barking, then get off his seat and hobble five times betwixt the door and the fireplace, before he could speak.

"It's nothing more than I expected," he cried, at last. "I tell you what it is, McLeod, our boy will be a post-captain before he is two-and-twenty."

Colin's brother's eyes sparkled with joy. Colin's mother's eyes so swam in tears that Ronald had to read the news to her himself.

"May Heaven protect my brave boy!" she said.

"To be sure," cried Uncle Peter, slapping his wooden leg. "To be sure. Heaven will protect him. Come, come, woman, it is laughing you should be instead of blubbering; only," he added, "there is never any accounting for anything a woman does. But I tell you what, sister, I feel so brim full of joy and hilarity that if I had two legs instead of one I'd just dance. Raoul, off with you, and tell Dominie Clayton to come over here at once. Tell him there is news from Colin. Tell him—"

But Raoul was away, flying like an old ferret, without his hat as usual.

In less than half an hour Raoul was back again, and with him the dominie, poor old Clayton, wreathed and wrinkled in smiles.

And what a forenoon of it Uncle Peter and he did hold to be sure!

* * *

Meanwhile the Theodora was quietly lying in Simon's Bay, and on that very forenoon Mildmay, quite recovered now, sat with his captain in the cabin engaged in conversation.

Between them was a despatch which had only that morning been received from the Admiralty.

"No, Mr. Mildmay," the captain was saying, "these are not slavers that are doing the mischief. They are pirates out and out."

"Well, yes," replied Mildmay; "and I know some little thing about them too. You know I was up in the Persian Gulf before serving against these liliputian pirates. They were junks and dhows, mostly the latter. Their crews were cut-throats of many different nationalities, the sweepings of the streets of Bombay and Calcutta, half-caste Portuguese from Goa, Arabs from the eastern shores of Africa, a few scoundrels of Chinamen, and may be, though not often, one or two Persians or Hindus. But," added Mildmay, "these last I have seldom found to be very fond of that kind of work any more than we are. They are fonder of trade."

"Ah, Mr. Mildmay, you know more about them than I do, evidently."

Mr. Mildmay could not help thinking that he knew a good many other things that his worthy captain was scarcely conversant with, only he did not say so.

"But," said Captain Blunderbore, "there are more than small fry here to be caught, for here is particularly described a pirate—a real pirate, of the name of Gaspar Moravo."

"Yes," said Mildmay, "I know him."

"You know him!"

"I do, and so does Golava. Indeed Golava knows a deal more about the fellow than I myself do. But Moravo was not always a pirate."

"Well," said Blunderbore, laughing, "I don't suppose he was born a pirate."

"My dear sir, I'm glad I amuse you; but really, although Gaspar Moravo was not born a pirate, it was next thing to it. I know quite a deal about the fellow's history. He was singularly enough transformed from an honest slave-dealer—if I may be allowed for once to use the word 'honest' in connection with so dastardly a calling—to a pirate."

"No, don't say 'honest' slave-dealer, Mildmay, say 'veritable.'"

"Veritable, then," said Mr. Mildmay.

"And you have met this Gaspar Moravo?"

"Years ago, sir," replied the lieutenant, "when out on the east coast, he commanded the Spartan, and many a good cargo of slaves he used to run from the more southerly shores of Africa to Zanzibar and farther north. Indeed, there is no saying where he did not sail in that rascally ship of his. Nor does any one know one tithe of the black and cowardly deeds this piratical scoundrel has been guilty of in his time. A slaver he was and is by trade, but the most merciless villain unhung. In a gale of wind off the Comoros once I was told he consigned no less than one hundred and fifty poor wretches to a watery grave, as an Atlantic liner sometimes does cattle, to lighten his ship. He did not draw the line at what—compared to his deeds—might be called legitimate slaving; he attacked, burned, and sank many an Indian craft, keeping only the black hands, ruthlessly murdering the white."

"I was the means, under God's providence," continued Mildmay, "of clearing the sea of this ocean scourge for a time. In boats I attacked him. It was out on the low sandy shores north of Bareda. He beached his vessel, but escaped inland with most of his cut-throat crew. Only once I saw him after. It was in the slave-market of Lamoo. He passed me quickly, but as he did so he hissed out the one word—

"Revenge!"

"Well," said Captain Blunderbore, "I trust that before very long he will have an opportunity of taking his revenge on you."

"If he can."

"Yes, if he can."

There was a knock at the door, and Captain West, the marine officer, entered to make a report.

"Another time," he said. "I didn't know you were busy."

"Come in," cried the captain. "We have had a despatch from England. Is your sword sharp, West?"

West smiled.

"My servant sees to that," he said. "But what is on the books, sir? A little fighting up the channel? Slavers? An outbreak at Port Natal? Another Kaffir war?"

"Ah! you wouldn't guess in a month," replied the captain.

"In that case I must beg for information."

"We're going to have a hunt for pirates."

"Whew!" whistled West, and so astonished was he that he dropped into a chair without invitation.

Captain West was a remarkable man

in many respects. Probably nobody enjoyed life more thoroughly than he did, but in so quiet a way that he seemed a wonder to all who knew him. About five-and-thirty he might have been, round rather handsome face, with fair beard and moustache, and hair cut so short you really could not have told the colour of it.

West painted in oil and water colours, and his sketches of foreign lands had graced many a page of the London illustrated papers. West played too, and had a piano in his cabin which occupied fully one half of it. Indeed so big was this piano that the cot in which West slept had to be slung over it. When playing his whole life and soul was bound up in his performance. He was then the musician and nothing else. West was a good swordsman, and a good shot with the revolver, and about the coolest Englishman under fire one could imagine. He never talked a great deal—that was another of his peculiarities.

I must be allowed here to tell one short anecdote of him. It will serve to illustrate his character.

It was at the capture of a kind of slave dépôt in a mangrove forest out on the east coast. There were there about six hundred slaves in all, and the Arabs to whom they belonged made a most determined resistance, both inside and outside the palisades, or bulwarks, as our blue-jackets called them.

It was hot work, but the Arabs had the worst of it.

Now West had behaved with no conspicuous gallantry, it is true, but with all the *sang froid* and military etiquette he would have displayed at a parade on the square of Chatham barracks. He was dressed too during the fight in the most correct fashion. And the following is something very like the little speech he made to his men just before they boarded the palisade. They were all of them red marines, by the way.*

"I say, you fellows," he said, "I know you'll do your duty. Marines always do. Ahem! I was going to make a speech, but there is such a confounded row! Here he drew his sword and pointed to the enemy. Then, "Away, men," he shouted, "West is with you."

Shortly after this he had been seen in the enemy's midst fighting bravely enough, but he appeared to single out the very best Arab swordsmen, and when fighting he was evidently studying their tactics, and when a man fell at last under his superior skill he looked disappointed.

But now there sat Captain West, looking at his chief with very open eyes indeed.

"I had thought," he said, at last, "that pirates had gone out of fashion. What does this fellow we are going to smash look like, Captain Blunderbore?"

Then Captain Blunderbore told him all he knew.

After this, all that dear, funny, fat old Golava had told them was commented on, and so, what with the knowledge contained in the despatch from home, the information given by Mildmay, and that vouchsafed by the genial but garrulous Golava, the history of the pirate, Gaspar Moravo, or, as West persisted in calling him, the "nautical

* Red marines—men of the R.M.L.I. (Royal Marine Light Infantry), called red from the colour of their coats or jackets.

marauder," was finally pretty well elicited.

Now, as this identical individual, Gaspar Moravo, did really exist and do a deal of mischief round the shores of India, China, and the Persian Gulf, I shall in the next chapter give a short account of him.

Mildmay, West, and Captain Blunderbore sat talking in the cabin till two bells, then they were asked to stay to luncheon.

The ports of the *Theodora* were open, and from those of Captain Blunderbore's cabin such a view was visible as one may roam the wide world over, as the song says, and not see surpassed.

A bay that is more of a gulf, so long and extended is it, surrounded on both sides by rocks and mountains, but possessing a horizon of its own at the head.

At present it is sleeping in the sunlight. Clouds there are in the sky, just a few long white flakes here and there, but nothing to overshadow the blue, *blue*,

cool-like, smooth, transparent water. All the mountains are a mass of charming tints and colours—greens, browns, and purples, and shades of crimson. The day is hot; it is midsummer in this part of the world, and will be Christmas in a week's time. There is hardly a breath of air to raise a ripple on the water, but above the table a white punkah is hung, and the very smallest second-class boy in the ship is squatting in a distant corner pulling the string.

Dr. McGee is on shore collecting specimens, and Quentin Steele is with him, for there really is nothing doing on board.

Only Mr. Gayly, the wasp-waisted smart little Gayly, deems it his duty to walk the snowy quarter-deck, if only to see that the signalman keeps a good look out.

The officers at lunch in the captain's cabin can hear Mr. Gayly's light tread just over their heads; it is a very regular one, and so light that it does not annoy them in the slightest.

But suddenly there is a break in its rhythm. Gayly has stopped. He is looking at something, that is evident.

Then they hear Gayly's voice.

"Signalman there!"

"Yessir."

"Are you asleep?"

"Asleep, sir, no."

"But I say you are, sir. You *are* asleep. Don't dare to contradict me, sir."

"Well, beggin' yer pardon, I—"

"Don't beg pardons, but keep your eyes skinned. Can't you see they are signalling from the Admiral's office?"

"Oh! yes, sir, I sees it now. Thank'ee, sir."

"Signalling to the flag-ship they bees, sir. Ship coming in, but nearly becalmed. A barque."

"Do you hear?" said Mildmay; "did you hear, sir?"

"Yes, I hear, and I do hope it is Benbow come at last."

(To be continued.)

TOM STANTON: A STORY OF COUNTRY LIFE.

CHAPTER V.

FEELING certain that he should meet no one that night, Tom ran on till he was tired. Then turning into a field at the side of the road, he hastily changed his clothes for those which he was carrying, and making a bundle of his own things, he hid them carefully in a ditch, and turning away felt secure from recognition.

And certainly the disguise was perfect. His face was still soiled with the smoke and heat of the fire, while the thick rough clothes completely concealed his slight erect figure. Standing still for a moment, he looked back and listened. Not a sound was to be heard save the occasional rustle of a leaf, but the glow of the fire could still be seen in the distance, though apparently much subdued.

Tom had not much money in his pocket, and he counted it now discontentedly as he continued his way along the road. One thing was evident, he would have to walk all the way, for the money he had would only provide him with food for a day or two. He knew he was going in the right direction for the sea, but he made up his mind to keep off the roads during the day, and to try to do as much travelling as he could after dark, for that pursuit was certain he was aware.

Excited and buoyed up by the feeling of freedom, he walked on unconscious of fatigue, till by the time the sun was well up he had put some miles between himself and his late home. Till now he had apparently had the road to himself, but seeing a cart in the distance, his resolution of the night before occurred to him, and, leaving the road, he entered a small wood which lay at one side of the way. Securely hidden, he sat to watch the cart rumble by, and while so sitting on the grass sleep overcame him and held him unconscious for several hours. Then the light of a stray sunbeam which had penetrated the trees and was playing on his face awoke him, and he sat up wondering where he was. But soon memory

brought back the events of the night before, and he started to his feet with the dread of pursuit, which is the runaway's constant terror.

With many a turn of the head and pause to listen, he continued his way, sometimes contriving by crossing the fields and creeping through hedges to avoid a long bend of the road. He was so anxious to get on and to leave the neighbourhood through which he might be sought far behind that he hardly noticed the pains of hunger which began to assail him, until about the middle of the day when, as he passed a cottage standing alone, he saw a little boy at the door eating a slice of bread. The sight reminded him of the necessity of providing food for himself now that there was no one else to do it, and he stood still a minute trying to make up his mind to apply here.

The little fellow with the bread seeing a bigger boy than himself hungrily watching him, prudently went inside, and Tom, with none of his former pride left, lifting the latch of the gate, walked up the little path and knocked timidly enough at the door.

The little boy inside called "Mother!" and with a noise of thick shoes on a brick floor, a woman appeared. She looked very big, red-faced, and rough to Tom, but she spoke to him kindly, calling him "my lad," and asking what he wanted. Tom had some difficulty in stammering out that he was hungry, and wanted something to eat.

"You're not on the tramp, surely?" asked the woman, looking at him doubtfully.

"No," answered Tom, hanging his head as if to hide his burning face. "If you will give me something I can pay for it," and he held out a shilling.

The woman laughed.

"Put up thy money, lad," she said. "It isn't much you'll get from me; but, such as it is, you can have it and welcome. You're not from these parts I can

hear by your talk. From Lunnon, perhaps?"

"Yes," said Tom, anxious to stop her questions.

"And where's thy father, then?"

"Close by here," said Tom, in desperation. "I am going to him."

"Ah! well, here's all I've got to give except a drink of well-water, if you'd like that?"

Tom accepted gratefully, and, with a large piece of bread in his hand, bade "good day" to the woman, and went on quickly. He did not know how hungry he was until he tasted the food, and then this bread, which had looked so uninviting, seemed to him the best he had ever eaten, and he only wished that there were more of it.

The rest of the day was spent in alternate walking and resting. Towards evening Tom's road led him through a small town, where he ventured into a shop and bought some meat and bread, for he felt his strength was beginning to fail, and supposed it was for want of proper food. He got out of the town and into the fields again before he began to eat, but was surprised to find that even the sight of the meat did not tempt him, and that all he cared for was some of the bread, with a draught of water from a little stream by which he was sitting. How long ago it seemed now since he was at home in his uncle's house! Surely it could not have been only the night before that the fire took place! Days seemed to have passed since then. He was getting on well on his way to the sea; but he must try to find out what towns lay before him, and which would be best for his purpose. It was dark enough now for him to trust himself on the road, and he walked a good distance before fatigue compelled him to seek out a dry spot under a hedge well hidden from the road, where he slept till the chill of daybreak awoke him, and made him glad to walk on to warm himself.

And in this way several days passed. Through sunshine, rain, and the darkness of night, Tom still plodded on, throwing himself down in some hiding-place to rest when his limbs refused to carry him any farther, and eating very little, for a strange distaste for food had come over him. His head, too, felt heavy and confused; he hardly knew sometimes where he was, and once or twice he found himself talking out loud to people whom he had fancied were with him. It was always his father and friends whom he had known in India that he thought he saw. All the time spent in his uncle's house seemed blotted out of his memory for the time. Only through all his bewilderment a pressing anxiety to escape made itself felt, and often he would start from a troubled sleep to run on his way, as if the pursuit he dreaded were close at hand.

It was early one morning when the first sight of the sea broke on his view. From the high ground which his road had been gradually ascending suddenly he saw a blue expanse stretching far away into the distance. With a cry of joy and relief he began to run towards it, though his swimming head and growing exhaustion soon made him moderate his pace. With eyes looking far away before him, he still kept the road, and soon the passers-by were too many for him to attract any attention.

Midday found him in the streets of Southampton, footsore and limping, with sunburnt face and hands, and soiled, torn clothes. Muttering to himself and pointing forwards, he still struggled on, but the number of streets seemed to bewilder him, and he stopped sometimes and looked about him wildly as if lost.

It was then that a policeman went up and spoke to him, asking him if he wanted to find any place. Tom looked as if he did not understand, but then said, "The sea," adding some confused words and explanations, out of which his hearer could make no sense.

Grave and puzzled, the policeman stood listening till suddenly Tom's face lighted up, and turning to a native Indian servant who was passing with a child in his arms, he addressed him in Hindustani.

Standing still and looking doubtfully at the appearance of the boy, the man stood listening, while Tom broke into a flood of explanations in the language which had once been so familiar to him.

Then his dark hearer salaamed, and spoke gently and respectfully to him in reply, and, turning to the policeman, asked him, in broken English, to come with the boy to his master, who was in a hotel close by.

Willingly Tom accompanied his dark guide, and, as if in a dream, found himself soon afterwards being spoken to by a tall, military-looking man, who asked him some questions which the boy tried to answer, for he felt as if here all his troubles had come to an end, and that soon he should be with his father.

He did not know how he got to bed, only he found himself there after a time; but his head was too heavy and he was too tired to care. Many people came to look at him, he thought, and he talked to them all, and wondered why they never answered and were always changing. He did not see any one he knew among them, but perhaps he was on board ship going to his father.

Then it was as if he sank into a sleep troubled with dreams, during which he seemed doomed to wander for ever in strange desolate places, where he could find no rest. His head was burning, and though he sought everywhere for water he could find none. Choking with thirst, he seemed to fall on the ground with a cry for help, and then before him, as in a picture, he saw the home he had so lately left. There stood the old house amongst its tall green trees, while the moat shone clear and cool in the sunlight. While gazing towards this vision with longing, regretful eyes, Tom sank into deeper unconsciousness, in which all dreams and fancies were lost.

When he awoke, after a long, long time, he was surprised to find that a weight seemed to lie on every limb. He could not raise himself, only his eyes wandered round the strange room, while he feebly wondered where he was.

What had happened? and how had he come here? And that old woman, who was looking at him so anxiously, who was she? He tried to speak to ask her a question, but the words would not come, and he could only look up at her with earnest, inquiring eyes. She spoke to him softly, gave him something to drink, arranged his pillows, and bade him try to rest; and in his weakness his heavy eyelids closed involuntarily, and a long dreamless sleep brought him the refreshing rest which he had longed for in all the wanderings of fever.

It was evening when he awoke again, and the red light shone on some clouds which he could see from the window. He lay for a time quietly watching them, too weak to care much about anything, but content to lie still, with no thought beyond the present.

Then the old woman came to look at him again, and he tried to smile at her. She blessed his heart, and told him he was a man again, and would soon be up and as well as ever. But she would not let him talk, and, after giving him some food, left him to fall asleep once more.

But in his sleep dreams came to him, and he thought that he was again among all the friends who cared for him. His father was there, but as Tom ran towards him with a cry of joy the face which had always looked at him in kindness was turned away, and no word of greeting fell from the cold closed lips.

Conscience-stricken, Tom turned away. Yes, they were all there—his uncle looking at him with grave, troubled eyes, Jack sitting with his arm round his dog, while Bertie stood near with his eyes on the ground.

The boys could not bear to look at him then. They felt, like his father, that he had disgraced himself, and now he was no longer to be one of them. He must go away; no one would hold out a hand to him any more. He was cast off, and in future must be a stranger to his own people.

Turning hopelessly away then, he saw a dark shadow beside him, and looking up met the evil smile of Bart. Holding out his hand, the man bent down to whisper, but with a cry of loathing and despair the boy dashed the hand away and hid his eyes. Then it seemed as if an arm were laid on his shoulder, and the voice of little Bertie spoke to him words of comfort. He hardly knew what was said, but the voice continued to speak, while a hand led him back to

where his father was standing. In his deep humiliation Tom dared not look up, but a stream of love and repentance broke in tears from his eyes as he stammered, "Father, I have sinned."

Then he awoke, with the heavy tears still on his face, but a hope of forgiveness and comfort creeping into his softened heart. Awoke to find himself lying in the dim sick-room, with the light of the night-lamp shining on the figure of his old nurse sleeping in her chair. Awoke to find himself alone amongst strangers, but awake at last to his own wrong-doing, folly, and ingratitude. Surely he had been sleeping all the time until now, or whence had come this new light which showed him all his past in its true colours? The face which was turned to the dim lamp was very pale and thin, but the earnest eyes were full of a brave resolve to repair as much as possible the evil which had been done.

When the old nurse bent over her patient in the early morning she found him in the restful sleep of returning health, and smiled to herself as she thought how her care had brought him through his severe illness. She was busying herself about the room when she heard herself called by a faint voice, and going to the bed found the boy too eager to talk for her to be able to stop him.

He wanted to know where he was, how he had come there, and if any one had written to his friends.

To the last question she could only say "No," as here no one knew where he had come from or who his friends were. A gentleman from India had made arrangements for him to be taken care of. He had had to go away with his family, but Mr. Carter, the landlord, wrote to him every day to say how the boy was getting on.

"What has been the matter with me, then?" asked Tom, wonderingly.

"Dear heart! nothing but the measles. But you took them rather badly from wandering about while you had them on you, that's how it was, you see. And all of us a-wondering how it was you came to be here all alone. The colonel's native servant said as you had run away, he thought. Was that it, lovey?"

"Yes," said Tom, while a faint colour came into his pale cheeks; "but I should like some one to write now, to let my uncle know where I am."

So a letter was written not very long after, which brought Mr. Stanton at once to the boy's bedside. Tom had been watching and listening for him longingly, and held out two trembling hands as his uncle entered the room. In his weakness the tears ran down his face, as he tried to utter something of the sorrow and repentance he felt. Ah! there was support and comfort in the firm, kind hands which held his, and nothing but love and compassion in the eyes into which he looked.

Long and quietly the two spoke together, and Tom resolved, with God's help, to keep his mouth henceforth from falsehood, and his feet from the paths of deceit. He saw the cowardice which had led him to try to hide one fault by another, and understood now something of the hopelessness of trying to escape the consequences of wrong-doing. He was anxious to hear all that had happened since the night of the fire, and listened with tingling ears as his uncle told him how Bart, in the first terror of

escape from an awful death, had made a clean breast of his share in the late transactions.

He had confessed how, with Tom's help, he had got an impression of the granary key, from which he had had one made, and under cover of darkness had visited the granary whenever he wanted food for his beasts; how one night, when he was concealed inside, the coachman, whose suspicions were excited, had put a padlock on the door and locked him in; how, being unable to escape otherwise,

he had set fire to the granary, hoping to slip out unseen in the confusion; how the fire had remained unobserved so long that the smoke had overpowered him, and he thought that he was to die; how, if the squire would let him off this once, he would promise never to come near the place any more—with much more in the same strain.

The holidays were over, Tom heard with surprise, and Jack and Bertie had gone back to school. Thence Tom was to follow them when he was perfectly

well; but in the meantime he was to be taken, as soon as he could be moved, back to the old house, where, in the fresh pure air of the country, he would regain the strength which he had lost.

"Your fellow-invalid is getting all right again," said Mr. Stanton, with a smile.

"Who is that?" asked Tom, looking surprised.

"Why, Sam, the gardener's boy. You caught your measles from him, you know." (THE END.)

UNDER THE TREES IN JUNE.

BY THE REV. B. G. JOHNS, M.A.

(See the Coloured Plate.)

JUNE has come at last, bright, breezy, and full of sunshine. The hedgerows are gay with bright, scented flowers; the bees are all busily at work from early dawn to sunset; butterflies are skimming hither and thither, or settled on a spray of hawthorn, or buried in a yellow cowslip, are opening and shutting their wings in the warm light and trying to look as busy as the bees. But we, clever people as we are, know better than this; and so, instead of idling in bed this fine morning, will be off for a stroll through the wood. If you like, it shall be a bit of the New Forest in Hampshire.

This is a grand place for butterflies, beetles, and insects of all kinds; hares, rabbits, and other wild creatures; and countless birds; besides a great variety of forest trees, among which, first and chief, comes the Oak. First and chief he ought to be, as the lion among the beasts or the eagle among the birds, and very proud are Englishmen of him; counting him a sort of royal tree for strength, majesty, and endurance. His name, "*Robur*," signifies strength, and long before the time of the Druids—who get their name from a Greek word signifying an "oak"—and their groves of oak, down to our own time, England has been famous for her noble oak-trees. One has been known to live—ay, and to be a fine hale tree—for five or six hundred, some say seven or eight hundred, years; standing as firmly and proudly in his old age as when a mere youngster of a hundred or so.

About a century ago, in this very forest, there stood a gigantic old oak, stretching its huge, knotted branches some forty feet each way. The great body of the tree was all "*knees and crooks*," as the shipbuilders used to call them; the main trunk was not more than twenty feet in length, but six in diameter at the top, as sound as a ripe nut and hard as iron. One of his mighty branches was as big as an ordinary tree, and no carriage in the county was found strong enough to bear its weight. When divided up it yielded two-and-thirty loads of hewn timber, besides fagots of firewood enough to defray all expenses of carriage. Close to the ground, where it was cut, it was twelve feet in diameter, and showed some three hundred rings, or rounds, of annual growth.

The famous "*Royal Oak*" at Boscobel, in Shropshire, got its name from the fact that after his perilous defeat at the Battle of Worcester Charles II. lay hidden among the branches for many days, while the soldiers vainly scoured the country all round in search of him. It was then a fair, spreading tree, the boughs thickly lined with ivy, but is now a poor, shattered, old, bare trunk, with a brick wall built all round it to keep off the fingers of curious visitors.

There are many grand old oak-trees in England, but there is no one grander or more famous than "*the Cowthorpe Oak*" near Weatherby, Yorkshire. This aged giant of the forest is said to be upwards of sixteen

hundred years old, and, though now fast falling into decay, has still one living branch upwards of fifty feet long and ten feet in girth. Fifty men may easily stand up together within the hollow trunk, and it must have been a godly tree in the days when the savage Britons stained their bodies with woad and Druids cut down the mistletoe with a golden knife.

After such a giant as this, if you wish to meet with a pigmy, take a run down to Whistman's Wood, in the middle of Dartmoor, and there you will find a grove of three or four hundred ragged and stunted oak-trees, about ten or twelve feet high, covered with moss and ivy, and twisted into all sorts of wild, fantastic shapes among the blocks of granite that crowd every hillside and valley.

But we must hurry on to the edge of the wood—through that long winding lane, with tall green Elms on either side of us. How jolly it is to get into the shade, after the blazing sunshine, which only peeps in now and then through the leafy hedge, and makes the shadows seem all the deeper. The elm is a tall, graceful tree, but quite a stripling when compared to the tough old oak, reaching his prime when about a hundred and fifty years old. He is of no service to the shipbuilder, but the coffin-maker finds him most useful; and as long as people *will* be buried in wooden coffins, planks of elm will fetch a good price. More than a dozen kinds of elm are to be found in England, all pretty much alike in general appearance, except the Wych elm, a shorter and more stunted tree, with smaller leaves and of inferior timber. The bark of the Wych elm, being tough and flexible, is used in Wales for mending thatch; and a sprig of it is sometimes stuck into the side of the churn by dairymaids, as a sort of charm, so they say, *to make the butter come*.

The elm, when it has plenty of light and space, grows to be a fine lofty tree, with tier after tier of graceful spreading branches, and is among the first to put on a robe of bright, fresh, green leaves, when April showers have got all things ready for sunny May. The Great Wood Tortoise-shell Butterfly is very fond of the elm; and on some hot mornings in August you may see as many as three or four of these swift flyers sunning themselves on the trunk of a hollow tree.

The lane brings us out just opposite to the great clump of Beech-trees, which you saw from the window of the railway-carriage half a mile away on the hillside, all in a shining mantle of dark green, with here and there a touch of purple or brown among the thick crowd of leaves. But the beech seldom gets to his full size and strength when one of a clump. The seed should be planted well out in the open, where there is plenty of air and sunshine, and then in about ten years it will grow to a sturdy tree of fair height, reaching its full stature at fourscore. In the

autumn the leaves of the beech turn to a golden red, and if gathered when dry are said to make good mattresses; while the crop of beech-nuts are capital food for poultry as well as pigs, which are often turned out into the forest to run wild and grow fat. Squirrels are specially fond of the beech-tree, and in spring-time like nothing better than to tear off long strips of the outer bark so as to get at the tender inner bark, which is juicy as a nut.

The wood of the beech, though tolerably hard, is easily worked, and can be cut into very thin slices, which are used for many purposes, especially pottles and light baskets for fruit. The French peasantry, too, use this white hard wood for making their *sabots*, or wooden shoes; a fagot of beech makes the jolliest of Christmas fires, and the best of all charcoal. Among the dead leaves in a beech-wood are to be found two curious kinds of fungus—one, the "*morel*," an odd-looking sort, of a mushroom-shape; and the other, called "*the truffle*," a sort of underground fungus, that when dug up looks like a warty potato; both are said to be very good eating.

But it is time to get out of the shady grove of beeches, and have a look at the clump of Sycamores at the edge of the wood. The sycamore is one of the commonest of our large trees, and, though not a native of England, easily takes root in almost any moist ground, and reaches its full growth in fifty or sixty years. It is a leafy, graceful tree, and in spring-time its drooping clusters of greenish blossom attract many bees, who find in them a good supply of honey when few honey-bearing flowers are yet fully out. It is sometimes called a sort of Plane, and was counted rather a scarce tree in the fourteenth century, though it is now found in almost every hedge-row. The sap is very abundant, and when distilled yields a goodly quantity of sugar; especially one variety called the sugar-maple, found in great numbers in Canada and New Brunswick. In old-fashioned days the sycamore was in great demand for making wooden platters, being close-grained and not apt to warp; while in Eastern countries it was still more widely used for mummy-chests such as are found in the catacombs. Every schoolboy knows what capital whistles can be made out of a bit of sycamore; and not long ago I saw in a Hampshire village more than a dozen made out of one branch, with notes ranging from lower C to upper F, all as clear and smooth as the voice of a thrush.

But however fond the bees may be of the sycamore, their favourite haunt is a grove of Limes, and beekeepers will tell you that the honey gathered from the yellow blossom of the lime is the best and daintiest to be had. In the sultry days of July and August nothing can be pleasanter than its leafy shade; the fragrance of the flowers is delicious, and if you stand still for a moment or two you will find the air is full of the murmur of myriads of busy bees, all hard at work among the

boughs overhead. The timber is much used by carvers, who easily cut it with fine saws into all sorts of shapes, especially for sounding-boards of pianos, while many curious mats are made out of the tough inner bark. It is one of the sunniest and most graceful of our trees, and has been so long settled in England as almost to be counted a native. If left to grow in its own fashion it becomes a noble tree, but, being easily trimmed, gardeners are sometimes fond of cutting it into all sorts of barbarous shapes.

Somewhat like it in general outline, though of much darker foliage, is the Walnut, a large spreading tree with a rough trunk and strong crooked branches, which originally came to us from Persia, Greece, and Italy, and now grows abundantly all over Europe. English walnuts are not so large as some of the foreigners, but make up in sweetness what they lack in size. The walnut grows wild in Tartary, where a single tree is said in some years to produce a crop of forty or fifty thousand nuts. When full grown the wood is hard, compact, and of a dark colour, veined and shaded with light-brown; and before mahogany was discovered walnut was much used for making furniture and boxes of all kinds. Now its chief use is for gunstocks, as it does not easily warp, and can hardly be matched for lightness and strength. The juice of the leaves and the husk yields a rich brown stain—as you may easily find out by shelling a few dozen of ripe nuts, and so make your fingers as brown as a gipsy's.

And here at last, outside the forest, we come upon a little winding brook of sparkling water, and not far off a range of tall Lombardy Poplars, which are said to get their name from a Greek word (*παράλλα*, to quiver) on account of the tremulous motion of their leaves. There are many varieties of this tree, such as the white poplar, the grey, the black, as well as the trembling poplar, or Aspen, which is about the most graceful of them all, unless it be a great clump of old weather-beaten Lombards such as you may see even now on Wandsworth Common. They are very old and ragged, their trunks are hollow, many of the great branches having been torn away by the storms, so that they are not much like the sugar-loaf shape sometimes found in pictures.

The poplar grows very rapidly, the wood being soft and light, and of little use; and though the foliage is heavy the leaves are nearly always in motion. Look up, now, and you will see that they are all in a sort of quivering, trembling state, though you can hardly feel a breath of air moving.

Just below, farther down the stream, is a Weeping Willow, with her long streamers, like green ribands, drooping over the water, as if she were in mourning for the whole grove. She seems to have got her name of "weeping willow" from the days of the people of Israel, who, when captives in Babylon, sat down among the willows by the stream and wept "when they remembered Zion."

There are more than fifty kinds of willow in Great Britain, and nearly all of them rejoice to grow by the watercourses, streams, and brooks. Some are trees, some shrubs, from ten to sixty feet in height, but all pine for water. The wood is soft and durable, with a sort of spring in it that is good for cricket-bats; it makes good firewood, while the bark is useful to tanners. But above all, one kind of willow (the common Osier) is specially needed for the manufacture of baskets, and in many parts of England—as in Cambridgeshire and Oxfordshire, Hants and Berkshire—hundreds of acres of marshy land are carefully laid out for the growing of withies or osiers for this very purpose.

The Ash abounds all over England, and, next to the oak, is always counted as a thoroughly English tree, being noted for strength, beauty, and a long life. It puts on its robe of green rather late in the year, when most of the trees are in full leaf, and is often found growing in strange, out-of-the-way

situations, such as church towers, crags, and old ruins, where the hand of man could not have planted it. This is owing to its having a winged seed, which is easily carried away by the wind to these odd place, and there takes root. The timber of the ash is valuable, being tough and elastic, and put to many uses—for ploughs, axletrees, and harrows, while it makes good oars, carts, ladders, walking-sticks, and bows. The roots of the ash always take, if they can, a horizontal direction, and thus, being near the surface, check the growth of grass and other vegetation. But the branches, some ten or twenty feet up, stretch in all directions, and make a noble tree.

Still more noble and more beautiful is the Chestnut, sometimes called "Spanish," but having a good claim to be counted as a thoroughly English tree, even as far back as Queen Elizabeth's time there having then been at Milton, in Kent, a chestnut wood of 278 acres, besides many other such woods in Hertfordshire. Possibly the Romans may have brought it over into Britain, and so it has had a good long time to settle and claim all the rights of an Englishman. If you want to see it in perfection you must travel as far as Italy, where you will find whole forests of it, which clothe the mountain side. The nuts, so well known, grow in a rough, prickly shell, which splits open and falls when thoroughly ripe, and are better eating when roasted than raw, though some hardy boys will eat them uncooked. In parts of France and Italy they are ground up and made into wholesome, sweet bread, or into porridge with milk.

Its relation, the "Horse-chestnut," is not so called because of horses being fond of it, but simply because if you pull out a leaf from the young shoot you will find on the bark the figure of a horse's shoe. The nuts are bitter and uneatable. The tree itself rises to the height of fifty or sixty feet, and in early spring is crowned with large clusters of white, pink, and yellow blossoms, not only beautiful to look at, but with store of honey for the bee. The leaves change colour and fall early in autumn; the timber is soft and poor, and of little use.

Lastly, we come to the group of Scotch Firs and Evergreens, for which we must wander away a mile or two from the forest, until we get to that lonely farmhouse on one of the high ridges of dry moorland pasture so often found in Hants. All the tribe of fir-trees are *Coniferae*, or cone-bearers, and all expressly fitted, by firmness of root and hardness of nature, to bear stormy winds and rough weather. They will grow among bare crags, and in the driest, sandiest soil stretch out their roots far and wide in a direction parallel with the soil, so as to catch the first chance of a drop of rain. They usually grow in a clump or cluster, just as you may now see on the brow of the hill, where three or four old, weather-beaten Scotch firs, or Pines, stretch their wiry branches to the sky. In some parts of Scotland you will find thick woods of pine clothing the sides of the valleys, and running far up the hills; but in England seldom more than a lonely cluster or clump. The shade under the firs is dense, and the air cool, as we saunter along over the mossy, hard ground—and how silent it seems! Listen for a moment, and you will hear a faint whispering sound of leaves, like the murmur of waves far away upon a pebbly beach. The air, too, is fragrant with the smell of the pine branches, and altogether you could pick out no nicer place for a quiet half-hour and a pleasant book. The pine is a most useful tree, the juice of the green wood forming turpentine and resin; while after it is cut down and hewn into billets, by a special process it is made to yield both pitch and tar in large quantities. Only this fir is a native of Britain.

Very different in appearance, growth, and value are the Spruce, or Norway Fir, the Silver Fir, and the Larch, all three more or less of the

sugar-loaf shape, but all more or less evergreens, and sometimes in full leaf when other trees are more like skeletons.

The Spruce Fir, in shape like a tall pyramid, is very erect, and grows to the height of 100 feet, the boughs being arranged in regular whorls and drooping into graceful curves, bearing bunches of tapering cones six inches in length and hanging downwards from the ends of the branches. To see this tree in full perfection you must visit the Hartz Mountains or the Alps, the slopes of which are covered with it almost up to the line of perpetual snow. The timber serves for fences and for fuel abroad, and is of great use, but is of little value in England. The sap, when exposed to the air, slowly hardens into a dry resin called Burgundy pitch. Squirrels are very fond of the spruce fir, and mischievously bite off the young shoots and drop them to the ground. Out of these shoots the Norwegians make spruce beer.

Much like the spruce in general shape is the Silver Fir, but the leaves have a silvery white tint underneath, and the large brown cones, instead of hanging down, stand up erect in clusters, with a few green shoots at the end of the bough. On these yellowish green shoots, just like his own wings in colour, you may—if you have sharp eyes—often see the common sulphur butterfly settle, perhaps to sip the gummy juice, or merely to rest in a safe place from his enemies. Although it was not brought into England before the seventeenth century, it is now common enough, and the wood being tough and elastic is turned to many uses both by land and sea. The turpentine it yields is of the best kind for clear varnish.

The Larch, with its tiers of drooping branches, runs up to a sharper point; and the leaves being of a brighter green, and the small ruddy cones ranged along the twigs in rows, it may easily be distinguished from the other firs, especially in early spring, when most of our native trees are bare. Great forests of it are found among the Alps and Apennines, where it towers to the height of a hundred feet. It is still much used in ship-building, and, becoming harder by age in a ship, holds iron as firmly as oak, and never corrodes. A sort of manna is produced from the shoots of young larches much like that of the ash.

All round the cosy farmhouse, with its red roof of tiles, is a thick hedge of Holly and Laurel, which looks green and bright nearly all the year round, but especially when Father Christmas comes in his wintry robe of snow, and the red berries and sprays of Mistletoe are so much in request. Just as the hawthorn is sometimes called "*May*," so holly gets the name of "*Christmas*." It is found in most parts of Europe, but thrives nowhere so well as in Britain, its native country. The leaves, of tough and durable fibre, take a long while to decay, and will remain attached to the tree for years. In front of the farmhouse, in the middle of the smooth green lawn, are a couple of noble Cedars, said to be more than a hundred years old, fine sturdy trees, though they have grown up far away from their native soil on the slopes of Lebanon. The first cedar that produced cones in England grew in the old Chelsea Garden in 1766, since which time it has spread widely over the land. It is the grandest and stateliest of all our trees, and has been famous from the days of the Holy Temple and Solomon's Palace at Jerusalem down to the present time. The needle-shaped leaves are shorter than those of the Scotch fir, growing in bunches, as on the larch, and the broad, mighty branches are crowned with fine erect cones of a goodly green and brown. The resin from the stem and cones is soft and fragrant like balsam, and a walk through a grove of cedars is of all walks most delightful. No grander sight can be imagined than a group of these noble trees among the snow far up towards the peaks of Lebanon.

With this grand old tree we must finish our

woodland ramble, which ends, as it began, in the midst of sounds and sights of beauty, joy, and fragrance; all coming to us from the same good and mighty Hand that has crowned the earth with His goodness. Every boy that has a heart in him will join in the song of sunshine and shade, flowers and green trees, bee, bird, and butterfly, that fills the summer woods.

THE SALT-WATER AQUARIUM.

BY THEODORE WOOD,

Author of "Our Insect Allies," etc.

(Continued from page 602.)

SOME there are which will feed upon the tiny particles of vegetable matter which are always floating in the water; these will take care of themselves. For others, however, you will have to provide food, such as small worms, fragments of meat, and so on. Never put in more than is required, and never allow it to remain and putrefy if not devoured in the course of two or three hours. If you neglect this precaution the water will rapidly become turbid and offensive, and you will have to empty it all away—first, of course, transferring the inmates to another vessel—thoroughly clean and rinse the tank, and then procure a fresh supply of water.

At the bottom of every vessel place a few pieces of rock or brick, or even three or four ordinary pebbles, in such a way as to form a few nooks and crannies, into which your captives can creep whenever they feel inclined. These, like the vessels themselves, must be thoroughly clean, and your best plan will be to place them for ten minutes or so in a saucepan of boiling water, in order that every particle of impure matter may be destroyed. It is a terrible trial to the temper to have to undertake so long and tiresome a business as the cleaning out of an aquarium simply on account of one's own negligence; and it is therefore far wiser to take a little trouble as soon as it becomes necessary, and thus to save a much greater amount of work later on.

For the same reason it is advisable to keep a sharp look-out for the bodies of any creatures which may happen to die, and to remove them before the least sign of decomposition appears. If a fish looks out of health, too, take him out at once and place him in a separate vessel. The change may do him good, and will at any rate prevent him from dying in the midst of his companions, and very likely contaminating the water in which they are living.

Never keep your aquarium in the window—or, indeed, in any part of the room to which the sunbeams have free access. Excessive light, as I have before explained, is always a thing to be avoided, and undue heat is even more mischievous, as would very soon be evident from the manner in which your prisoners would die off. There is, moreover, another reason for choosing a dark corner, and that is that the sunlight encourages the growth of the minute plants known as *Conserve* to such an extent that you will scarcely be able to keep your glasses free from them, in spite of repeated applications of the little instrument before described. The common Periwinkle, by the way, is a capital assistant in this task.

Now for a few words concerning the receptacles in which the inhabitants of the aquarium are to be conveyed from the sea to their future abode.

Some, such as the crabs, molluscs, the common beadlet, or smooth anemone, and so on, give no trouble whatever, all that is required being to pack them loosely in wet seaweed, and to carry them home in any manner most convenient. Others, however, cannot bear a prolonged exposure to the air, even under the most favourable circumstances, and must never be taken from the

water for more than a few moments at a time.

My own vessel for the conveyance of gentry such as these is of the simplest possible character, consisting merely of a large glass pickle-jar, very carefully cleansed, and furnished with an ordinary string handle, tied round the neck, and passed across from side to side in such a manner as to form a tolerably long loop. This is really all that is required, and the most delicate specimens will travel in it without receiving the slightest injury. Fill it about three parts full; not more, or a chance slip may spill half the contents, and lose you some of your choicest prisoners.

(To be continued.)

THE "BOY'S OWN" GORDON MEMORIAL FUND.

(Continued from page 575.)

IN the June "Leisure Hour" the editor remarks:—"A Fund has been opened in connection with 'THE BOY'S OWN PAPER' for a memorial to the late General Gordon, to be raised exclusively by boys, for the benefit of boys. The scheme, which harmonises with a widely-expressed wish, is admirable."

(Contributions received up to June 6.)

Correspondence.

FISHERMAN.—1. As we strongly deprecate cruelty of every kind, we object to live bait being used; nor is it necessary. Every attentive reader of the B. O. P. must know that wherever minnows (as in our last number) or worms are referred to it is always understood, as already fully explained, that they are first killed by being dropped into water sufficiently hot to kill them instantaneously. 2. The editor of the B. O. P. is Mr. G. A. Hutchison, and it is his signature which appears on your Certificate of Merit.

NORTHERN LIGHT.—1. In cleaning japanned goods use a little ammonia in the water. 2. A fine black japan for tin is made of an ounce and a half of asphaltum, four pints of boiled linseed oil, and four ounces of burnt umber heated together till well mixed, and when cool thinned down with turpentine. For red japan use first a mixture of madder lake and oil of turpentine, then give a coat of lake and white copal varnish; and then finish with a mixture of lake, copal, and turpentine varnish. Vermilion or carmine will do if you like the colour better.

C. A. PROUDFOOT.—1. The phrase "Entered at Stationers' Hall" means that the article has been registered at the Hall to protect the copyright. The register of copyright is kept by the Stationers' Company. 2. You can become a direct subscriber if you like; but situated as you are in a distant colony, and near one of our depôts, you would find it much cheaper to get your paper there.

J. WATTS.—1. The skeletons of the smaller animals are generally obtained by maceration. 2. Nicholson's "Manual of Zoology," published by Blackwood and Sons, is one of the best of the books.

J. W. HAMBLETT.—From any of the chief bookstalls, or from the Canadian Offices in Victoria Street, you can get a complete guide to Canada for one penny. It is specially compiled for intending settlers, and consists of 136 large pages beautifully printed, and illustrated by the Princess Louise.

MENTANUS.—Your first four questions might have been addressed to the Registrar of the University of London, and would have elicited full replies. Nearly all the colleges in the country prepare for the London degrees, and you would not be far wrong in applying to the nearest and most convenient to you. You would stand an excellent chance for a scholarship if the examination was a true test. We could not give tutors' names. What suits one does not suit another; but if we were to have to read six hours a day we should be up at daylight, bathe, read for three hours, have a good substantial breakfast, read for another three hours, and spend the rest of the day out of doors.

YOUNG NATURALIST.—The "Boy's Own Museum" articles were in the third volume. Refer to the index.

A RUHMKURFF COIL.—1. Boil together two ounces of yellow wax, an ounce of soap, and twenty-five ounces of water, and add two and a half ounces each of boiled linseed oil and oil of turpentine. This will give you a very good furniture cream. 2. The preparations are all patented. 3. No articles have been published since the legislation took place.

BRISTOL.—1. Paint flags for model yachts with artists' oil colours. Use sarsenet ribbon of the lightest colour in the flag, which you of course leave unpainted. 2. More about steamers in the coming by-and-by.

W. S. MACLEOD.—A capital French Dictionary at twelve shillings and sixpence is Gasc's, published by George Bell and Sons.

C. C. J.—The good of it? Did you ever hear the story of Euclid and the boy? The boy, after learning the first proposition, asked what was the use of it. "Here," said Euclid, "give the boy three pence, since he must make money out of everything he learns." If you are to conduct your education solely with a view to making money by it your plans are not unlikely to miscarry.

J. SCUDDER.—If you will refer to our article on Sebastian Cabot you will see who were the discoverers of America.

L. E. FILMORE.—1. You can buy indiarubber solution from most macintosh or bicycle shops that you could use for repairing the tear in your coat. Buttons are generally sewn through and a patch of macintosh stuck on the back. 2. There are no scholarships on the training-ships. The terms for the Conway are forty guineas per annum, payable in advance. For further particulars as to outfit, etc., get your parents to write to the captain. You must be free from any physical defect, and it would be hopeless for a deaf boy to attempt to get a berth.

F. C.—There is a two-shilling ready-reckoner for land, by Abraham Arman, published by Crosby Lockwood and Co., Stationers' Hall Court.

MAC.—The coin is a Guernsey penny. Channel Island coins are very common.

E. A. SMITH.—It is not a misprint. The articles on Signals at Sea were in the November part for 1882. Had you purchased the part you would have seen that the October weekly numbers form the November monthly part.

OUR SUMMER HOLIDAYS.

[See the "BOY'S OWN" SUMMER NUMBER, now ready at all booksellers, Price 6d.]

No. 338.—Vol. VII.

SATURDAY, JULY 4, 1885.

Price One Penny.

REGINALD CRUDEN:

A
TALE OF CITY LIFE.

BY

TALBOT BAINES REED,
*Author of "My Friend Smith,"
etc., etc.*

CHAPTER XIV.—THE SELECT
AGENCY CORPORATION LOSES
ITS OFFICE BOY.

MR. MEDLOCK duly appeared next morning. He greeted the new secretary with much friendliness, hoped he had a good journey, and left them all well at home, and so on. He further hoped Reginald would find his new quarters

"Flung himself, tooth and nail, on Reginald."

comfortable. Most unfortunately they had missed securing the lease of a very fine suite of offices in Lord Street, and had to put up with these for the present. Reginald must see everything was comfortable; and as of course he would be pretty closely tied to the place (for the directors would not like the offices left in charge of a mere office-boy), he must make it as much of a home as possible.

As to money, salaries were always paid quarterly, and on Christmas Day Reginald would receive his first instalment. Meanwhile, as there were sure to be a few expenses, Reginald would receive five pounds on account (a princely allowance, equal to about thirteen shillings a week for the eight weeks between now and Christmas!)

The directors, Mr. Medlock said, placed implicit confidence in the new secretary. He was authorised to open all letters that came. Any money they might contain he was strictly to account for and pay into the bank daily to Mr. Medlock's account. He needn't send receipts, Mr. Medlock would see to that. Any orders that came he was to take copies of, and then forward them to Mr. John Smith, Weaver's Hotel, London, "to be called for," for execution. He would have to answer the questions of any who called to make inquiries, without of course disclosing any business secrets. In fact, as the aim of the Corporation was to supply their supporters with goods at the lowest possible price, they naturally met with a good deal of jealousy from tradesmen and persons of that sort, so that Reginald must be most guarded in all he said. If it became known how their business was carried on, others would be sure to attempt an imitation; and the whole scheme would fail.

"You know, Mr. Reginald," said he—"Excuse me," interrupted Reginald, "I'm afraid you're mistaken about my name. You've printed it Cruden Reginald, it should be Reginald Cruden."

"Dear me, how extraordinarily unfortunate!" said Mr. Medlock; "I quite understood that was your name. And the unlucky part of it is, we have got all the circulars printed and many of them circulated. I have also given your name as Mr. Reginald to the directors, and advertised it, so that I don't see what can be done, except to keep it as it is. After all, it is a common thing, and it would put us to the greatest inconvenience to alter it now. Dear me, when I saw you in London I called you Mr. Reginald, didn't I?"

"No, sir, you called me Mr. Cruden."

"I must have supposed it was your Christian name, then."

"Perhaps it doesn't matter much," said Reginald; "and I don't wish to put the directors to any trouble."

"To be sure—I knew you would not. Well, I was saying, Reginald (that's right, whatever way you take it!), the directors look upon you as a gentleman of character and education, and are satisfied to allow you to use your discretion and good sense in conducting their business. You have their names, which you can show to any one. They are greatly scattered, so that our Board meetings will be rare. Meanwhile they will be glad to hear how you are getting on, and will, I know, appreciate and recognise your services. By the way, I believe I mentioned (but really my memory is so

bad) that we should ask you to qualify to the extent of £50 in the shares of the company?"

"Oh yes, I have the cheque here," said Reginald, taking it out of his pocket.

"That's right. And of course you will give yourself a receipt for it in the company's name. Curious, isn't it?"

With which pleasantry Mr. Medlock departed, promising to look in frequently, and meanwhile to send in a fresh directory marked and some new circulars for him to get on with.

Reginald, not quite sure whether it was all as good as he expected, set to work without delay to put into practice the various instructions he had received.

Mr. Medlock's invitation to him to see everything was comfortable could hardly be fully realised on 13s. a week. That must wait for Christmas, and meanwhile he must make the best of what he had.

He set Love to work folding and enclosing the new circulars (this time calling attention to some extremely cheap globes and blackboards for ladies' and infants' schools), while he drew himself up a programme of his daily duties in accordance with his impression of the directors' wishes. The result of this was that he came to the conclusion he should have his hands very full indeed, a possibility he by no means objected to.

But it was not clear to him how he was to get much outdoor exercise or recreation, or how he was to go to church on Sundays, or even to the bank on week-days, if the office was never to be left either wholly or in charge of the office-boy. On this point he consulted Mr. Medlock when he called in later in the day, and arranged that for two hours on Sunday, and an hour every evening, besides the necessary walk to the bank, he might lock up the office and take his walks abroad. Whereat he felt grateful and a little relieved.

It was not till about four days after his arrival that the first crop of circulars sown among the clergy yielded their first-fruits. On that day it was a harvest with a vengeance. At least 150 letters arrived. Most of them contained the two pounds and an order for the suit. In some cases most elaborate measurements accompanied the order. Some asked for High Church waistcoats, others for Low; some wished for wideawake hats, others for broad-brimmed clericals. Some sent extra money for a schoolboy's suit as well, and some contained instructions for a complete family outfit. All were very eager about the matter, and one or two begged that the parcel might be sent marked "private."

Reginald had a busy day from morning till nearly midnight, entering and paying in the cash and forwarding the orders to Mr. John Smith. He organised a beautiful tabular account, in which were entered the name and address of each correspondent, the date of their letters, the goods they ordered, and the amount they enclosed, and before the day was over the list had grown to a startling extent.

The next day brought a similar number of applications and remittances as to the globes and blackboards, and of course some more also about the clerical suits. And so, from day to day, the post showered letters in at the door, and the secretary of the Select Agency Corporation was one of the hardest worked men in Liverpool.

Master Love meanwhile had very little time for his "Penny Dreadfuls," and complained bitterly of his hardships. And indeed he looked so pale and unhealthy that Reginald began to fear the constant "licking" was undermining his constitution, and ordered him to use a sponge instead of his tongue. But on this point Love's loyalty made a stand. Nothing would induce him to use the artificial expedient. He deliberately made away with the sponge, and after a battle royal was allowed his own way, and continued to lick till his tongue literally clave to the roof of his mouth.

By the end of a fortnight the first rush of work was over, and Reginald and his henchman had time to draw breath. Mr. Medlock had gone to London, presumably to superintend the dispatch of the various articles ordered.

It was about this time that Reginald had written home to Horace complaining of the dulness of his life, and begging him to repay Blandford the 6s. 6d. which had been weighing like lead on his mind ever since he left town, and which he now despaired of ever being able to spare out of the slender pittance on which he was doomed to subsist till Christmas. Happily that festive season was only a few weeks away now, and then how delighted he should be to send home a round half of his income, and convince himself he was after all a main prop to that dear distant little household.

Had he been gifted with ears sharp enough to catch a conversation that took place at the "Bodega" in London one evening about the same time, the Christmas spirit within him might have experienced a considerable chill.

The company consisted of Mr. Medlock, Mr. Shanklin, and Mr. Durfy. The latter was present by sufferance, not because he was wanted or invited, but because he felt inclined for a good supper, and was sharp enough to know that neither of his employers could afford to fall out with him just then.

"Well, how goes it?" said Mr. Shanklin. "You've had a run lately, and no mistake."

"Yes, I flatter myself we've done pretty well. One hundred pounds a day for ten days makes how much, Durfy?"

"A thousand," said Durfy.

"Humph!" said Mr. Shanklin. "Time to think of our Christmas holidays."

"Wait a bit. We've not done yet. You say your two young mashers are still in tow, Alf?"

"Yes; green as duckweed. But they're nearly played out, I guess. One of them has a little bill for fifty pounds coming due in a fortnight, and t'other—well, he wagered me a hundred pounds on a horse that never ran for the Leger, and he's got one or two trifles besides down in my books."

"Yes, I got you that tip about the Leger," said Durfy, beginning to think himself neglected in this dialogue of self-congratulation.

"Yes; you managed to do it this time without botching it, for a wonder!" said Mr. Shanklin.

"Yes; and I hope you'll manage to give me the ten-pound note you promised me for it, Mr. S.," replied Durfy, with a snarl. "You seem to have forgotten that, and my commission 'too for finding you your new secretary."

"Yes. By the way," said Mr. Medlock,

"he deserves something for that; it's the best stroke of business we've done for a long time. It's worth three weeks to us to have him there to answer questions and choke off the inquisitive. He's got his busy time coming on, I fancy. Bless you, Durfy, the fellow was born for us! He swallows anything. I've allowed him thirteen shillings a week till Christmas, and he says, 'Thank you.' He's had his name turned inside out, and I do believe he thinks it an improvement! He sticks in the place all day with that young cockney gaol-bird you picked us up too, Durfy, and never growls."

"Does he help himself to any of the money?"

"Not a brass farthing! I do believe he buys his own postage-stamps when he writes home to his mamma!"

This last announcement was too comical to be received gravely.

"Ha, ha! he ought to be exhibited!" said Shanklin.

"He ought to be starved!" said Durfy, viciously. "He knocked me down once, and I wouldn't have told you of him if I didn't owe him a grudge—the puppy!"

"Oh, well; I dare say you'll be gratified some day or other," said Medlock.

"I tell you one thing," said Durfy, "you'd better put a stopper on his writing home too often; I believe he's put his precious brother up to watch me. Why, the other night, when I was waiting for the postman to get hold of that letter you wanted, I'm blessed if he didn't turn up and rout me out—he and a young chum of his brother's that used to be in the swim with me. I don't think they saw me, luckily, but it was a shave, and of course I missed the letter."

"Yes, you did; there was no mistake about that!" said Mr. Shanklin, viciously. "When did you ever not miss it?"

"How can I help it, when it's your own secretary is dogging me?"

"Bless you! I think of him dogging any one, the innocent! Anyhow, we can cut off his letters home for a bit, so as to give you no excuse next time."

"And what's the next job to be, then?" asked Durfy.

"The most particular of all," replied the sporting man. "I want a letter with the Boldham postmark, or perhaps a telegram, that will be delivered to-morrow night by the last post. There's a fifty pounds turns on it, and I must have it before the morning papers are out. Never mind what it is; you must get it somehow, and you'll get a fiver for it. As soon as that's done, Medlock, and the young dandies' bills have come due, we can order a cab. Your secretary at Liverpool will hold out long enough for us to get to the moon before we're wanted."

"You're right there!" said Mr. Medlock, laughing. "I'll go down and look him up to-morrow and clear up, and then I fancy he'll manage the rest himself; and we can clear out. Ha, ha! capital sherry this brand. Have some more, Durfy."

Mr. Medlock kept his promise and cheered Reginald in his loneliness by a friendly visit.

"I've been away longer than I expected, and I must say the way you have managed matters in my absence does you the greatest credit, Reginald. I shall feel perfectly comfortable in future when I am absent."

A flush of pleasure rose to Reginald's cheeks, such as would have moved to pity

any heart less cold-blooded than Mr. Medlock's.

"No one has called, I suppose?"

"No, sir. There's been a letter, though, from the Rev. T. Mulberry, of Woolford-in-the-Meadow, to ask why the suit he ordered has not yet been delivered."

Mr. Medlock smiled.

"These good men are so impatient," said he, "they imagine their order is the only one we have to think of. What would they think of the four hundred and odd suits we have on order, eh, Mr. Reginald?"

"I suppose I had better write and say the orders will be taken in rotation, and that his will be forwarded in a few days."

"Better say a few weeks. You've no notion of the difficulty we have in trying to meet every one's wishes. Say before Christmas—and the same with the globes and other things. The time and trouble taken in packing the things really cuts into the profits terribly."

"Could we do any of it down here?" said Reginald. "Love and I have often nothing to do."

It was well the speaker did not notice the fiendish grimace with which the young gentleman referred to accepted the statement.

"You're very good," said Mr. Medlock, "but I shouldn't think of it. We want you for head work. There are plenty to be hired in London to do the hand work. By the way, I will take up the register of orders and cash you have been keeping to check with the letters in town. You won't want it for a few days."

Reginald felt sorry to part with a work in which he felt such pride as this beautifully kept register. However, he had made it for the use of the Corporation, and it was not his to withhold.

After clearing up cautiously all round, with the result that Reginald had very little besides pen, ink, and paper left him, Mr. Medlock said good morning.

"I may have to run up to town for a few days," he said, "but I shall see you again very soon, I hope. Meanwhile make yourself comfortable. The directors are very favourably impressed with you already, and I hope at Christmas they may meet and tell you so in person. Boy, make a parcel of these books and papers and bring them for me to my hotel."

Love obeyed surlily. He was only waiting for Mr. Medlock's departure to dive into the mystery of "Trumpery Toadstool, or Murdered for a Lark," in which he had that morning invested. He made a clumsy parcel of the books and then shambled forth in a somewhat homicidal spirit in Mr. Medlock's wake down the street.

At the corner that gentleman halted till he came up.

"Well, young fellow, picked any pockets lately?"

The boy scowled at him inquisitively.

"All right," said Mr. Medlock. "I never said you had. I'm not going to take you to the police-station, I'm going to give you half-a-crown."

This put a new aspect on the situation. Love brightened up as he watched Mr. Medlock's hand dive into his pocket.

"What should you do with a half-crown if you had it?"

"Do? I know, and no error. I'd get the 'Noogate Calendar,' that's what I'd do."

"You can read, then?"

"Ray-ther, oh no, not me."

"Can you read writing?"

"In corse."

"Do you always go to the post with the letters?"

"In corse."

"Do you ever see any addressed to Mrs. Cruden or Mr. Cruden in London?"

"'Bout once a week. That there sek-ket-ery always gives 'em to me separate, and says I'm to be sure and post 'em."

"Well, I say they're not to be posted," said Mr. Medlock. "Here's half-a-crown; and listen: next time you get any to post put them on one side, and every one you can show me you shall have sixpence for. Mind what you're at, or he'll flay you alive if he catches you. Off you go, there's a good boy."

And Love pocketed his half-crown greedily, and with a knowing wink at his employer sped back to the office.

That afternoon Reginald wrote a short polite note to the Rev. T. Mulberry, explaining to him the reason for any apparent delay in the execution of his order, and promising that he should duly receive it before Christmas. This was the only letter for the post that day, and Love had no opportunity of earning a further sixpence.

He had an opportunity of spending his half-crown, however, and when he returned from the post he was radiant in face and stouter under the waistcoat by the thickness of the coveted volume of the Newgate Calendar series.

With the impetuosity characteristic of his age, he plunged into its contents the moment he found himself free of work, and by the time Reginald returned from his short evening stroll he was master of several of its stories. "Tim Tigerskin" and "The Pirate's Bride" were nothing to it. They all performed their incredible exploits on the other side of the world, but these heroes were beings of flesh and blood like himself, and for all he knew he might have seen them and talked to them, and have known some of the very spots in London which they frequented. He felt a personal interest in their achievements.

"Say, governor," said he as soon as Reginald entered, "do you know South wark Road?"

"In London? yes," said Reginald.

"This 'ere chap, Bright, was a light porter to a cove as kep' a grocer's shop there, and one night when he was asleep in the arm-cheer he puts a sack on 'is 'ead and chokes 'im. The old cove he struggles a bit, but—"

"Shut up!" said Reginald, angrily. "I've told you quite often enough. Give me that book."

At the words and the tones in which they were uttered Love suddenly turned into a small fiend. He struggled, he kicked, he cursed, he howled to keep his treasure. Reginald was inexorable, and of course it was only a matter of time until the book was in his hands. A glance at its contents satisfied him.

"Look here," said he, holding the book behind his back and parrying all the boy's frantic efforts to recover it, "don't make a fool of yourself, youngster."

"Give it to me! Give me my book, you—"

And the boy broke into a volley of oaths and flung himself once more tooth-and-nail on Reginald. Already Reginald saw he had made a mistake. He had done about the most un-

wise thing he possibly could have done. But it was too late to undo it. The only thing, apparently, was to go through with it now. So he flung the book into the fire, and, catching the boy by the arm, told him if he did not stop swearing and struggling at once he would make him.

The boy did not stop, and Reginald did make him.

It was a poor sort of victory, and no one knew it better than Reginald. If the boy was awed into silence he was no nearer listening to reason—nay, further than ever. He slunk sulkily into a corner, glowering at his oppressor and deaf

to every word he uttered. In vain Reginald expostulated, coaxed, reasoned, even apologised. The boy met it all with a sullen scowl. Reginald offered to pay him for the book, to buy him another, to read aloud to him, to give him an extra hour a day—it was all no use; the injury was too deep to wash out so easily; and finally he had to give it up and trust that time might do what argument and threats had failed to effect.

But in this he was disappointed. For next morning when nine o'clock arrived no Love was there, nor as the day wore on did he put in an appearance. When at last evening came and still no signs of

him, Reginald began to discover that the sole result of his well-meant interference had been to drive his only companion from him, and doom himself henceforth to the miseries of solitary confinement.

For days he scarcely spoke a word. The silence of that office was unearthly. He opened the window, winter as it was, to let in the sound of cabs and footsteps for company. He missed even the familiar rustle of the "penny dreadfuls" as the boy turned their pages. He wished anybody, even his direst foe, might turn up to save him from dying of loneliness.

(To be continued.)

UP AND DOWN: A STORY OF THE OCEAN WAVE.

By ASCOTT R. HOPE,

Author of "The Tell-Tale," "The Amateur Dominic," etc.

CHAPTER I.—"UP!"

REALLY it is no business of the reader's what school I had been at for my first term. All he need know is that when the holidays came my people were staying at Arcachon, in the South of France, where

I was to join them by way of steamer from London to Bordeaux. This was the first voyage I had ever made in my short life, and it may be imagined that as a small John Bull I felt pleasingly excited at the prospect, holding myself an inch higher among my cronies on the strength of it, as became one about to confront the manly dangers of the ocean wave. All we young Britons have so much of the salt in our blood, though a little experience may soon prove enough to wash out such aspirations.

"I am going in a ship," I kept telling the fellows for at least a month before the holidays came, and I took nothing but Marryat's and Cooper's novels out of the school library.

But my satisfaction was dismally damped when I found who would be going to Bordeaux by the same boat—who but Gooderidge, a big, hulking fourth-form boy, and the last of my schoolfellows I should have chosen for a

travelling companion! Gooderidge was a notorious bully, one to whom we juniors took care to give the widest berth possible on land, so I thought I would almost as soon be shut up with a wild beast as spend three days in a situation where there could be no escape from such attentions as he might be pleased to show me. I had already had too good reason to know the sort of fellow he was. Even now when I have the nightmare I sometimes dream the horror of being a new boy in the hands of that merciless oppressor. But there was no help for it; my passage was taken, so was his, and we duly met on the quay like a wolf and a lamb going home for the holidays together.

An uncle of mine came to see me off at the docks, before whom Gooderidge did not condescend to bestow upon me the slightest sign of recognition. It was only when he got me alone on the tender that he beckoned me up and said patronisingly, in a tone that the holiday spirit made even gracious for him, "Well, youngster, so *you* are going to Bordeaux!"

"Yes, Gooderidge," I replied, smiling feebly as one does in the effort to propitiate great personages. "What a joke!" quoth Gooderidge, loftily, as if it were presumption in the like of me to go anywhere. "You will be fearfully sick in the Bay of Biscay, you know. But one good job is that I shall have a fag to look after me, and I will look after you and see that you don't get too cheeky; so just mind what you are about, small boy! I'll tell the steward to give you a berth beside me, then I can keep an eye upon you. Fellows that belong to the same school should stick together always."

My heart sank within me at such an ominous utterance. By this time we were alongside the steamer, and, ordering me to bring along his portmanteau, and take care not to bump it, Gooderidge plunged into the crowd that was scrambling to be first up the gangway.

Most of the cabin passengers, as it happened, were schoolboys like ourselves, going home for the holidays. There were only two grown-up travellers, and, luckily for themselves, no ladies. The steward had need of all his patience and good-temper when we burst, a noisy mob, into

the saloon, each clamorously demanding the best berth, and swarming curiously into every hole and corner of the limited accommodation. Four or five boys had to be crammed into most of the cabins, but by means of a tip Gooderidge got for himself the empty ladies' cabin, the upper berth of which he secured for me, and though I would rather have taken up my quarters in the coal-hole, I durst make no objection.

By the time we were all shaken down a little into our places, the boat had been cast loose from her moorings and slowly got into motion, threading her way down the crowded river. London Bridge and the Tower soon disappeared behind us, but ever-new scenes of the stirring panorama of the Thames opened out in turn before our eyes, the busy warehouses and wharves, the endless maze of tall chimneys, the huge docks, one forest of masts after another, the numerous craft going up and down stream, great ocean steamers, their decks all alive with passengers, weather-beaten ships of every rig from all parts of the world, deep-laden barges toiling sluggishly, light skiffs shooting from side to side, the noisy shipbuilding yards, the dingy waterside houses, the low mud banks; farther down the widening reaches and sweeping bend of the great river as we came in sight of Greenwich, backed by its wooded heights, and saw the green hills and flats of Kent lying bright in the sunshine of a fine afternoon. Such a succession of inspiring sights might well cause us to congratulate ourselves that our journeying was not to be done in any stuffy railway train, and we looked forward to the three days or so for which it would last as all one halcyon trip no less agreeable than its auspicious commencement.

There were at least some score of us youngsters, of all sorts and sizes, from tail-coats down to puny knickerbockers like myself. There was a Bluecoat boy going out to astenish the Frenchmen with his long gown and yellow stockings. There was an Eton fellow in his neat round jacket and spotless turn-over collar, who appeared to give himself airs, holding grandly aloof from the common herd. There was a very knowing and dandified city youth, bound for an office in Bordeaux, where I trust he has by

this time begun to make his fortune. There were two tall King's College School boys with knapsacks and guide-books, for a walking excursion in the Pyrenees. There was another young London tourist equipped with very tight breeches and a very tall bicycle. There were two or three gorgeous young gentlemen from an army tutor's, who lighted big pipes the moment they came on board, and lost no time in seeking acquaintance with the captain. There were several French lads returning from English schools; they naturally drew together and formed a party by themselves. The rest of us were a miscellaneous collection from schools in different parts of the country, as we soon learned when we began to mingle and ask questions, just like so many boys coming to school and not leaving it. And you may be sure that we wandered restlessly all over the boat, pacing the decks with the most nautical swagger we could assume, bent on proving to ourselves and to each other that we were quite at home on board ship. The second-class passengers forward chiefly consisted of a troupe of foreign acrobats, very seedy-looking persons in private life, and altogether the captain declared that he never before had charge of such a Noah's Ark.

Before we got to Gravesend the teabell rang, and we flocked down into the saloon to find the table spread with the usual substantial dishes of a steamboat's bill of fare—ham, cold beef, pie, eggs and bacon, ship biscuits, and so forth. On these we fell heartily, and kept all the steward's staff busy in filling plateful after plateful for us of one viand after another, while the big-bearded captain from the head of the table watched us silently with a sly twinkle in his eye. He was a man of few words, the captain, but perhaps thought all the more for his taciturnity.

"What sort of weather are we going to have, captain?" asked one of the older lads in an offhand manner, as if giving to understand that he for his part did not much care how hard the stormy winds might blow.

"I'll tell you when it comes," quoth the skipper, drily, and I thought I saw him wink at the steward, who was going round asking if we would like to contract for our food at the rate of a pound a head till we got to Bordeaux. This seemed too good a bargain not to be accepted by all but two frugal youths who had come on board with their own store of sandwiches, biscuits, and oranges, for which they were somewhat looked down upon by the rest of us; but they turned out in the end to have the best of it.

The weather as yet was most promising. When we came on deck after tea we found our gallant craft slipping past the Nore into the open Channel, which looked like a placid lake shining in the glow of a clear sunset. We were all in high good humour as we steamed along in the pleasant twilight, watching the lighthouses flash out one by one, and the rows of lights marking towns on the coast, Margate, Broadstairs, Ramsgate, Deal, places well known to some of us from another point of view. The French acrobats began to stand on their heads and perform other antics on the fore-deck, to the amusement of the sailors and cabin passengers; some of the boys took

to playing leapfrog round the poop; others contented themselves by lolling about with the airs of full-blown midshipmen. Darkness did not come on till we had got opposite the Downs, by which time we had grown more or less familiar with our companions, and not a few of the party were proving somewhat boisterous.

As for me, after an effort to propitiate my formidable schoolfellow by an offering of raisins and dates, I addressed myself to keeping out of his way as well as possible. But Gooderidge soon found me skulking, as he called it, and invited me to show a more social spirit on pain of his high displeasure, of which he forthwith gave me a specimen by twisting my arm till I cried out for pain.

"What are you doing to that little fellow?" came a voice from the poop deck above; and Gooderidge left torturing me to reply, in his insolent fashion, "What business is that of yours?"

"You'll soon see," quoth the speaker, then it was the Bluecoat boy's queer legs that appeared on the ladder. When he reached the waist of the vessel, where we stood under the lee of a pile of boxes, he squared up to my tormentor with, "Now then, drop it!"

"Who'll make me?" blustered Gooderidge.

"I'll show you soon enough!"

"I'd just like you to show me!"

"None of your bullying!"

"None of your cheek!"

While thus they were taunting each other and ruffling themselves up like two turkey cocks, a number of other boys appeared on the scene, and quickly the cry was raised, "A fight! a fight!" goading the quarrellers into encounter. A ring of excited spectators closed round them at once, so that I could not see what happened next, standing outside doubtful whether to be thankful or sorry for this interference in my favour, since whichever won Gooderidge would hardly fail to find some opportunity of wreaking his spite on me.

At it they went in the dim light, amid a hubbub of voices asking what the row was about. But it did not last long.

"None of that!" roared a voice from the bridge above, and we saw the captain shaking his brawny fist as if to intimate that he might descend and take part in the fray. "No fighting on board this boat! Stop it, or I'll show you how!"

Half laughing and half serious, the crowd dispersed, the combatants separating in obedience to this masterful word of command. I think Gooderidge for one had already had enough of it. I stole away, but presently I ran against him again in the cabin hatchway. He was in a towering bad humour—and no wonder, for the Bluecoat had given him a black eye. So he turned furiously on me.

"You little sneaking imp! Why don't you stand up for your own school? I have a good mind to break every bone in your miserable carcass. I would be ashamed to have a cad of a charity boy taking my side. Mind you, I haven't done with him or you either!"

But he said no more, for the Bluecoat now hove in sight, and the valiant Gooderidge, muttering something about "tomorrow," plunged below to bathe his eye. I was so troubled to find myself an unwilling bone of contention that I had not the grace to thank my champion, but held

aloof from him too, and presently took shelter for a time with the stewardess, a motherly old person, who, seeing me the smallest and quietest of these boys, invited me into her cabin for a chat and a treat of cake, and promised to look after me if I should be sea-sick. But, sick or well, I foresaw that this voyage was going to be a terrible time for me, since I could not hope long to keep out of that young tyrant's way.

(To be continued.)

BOYS' PETS, AND HOW TO TAME AND TRAIN THEM.

BY GORDON STABLES, M.D., R.N.

II.—CATS, PARROTS, ETC.

SOME weeks ago I laid before my readers a paper on training dogs and teaching them "tricks," as they are called. I feel convinced that many boys will have found out by this time that it was a very practical article. I mean in my present paper to be quite as practical. I had intended at first to bring under your notice quite a happy family of cats, birds, monkeys, mongooses, and all the creatures we know by the name of "pets." I will not do so. I could not do justice to them in the space, but I may return to the subject some other day.

At this very moment one of my Persian cats—a great favourite—is seated on my shoulder, and rubbing the back of her head to the back of mine, apparently with a view to find out whether my hair or hers is the longer. Not far off, on the top of his cage, is my "slender-bill cockatoo." Such an amusing, talkative old rascal you never probably saw in all your life. He is going on now like any village crone. He is crying for "a bit of sugar," for "a sop of bread," "a bone," and his "breakfast." He is beating against the cage with his bill; he wants me to play the violin or guitar that he may dance or sing.

"What are you doing, old boy?" he cries.

Now I do object to be addressed thus familiarly by a bird. I *had* meant to begin by describing the training of cockatoos. Now Polly can wait, and pussy comes to the front.

Every household possesses a cat, or should possess one. Let me say here parenthetically that pussy is as a rule a poor ill-used, much-neglected animal, and very little understood. Almost anything or everything is expected of her, and she gets very little in return. There is one thing I never can forgive the great naturalist Buffon for, and that is the way he wrote about cats—the disparaging, thoughtless, ill-considered way in which he describes them.

I could tell you the names of many of the bravest soldiers and sailors that ever drew sword on battle-field or on battle-deck, who would not think their firesides complete at home without pussy on the rug. But you will say, "There are cats *and* cats." With your boyish generosity you will be willing to admit that *some* cats are nice enough. But do you know that cats are very much what their masters or mistresses make them? No one who knows a cat from a barn-owl will attempt to deny that pussy is an exceedingly sagacious animal, wiser in some respects than even our friend the dog, for the cat has to look after her own interests, find her way from home, or to home, wander away for miles, and never get lost, and defend herself against a score of enemies of as many different sorts. The dog does not look after himself to the same extent, or anything like it. Its master does that for him.

Yes; but too many of those who are willing enough to admit the superior intelligence and sagacity of cats, starve and ill-treat them. They feed them, either not at all, or

at no stated times; they "can't be bothered"—they never consider that pussy is a feeling, sentient, and too often suffering being; that she cannot help being hungry at times, and longing for food. And being hungry, can you wonder if she should at times stretch out a paw and seize a morsel from her master's table? I tell you this, if you neglect to give pussy her breakfast, and then turn round on her when she helps herself, and call her a thief, you are—not wise.

But now for the training of a favourite cat. Perhaps you do not possess one. Well, pussy is of all pets the most easily kept, and costs but very little. Indeed, if you make a practice of giving her a morsel in her saucer at breakfast-time, dinner-time, and supper-

time, you will never miss what she eats. She will keep regular hours then, and stay indoors at night, and that is a great thing. She will come to love you very much too, and that is a greater thing if you mean to teach her tricks.

Well, I will suppose you do not at present own a cat, but want to. The question is, what is the best kind to have?

For simply learning clever tricks I think there really is nothing to beat a pretty old-fashioned brown or dark-grey tabby. Get a female, they train more easily than the males. Let it be a longish-headed one, and have it home as soon as ever it is able to lap.

You will naturally wish to have your favourite clean in the house. This is easily

taught, but pray never lose your temper. From the very beginning let pussy have no unkind remembrances of you. Get a large flower-pot saucer, and fill it with nice garden mould. The kitten will go to it almost naturally; if not, show it to her once or twice, that will be enough. By degrees you must entice her to play out of doors, and she will soon prefer this to a box of earth inside. There is one thing you must remember in teaching a cat to be cleanly: the box or flower-pot saucer ought to be emptied every morning and refilled with clean mould. Cats are exceedingly particular, and some of them would do almost anything rather than soil even a toe-nail.

(To be continued.)

IVAN DOBROFF: A RUSSIAN STORY.

By PROF. J. F. HODGETTS.

CHAPTER XXV.—SELF-CONQUEST THE BEST VICTORY.

A MONTH after the conversation recorded in our last chapter Ivan was sitting in a very pleasant room in Smirnof's house. Everything seemed to thrive with the merchant. His speculations turned out well, and as there is nothing so successful as success, his fame was great through the length and breadth of the empire. His house was continually improving in taste and elegance, for he said wealth was given to circulate, not to hoard, and as Strammeller had performed a cure upon Ivan which madened all the Russian doctors and made them call him a quack, Smirnof had taken his advice in arranging special rooms for the invalid, to whom he owed his life. There was a lift contrived, by which Ivan could be moved from a low pony phaeton drawn by two cream-coloured ponies, in the litter invented and constructed by the doctor, by means of which he could, without change of posture or moving a muscle, be carried right into his own rooms.

The handsome manner in which Smirnof rewarded Strammeller ought to be recorded. One day when the doctor called, Smirnof sent word that if his time allowed he should be most happy to receive him for a few moments.

"Walk in, doctor," said Smirnof, rising. "I want to have a talk to you about business. Let us put the ordinary etiquette of affecting not to speak of money matters to professional gentlemen on one side. I am a man of business and don't understand delicacy in such matters, so you must excuse my being blunt. You have rendered me a service in the cure of Ivan which I cannot measure by money, and don't mean to attempt to pay for!" Strammeller bowed and looked rather foolish and very much disappointed. "But I am about to speculate for the good of my country. If you were quite free of all pecuniary cares you would have time and means to pursue your inventions and to do great good to Russia. The investment I have made, therefore, is to secure your services for the nation by securing to you an income which is quite independent of your professional labours. An investment has been made in your name, which has placed ten thousand roubles to your credit in the Merchants' Bank at Moscow, and half that sum will arise annually in consequence. Allow me to present you with this cheque-book on the bank in question, which will enable you to

draw to that amount. At the same time the directors have requested me to present you with this official nomination as their medical inspector at a salary of three thousand roubles a year. The duty is light and the pay is not much, but then your practice goes on just as before."

"Really, Mr. Smirnof! I cannot accept all this at your hands. It is monstrous!"

Smirnof laughed good-naturedly, and said,

"Never mind the monstrosity of it, the business matter is settled. Not that I think I have paid you for your care of Ivan. I should never be able to do that, but I have been able to show my personal feeling towards you and to put you into a groove."

But all this time we have left Ivan waiting in his room. He was thinking, and did not hear the servant who came in to announce a visitor. At last he understood that a gentleman named Tenterton desired to see him.

"All right. Show Mr. Tenterton up."

"You are always welcome, Mr. Tenterton; I owe you so much for your sympathy and advice. I have done nothing else but think of all you said about the service ever since, and, what will seem very strange to you, now that you have convinced me of the perfect legitimacy and propriety of the military profession, I have resolved to give up all idea of being a soldier. When I half believed that there was something wrong in it I determined to be nothing else!"

"Tell me all about your conversion to the side of peace," said Tenterton.

"I am not converted to anything; I have only resolved never to enter the service because I feel how deeply grieved Mr. Smirnof would be if I became a soldier, and I have resolved to do nothing to embitter a life which I am proud of having been the means of saving. Now you know all."

"You are quite right, Ivan, in your decision, and the sacrifice is perhaps the more complete as it has not been formally demanded of you. Mr. Smirnof will be greatly delighted."

"If I can really give him pleasure, that will be a great triumph. Think how good he has been to me, and what pain and bitterness of spirit I have caused him! How are the Schaaftstadts?"

"The count is to be promoted, I believe,

to some new dignity—at least, so his daughter tells me."

"Indeed! That looks bad."

"How do you mean? Are you sorry?"

"Very sorry. It is always the way in Russia when some Court intrigue against a man becomes successful, he obtains some petty rise in nominal rank which deprives him of the more solid advantages attached to any post he may hold. I shall not be surprised at hearing that he loses the Kremlin."

"The Countess Olga said something about their being about to retire, but she did not seem sad."

"It would have been very bad taste in her had she seemed sad. But now I am sure something is wrong. I wonder what it is. How is General Kakaroff?"

"He is very well and very active. There is a talk of his being made governor of Finland."

"That is different news altogether. I trust it is all as it should be."

"His drosky was at the door with the Cossacks when I came in."

"Oh, then perhaps he will come and see me. I wanted to see him very much."

The friends continued chatting, Ivan asking Tenterton's advice on various subjects connected with the course of reading he was to pursue to prepare himself for the mercantile profession.

As Tenterton rose to go Smirnof entered the room, accompanied by Kakaroff, who looked extremely pleased.

"How is my young friend the wolf-slayer? We shall soon hear of his attacking nobler game on a larger scale."

"How do you mean, general?" said Ivan.

"Why, it means," said Smirnof, "that General Kakaroff has obtained an appointment for you in the military college, and as soon as you are well enough to go to the Znaminski, which is not far off, you will see the general commanding the college, and, after passing an examination—a mere matter of form—you will be admitted."

"How kind everybody is to me!" said Ivan. "It seems so ungrateful not to accept what is so kindly offered, but I am afraid I can never serve."

"What nonsense! Strammeller says that you are in a fair way to recovery, and once get your foot on the ladder of promotion I will answer for your rising to the top."

"It is not that, but my future must be commerce. I have been adopted as a

son by the head of a great house, and I am bound in honour to maintain the reputation of that house, if only in common gratitude; but, besides that, I have quite made up my mind to devote myself to the cause of commerce. It is a very noble one, and it is that which must give Russia her future glory. I am the adopted son of a great merchant, and I must uphold the cause of Russian commerce."

Kakaroff looked at Smirnoff, and seemed about to express some feeling of resentment, but Ivan saw the look, and said quickly,

"Pray do not misunderstand me. I have all along been teasing Mr. Smirnoff to let me serve in the army, but since my accident I have been greatly thrown on my own resources, and have been thinking, thinking, thinking, and it seems to me wrong to set myself up, a mere peasant boy, to despise the very means which have enabled him to be so generous to me. I beg your pardon, Mr. Smirnoff, for my silly conduct, and thank you for interesting the general in my behalf, and he is too good and too noble to be angry with a poor little boy."

This was said very archly, and made Kakaroff laugh.

"I must tell my wife about this," he said. "She will enjoy it mightily. However, I shall not go back to the Znaminski until I hear further from you. You must talk this over, you know. Send for Anniesie. She can have her old rooms at the prefecture whenever she likes, and my wife will always be happy to receive her. Settle nothing till you have seen her. Good-bye, Ivan, good-bye."

And he was off in his drosky again, leaving our friends alone.

And so the days passed on, Ivan soon becoming quite his old self. Dr. Strammeller had obtained an air-gun for Ivan, with which our hero was very fond of practising through the wide doors of his rooms, which afforded him a charming shooting-gallery. It would not have been permitted had he requested to shoot with ordinary fire-arms, that being prohibited by the police; but the practice thus obtained was very good, and was helpful in training his hand and eye in the management of the weapon. Then Tenterton had imported from London a whole case full of English bows and arrows, foils, masks, and gloves for fencing, basket-sticks, and cross-bows, all of which could be used easily in the grand Russian rooms which he inhabited. Besides which, he had all sorts of games, conjuring tricks, mechanical apparatus, and tools and books *ad libitum*. He had worked a little at English, but during his long illness he had begged Tenterton to teach him more seriously. And he could with Tenterton's help make out and enjoy the capital stories for boys of which English literature has such excellent store. His favourite book was "Robinson Crusoe" (given him by Anniesie), of which he preferred the second part, and especially that portion of it which treats of the journey overland through Russia. He enjoyed all wolf stories, and was one afternoon telling Dr. Strammeller what he thought of the various wolf tales he had read, expressing his opinion that the writers of most of these stories, although writing in the first person, had never seen a live wolf.

"Did I ever tell you my wolf story?" asked the doctor.

"No. Pray tell it now. Do! Pray do. Did you ever hunt a wolf?"

"No; I was not an active party in the affair. It is only a tale told me among the many I have heard."

"Never mind; out with it, doctor."

"Well, a German traveller for a mercantile house at Berlin had to travel in the winter from Smolensk to St. Petersburg before the Smolensk Railway was thought of. Half way he was attacked by a whole pack of wolves, but the sledge-driver made for a large hollow oak-tree that stood in the neighbourhood, and was, as it were, a sentinel tree to a forest at no great distance. Unfortunately, however, the wolves were on him before he could reach the tree. They attacked and killed his driver, with whom they were busied while the terrified horse flew over the snow, until, striking against a tall fir-tree, the sledge was overturned. The German climbed up the trunk, and saw the brutes in pursuit of the horse and wrecked sledge."

"The animal was soon overtaken and devoured. Our German rapidly descended, and made his way down the interior of the stem of the old oak hollow, and saw that there was a fissure in it near the foot, through which he could observe the approach of the pack over the snow from their horrid feast on the flesh of the horse. It was not pleasant to be surrounded by these creatures, but he was a keen observer and a humorist, and discovered that one of the wolves seemed to be the leader of the band. He was an old grey brute, with a longer tail than the rest. He was the nearest to the tree, and kept moving round it in the hope of finding some inlet, every now and again turning round, snarling and biting at those which pressed too near him."

"On one of these occasions the German found him backing up to the tree against the hole, snapping at the others. In a moment he put out his hand and caught the monster's tail. With the eagerness of despair he drew it into the hole, gripping it with both hands. The wolf howled in the most unearthly manner, and the nearest wolves, frightened at his tones, backed into the denser pack. But our friend held on to the old wolf's tail until the comic idea seized him that it was like the handle of a street organ. Being, as I said, a great humorist, he commenced organ-grinding by turning the wolf's tail round and round, singing out lustily, 'Let's have another tune.' The yells of the animal and the howls of the rest of the pack became unearthly in the extreme, but the German kept hold of the tail. At last, from too vigorous a turn, the turning having invariably taken place in the same way, the tail came off in the traveller's hand. Away started the tailless wolf and all the others after him. Being well assured of their departure, our German emerged from the top of the tree, and sat down on a branch to see what would happen next."

"A peasant's sledge soon drove up. The driver, much astonished at the position of the German, approached the tree. But they could not make themselves mutually understood. At last the German mentioned the name of the town he wanted to reach before going on to St. Petersburg, and the peasant understood him. He next showed some money; he understood him better still, and at last he

drove off with the German to the town in question, stopping to pick up the articles which had been in the overturned sledge. The town was reached, the story told, and disbelieved by everybody until the tale was produced in proof of its accuracy. The business arrangements turned out much better than had been expected, and our German returned to Berlin well satisfied with the result of his trip."

"Some years after he was again induced to travel in Russia, and this time he resolved to have three horses and travel fast. The same journey from Smolensk to St. Petersburg, stopping again at the same town, had to be undertaken. He had forgotten all about the wolves, when just about the old spot the horses became restive, and the driver exclaimed, 'Wolves! wolves!'

"It was not pleasant, but our German friend ordered the man in the best Russian he could command to drive faster. The wolves appeared, and came unpleasantly near the back of the sledge. The unfortunate German gave himself up for lost, but looking intently at the advancing foe he distinguished a *very old grey wolf without a tail!* 'If that is my old acquaintance,' he thought, 'I shall perhaps get through!' So he waited until they came quite close, and then he roared out, 'Let us have another tune!'

"The old wolf stopped as if transfixed with horror, threw his head up, uttered a frantic yell, turned and fled, followed by all the pack!"

"The German made a good thing of it this time, but returned to Berlin *via* Kovno. He was often asked to return to Russia on business for the same house, but he objected to the climate!"

"That is not a bad story, doctor. We may call it 'The Wolf's Tail, or the Tale of a Wolf.' Did they believe him at Berlin?"

"He had the tail to prove the story."

But what is Anniesie doing? She came by invitation of Madame Kakaroff to spend a good long holiday with her in Moscow. She had at first been quite of Ivan's opinion that the army must be his profession. In this view she was confirmed by Dr. Strammeller, who was very frequently at the Kakaroffs'. But she was induced to change her opinion by some rumours which were conveyed to her through Madame Kakaroff herself.

"My dear Anniesie, advise Ivan and Smirnoff to give up the military scheme and stick to business. Ivan's last resolution of sacrificing his personal feeling at the shrine of gratitude to Smirnoff is charming, and it will be most necessary. That house is a very good and a very safe one. But Smirnoff has become a speculator. He has been so universally successful that he imagines he has only to touch a speculation and it becomes good and sound directly, just as certain military men seem to bear charmed lives. But a change may come; nay, must come if he continues his reckless course. No one but Ivan could save him. And if Ivan be a soldier his opinion on business matters would have no weight. I have already spoken to General Kakaroff, and he quite agrees with me. Talk to the doctor and bring him round to our way of thinking. Now don't blush, he is so important a person with both Smirnoff and Ivan that he must be gained over."

(To be continued.)

"The German climbed up the trunk."—Page 631.

ON SPECIAL SERVICE: A NAVAL STORY.

BY GORDON STABLES, M.D., R.N.,

Author of "The Cruise of the Snowbird," "Stanley O'Grahame," etc.

CHAPTER XIII.—THE TRUE STORY OF A PIRATE—GOLAVA'S ADVENTURES—CHRISTMAS AT MIDSUMMER.

CAPTAIN BLUNDERBORE was right; it was Benbow in his Waterwitch.

They were towed into the bay, for the wind had quite left them at midday, and very soon the long rakish clipper-barque was safely at anchor near the Theodora, and Benbow and Colin, both looking as fresh as brook-trouts but as brown as nuts in October, had gone on board their own ships and made their report and told the story of their voyage.

"You've done excellently well, both of you," said Blunderbore, laying one hand kindly on a shoulder of each.

our fellows idle altogether while they were at Sierra Leone, so I bought a few buckets of paint, and just touched her up a bit. Then I had the masts all scraped, and—there she is."

"And," said Mildmay, "she really is a pretty craft. Pity she is going to be burned. If she were mine, now, I'd knock that poop off her and give her a flush deck."

"That would be a decided improvement," said Benbow, holding his head to one side and viewing her with the critical eye of a sailor. "And, as you say, Mr. Mild-

may, it is a pity she should be burned. But I'm not so sure she ought to be. What do you say, Captain Blunderbore?"

"Oh, I'd keep her if it was my will. But it is service, you know, to burn slavers."

"Yes, and I don't mind a dirty old dhow, or as many dirty old dhows as you please, being consigned to the flames, but a thing like that! Just look at her now."

"Ay," said West, the artist, looking up from a sketch of her he was making, "she is beautiful, rising and falling there on the gentle swell, and the blue clear water around her, and the bits of brown floating seaweed, and those splendidly-tinted medusa-like umbrellas made of glass, all afloat in the water."

"Hullo!" cried Benbow, "here comes the doctor and Steele. How d'ye do, old Sawbones? What have you in your bag? Anything to eat?"

"Birds and moths and weeds and rushes and rats," said McGee. "Man! you're both looking fine and hardy. West yonder is so fat, getting—"

"Stop a bit," said West, good-humour-

They were standing on the quarter-deck, and looking towards the Waterwitch.

This was the name, by-the-by, that Benbow had given her

"Why," said Blunderbore, "what have you been doing to the barque? She doesn't look the same."

Benbow laughed and was pleased.

"Well," he said, "I didn't like to have

edly. "We're all going up the 'bique to fight a real live pir—nautical marauder. That'll take the fat off your poor West, the butt of all your chaff."

"Hullo! Gayly, how goes it?" cried Benbow.

Gayly gave him the tips of two fingers, and Benbow nearly wrenched them off.

There was quite a deal to talk of that evening at mess. The captain was dining with the admiral, so was Gayly, but this did not tend to depress anybody. The captain would not have been in the wardroom had he remained on board, and Gayly's chair was well filled by Quentin. Next him sat Colin, and even supernumerary Brown was there. He was appointed to the Theodora after all, and very glad he was to remain in her.

The messman had placed a chair for this fat-faced young gentleman next to West's, who was vice-president.

M'Gee was president to-night, but no sooner was every one seated than,

"No, no, no," cried M'Gee. "I object. Here, Mr. Brown, change places, please, with Mr. McLeod. I can't have two 'fatties' right in front of me."

The exchange was effected.

"If I were West I'd give it to you," said Benbow, laughing.

"West won't," the doctor replied. "West is a kind of out-patient of mine, so he has to be civil."

"A patient of yours, doctor! then the fates help him!"

Now while these jolly sailors are dining I will give the reader a short sketch of a somewhat remarkable man, to wit,

GASPAR MORAVO.

The Arabs who for so long a time have been engaged in the slave trade on the coast of Africa never did and perhaps never will bear anything but the deadliest hatred to the British, especially if they wear the blue jackets of the man-o'-war's man, or the uniform of marines.

This hatred is always smouldering, and every now and then, on every chance in fact, it bursts out into flame.

In my own time I have not only known bold resistance to the death made against our fellows when boarding a dhow or capturing a barracoon, but revenge taken by direct violence by plotting and scheming, and by the hands of hired assassins.

The Arabs dominate the coast north of Zanzibar, they dominate the Somali Indians and the other half-caste tribes, and, however much either of these latter may pretend to be our friends, the Arab is the master whom they obey; the Arab they have always with them, they respect and fear him, and so cases are constantly occurring of boats' crews being massacred, of poor blue-jackets killed in the streets by night—when sound asleep, perhaps, for Jack will sleep anywhere at times—and of officers disappearing and never being heard of more. Whatever became of the poor gunner of the P——n we lost in Mozambique, I wonder? Where did second-master P——r get to, that his pleasant round face never appeared at the mess-table again? Where did Lieutenant M—— wander to? He was never seen by his messmates again, alive or dead. Who did to the death two men of the A—— in a back slum of Zanzibar? Who enticed our boats' crews on shore at Bareda and massacred every man and officer? Who? Who but the Arabs.

But, stay, we must not judge even these too harshly, nor can I forget that I owe my life to an Arab, or that I have had many a good friend among them. No, we will not judge them rashly, we will rather look upon their evil deeds, or try to do so, from their own point of view—a view probably never taken by a British sailor before. But I have seen a good deal of the home and inner life of the Arab slave-dealer. I had the *entrée* while on the coast—no matter how obtained, 'twas honest—to a kind of society none of our fellows ever thought of cultivating. It had been remarked of me often that I nearly always went on shore alone, seldom bothering even to ask for a ship's boat, unless it were the dingy, but chartering an outrigger canoe. I was studying natural history.

Well, the Arabs are brought up from their infancy to look upon the British cruisers as their enemies, their sailors as their bitterest foes. We can hardly wonder at this; for in putting down the nefarious slave trade do we not render many a family homeless, make children fatherless, and mothers widows?

Yet the good work must go on. Missionaries on shore must preach peace and goodwill to men, our brave sailors at sea must put down the slave-trader with the strong hand of the law at all risks, at all costs, till from end to end the vast continent of Africa shall have seen civilisation and been made free.

Now there is one thing the Arab slaver loves above all things, and that is gold. He prefers it even to his thirst for English blood. There is nothing he will not do for it, nothing he will not barter; he will sell his honour for it—ay, and risk his life as well.

Were I to write you the whole life of Gaspar Moravo you would say it read like a romance. A romance, alas! with a bad ending to it, but it was nevertheless a romance that grew out of our (British) endeavours to put down the slave trade on the coast of Africa. Of his early days little need be said. He was born at sea; his father was a slave-trader, a daring, bold, unscrupulous man, and cruel in the extreme. His main object was to make money by the nefarious trade he had taken up—that of capturing slaves, running them down to the coast, and selling them in the slave-market of Zanzibar. Sometimes he ran cargoes of picked slaves—bought in the market—north to the Gulf of Persia, where on being taken inland they found a ready sale.

It was in Persia where Gaspar when only a boy first fell in with a patron whom in after life he served long and faithfully, and who supplied him with money to purchase and arm dhow after dhow, and thus carry on his patron's business and his own pleasure. Gaspar when young had seen his father struck dead at his feet by the bayonet of a British sailor. It was in the fight between Admiral McH—— (not an admiral then) and two northern fighting dhows, or pirates, so called.

In a manner of speaking—and this only proves how careful we ought to be to turn our talents to good account—in a manner of speaking, I say, Gaspar was a genius. Had he been born under luckier stars and received a fitting education he might have made a name in his own country of which his countrymen would have been proud. He had undoubted ability, and could have won laurels on

the battle-deck of a man-o'-war or as a general in the tented field.

But the turning-point in Gaspar's history came at last.

It was a wild and stormy day about the setting-in of the rainy season on the coast. The weather was dark and threatening, with heavy rain-clouds and driving mists hurrying ever and anon across the troubled water. It was a day on which you might have witnessed the curious phenomenon of two thunderstorms raging at one and the same time in different directions of the compass. Yet the wind was by no means steady, nor was the sea very high. Sometimes a white squall would sweep with hurricane force across the sea; then, passing, leave calm and clouds and muttering thunders.

It was hardly a day, Gaspar thought, that British cruisers would be much on the alert. He had been lying concealed in a wooded creek for weeks, waiting the chance to slip out and get away up north with his cargo of slaves. He was full to the hatches.

He had reckoned without his host for once, however.

He ran into the very jaws of the British lion. Had the wind kept up he might even yet have escaped. It did not. The breeze failed and Gaspar fought. A desperate struggle it was, and a short one. It took place close to the coast, near a little village called Bareda, which I doubt if you will find on the map. It lies twixt the Red Sea and Magedona. Gaspar's dhow was captured. Gaspar himself leapt into the sea, just as Captain Semmes of the Alabama did. There was no yacht to pick Gaspar up, though, but he swam on shore through the surf, and took to the rocks till the storm blew over; but from that hour he was dubbed pirate—had he not shed English blood?—and a price was set on his head. At all events, whoever met him were to be justified, if not rewarded, in slaying him.

Gaspar found a passage back to his Persian patron, who refitted him and sent him back to the cruising ground. This patron could afford to pay Gaspar well, and did.

Were space no object with us, the temptation to describe Gaspar's patron's home would be irresistible. It was a lovely spot in a lovely land, a castle of indolence. And he who dwelt there was a true prince of indolence. Young he was, dark-haired, dark-eyed, but fair in skin, a dreamer, a voluptuary, with no thought save that of pleasure, no aspirations, no ambitions.

Did Gaspar love his master? No! he despised him, and only served him faithfully for his own ends. It suited him to do so.

Gaspar Moravo had no scruple against taking life, and he was one of those who believe in the motto of the Clan Camieron—

"Whatever a man dares he can do."

Before he had been a piratical slave-hunter for many years he owned a whole fleet of dhows.

Do not imagine that those dhows ever ran any risk of capture by British cruisers if it could be avoided. No! for Gaspar's fleet carried papers from the then Sultan of Zanzibar, which gave them his Majesty's permission to trade in so-called "household slaves."

It was only on rare occasions that even

Gaspar dared to sail without these.* And, to make assurance doubly sure, the pirate was as often in disguise as not. But when Gaspar became owner and master of that fleet witch of the Indian Ocean called, among other names, the *Castigo*, he became still more daring, and ambition carried him away.

The aim and end of all this ambition was to effect the destruction of one of her Majesty's cruisers. For this he plotted and planned for years and years; and his adventures in doing so, both ashore and afloat, both in England and out on the coast, would fill a book.

Gaspar was not slow in perceiving that nearly all the cruisers on the coast were strong to fight but *useless in a chase*.

Dear reader, many a hundred pounds would be at this moment lying at my bankers to my credit, had the vessels in which I sailed and served been only fast enough to come up with the slavers they chased. Speed in a cruiser is half the battle. Wait till England goes to war, and fits out vessels that *can* sail and steam, and we will hear and read of exploits at sea that will completely eclipse all the stories of derring-do that have ever yet been done or described.

Gaspar waxed wealthy at last, and as he did so he became more daring.

For a time, too, fortune favoured him. The ship he had succeeded in getting, and which he named the *Castigo*—or *Scourge*—was undoubtedly a fleet one. She seemed, too, to be ubiquitous. She was heard of one day on the African coast, and next she appeared to have turned up in the Persian Gulf or in China.

Few of our cruisers ever saw her; many did not believe in her existence.

One of our vessels boarded her three times, found her papers all right (apparently), and nothing suspicious—not even a slave-iron—on board of her. She was at that time passing for a sugar ship.

But it was quite evident that information had been received by our lords at home which quite convinced them that the *Castigo* was not the myth which some Navy captains, who could not find her, or couldn't catch her when they did find her, would have her to be.

And so, very quietly indeed, the *Theodora*—a really fleet and good vessel—had been commissioned and dispatched.

It was a capital appointment for Blunderbore, who was a favourite in high places, not, I'm sorry to say, for his intrinsic worth, but for other reasons which need not be named. A capital appointment! The *Theodora* was going on special service, and success would bring with it special honours, promotions, and all kinds of pretty things for those engaged in it.

The worst of it was that no one on board, not even honest Captain Blunderbore himself, had an inkling of the kind of service he was detailed for.

His orders had simply been to creep down the western coast of Africa, and break the back of slavery there if he saw a chance—in this, as we have already seen, he was singularly fortunate—then to carry despatches to Accension, and afterwards to go to the Cape and wait for orders.

So this is how matters stood when we find the *Theodora* lying in Simon's Bay on this lovely evening.

But let me state now that I never rightly knew what became of Benbow's Waterwitch. I only know that the aristocratic clerk D'Austin wrote a letter on service about her, dictated by Captain Blunderbore, who really was instigated by Benbow in this matter. I rather think, however, she was finally burned. And the more was the pity; she was a beauty; only service is service.

After dinner a boat came off from the *Aurora*, with a few of the junior officers of that crack frigate.

Their captain, or rather commodore—O'Connell was his name—was also dining on shore with the admiral. So the evening was spent in a very happy and jolly fashion indeed. Old Golava—old is here a term of endearment—was had into the ward-room, and given sherbet to drink, and much fun was got out of him. Indeed, to hear Golava tell of his adventures was great amusement. There was, to begin with, a charm about his very style of relation that was delightful; then you could see as well as hear that he was telling nothing but the truth, describing simply the events of his everyday life.

At one moment Golava would have you sweeping along in boats, about to make an attack upon some armed dhow that lay round the corner of a wood in a creek, and so graphically would he describe this that you seemed to see everything as it occurred, away on the star-

board of the boats the bright blue sea melting insensibly into the distant horizon, the woods on the port side rolling down to the very water in a cloudbank of green, the lazy medusæ or turtle floating about in the transparent water, the perspiring blue-jackets half naked and bending to their strong straight oars, and the stolid faces of the hardy marines quietly loading with ball cartridge.

Next moment Golava would have you on the deck of that dhow, and you could actually see the tall long-haired Arabs falling before the rush of British cutlasses, or casting their spears and guns away and leaping headlong overboard.

In the middle of this graphic and terrible relation Golava would raise a laugh by saying in so earnest and businesslike a fashion: "But, gentlemen, you see, I'm no hand to fight much, I board with, but after the marines, and look about for a quiet corner to hide till the scrimmage is over."

Then Golava would suddenly transport you to the densest part of an African forest by night, and you could see a dark figure creeping stealthily from tree to tree, or crawling along snakelike through the cactus bushes, till it got within earshot of a grass hut, in which some gentlemen Arabs were discussing their plans of running a cargo of slaves from Brava to Zanzibar or *vice versa*. That figure would be Golava's. And if you asked, "Weren't you a bit scared sometimes, Golava?" "Scared?" Golava would reply. "Bless you, yes, gentlemen. I always move about when doing work of this kind with my heart in my mouth."

Then Golava would suddenly change the scene, and you would find him just approaching his own house door at H—n in Zanzibar, where his wives dwelt.

* * *

Christmas was spent at Simon's Town.

It seems strange to sit down to roast beef and plum-pudding with the thermometer standing at 90 degrees in the shade, and all the ports open, and a pun-kah waving through the hot air over your head.

But such was the case with our heroes on this particular Christmas.

Yet they were happy, and one thing had occurred only the day before that tended to make them additionally happy. The English mailboat arrived and brought letters from home.

(To be continued.)

GREAT SHIPWRECKS OF THE WORLD.

THE WRECK OF THE KILLARNEY.

THE Irish coast is of evil repute to the sailor. No more rugged, dangerous wall rises from the waters. As an example of a wreck on the pitiless buttresses that for ages and ages have kept back the Atlantic from sweeping away the green isle of the sea, let us take that of the *Killarney*. It is not a recent event, but the extraordinary circumstances of the rescue of the survivors are such as to render it famous even in these days, nearly half a century after its occurrence. And let us tell the story as plainly and concisely as we can, trusting to our sketches to fill in the scene; dwelling but little on the stolid indifference of the peasantry who thought so little of the life of others so long as they secured sufficient plun-

der; and giving all due honour to Mr. Hull and his gallant comrades, whose persistent ingenuity at last met its need of success.

The *Killarney*, a small paddle steamer, with about fifty passengers and crew on board, left Cork for Bristol on January 19, 1838. The weather was rough, and after leaving the harbour she returned for shelter; but as the wind and sea had lulled a little a second attempt was made, and off she went—to her doom. She had on her deck about six hundred pigs, and during the night a quarter of them were swept overboard, and with them went many articles of the cargo. The storm increased so that the captain resolved to put back. His vessel threatened every instant to turn on to her beam ends, the

sea broke over her continually, and the passengers were crawling about her shattered cabin on their hands and knees.

In vain the captain endeavoured to make Cork Harbour. He failed. He then tried to enter Roberts' Cove, but just as he got the steamer before the wind a tremendous sea came crashing over her stern, carrying away bulwarks, wheel, binnacle, and companion, and sending her clean on to the rocks. In the bay there was one rock conspicuous in the angry water, and on it twenty-five of the passengers and crew found refuge. The rest were drowned. Among those that reached the rock was a little boy of nine years old, who had been left by his father in apparent safety while he went to help a lady who was

* These papers could be had in those days for a small bribe to the Sultan's ministers.—G. S.

floating past. When his father turned round again he found his son had been swept off the ledge by the rising waves.

The vessel went to pieces on Saturday night; the survivors spent Saturday night, Sunday, and part of Monday on their almost inaccessible refuge, cold and starving, and with the waves continually breaking over them. Their sufferings were acute. "To such dreadful shifts," says Baron Spolasco, a surgeon who was amongst the passengers, and who was the father of the little lad that was washed away — "to such dreadful shifts were we driven, that during the night I was obliged to hold on with one hand, while with the other I grasped the hand of a fellow-sufferer, in order that each might receive some portion of vital heat; this we did alternately with right and left hand. But we were all so depressed in spirits, and suffering so grievously from the cold and the rain as the night advanced, that we did little else than turn our thoughts to the Most High and calmly await the approach of day and with it some hope of relief. My face, nose, and particularly the inside of my mouth, were dreadfully mangled, and my teeth loosened, being so repeatedly forced by the billows against the rock to which I was clinging. In short, I think no human endurance equalled ours, for towards morning, when my fingers became so benumbed from wet and cold that I lost the use of them, and I found that it was impossible to hold on longer, I twice felt resigned to commit myself to the deep, and was on the point of doing so, invoking Heaven to receive

my spirit. The very lacerated state of my nose, mouth, and feet when I was borne from the rock was indicative of the sufferings I had endured. Poor McArthur seemed either quite regardless of or insensible to my repeated warnings of his danger. He at last put his hands into the pockets of his trousers in spite of my remonstrances to the contrary. The point of the rock on which he stood affording him a better foothold or standing than mine, and that portion of the rock immediately before him not being so perpendicular as that before me, allowed him to bend forward. This last advantage, coupled with that of his better footing, and his being overpowered with sleep, induced him to be so careless of his safety. But almost instantly a fearful and tremendous sea struck the rock just below the slight shelves or openings which supported our toes, and immediately rebounded over us many feet in height; then breaking and falling with great force on our heads, it had the effect of hurling off on the instant poor McArthur. Oh, gracious God! I never can be sufficiently grateful for Thy bountiful goodness and singular preservation in protecting me through so many imminent perils, so many hairbreadth escapes. For of all the passengers with whom I dined on Friday in the steamer Killarney I am the only survivor!"

Many of the poor castaways were swept off during the night, and on the Sunday morning those that were left managed to scramble up the sides of the rock into comparative safety on the summit. Here they sat iso-

lated in the centre of the bay, as shown in our sketch. Around them the waters foamed and tossed; and beyond them along the beach were hundreds of the peasantry busily engaged in carrying off the dead pigs and other plunder of the wreck, and stirring not a hand or foot to help the wretched crew. In vain they shouted, in vain they even held up their purses to show that they could pay for safety. The rustics would look up for a second and stolidly stare at the rock, and then return as busily as ever to the gathering of the dreadful harvest that they thanked the sea for giving them. Of the twenty-four thus heartlessly left to perish, thirteen died before the rescue came; and yet they were so near the shore that the people on the nearest cliff had to bend over its edge to look down upon them!

"During the whole of the morning of that day," says Spolasco, "indeed up to the afternoon, all we saw was a crowd of peasants on the beach, each carrying his or her burden from the spoils of the wreck of the steamer Killarney, and on the cliff above us numbers — altogether amounting to some hundreds. It was in vain we looked for some respectable person among them who would be likely to tender us the desired assistance."

At last the "respectable person" did appear, and as soon as he caught sight of the castaways he waved his hat to cheer them, and hurried off for help. He was soon back with several other gentlemen, bringing ropes and slings. They descended to the edge of the precipice to within about two hundred feet of the rock, and began to throw out

The First Journey of the Life-Car.

On the Rock.

stones to which lines were attached. The footing was so insecure that they failed to fling them far enough.

They then tried to sling the stones over, but although the distance was so trifling they still failed to get the line out to the rock. Then Mr. Galwey and Mr. Hull went to work with crow-bars to form a ledge to stand securely on, and then they tried to fly a duck across with a line tied to its leg. Then a string was tied to a bullet and fired at the rock; but all was to no purpose. Then Mr. Knolles tried to get his dog to swim out through the waves, but the dog refused to go, and he himself was swept off his legs and nearly drowned.

Meanwhile the crowd had been gathering on the cliffs until the people could be counted in thousands. As night was closing in one of the survivors volunteered to carry a line from the rock to the beach. He boldly plunged into the surf—and was seen no more. And then came another effort from those on the land. A rope was fixed to one promontory and the end carried round to the other at the horn of the bay, and the two ends being drawn tight were brought so as to overhang the rock. From the centre hung a small tripping-line, which the survivors seized and hauled upon till they held the rope, and then the darkness closed in.

"When the rope was conveyed to us," says Spolasco, "we all cheered as if reanimated by

a new existence, and although it reached us too late to be of any service on that night, such was our eagerness to be delivered from the rock that one man volunteered and immediately descended to the base of it, and by a triangular knot made himself fast to the hawser, which had been conveyed to us by means of the small lines already alluded to. The rope or hawser, although not a new one, I think was sufficiently strong to bear one at a time to shore, and, indeed, up the lofty cliff in safety; but a boy who had been in care of the pigs unfortunately, through over-anxiety to escape from the rock, descended, and most imprudently attached himself also at the same time to it, notwithstanding our earnest remonstrances to the contrary; and when they said all was ready—meaning that they were secured to the rope—at the same time directing us to shout to those on the mainland to pull them ashore. We did so, and they immediately drew them towards the cliff, upon which we heard a splash, but could see nothing, it being at this time dark."

The rope had broken!

An hour before daylight Mr. Hull was back with more rope to give his invention another trial. The weather was miserable, and the rain and snow came driving down in sheets. At dawn the coastguard officer arrived from Kinsale with a life-car and a Manby appa-

ratus, which was at once brought into use—and to no effect. The two-pound shot discharged from the howitzer failed to carry the line. Then slings were tried again, and, these having failed, the ropes were again carried round and stretched from headland to headland, and the life-car was run on. Then the hawser was taken down the precipice to nearly three hundred feet below; and thence Mr. Hull and three of the coastguardsmen despatched a basket of refreshments out to the rock, and with it a letter telling the castaways how to act.

The first to enter the cot was Mary Leary. There was a good deal of nervousness as to who should go first; for the contrivance had to be hauled a distance of nearly a hundred feet over the sea before it landed on the ledge where Mr. Hull and his men were waiting, and from that ledge the survivors had to be carried on men's backs up to the top of the cliff, an almost perpendicular climb of three hundred feet, and the least false step on the journey would be fatal. The woman was safely got ashore, and then came the doctor, and then the ship's carpenter, who died immediately he touched the ground. Then came ten of the crew, and then, in his proper place, last of all, came the captain, who throughout had done all in his power to save his ship and those entrusted to his care.

THE TROUT, AND HOW TO CATCH IT.

By J. HARRINGTON KEENE,

Author of "The Practical Fisherman," "Fishing Tackle, and How to Make It," etc.

PART X.

Fig. 8.

Fig. 9.

OF artificial baits those figured (Figs. 8, 9, 10) are, in my opinion, the best. Fig. 8 is an imitation of the real minnow with fans

at the shoulder, like Figs. 9 and 10, to spin it. Fig. 9 is the "Devon Killer," and Fig. 10 is called the "Clipper," made by Mr. Gregory, of

Vyse Street, Birmingham, if I mistake not. All are very useful when the natural minnow cannot be obtained, and being themselves

weighted do not require extra lead on the trace. With these tackles in his tackle-box the learner need not fear to encounter the fish of any water.

It is high time now that my readers were put in possession of the "How" to fish with

answer to your questions is an explanation of this acute sentence from Foster's book. There is no doubt but that the "weakest go to the wall" in the struggle for existence amongst fish as amongst the higher animals. A wounded fish—nay, even a minnow im-

Fig. 10.

the minnow. The observant tyro will probably first ask why the trout take a minnow spinning. "Why do they not prefer the fish without a spin, even though it be dead?" I hear some one say. "Would it not be better to draw the bait through the water without what seems an unnatural movement?" To these questions I can reply with some degree of confidence, having given much time and thought to their elucidation. But first I am strengthened by a truly "scientific angler," who says, "The theory of bait spinning is founded upon the well-known propensities of the heavy fish for weakly fry, which accounts for the otherwise unaccountable fact of the well-spun bait being seized from the very midst of a shoal of living minnows." My

paled on the hook for perch-fishing, if dropped amongst a shoal of his fellows, will be set upon and harried to death, just in the same way as a flock of turkeys will peck and worry one of their real brethren till it dies, as I have more than once observed. So, also, a perch will prefer to take the impaled bait in preference to the lively and free minnow, not because the former is less lively, but because its evident distress in not being able to escape from its tyrant and savage pursuer indicates to the latter a helplessness which is attractive. The spinning bait as it spins through the water imitates as closely as it is possible to imitate a natural action by a mechanical one a wounded fish—in other words, a fish with a tail decayed or fins

bitten off. Any one who has seen such a one will recognise on comparison of the two the similarity of which I speak.

So much for the theory of the matter, now for the practice. If you are fishing for whatsoever fish it is clearly your wisest plan to imitate the false prophet Mahomet, who, when the mountain would not come to him, like a sensible man went to the mountain. Therefore, if you find that the fish you are seeking in mid-stream will not take your lure, because they are not there, why simply alter your tactics and go to them at their homes. If fish are feeding in mid-stream you may easily see that they are doing so. Gently pitch your minnow or fly amongst them, and if they are feeding you will be rewarded. It is when, however, the fish are at home and not in the humour to feed on flies, when, perhaps, they are "grubbing," as it is termed, or, in other words, picking up unconsidered trifles from the bottom, that the minnow is spun with the greatest success. With a deftly flung line every crevice, nook, and corner can be explored, and especially is it when the bait with easy swiftness speeds across some shadowy lagoon that the old aldermanic trout who has hitherto disdained the fly as mere vanity and vexation of spirit, and has voted the caddis of the gravel meat of an indigestible character, rushes out and incontinently takes the bait to find the biter bit.

(To be continued.)

CHESS.

(Continued from page 543.)

Problem No. 106.

By T. SIMMONDS.

White to play, and mate in two (2) moves.

To Chess Correspondents.

G. R.—We must employ only the thirty-two pieces, for the ordinary game does not contain two white Queens. What you have attained with the second white Q, namely, *twenty-one mates in a two-mover*, is produced with fewer pieces in the following

PROBLEM No. 107.

White: K—K B 5; Q—Q sq.; R—K R sq.; Bs—Q R sq. and K 6; Ps—Q Kt 7, Q 3 and

6, K 7, and K B 7.—Black: K—K R sq.; Q—Q Kt sq.; R—K R 7; B—Q Kt 7; Ps—Q R 6 and K Kt 6.—(10+6=16 pieces.) White mates in two moves.

H. H. (Highbury Hill).—Try to rectify the position, for the second move may be B—Q 7.

N. N.—You require only nine white pieces in order to defend all the sixty-four squares, so that the black K cannot be placed on the board, thus:—K—K B 6; Q—Q B 6; Rs—Q R 8 and K R sq.; B—K B 3; Kts—Q Kt 3 and Q 3; Ps—Q B 2 and K B 2.

E. E.—Castling is one of the elementary moves in chess, and is therefore permitted in problems as well as in games.—Taking a Pawn in passing cannot be the first move in a problem, because the opponent has not previously moved (a problem is not the result of a game). The first move in a position, which is stated to be the ending of a game, may be the taking of a Pawn in passing, provided the solver can show that his opponent has, at the last move, advanced the P two squares. There is a fine position by S. Loyd, which may properly be called an *end-game composition*, in which it is White's turn to play, and he has to prove that he can give mate in one move:—White: K—Q B 5; R—K R 8; Ps—Q R 5, Q B 6, K 2, K Kt 2, 3, and 4, and K R 7.—Black: K—Q B 2; B—Q Kt sq.; Ps—Q Kt 4, K B 2 and 3, K Kt 2 and 3, and K R 6. (17 pieces.)

OUR NOTE BOOK.

THE NEW HEADMASTER OF HARROW.

The Rev. James Edward Cowell Welldon, M.A., headmaster of Dulwich College and fellow of King's College, Cambridge, whose portrait we gave in No. 301, has been unanimously elected by the governors of Harrow School to fill the vacancy in the headmastership caused by the appointment of the Rev. Dr. Butler (whose portrait has also appeared in No. 299) to the Deanery of Gloucester.

The new headmaster had a distinguished career at Eton and King's, Cambridge, of both of which colleges he was a scholar. At Eton he won the Newcastle Scholarship, and at Cambridge, where he went up in 1873, he was Bell's Scholar in 1874 and Craven Scholar in 1876, and obtained in 1873 the Carus Greek Testament Prize, and in 1875 and 1876 Sir William Browne's medal for a Greek ode. He took his degree in 1877 as Senior Classic and Senior Chancellor's Medallist. He was ordained in 1883. Less than three years ago he was chosen to be headmaster of Dulwich.

FLORAL BADGES.

An excellent example of floral badges are those of the Highland clans. Each clan wore a native plant or flower for its badge. Thus Buchanan wore a birch, Cameron an oak, Campbell a myrtle, Chisholm an alder, Colquhoun a hazel, Cumming common sallow, Drummond holly, Farquharson purple foxglove, Ferguson poplar, Forbes broom, Fraser yew, Gordon ivy, Graham laurel, Grant cranberry heath, Gunn rosewort, Lamont crab apple tree, Macalister five-leaved heath, Macdonald bell heath, Macdonnell mountain heath, Macdougall cypress, Macfarlane cloud berry bush, Macgregor pine, Macintosh box, Mackay bulrush, Mackenzie deer grass, Mackinnon St. John's wort, Macaachlan mountain ash, Maclean blackberry heath, Macleod red wortleberry, Macnab rose buckberry, Macneil seaweare, Macpherson variegated box, Macquarrie blackthorn, Macrae fir club moss, Munro eagle's feather's, Menzies ash, Murray juniper, Ogilvie hawthorn, Oliphant maple, Robertson fern, Rose brier rose, Ross bear-berries, Sinclair clover, Stewart thistle, Sutherland cat's-tail grass.—Rev. J. King, M.A.

THE SALT-WATER AQUARIUM.

BY THEODORE WOOD,

Author of "Our Insect Allies," etc.

(Continued from page 623.)

As regards the necessary implements for capturing your specimens, but little requires to be said.

You will want, first of all, a small hand-net, with a longish handle, with which to fish in the small pools left by the sea among the rocks. The ring of this, which should not be more than six or seven inches in diameter, should be made of tolerably stout iron-bar, firmly welded into a short socket, into which the handle can be fastened by means of a couple of screws. The bag ought to be a foot or a little more in depth, and should be made of the best mosquito-net, which is less liable to tear than lino or muslin. By the judicious use of such a net you can catch a wonderful number of specimens without difficulty, by carefully dragging the small pools left among the weed-covered rocks by the retreating tide; gobies, gunnells, and other small fish are sometimes very abundant in such situations.

If you are very ambitious, you may also set up a broad flat net similar to those used for shrimp-catching, which is very useful when the tide is flowing. An almost equally good plan, however, is to offer a professional shrimp a few pence for the pick of the con-

tents of his net, choosing the specimens for yourself whenever he stops to examine his captures. In this way you may often meet with really valuable acquisitions to your aquarium, which, but for your interference, would of course have been thrown back into the sea as worthless.

A mallet and a cold chisel are indispensable for some of the rock-frequenting animals, which cling so firmly to their hold that they must on no account be forcibly removed. Anemones, for instance, although they can be occasionally induced to vacate their positions, are delicate creatures to meddle with, and ought never to be violently detached from their resting-places. A fragment of rock is easily chipped off, and it is far better to take a little extra trouble than to run the risk of damaging a choice specimen.

The last, and most important, requisite in the search is Perseverance. Map out a small portion of shore, and examine it thoroughly. Work it both as the tide comes in and retreats. Pass over neither crevice nor pool, no matter how small, but systematically search every possible nook and corner before passing on to another locality. By so doing you will find a wonderful number of objects

which you would otherwise inevitably have passed over, and which you will shortly find of far more interest than the majority of those whose size and habits render them more conspicuous objects. Lastly, remember that different winds bring different specimens, and that the yield after a stiff breeze from the north-east may very likely be of a totally different character from that following a gale from the south-west.

As regards the choice of creatures to be kept, it is difficult to give you any advice. You will very soon find out more for yourself than can possibly be told you in a short paper such as the present, and by the time you have discovered which animals are cannibals and which may be safely trusted to mingle with their companions you will have learnt a good deal about the habits of your captives. So, make a few experiments for yourself. You are sure to meet with one or two failures, but you cannot help that. Do not let them discourage you, and before very long you will find yourself the possessor of a considerable stock of knowledge concerning the smaller inhabitants of the salt water, and will, moreover, have the satisfaction of having found it all out for yourself.

JULY.

THE POULTRY RUN.—There are in this month and in the next, especially if the weather be hot, great chances of illnesses of various kinds in your fowl-run. Now, as disease of all sorts is difficult to cure in birds, whether fowls, pigeons, or canaries, it is far better to do all we can to prevent them. If we have in our own mind a list of the various disease-producers, it is easy enough, by using ordinary tact

and precaution, to keep them at bay. What, then, are the common causes of illnesses? They are—1. Irregularity and mismanagement in the feeding. 2. Unwholesome green food. 3. Impure water. 4. Uncleanliness of all kinds. 5. Want of exercise. 6. Overcrowding. 7. Want of pure air in the fowl-house. 8. Vermin. Now, a thoughtful boy will see that his fowls are not subjected to any of these disease-causes.

He will think about them constantly, and whenever a fowl is sick or drooping he will not only use such simple means of remedy as may suggest themselves to him, such as putting the sick birds into a quiet warm corner, and feeding better, etc., but he will endeavour to find out the cause of the trouble.

Let us take a case. It is a half-grown chicken that is drooping, and cannot stand up; it would feed if it

could, and makes efforts to crawl after the grain thrown down, but it is at a disadvantage. It is, in fact, paralysed to a great extent. The question its owner would ask himself is, Has the chicken not been confined too much? or has the diet it has been feeding on not been too stimulating for the life of inaction it has been leading? Then he will not only see after this bird, which is suffering from leg-weakness, but he will alter the conditions of life of all its companions as well; he will let them have a bigger run, and more sunlight and pure air, and he will mix bone-dust with their food, and a tonic in the drinking-water. A rusty nail or two is a very good one.

Or it may be one or two fowls that are down with diarrhoea. This will effectually prevent egg-laying, and weaken the birds very much in every way. It is caused by exposure to wet and cold, to alternate wet and hot sunshine, by foul runs, and bad feeding. We have before spoken about the cure for diarrhoea. But the cure is not everything. You must remove the cause, else others may take the same complaint and you may lose many. So that disease of any kind in the run should make one carefully reconsider his whole plan of conducting the economy of the run. Feed more regularly, attend to the cleanliness of the run and everything in it. See to the fowl-house, the shelter-shed, the dust-bath, and water utensils; and see also that the fowls have exercise of some kind, if only scraping for grain in a heap of garden refuse placed in the run on purpose.

In July, and in hot months generally, fowls that are not over well seem to suffer a deal from vermin. Such birds are seldom much to look at; they are weary, tired-looking birds, with drooping tails, and are constantly picking their feathers. A large wine-bucket of strong carbolic acid should be mixed in a bucket of water, and with this, after cleaning it, and before the fowls are out of a morning, you must well syringe all about the run. Then renew the dust-bath; put plenty of dry mortar, dust, peat earth, ordinary garden earth, gravel, etc., in it. Make it a big one, and put plenty of sulphur in it. Sulphur may also be put about the nests and even among the feathers of the birds. But you will very likely have to limewash all the fowl-house more than once before you get rid of these disagreeable pests.

Besides attending to the general cleanliness and comfort of the poultry run, you must this month begin to fatten and weed out all the birds you don't want to keep. Prepare for shows, if you have any birds that give promise. Kill old fowls that are gone off laying. Continue to preserve eggs for winter use.

THE PIGEON LOFT.—Read our last month's DOINGS again. Attend most carefully to the feeding of the loft, and to its dryness and cleanliness. Beware of overcrowding if you would keep clear of that loathsome disease commonly called canker. It is believed by most competent authorities to be infectious, and it probably spreads from one to the other through the medium of the drinking-water. Carefully quarantine any ailing bird, therefore, and then see to the rest. Also cleanse and thoroughly disinfect your loft. A day spent at this work will be profitable enough now, at all events, and probably prevent disease of many kinds. Pigeon shows will now be on. You of course will always go to one when opportunity offers. One learns such a deal by conversing with others, and seeing other really good birds.

THE AVIARY.—The season is wearing on, and the breeding season is well-nigh over. It is well now to prevent more hatching. If eggs are laid, break them or blow them, for moulting will soon be beginning. If the birds, then, are no longer sitting, the egg-and-breadcrumb food may be discontinued, but this must be done gradually, not all at once. Wean off your last nests. Sell your young birds. They sell best when in their first plumage. But mind to keep the very best for your next season's breeding, for charity beginneth at home.

Now you can begin to put away your breeding-cages, and to turn the birds into their ordinary flights. But before you put the cages away do not forget a thorough cleansing. Then roll them neatly up in paper to keep out the dust.

Do not give ordinary singing-birds dainties. We are sometimes consulted about sudden loss of voice in birds. It is caused at times by cold, this we are willing to admit, but the fault is just as often in the feeding. Sweet biscuits, cheese-cakes, sponge-cakes, sugar, etc., should be withheld if the bird is at all greedy in eating such things.

Do not forget green food now, and see that the ordinary seeds you buy are rich-looking and quite free from dust.

THE RABBITRY.—Lay up stores of hay and soft dry weeds for the winter's bedding. See that your rabbits have plenty of exercise, and above all keep the hutches dry and sweet. Do not leave roots about to spoil. They will assuredly breed disease.

See that the hutches are not too hot and warm. A covering of thatch keeps off the summer's heat and also the winter's cold. Do not lift rabbits by the ears, nor allow your friends to do so. Fatten for the market. Give a mash of barley-meal and oatmeal, with a little tea-leaves in it, and boiled potatoes, once a day; give plenty of grains and good roots, and not much green food. Keep them quiet, but not in the dark.

THE KENNEL.—Beware of running your dog or dogs too much in the sunshine. If a dog is panting much and his tongue hangs out, and he makes frequent rushes for the water-pond, it is a sign that he is having far too much exercise. Do not give the dog his dinner now till about six o'clock, and take him out for a walk or a run after. Give plenty of well-mashed greens in the food, and now and then a little sulphur. It is no use putting a piece of brimstone in the water.

DOMESTIC PETS.—We shall feel much pleasure in giving advice under this heading upon any domestic animal that boys inquire about, from a horse to a hedgehog. But let us now, in this hot month of July, remind our readers that all animals need water to drink; and those that will bathe ought to have a shallow pan given them for the purpose. Nearly all birds are fond of bathing. Milk and water make a very good drink for such pets as will partake of it. So do oatmeal and water.

THE KITCHEN GARDEN.—The chief work of the month is planting winter greens, planting out celery, sowing a bed of cabbage the plants of which will come in very handy, staking beans, and killing weeds everywhere. Gather up all garden rubbish and put away to rot. It must be well buried, if there be cabbage or kale stalks in it. Never let pieces of stick get among your manure.

THE FLOWER GARDEN.—Bud roses, remove flowers from plants when they begin to fade, the plant will thus keep on blooming longer. Take cuttings of geraniums. Water wherever needed. Keep down weeds, and keep all walks, grass, and borders neat and tidy.

THE WINDOW GARDEN.—Train creepers. Stir the earth constantly around flowering plants. If any are drooping, water coloured deep with permanganate of potash will be found an excellent reviver. See that you water well and thoroughly. Attend to the hanging basket. It is so apt to get dry. Do not let creepers that don't belong to it get around it, for the basket should be made to lower down at will, and a twining creeper would effectually prevent this.

Correspondence.

CYMBELINE.—Balthazar's song in "Much Ado about Nothing" was "Men were deceivers ever." Do not say "Shakespeare says" so and so. Quote the name of the character, and not that of the poet. Shakespeare's greatness consists in his making his characters speak their characteristic thoughts. What the author thought is nowhere shown; hence the puppets seem living men and women. The thoughts and phrases of an Iago are widely different from those of a Miranda; and it would be as absurd to credit the bard with all the villainy of the one as with all the innocent purity of the other. A cynic speaks cynically, a braggart speaks boastfully, and "Shakespeare says"—nothing.

M. M.—Most of the silkworm gut comes from Murcia, in the south of Spain, where mulberry-trees are plentiful. The worm is thrown into hot vinegar, and the intestine is stretched out and wound upon pins.

C. I. A.—If you apply to Mr. Goy, of Leadenhall Street, he will send you particulars of several bicycle schools where the terms for tuition are moderate.

PHYLL.—Boil the leaves in a solution of three ounces of washing-soda and an ounce and a half of quicklime in a quart of water until they are pulpy, and then clear off the fragments. This is the quickest way of skeletonising.

A. DULWICH BOY.—Our circulation is so large for a magazine that we have to go to press weeks in advance, and hence any news we might be able to give would be anticipated so long by the newspapers as to be almost useless.

AN INQUIRER.—You can get a copy of the plate of Highland Clans by buying the part in which it appeared. The cost is sixpence.

ALLAN RENNIE.—1. You may think yourself lucky if you get five skillings per week at your age. 2. The stamps with "Magyar" on them are Hungarian.

SINCE FIRST VOLUME.—Write to headquarters; but particulars as to situations as bandmen can generally be obtained from the military musical instrument sellers.

S. M. POTTS.—In "Birthday Flowers," published by Chatto and Windus at six shillings, there are three hundred and sixty-six coloured portraits of flowers, wild and cultivated. We know of no other coloured selection that has so many flowers at the price.

ROE BUCK.—Roughly speaking, a fast ocean steamer burns a ton of coals per hour for every knot she runs.

H. V. HOWS.—The stamp without letters or figures, but with the head of Mercury surrounded by a Greek key pattern, is an Austrian.

W. HEGGS.—See our article on Bishops and Bishoprics. It was the bishop who moved to the chief town from some distant village; and in some cases the seat of the see remains in its old place.

A. R. K.—1. Sketches for book illustrations are generally drawn in body colour. 2. Advertise in the technical papers of the profession you wish to join.

SHAMROCK.—Shilling books on water-colour drawing are published by most artists' colourmen. Apply to Winsor and Newton, of Rathbone Place; Reeves, of Cheapside; Rowney, of Oxford Street, etc., etc.

T. J. B.—The "battery" you send is an induction coil. For instructions how to make it consult the index.

F. E. NEWTON.—To clean an oil picture lay a wet towel on it, and keep it thoroughly wet for three or four days. Then sponge the picture with clean water, and soak it again. To dissolve hard old varnish use spirits of wine and turpentine, but the instant you begin to touch the colours rinse the picture thoroughly with clean water.

M. WHITE.—There was no Afghan campaign in 1845. General Pollock took Cabul in 1842.

BEAUSEANT.—Write to Dulau and Co., 37, Soho Square, for list of their "Thorough Guide" series. The books are by Ward and Baddley, and are practical and cheap, costing from half-a-crown to three shillings and sixpence. Stanford, of Charing Cross, also publishes well-known guide-books; and there are many others, including of course the classic Murray.

T. W. WARREN.—Our article on the Tricycle Meet was in the September part for 1881. Your best plan would be to apply to Goy, Leadenhall Street. Your machine should be japanned, not painted, and the best japan for the purpose is obtainable from the bicycle shops.

A. E. MAIDMENT.—We have given so many articles on boatbuilding that you had better send for the indexes and get the particulars for yourself. There are six indexes, and they cost a penny each.

CYCLIST.—Try glycerine, or blacklead and glycerine. There are, however, so many good lubricants for cycles sold at the shops that you can scarcely hope to excel them either in quality or price.

NATURALIST.—1. You will get most fossils in the diagrammatic sheet, "Lowry's British Fossils," published by Stanford; but what you want is a good manual of geology, of which there are so many in the market. There is a long list, but no figures, in Penning's "Field Geology," and of course there is the standard book, Morris's "British Fossils," than which no better guide is published. 2. It would be simply misleading you. An aquarium must have stone or glass sides. You might coat the sides with window-glass and fill in with Portland cement, but we do not like to guarantee that it would be successful.

W. MILLER.—For particulars as to Andrew Wilson's "Ever Victorious Army—a history of Gordon's Chinese Campaign," write to Messrs. Blackwood and Sons, who were its publishers.

READY.—The quotation, "Like angels' visits, few and far between," is from Campbell's "Pleasures of Hope." There is also something very like it in Blair's "Grave." For "Men were deceivers ever" see answer to CYMBELINE.

H. M. B.—1. On letters, etc., it is customary to give the full name and initials of degree. "The Rev. J. Smith, M.A." is right enough; but "The Rev. J. Smith, etc., etc." is just as polite, and ensures accuracy. 2. "Entered at Stationers' Hall" means that the title has been registered for copyright purposes.

CORNWALL and CLIFTON.—Had you read the paper you would have found the explanation for yourselves. The portraits were from photographs supplied by the team. The error as to the name of the head master of Clifton appeared only in some of the copies, and was noted in all the copies at the head of the Correspondence on the earliest possible occasion. The article on the Counties gave the reason of the selection.

A. C. HOBDAV.—No; but if you will mix your colours with varnish instead of water there will be no difficulty. Rub them down in the usual way.

R. E. NYEN.—The responsibility of advising on investments would be too great for us to undertake. You may choose for yourself; but remember the old Duke of Wellington's remark, that "high interest means bad security." All investments have a tendency to reduce themselves to a five per cent. basis. Trust investments are permitted by the Court of Chancery in Consols, Bank of England, Metropolitan Board of Works, and Indian Government Stocks; in Canadian Four per Cent. Guaranteed, in Turkish Four per Cent. Guaranteed, and in the Bank of Ireland Stock. Among other safe four to five per cent. investments are the Colonial Government Securities, and the Dutch, Belgian, French, and United States Government Stocks, all British Railway Debenture Stocks, Indian Railway Debenture Stocks, British Railway Preference Stocks, Indian Railway Guaranteed Ordinary Stocks, Docks, and, speaking generally, all British Railway Stocks of established lines. Above six per cent. no investment can be safely recommended.

C. WEEKS.—An oblique or skew arch is one that crosses at an angle not a right angle. The getting out of the stones for such an arch is a very complicated proceeding, and your best plan would be to obtain a book on "Skew Arches" from one of the engineering publishers. Batsford, of Holborn, generally has a stock of such technical books.

C. S.—1. The articles on Kite Carriages were in the third volume, pages 57, 63, and 93 (Nos. 93, 94, and 95). 2. The three-ply wood for fret-cutting is made by Mr. J. H. Skinner, of East Dereham, Norfolk. The centre layer runs the opposite way of the grain to the others. The prices per square foot are sixpence for an eighth of an inch thick, sevenpence for three-sixteenths of an inch, and eightpence for a quarter-inch. This is for walnut, mahogany, and brown oak; other woods cost fivepence, sixpence, and sevenpence.

No. 339.—Vol. VII.

SATURDAY, JULY 11, 1885.

Price One Penny.
[ALL RIGHTS RESERVED.]

"DEAR REG." (so ran a letter from Horace which Reginald received a day or two after Master Love's desertion), "I'm afraid you are having rather a slow time up there, which is more than can be said for us here. There's been no end of a row at the 'Rocket,' which you may

"He lit another match."

like to hear about, especially as two of the chief persons concerned were your friend Durfy and your affectionate brother.

"Granville, the sub-editor, came into the office where Booms and Waterford and I were working on Friday morning, and said, in his usual mild way,

"I should like to know who generally clears the post-box in the morning?"

"I do," said Booms. You know the way he groans when he speaks.

"The reason I want to know is, because I have an idea one or two letters lately have either been looked at or tampered with before the editor or I see them."

"I suppose I'm to be given in charge?" said Booms. "I didn't do it; but when once a man's suspected, what's the use of saying anything?"

"Even Granville couldn't help grinning at this.

"Nonsense, Booms. I'm glad to say I know you three fellows well enough by this time to feel sure it wasn't one of you. I shouldn't have spoken to you about it if I had."

"Booms seemed quite disappointed he wasn't to be made a martyr of after all.

"You think I know all about it?" he said.

"No, I don't; and if you'll just listen without running away with ridiculous notions, Booms," said Granville, warming up a bit, "I'll explain myself. Two letters during the last fortnight have been undoubtedly opened before I saw them. They both arrived between eight o'clock in the evening and nine next morning, and they both came from sporting correspondents of ours in the country, and contained information of a private nature intended for our paper the next day. In one case it was about a horse race, and in the other about an important football match. The letters were not tampered with for the purpose of giving information to any other papers, because we were still the only paper who gave the news, so the probability is some one who wanted to bet on the event has tried to get hold of the news beforehand."

"I never made a bet in my life," said Booms.

"We couldn't help laughing at this, for the stories he tells us of his terrific sporting exploits when he goes out of an evening in his high collar would make you think he was the loudest betting man in London.

"Granville laughed too.

"Better not begin," he said, and then blushed very red as it occurred to him he had made an unintentional pun. But we looked quite grave, and did not give any sign of having seen it, and that put him on his feet again.

"It's not a comfortable thing to happen," said he, "and what I want to propose is that one or two of you should stay late for a night or two and see if you can find out how it occurs. There are one or two events coming off during the next few days about which we expect special communications, so that very likely whoever it is may try again. You must be very careful, and I shall have to leave you to use your discretion, for I'm so busy with the new Literary Supplement that I cannot stay myself."

"Well, when he'd gone we had a consultation, and of course it ended in Waterford and me determining to sit up. Poor Booms's heart would break if he

couldn't go 'on the mash' as usual; and though he tried to seem very much hurt that he was not to stay, we could see he was greatly relieved. Waterford and I were rather glad, as it happened, for we'd some work on hand it just suited us to get a quiet evening for.

"So I wrote a note to Miss Crisp. Don't get excited, old man; she's a very nice girl, but she's another's. [By the way, *Jemima* asks after you every time I meet her, which is once a week now; she's invited herself into our shorthand class.] And after helping to rig old Booms up to the ninety-nines, which wasn't easy work, for his 'dicky' kept twisting round to the side of his neck, and we had to pin it in three places before it would keep steady, I gave him the note and asked him would he ever be so kind as to take it round for me, as it was to ask Miss Crisp if she would go and keep my mother company during my absence.

After that I thought we should never get rid of him. He insisted on overhauling every article of his toilet. At least four more pins were added to fix the restless dicky in its place on his manly breast. We polished up his eyeglasses with wash-leather till the pewter nearly all rubbed off; we helped him roll his flannel shirt-sleeves up to the elbows, for fear—horrible idea!—they should chance to peep out from below his cuffs; we devoted an anxious two minutes to the poisoning of his hat at the right angle, and then passed him affectionately from one to the other to see he was all right. After which he went off, holding my letter carefully in his scented handkerchief and saying—dear gay deceiver!—that he envied us spending a cosy evening in that snug office by the fire!

"The work Waterford and I have on hand is—tell it not in Gath, old man, and don't scorn a fellow off the face of the earth—to try to write something that will get into the Literary Supplement. This supplement is a new idea of the editor's, and makes a sort of weekly magazine. He writes a lot of it himself, and we chip a lot of stuff for him out of other papers. The idea of having a shot at it occurred to us both independently, in a funny and rather humiliating way. It seems Waterford, without saying a word to me or anybody, had sat down and composed some lines on the 'Swallow'—appropriate topic for this season of the year. I at the same time, without saying a word to Waterford or anybody except mother, had sat down and, with awful groanings and wrestling of mind, evolved a lucubration in prose on 'Ancient and Modern Athletic Sports.' Of course I crammed a lot of it up out of encyclopædias and that sort of thing. It was the driest rot you ever read, and I knew it was doomed before I sent it in. But as it was written I thought I might try. So, as of course I couldn't send it in under my own name, I asked Miss Crisp if I might send it under hers. The obliging little lady laughed and said, 'Yes,' but she didn't tell me at the same time that Waterford had come to her with his 'Swallow' and asked the very same thing. A rare laugh she must have had at our expense! Well, I sent mine in and Waterford sent in his.

"We were both very abstracted for the next few days, but little guessed our perturbation arose from the same cause.

Then came the fatal Wednesday—the 'd. w. t.' day as we call it—for Granville always saves up his rejected addresses for us to 'decline with thanks' for Wednesdays. There was a good batch of them this day, so Waterford and I took half each. I took a hurried skim through mine, but no 'Ancient and Modern Athletic Sports' were there. I concluded therefore Waterford had it. Granville writes in the corner of each 'd. w. t.' or 'd. w. t. note,' which means 'declined with thanks' pure and simple, or 'declined with thanks' and a short polite note to be written at the same time stating that the sub-editor, while recognising some merit in the contribution, regretted it was not suitable for the supplement. I polished off my pure and simple first, and then began to tackle the notes. About the fourth I came to considerably astonished me. It was a couple of mild sonnets on the 'Swallow,' with the name M. E. Crisp attached!

"Hullo," I said to Waterford, tossing the paper over to him, 'here's Miss Crisp writing some verses. I should have thought she could write better stuff than that, shouldn't you?'

"Waterford, very red in the face, snatched up the paper and glanced at it.

"Do you think they're so bad?" said he.

"Frightful twaddle," said I; 'fancy any one saying,

"The drowsy year from winter's sleep ye wake,
Yet two of ye do not a summer make."

"Well," said he, grinning, "you'd better tell her straight off it's bosh, and then she's not likely to make a fool of herself again. Hullo, though, I say; he exclaimed, picking up a paper in front of him, every smudge and blot of which I knew only too well, 'why she's at it again. What's this? "Ancient and Modern." Why it's in your writing; did you copy it out for her?'

"I wrote that out, yes," said I, feeling it my turn to colour up and look sheepish.

"Waterford glanced rapidly through the first few lines and then said,

"Well, all I can say is, it's a pity she didn't stick to poetry. I'm sure the line about waking the drowsy year is a jolly sight better than this awful rot:

"Though we are not told so in so many words, we may reasonably conclude that athletic sports were not unpractised by Cain and Abel prior to the death of the latter!"

"As if they could have done it after!"

"I never said they could," I said, feeling very much taken down.

"Oh—it was you composed it as well as wrote it, was it?" said he, laughing. "Ho, ho! that's the best joke I ever heard. Poor little Crisp, what a shame to get her to father—or mother a thing like this; ha, ha! "prior to the death of the latter"—that's something like a play of language! My eye, what a game she's been having with us!"

"Us! then you're the idiot who wrote about the Swallows!" said I.

"Suppose I am," said he, blushing all over, 'suppose I am.'

"Well, all I can say is, I'm precious glad the little Crisp isn't guilty of it. "Two of ye do not a summer make," indeed!"

"Well, they don't," said he.

"I know they don't," said I, half dead

with laughing, 'but you needn't go and tell everybody.'

"I'm sure it's just as interesting as 'Cain and Abel—'"

"There now, we don't want to hear any more about them," said I, 'but I think we ought to send them both back to Miss Crisp, to give her her laugh against us too.'

"We did so; and I needn't tell you she lets us have it whenever we get within twenty yards of her."

"Here's a long digression, but it may amuse you; and you said you wanted something to read."

"Well, Waterford and I recovered in a few days from our first reverse, and decided to have another shot; and so we were rather glad of the quiet evening at the office to make our new attempts. We half thought of writing a piece between us; but decided we'd better go on our own hooks after all, as our styles were not yet broken in to one another. We agreed we had better this time both write on subjects we knew something about; Waterford accordingly selected 'A Day in a Sub-Sub-Editor's Life' as a topic he really could claim to be familiar with; while I pitched upon 'Early Rising,' a branch of science in which I flatter myself, old man, *you* are not competent to tell me whether I excel or not. Half the battle was done when we had fixed on our subjects; so as soon as every one was gone we poked up the fire and made ourselves snug, and settled down to work."

"We plodded on steadily till we heard the half-past nine letters dropped into the box. Then it occurred to us we had better turn down the lights and give our office as deserted a look as we could. It was rather slow work sitting in the dark for a couple of hours, not speaking a word or daring to move a toe. The fire got low, but we dared not make it up; and of course we both had awful desires to sneeze and cough—you always do at such times—and half killed ourselves in our efforts to smother them. We could hear the cabs and omnibuses in Fleet Street keeping up a regular roar; but no footsteps came near us, except once when a telegraph boy (as we guessed by his shrill whistling and his smart step) came and dropped a telegram into the box. I assure you the click the flap of the letter-box made that moment, although I knew what it was and why it was, made my heart beat like a steam-engine."

"It was beginning to get rather slow when twelve came and still nothing to disturb us. We might have been forging ahead with our writing all this time if we had only known."

"Presently Waterford whispered,

"They won't try to-night now."

"Just as he spoke we heard a creak on the stairs outside. We had heard lots of creaks already, but somehow this one startled us both. I instinctively picked up the ruler from the table, and Waterford took my arm and motioned me close to the wall beside him. Another creak came presently and then another. Evidently some one was coming down the stairs cautiously, and in the dark too, for we saw no glimmer of a light through the partly-opened door. We were behind it, so that if it opened we should be quite hidden unless the fellow groped round it."

"Down he came slowly, and there was no mistake now about its being a human

being and not a ghost, for we heard him clearing his throat very quietly and snuffling as he reached the bottom step. I can tell you it was rather exciting, even for a fellow of my dull nerves."

"Waterford nudged me to creep a little nearer the gas, ready to turn it up at a moment's notice, while he kept at the door to prevent our man getting out after he was once in."

"Presently the door opened very quietly. He did not fling it wide open, luckily, or he was bound to spot us behind it; but he opened it just enough to squeeze in, and then, feeling his way round by the wall, made straight for the letter-box. Although it was dark he seemed to know his way pretty well, and in a few seconds we heard him stop and fumble with a key in the lock. In a second or two he had opened it, and then, crouching down, began cautiously to rub a match on the floor. The light was too dim to see anything but the crouching figure of a man bending over the box and examining the addresses of one or two of the letters in it. His match went out before he had found what he wanted."

"It was hard work to keep from giving him a little unexpected light, for my fingers itched to turn up the gas. However, it was evidently better to wait a little longer and see what he really was up to before we were down on him."

"He lit another match, and this time seemed to find what he wanted, for we saw him put one letter in his pocket and drop all the others back into the box, blowing out his match as he did so."

"Now was our time. I felt a nudge from Waterford and turned the gas full on, while he quietly closed the door and turned the key."

"I felt quite sorry for the poor scared beggar as he knelt there and turned his white face to the light, unable to move or speak or do anything. You'll have guessed who it was."

"So, Mr. Durfy," said Waterford, leaning up against the door and folding his arms, 'it's you, is it?'

"The culprit glared at him and then at me, and rose to his feet with a forced laugh."

"It looks like it," he said.

"So it does," said Waterford, taking the key out of the door and putting it in his pocket; 'very like it. And it looks very much as if he would have to make himself comfortable here till Mr. Granville comes!'

"What do you mean?' exclaimed the fellow. 'I've as much right to be here as you have, for the matter of that, at this hour.'

"Very well, then," said Waterford, as cool as a cucumber, 'we'll all three stay here. Eh, Cruden?'

"I'm game," said I.

"He evidently didn't like the turn things were taking, and changed his tack."

"Come, don't play the fool!' he said, coaxingly. 'The fact is, I expected a letter from a friend, and as it was very important I came to get it. It's all right.'

"You may think so," said Waterford; 'you may think it's all right to come here on tiptoe at midnight with a false key, and steal, but other people may differ from you, that's all! Besides, you're telling a lie: the letter you've got in your pocket doesn't belong to you!'

"It was rather a rash challenge, but

we could see by the way his face fell it was a good shot."

"He uttered an oath, and advanced threateningly towards the door."

"Sit down," said Waterford, 'unless you want to be tied up. There are two of us here, and we're not going to stand any nonsense, I can tell you!'

"You've no right—"

"Sit down, and shut up!" repeated Waterford.

"I tell you if you—"

"Cruden, you'll find some cord in one of those drawers. If you don't shut up, and sit down, Durfy, we shall make you."

"He caved in after that, and I was rather glad we hadn't to go to extremes."

"Hadh't we better get the letter?" whispered I.

"No; he'd better fork it out to Granville," said Waterford.

"He was wrong for once, as you shall hear."

"Durfy slunk off and sat down on a chair in the far corner of the room, swearing to himself, but not venturing to raise his voice above a growl."

"It was now about half-past twelve, and we had the lively prospect of waiting at least eight hours before Granville turned up."

"Don't you bother to stay," said Waterford. 'I can look after him.'

"But I scouted the idea, and said nothing would induce me to go."

"Very well, then," said he; 'we may as well get on with our writing.'

"So we pulled our chairs up to the table, with a full view of Durfy in the corner, and tried to continue our lucubrations."

"But when you are sitting up at dead of night, with a prisoner in the corner of the room cursing and gnashing his teeth at you, it is not easy to grow eloquent either on the subject of 'A Day in a Sub-Sub-Editor's Life,' or 'Early Rising.' And so we found. We gave it up presently, and made up the fire and chatted together in a whisper."

"Once or twice, Durfy broke the silence."

"I'm hungry," growled he, about two o'clock."

"So are we," said Waterford.

"Well, go and get something. I'm not going to be starved, I tell you. I'll make you smart for it, both of you."

"You've been told to shut up," said Waterford, rising to his feet with a glance towards the drawer where the cord was kept."

"Durfy was quiet after that for an hour or so. Then I suppose he must have overheard me saying something to Waterford about you, for he broke out with a vicious laugh."

"Reginald! Yes, he'll thank you for this. I'll make it so hot for him—"

"Look here," said Waterford, 'this is the last time you're going to be cautioned, Durfy. If you open your mouth once more you'll be gagged; mind that. I mean what I say.'

"This was quite enough for Durfy. He made no further attempt to speak, but curled himself up on the floor and turned his face to the wall, and disposed himself to all appearances to sleep. Whether he succeeded or not I can't say. But towards morning he glowered round at us. Then he took out some tobacco and commenced chewing it, and finally turned his back on us again and continued dozing and chewing alternately

till the eight o'clock bell rang and aroused us.

"Half an hour later Granville arrived, and a glance at our group was quite sufficient to acquaint him with the state of affairs.

"So this is the man," said he, pointing to Durfy.

"Yes, sir. We caught him in the act of taking a letter out of the box at midnight. In fact he's got it in his pocket this moment."

"Durfy gave a fiendish grin, and said,

"That's a lie. I've no letter in my pocket!"

"And he proceeded to turn his pockets one after the other inside out.

"All I know is we both saw him take a letter out of the box and put it in his pocket," said Waterford.

"Yes," snarled Durfy, "and I told you it was a private letter of my own."

"Whatever the letter is, you took it out of the box, and you had better show it quietly," said Granville; "it will save you trouble."

"I tell you I have no letter," replied Durfy again.

"Very well, then, Cruden, perhaps you will kindly fetch a policeman."

"I started to go, but Durfy broke out, this time in tones of sincere terror,

"Don't do that, don't ruin me. I did take it, but—"

"Give it to me, then."

"I can't. I've eaten it!"

"Wasn't this a thunderbolt! How were we to prove whose the letter was. Wild thoughts of a stomach-pump, or soap and warm water, did flash through my mind, but what was the use? The fellow had done us after all, and we had to admit it.

"No one stopped him as he went to the door, half scowling, half grinning.

"Good morning, gentlemen!" said he. "I hope you'll get a better night's rest to-morrow. I promise not to disturb you" (here followed a few oaths). "But I'll pay you out, some of you—Crudens, Reginalds, sneaks, prigs—all of you!"

"With which neat peroration he took his leave, and the 'Rocket' has not seen him since.

"Here's a long screed! I must pull up now."

"Mother's not very well, she's fretting, I'm afraid, and her eyes trouble her. I can't say we shall be sorry when Christmas comes, for try all we can, we're in debt at one or two of the shops. I know you'll hate to hear it, but it's simply unavoidable on our present means. I wish I could come down and see you; but for one thing, I can't afford it, and for another, I can't leave mother. Mrs. Shuckelford is really very kind, though she's not a congenial spirit.

"Young Gedge and I see plenty of one another: he's joined our shorthand class, and is going in for a little steady work all round. He owes you a lot for befriending him at the time you did, and he's not forgotten it. I promised to send you his love next time I wrote. Harker will be in town next week, which will be jolly. I've never seen Bland since I called to pay the 6s. 6d. I fancy he's got into rather a fast lot, and is making a fool of himself, which is a pity.

"You tell us very little about your Corporation; I hope it is going on all right. I wish to goodness you were back in town. I never was in love with the concern, as you know, and at the risk of putting you in a rage, I can't help saying it's a pity we couldn't all have stayed together just now. Forgive this growl, old man.

"Your affectionate brother,

"HORACE.

"Wednesday, 'd. w. t.' day. To our surprise and trepidation, neither the 'Day in a Sub-Sub-Editor's Life' nor 'Early Rising' were among the papers given out to-day to be 'declined with thanks.' Granville may have put them into the fire as not even worth returning, or he may actually—*O mirabile dictu*—be going to put us into print!"

(To be continued.)

IVAN DOBROFF: A RUSSIAN STORY.

BY PROFESSOR J. F. HODGETTS,

Late Examiner to the University of Moscow, Professor in the Russian Imperial College of Practical Science,

Author of "Harold, the Boy-Earl," etc.

CHAPTER XXVI.

THINGS have moved apace since our last chapter. The doctor had proposed to and been accepted by Annie, for whom a free pardon had been obtained from the Empress. We are not going to describe the wedding itself, but one of the presents which she received on the morning of her marriage may be of special interest. It consisted of one of the most beautiful ivory caskets imaginable. The sides were elaborately decorated with carvings representing the four seasons, in the winter scene showing a sledge attacked by wolves in the snow. On the lid were carved in bas-relief portraits of the Emperor and the Empress. On opening this pretty box she found a document, which on examination proved to be a full and free pardon for the misdemeanour for which she had been exiled, and also for the step which she had taken in quitting Siberia without receiving official permission.

Ivan had overcome his dislike to the organ in the English church, and having been introduced by Tenterton to Mr. Hamilton had frequently accompanied him in his visits to the good chaplain, who took a very lively interest in the battle which Ivan had been fighting against his own selfhood. Many words of affectionate encouragement did he say to the boy, who had commenced his career as a Christian soldier by giving up with all his heart and soul the love which he had acquired for the pomp and glitter of mortal arms.

Tenterton was a first-rate arithmetician, and proved invaluable to Ivan in showing him some peculiarities in book-keeping and in giving him many hints for the arrangement of his time.

It was a happy day for Ivan when his two beloved friends Annie and Strammeller were married, although he pretended to be very angry with her for telling him nothing about it before, which he called mean in her, from whom he (Ivan) concealed nothing. He told Strammeller that he considered him an instance of base ingratitude for never saying a word of thanks for saving from exile and bringing to him certainly the best wife in Europe.

We must now turn to more prosaic matters. When the great cause of Abrazoff against Abrazoff had been decided in Ivan's favour, Smirnoff was appointed curator or guardian of Ivan, and trustee of his money. He was desired to name a co-trustee to act with him in the task of looking after Ivan's interests. He had at first thought the distance to Kursk an obstacle to the nomination of Steinfeldt; but finding this gentleman very willing to undertake the duty, he had at last requested him to share the responsibilities of Ivan's future with him. Now certain large sums had been made over to Ivan by Smirnoff, and these were well and safely invested. All the money accruing from the Riazan estates had been placed in the Imperial Bank at Moscow. A share had been purchased in Ivan's

name in the Merchants' Bank, of which Smirnoff was one of the managers, so that everything had been done to secure his safety in case of any accident happening to Smirnoff.

But—for there was a *but*—Steinfeldt discovered that this having been done, the remainder of Smirnoff's immense capital had been sunk in the celebrated South Russian Coal Mine Company, which was on the eve of bankruptcy! It was not known to the general public how much this horrible mine had swallowed. To the outside world it represented a fraction of Smirnoff's possessions. In reality it represented his all! The crisis was approaching when the whole of that magnificent mercantile fabric—that palace in fairyland—should vanish into "thin air, and leave not a wrack behind," unless some unforeseen event should put Smirnoff again in possession of certain large sums.

The reports on 'Change up to this time had all been favourable to Smirnoff; but now ominous whispers had begun to be heard, and of these Von Steinfeldt became aware. They were only rumours as yet; but Steinfeldt was a thorough man of business, and knew what power for good or ill lay within those rumours, so wherever he could he flatly denied any danger, having indeed the fullest confidence in Smirnoff to pull through.

Just at this moment a grand undertaking was started, in which the great house of Smirnoff was expected to take

part. It meant enormous addition to its power as a house if taken up; it meant ruin and confirmation of the evil rumours if participation were declined. What could poor Smirnoff do? All the available funds at his disposal had been sunk in the wretched mining scheme, which he now saw that he ought never to have touched. He could not ask his business friends to join him and furnish the missing capital, for that would be equal to a confession of his own bankrupt condition. Ivan's money he could not touch alone,

me, it would be a great relief. I can't work these problems out for thinking of him. He looks so utterly sad at home sometimes, though he never lets the world know. Is anything wrong?"

"I am afraid so, Ivan."

"How much is it?"

"About five hundred thousand roubles."

"Has my money been touched?"

sible? You may do what you like with my money."

"I know you are 'Ivan Dobroff' [the good], but it would not do to withdraw that—at least, it would be difficult. I will, however, ask him to let me do it."

"Of course you must ask him; I don't want money—never shall. You must make him do it. I will sign anything."

"The rich and powerful Merchant was on the eve of utter ruin."

and he never thought of consulting Steinfeldt, who learnt the facts from others.

Full of very desponding thoughts, Steinfeldt called upon Smirnoff early one morning, and, finding him not at home, asked to see Ivan, to whom he was at once admitted. He found the boy looking pale, worried, and tired.

"What is the matter with you, Ivan?"

"Don't feel well, uncle.* I am glad you have come; want to talk to you about Mr. Smirnoff. Do you know what is the matter with him? If so, please tell

"Not a penny."

"Well, that is always something. I suppose there would be about two hundred thousand roubles in the Imperial Bank in my name, besides the Riazan money?"

"There is more than that, Ivan."

"Then why does he not use it? He is my guardian, and has a right to dispose of it."

"My dear boy, he cannot, without my consent, until you are of age. And that is a long way off!"

"But you are here. Why don't you use my money? Why don't you go to him and give him all the help pos-

Besides, it is all his own money. In the meantime I have an idea. You know the Countess Schaafstadt? Well, her son told me the other day that she had come into an enormous fortune. I will go and see her."

The rich and powerful merchant was on the eve of utter ruin. He expected on the following day to be formally asked to join the undertaking to which we have referred by putting half a million of roubles into it. He had not fifty thousand at his command at the moment, and, true to his principles, would not touch Ivan's money. His agitation was extreme. He walked up and down in his private room in the office portion of his lordly dwelling, a prey to the bitterest anxiety. Hour after hour passed. Many people called to see him, but he was denied to all. At last, worn out with care and anxiety, he flung himself down in an armchair and covered his face with his hands. With such violence did he press them to his aching brow that he was unconscious of a gentle tap at his door. He heard no one come in, and started as if struck by a bullet at the touch of Ivan's hand.

"I have brought the Countess Schaaf-

* Very intimate friends of a family in Russia and Germany are often addressed by the children as uncle.

stadt Papaschinka! She is in the outer reception-room."

The next day the messenger from the Minister of Finance arrived, and to his great delight met two of the most important merchants of Moscow with Smirnoff, who told him that their friend was "in it" to the tune of half a million of roubles.

Our tale is nearly done, but there are some of our friends of whom we must say a word or two in conclusion.

Strammeller and Annie lived very happily at Moscow, where they often saw Ivan Dobroff, or rather Abrazoff. He became celebrated as a sound man of business, and known for his fondness for the society of cavalry officers. In a letter

we received from him not long since, he remarks,

"I used to hate Germans and heretics! How they have revenged themselves on me! I owe my life to a German, and my knowledge of its value in the future to a heretic! Queer, isn't it?"

General Kakaroff became Governor of Finland, and is very happy in the performance of his important duties.

Count Schaafstadt is a cabinet minister. His wife's investment at the moment when it was made rendered them immensely wealthy, and his position in the State enables him to carry out his benevolent plans for his country's improvement, to which a great portion of his vast wealth is devoted.

Prince Tchernyaffskie retired from the service after having, at Ivan's request, procured a brilliant career for young Abrazoff.

Tenterton became tutor in the Imperial family, and will retire with a pension.

Palitzki died miserably in the mines, and Von Hohenhorst, after working some years, contrived to escape from prison, but was pursued by the guard and shot because he refused to stop when commanded.

Captain Malutin is a general in earnest now, and his family is the happiest in Russia. He is police-master in some government in Little Russia. His son Serge has entered the page corps

(THE END.)

ON SPECIAL SERVICE: A NAVAL STORY.

By GORDON STABLES, M.D., R.N.

CHAPTER XIV.—LIFE ON THE OCEAN WAVE—A YEAR'S CRUISE IN INDIAN WATERS—STRANGE ADVENTURES.

COMMODORE O'CONNELL, of the *Aurora*—or the *Roarer*, as all the blue-jackets called her—was a right good old fellow, and something of a character in his way.

Irish he was to the backbone, and did not deny his country; indeed, he was proud of it, and often assumed just the least taste in the world of the brogue—enough, and no more, to give a kind of piquancy or flavour to his remarks, like a dash of cayenne pepper upon a poached egg.

Blunderbore and he were old friends. They really were fond enough of each other; their wives and their families both lived in the same town in England, and they were also fond of each other; but there existed between O'Connell and Blunderbore, and between their wives and families also, a little service jealousy. That is all.

Blunderbore was of bluer blood than old O'Connell; but then Blunderbore was not a commodore.

Blunderbore's wife and daughters prided themselves on their *blue* blood; but O'Connell was a commodore, and O'Connell's wives and daughters cocked their caps accordingly. So even my boy readers will see how the land lay, and what particular spirit instigated a remark which O'Connell made one day shortly before the *Theodora* sailed away up the *Bique* on her special service. They had been dining together in the old *Roarer*.

"It's all very well, Blunderbore, sending a craft like the *Theodora* after this imaginary piratical slaver, but then you know it's an expense to the country."

"Bother the expense," he said; "that doesn't come out of your pocket, O'Connell, nor out of mine either."

"Ah! but the taxpayer should be thought of, sir. Now, here am I, lying most of my time half idle, in a good frigate. Why, I want to know, didn't they send me after this imaginary piratical dhow?"

"For the simple reason, O'Connell—and I tell you straight—you could never expect to catch the *Castigo*—she does twelve knots easily—in this old tub of a *Roarer*, as our fellows call her."

"Tub of a *Roarer*! Do they? Hum! Well, Blunderbore, you are cool, to say

the least of it, to tell me this on board my own ship. Tub of a *Roarer*! Eh?"

Blunderbore felt sorry he had gone so far, so he said, soothingly,

"You know very well, O'Connell, that you haven't got my sailing power. Have you now? And you haven't got my knotage under steam either. Come now."

O'Connell cracked a walnut most viciously before he replied.

"Captain Blunderbore, sir. At two miles distant I could blow your confounded *Castigo*, or whatever her name is, clean out of the water. Honolulu! sir," he continued, "I wish I could only meet this Gaspar Moravo fellow. I'd make a Gaspar of him. He wouldn't gasp again, I can tell you. Ha! ha! ha!"

O'Connell laughed at his own little joke, and as Blunderbore joined him heartily, the commodore was much mollified, and the two parted in the evening the very best of friends.

O'Connell fell asleep that night and dreamed that he had taken the piratical slaver and done his friend out of all the prize-money and out of all the honour and glory. He laughed, when shaving next morning, as he remembered his dream—laughed till he cut himself.

* * * *

If there did exist a little jealousy between the captains of the *Aurora* and the *Theodora*, there was nothing but genuine good fellowship between the ward-room officers of those ships. And when the *Theo* sailed away at last on the wings of a ten-knot breeze, the *Roarer* manned her yards and gave the outgoing vessel many a ringing cheer, while the band played good-bye airs on the quarterdeck.

The *Theodora* got into rough weather soon after leaving the Cape. The breeze that had carried them out of the bay veered and increased to a gale of almost hurricane force. But the good ship stood it well, and passed many a vessel lying to almost under bare poles.

Benbow was delighted with his ship, so was every one on board, for the matter of that, only, being her navigating lieutenant, Benbow seemed to feel himself responsible for all the doings of the gallant craft when she was under sail and not steam.

The voyage to the Persian Gulf was not devoid of interest nor of adventure, but neither of these can I pause to describe at present. Suffice it to say that the *Theodora* called at Mozambique, that she lay at Johanna for a whole week and coaled, that she delivered despatches and letters at Zanzibar, where at least a fortnight was spent, and much enjoyed by all on board—and here Mildmay and Golava met many an old friend, but the information picked up about the piratical slaver was simply nil—and that after a week at the strange and beautiful island of Seychelles, they started once more, and in due time reached their cruising-ground.

But if any one on board the *Theodora* imagined for a moment that they had only to reach the Persian Gulf, sight this *Castigo*, and sink her, he was mistaken.

Perhaps Gaspar actually knew of their coming, anyhow he kept out of the way. Perhaps he said to himself, "Only very young sparrows are taken with chaff."

The *Theodora* searched the gulf, and she searched the Red Sea. She called at Aden for information, she went down the coast on a wild-geese chase, and, though there she captured some dhows, which added to prospective prize-money, she never saw the pirate.

She might have been the Flying Dutchman for anything any one seemed to know about her.

Some rumours of her whereabouts at last reached Captain Blunderbore's ears, and he returned to the gulf. But all in vain. No, not quite in vain, for a sailor's proper place is on board a man-o'-war. And I can tell you that the men of the *Theodora* were never idle. Gayly was a good taskmaster, and Mildmay a stickler for duty. So it was drill, drill, drill, all day long, from prayers in the morning till quarters in the evening.

About once a month there would be night quarters. No one knew, except Captain Blunderbore himself, when this was to take place. But suddenly the bugle would ring out the assembly, and hardly had the last notes died away over the water ere every man Jack was in his place, then an imaginary enemy was supposed to be visible under the stars, on beam or bow, and the great guns gave tongue, or suddenly perhaps the "cease

firing" would be heard and boarders would be prepared for. The whole business occupied about an hour.

Gayly's shrill commanding voice was always heard, everywhere apparently. He had good eyes too, for once during a sham action of this kind he noticed that Dr. McGee, after laying out his instruments, etc., laid himself out quite at ease and began to read. This did not suit Gayly's notions of strict service, so during a lull he sang down to the doctor, "Surgeon, there is a man killed."

"Then he's beyond my power," said McGee, looking up without getting up. "Surgeon," shouted Gayly, "a man is shot through the leg."

"Send him below here," cried the doctor, who was not over well pleased; "send him down, sir. I'm quite prepared to lop a limb from any living man on board, even from the second lieutenant himself."

Gayly said no more.

Well, the men had fire quarters very often, and lifeboat-crew quarters, to say nothing of gun-drill, rifle-drill, cutlass, pike, and bayonet exercise, and when not drilling they were at something else, washing, or make-and-mending clothes. Yes, there is always plenty to do on a line-of-battle ship.

Colin grew in strength, and though little more than sixteen, was as hard and manly-looking as could be wished.

He always wrote a letter to his mother once a week, describing his life on board and his cruises on shore. To be sure, he could not post his letter every week, but whenever a chance offered he had only to run down below to his sea-chest and pop the manuscripts into a ready-directed envelope, and away it went.

More than a year thus passed away. The *Theodora*, tired of poking around the gulf, started off on a cruise round India. They called at Bombay first, and there they received despatches from home directing their movements, which for a time were to be devoted entirely to "the protection of British commerce and British interests."

From Bombay the *Theodora* went to the Lacedive Islands, then on to the Maldives. These latter isles of the Indian Ocean were a favourite resort of the piratical slavers. Golava told Mildmay this, but he added that it was very unlikely the pirate was there at present. Never mind, Blunderbore had such faith in his Arab that a six weeks' boat cruise was ordered. This was simply a glorious outing for the officers and men of the *Theodora*, four armed boats in all. But they saw no pirates—alive, that is—for there was undoubted evidence that Gaspar had been here, and that he had not been idle. Probably he had hidden among these islands, and sallied out now and then to attack ships, for here were the remains of his camp, his huts of bamboo, and beached and burned to the water's edge no less than three vessels.

Where were the crews of these unfortunate ships? Who can tell? But unburied human bones lay bleaching on the sand; in the interior they found a skeleton hanging by the neck to a cocoa-de-mer tree, and two or three other skeletons half hidden by the grass, with green-and-crimson lizards basking on their bare ribs, and horrid brown-green scorpions running in and out of the skulls.

This boat cruise was one long delicious

picnic, nor was it entirely devoid of result, for although they came across no pirates, they captured and burned several slavers.

They duly measured them to get at the tonnage before they set them on fire, and I may tell you *sub rosa* they did not make them any smaller on paper than they had been afloat.

From the Maldives they went to Ceylon. Quentin, Benbow, and Colin went off elephant shooting here.

It is cruel sort of work. Poor Colin got nearly killed. A bull elephant or tusker attacked the party. Colin got into a tree, the monster tore it up by the roots and threw it into a pond, Colin and all. The branches held him down. Duncan Robb dashed in to the rescue, and brought his master to bank, but it was an hour before Colin opened his eyes.

From Ceylon Blunderbore sent a long despatch home to headquarters, describing in glowing language the result of the cruise round the Maldives. Indeed D'Austin so worded this document that it read as though the *Theodora* had chased the pirates from the islands, and were sweeping them from the seas. And good old fogies at home believed it, and thought they did right well by keeping the *Theodora* on special service to protect the commerce of the British nation.

Our gallant cruisers spent a month at Calcutta, then cruised south among the Andamans and Nicobar Islands.

At the Andamans West was one of the officers who landed to have a look round. He went off somewhere sketching, and by-and-by Benbow's little black servant Othello rushed to the beach where Benbow and Colin were preparing to go off.

"Golly, golly, run quick," cried the blameless Ethiopian, "dey have catchee Capting West for true, and dey are going to cookee he."

Benbow hastily got his fellows together, and went off to the rescue. Othello guided them to an Indian village far away in the bush.

They did not arrive one moment too soon. Poor West was found tied to a tree, and the savages were about to bleed him. He had a nice view from the spot where he was tied of the preparations being made to cook and eat him.

"It was very unpleasant," West said that evening at dessert, and just after Benbow had entertained the mess for half an hour with a graphic and flowery description of the whole affair.

"Well," said McGee, "if you'd followed out my instructions you wouldn't be so fat, you know. A fellow like you, West, must be no end of a temptation to a hungry cannibal!"

"Doctor," said West, emphatically, "I'll begin dumb-belling again to-morrow morning."

Penang was next visited, then Sumatra and Borneo. Then north they went to Hong Kong, and thence to Yeddo, in Japan.

Up here they heard quite a deal about pirates, but they saw none.

However, the captain and D'Austin wrote more despatches, and lay quietly at Yeddo for three months.

Then the return voyage was made to Bombay. But one night—and a lovely night it was, a bright full moon in the sky, and stars like Koh-i-noors—the *Theodora* went on shore on a reef. Lucky for her there was no wind, and that it

was moonlight. Guns were put into the boats and coals thrown overboard, but all to no purpose. The *Theodora* would not budge. But at daylight a steamer luckily hove in sight, and after five or six hours' hard work and incessant noise the *Theodora* got clear, and went—convoys by the steamer, for she was making a deal of leakage—to Bombay.

Another despatch had, of course, to be written home about this. Everything must be reported, but naturally it was not couched in such glowing terms as either of the former.

The accident necessitated a month in dry dock at Bombay.

They found the *Aurora* there, somewhat to their surprise, and a very pleasant time was spent by both ships.

Benbow declared that the accident had really done the *Theodora* good, and that improvements were being made on her in dock that would greatly improve her powers of speed. Dear old irrepressible Benbow, nothing in the world seemed capable of damping his ardour!

One evening a little party dined at the Biculla Club. It consisted of the four friends, staunch and true—Benbow, Mildmay, Colin, and Quentin. They were just commencing fruit, when D'Austin, dressed in mufti of most fashionable cut, sauntered into the room.

"Hullo, here's D'Austin! Come and sit down, D'Austin; just in time for dessert."

D'Austin laid aside his lavender-coloured gloves, his gold-headed cane, and silk hat, and sank languidly into a chair.

"Thanks! I won't eat, though; so howidly hot! Long walk, and that sort o' thing. Waitah, bwing me a shebet—iced, ye know."

"Well, D'Austin, been to the office? What's the news?"

"Oh, howid news! As soon as repaiahs are completed we're off to the Cape again. Such a bore!"

"A Blunderbore, eh?" said Mildmay, laughing.

D'Austin looked at him a moment.

"I'll go on to the balcony," he drawled. "It is insufferably hot heah, gentlemen."

"You've offended my lord," said Benbow.

Now D'Austin was always with the captain, and got news before any one. It was not long, therefore, before he was joined on the balcony by his shipmates, who really wanted to hear the news.

It was a dark but starry night. Down beneath them were the wide lawns and shrubberies, and there ghostly lights were flitting about or dancing up and down—the gigantic fireflies. The hum of the native city, the beating of tom-toms, and an occasional wild, unearthly shriek fell on their ears.

Far away out yonder was the sea. It was not visible, but they knew it was there; they felt it was there; they were sailors.

"Heigho!" said Mildmay. "I shan't be sorry when we're afloat once more."

Then D'Austin told them the news at once. A despatch had come. They were ordered off down Mauritius way as soon as they were fit for sea.

That day soon came, and away went the *Theodora* once more.

Bombay and all its surroundings never looked more charming than it did on this lovely morning. Like the sky itself, the sea was blue and placid. The houses

and public buildings stood out white and clear against its azure background; in front was the forests of masts, shipping from every land and clime. Early boats were leaving the bundahs with shout and song and rippling laughter; and the romantic isle of Elephanta, with its shadows of purple and violet, seemed to float in the water like some giant raft.

Away went the Theodora, a broad white wake behind her, the smoke from her funnel trailing over the ocean for miles like some mighty snake. On board her every one was cheerful and happy. Long after the last notes of the Roarer's band had died away in the distance the gulls kept up their farewell song, and

convulsively a moment in mid-air, then with wings all awry came whirling down and struck the water with a splash. And there it floated dead.

Not for long, though.

"Look! look!" cried Colin, and, lo! tearing through the water towards the bird, its dorsal fin and part of its blue-grey back above water, could be seen an immense shark. It had disappeared next moment, and with it the body of the Bramla kite. The doctor turned and walked aft.

Benbow paused a moment; he took Colin by the arm.

"Do you see that strange cloud out yonder?" he said.

was kept farther eastward, for sea room was needed; besides, this was their way southwards to seek for the derelict.

So the wind was nearly ahead, but the good ship plunged gallantly into it, and Benbow afterwards averred that she was making at least five knots an hour when the gale was at its worst, but being cross-questioned, he admitted that the wind had gone round a few points.

The wind had got up too soon for the waves to be high, but they were very rough. They seethed and they boiled under the bows, and the water often leapt on board in solid seas that came rushing aft, carrying everything loose along with them, and so lighting up the deck with

"Poor West was found tied to a tree."

sailed tacking and tacking round the vessel. Their graceful motions in the air and their brightness, swiftness, and beauty were in keeping with the scene. But among them floated many a bird of evil omen—the hated Bramla kite, silent, slow, and dark, as if their plumes had been painted by the goddess of night.

Dr. McGee was on deck that same day shortly before sunset. This officer prided himself on his shooting. He now had a rifle and was for'ard at the bows.

"Benbow," he said, for that officer was near him, "do you see that black and ugly bird cleaving the air high up yonder?"

"Yes," said Benbow; "but don't shoot. It isn't lucky. Only," he added, "you may shoot if you like; you won't kill."

Bang went the surgeon's rifle.

The great bird wheeled over, struggled

"Rising up out of the sea like a great black rock?"

"Yes," said Benbow; "that means storm. We will need all the Theodora's good qualities before daylight comes again."

Colin felt a slight shiver run through his blood. He could not tell why.

"Some one is walking over my grave," he said.

Shortly after the sun set.

His parting glance was an angry glare across the water, which was dyed a sulphurous red. And clouds banked up, the waters grew grey and dark, stars struggled out in the east, but were soon hidden by the quickly rising cumulus.

Then it was night.

The storm came on and roared apace through the empty sailless rigging. The course of the Theodora was altered, she

their own phosphorescent foam that the bulwarks rising black at each side of them could be seen, and the rigging and masts, and even the men, though they merely looked like black shapes.

But the engines went labouring on with steady determined roar, and the great screw went round, sometimes so deeply immersed it sounded "drowned"—seafarers will know what I mean—and at other times, when the vessel was well down by the head, it rattled in the empty air.

But a great packet of letters had brought sunshine to the ship as they were leaving the harbour—sunshine fore and sunshine aft.

Who cared for storm or gale? Who cared for raging seas or rushing wind, when there was news from home?

(To be continued.)

A Terrible Custom.

STANLEY ON THE CONGO.

I.

IN our first volume we gave two articles on Mr. Stanley's adventurous voyage "Through the Dark Continent," in which he circumnavigated the Victoria Lake, and proved the Lualaba to be the Congo by descending the great African river to the Atlantic. We now purpose saying a few words regarding his new book, in which he tells the story of the founding of the Free State. A wonderful story it is of a wonderful land; but not so much a narrative of travel as a history of persistent work and hard-won victory.

As the representative of the International African Association, Stanley has moulded into shape an immense country. It contains over a million square miles, and has a population of quite forty-three millions, being in size and number of people as nearly as possible half as large as the Russian Empire in Europe. And a huge river is its great waterway—the Congo—one of the largest on the globe, over three thousand miles in length, and having with its tributaries five thousand two hundred and fifty miles of navigation! And all this vast territory is now open to the free trade of all nations, thanks to Mr. Stanley, the King of the Belgians, and the recent Conference at Berlin.

The book in which this story of success is told will occupy an important place in the history of Africa. With its maps, its documents, and its treaties, it is a complete guide to state organisation among half-civilised communities. Even for those who take no interest in the familiar continent—the old friend with a new face, which, instead of a barren desert and pestiferous swamp, now stands revealed as a land of abounding wealth and fertility—the book is worth reading for the vivid light it casts on the early settlement of America. Here we have the same things going on under our eyes that seem so strange when we read about them happening two hundred years ago. We have

the same inevitable conquest of civilisation, and the same indifference to recognise it on the part of our practical men. We have the same rough life, the same difficulties with the natives, and the same scenery—the mighty river and the background of forest primeval teeming with birds and beasts of the chase. And the pioneers are the same—some prosper, some soon die, and some return to abuse the country in which through their own incapacity they have failed.

From the day when Diego Cão discovered the river in 1484 and Behaim named it the Poderoso, until Stanley in 1876 emerged from its mouth, the true size of the Congo was unsuspected. It was known to be a large stream bringing down a great body of water, but the size seemed nothing extraordinary. In 1816 Captain Tuckey was sent by the British Government to explore and report upon it, and he succeeded in getting inland for only 172 miles. The expedition was disastrous, the captain and seventeen of his companions dying within three months of their entering the mouth.

Fifty years afterwards Livingstone set out on his last journey to explore the watershed between Nyassa and Tanganika, and found the large river flowing westward which he believed to be the head of the Nile. It came from the country of the Mambwe, and he traced it as the Chambezi until it flowed into Lake Bangweolo, and he traced it as it flowed out as the Luapula up to Lake Mweru. Again it changed its name as it left the lake, this time from Luapula to Lualaba; and Livingstone followed it to Nyangwe, fifteen hundred miles from its source. Stanley took up the running at Nyangwe, and, sailing down the stream, proved that the Chambezi, the Luapula, the Lualaba, and the Congo were all the same river, and that that river was the high road into Equatorial Africa. Under the auspices of the King of the Belgians the International African Association was then

formed—by easy stages—and the explorer returned to the scene of his triumphs to found the needful stations for its work.

Some idea of the difficulties of the undertaking may be formed from the following summary:—

"It will be remembered that it was on the 21st of February, 1880, that we set out on our first reconnaissance, directly after the completion of the building of Vivi Station, to explore the route to this very landing-place, which on the 21st of February, 1881, 366 days later, found us all prepared to commence another section of our work, of a somewhat different character to that which was now happily terminated.

"Computing by statute miles the various marchings, and as frequent counter-marchings, accomplished during the year, we find they amount to the grand total of 2,352 English miles, according to tape-line measurement of foot by foot, making an average of six and a half miles performed throughout each day in the year, to gain an advance into the interior of only fifty-two English miles. Take away the necessary days of rest enjoyed during the year, the period of ninety-one days employed in making a passable road for our waggons, which, unless tolerably level, would have been impassable for our top-heavy waggon-loads, and the average rate of travel will prove that we must have had an unusual and sacred regard for duty, besides large hope that some day we should be rewarded with positive success after all this strenuous endeavour.

"That it was not a holiday affair, with its diet of beans and goat-meat and sodden bananas, in the muggy atmosphere of the Congo cañon, with the fierce heat from the rocks, and the chill bleak winds blowing up the gorge and down from sere grassy plateaus, let the deaths of six Europeans and twenty-two natives, and the retirement of

thirteen invalided whites, only one of whom saw the interior, speak for us. It has been a year dark with trial and unusual toil. Our little band of labourers are proud of the grand work their muscles have accomplished, but are more hopeful of the future, inasmuch as their labours, by means of the steamers, will be greatly lightened."

And the building of Vivi may also be given in Mr. Stanley's own words:—

"A day or two after, my tent was taken up and set for the first time on the future site of Vivi, which, clean cleared of rocks and scrub, was now revealed in all its length and breadth, naked and brick-red of colour, except where the face of it was disfigured by massive boulders rolled down from some part of the overhanging height, and which were too ponderous to be touched by the untutored hands of natives.

"Now, with paper and pencil, and the outline of the top of Vivi drawn according to scale, did I proceed with due regard to safety from fire, and to defensive qualities as a provision against result of rupture when absent, to map out the site of each house and store. Then I bethought me of a garden—the place looked so devoid of grace and completeness without it—and, for the sake of giving a finish to the plan, a long oval was drawn which should represent an enclosure wherein, some time hence, verdure might give relief to eyes aching from sun-glare, and wearying of the view of white-painted structures and a brick-red plaza. When this was done, the carpenter and his assistants were appointed to begin the construction of the wooden huts; an engineer, disgusted with driving an engine on a three-ton launch, was detailed with a few men to erect the iron stores; a force of men was set to excavate an oval basin 150 feet by 40 feet 18 inches deep in the hard, sterile face of the platform. With the earth from this excavation we levelled the ground and made the foundations for the houses uniform. Gangs of men with crowbars and sledge-hammers were engaged in prising the larger boulders over the precipitous steep to the depths below, and pulverising others for road beds, which should be presently covered with a few inches of clay soil.

"It is for this work of pulverisation of rock that the Vivi chiefs, wonderingly looking on while I taught my men how to wield a sledge-hammer effectively, bestowed on me the title of Bula Matari—Breaker of Rocks—with which, from the sea to Stanley Falls, all natives of the Congo are now so familiar. It is merely a distinctive title, having no privileges to boast of, but the friend, or 'son,' or 'brother' of Bula Matari will not be unkindly treated by the Bakongo, Bateké, or By-yanzi, and that is something, surely.

"As fast as a portion of the garden basin was excavated the natives of Vivi, male and female, were engaged to carry the rich black alluvial soil from the Nkusu valley, on the eastern side of the hill, at so much per hundred boxes of earth. In this operation there were many attempts made to defraud me of my due weight of earth, but a Zanzibari policeman at the head of the road examining each box soon prevented that trick. Five thousand boxfuls of earth for twenty days represent roughly 2,000 tons, with which I formed 2,000 square feet of a garden, wherein, after dressing, and levelling, and forming narrow alleys, I planted my nine mango, a few orange, avocado pears, and lime plants I had brought from Zanzibar. Beds of carrots, onions, lettuce, parsnips, turnips, cabbage, beets, tomatoes were made; some papaw seeds were planted, and a palisade was constructed around it. Thus I formed my garden, which, under careful watering, soon showed green, and in a few months repaid me, not only by its pleasant verdure, but contributed much variety of vegetables to the table, limited as it was. In January, 1883, I gathered eleven large mangoes, the first year's production of fruit, and the stones of them

were planted at Léopoldville, to be in 1885 ten feet high."

As the expedition slowly advanced up the river, founding the stations as it went, we read of many adventurous deeds and exciting scenes, some of them with a fatal termination. Poor Soudi, of Ituru, for instance, lost his life through over-confidence. This was the man who was swept over the Kalulu Falls in 1877, and was captured and for a short time enslaved by the natives. Rashly thinking that his Snider was a match for anything, he started on a buffalo stalk. When within what he supposed to be a safe distance for a shot he fired, and wounded the buffalo. Encouraged by its fall, Soudi rushed up to sever the jugular, since without this ceremony the meat would have been unfit for a Moslem to eat; but the buffalo, not being dead, on seeing its enemy, charged, and tossed him into the air, and made a plaything of him, until he was so mangled that he died.

But other stirring scenes end more happily.

"About ten o'clock, as we were issuing out of a long bay-like bight in the shore, we saw half a dozen small canoes well out in the lake, and one probably two miles farther out, and after passing the rocky point, we saw the village to which these canoes evidently belonged. I thought this an excellent opportunity to obtain some information respecting the country, and perhaps obtain fresh fish and food. We bore down upon the fishermen, who, all engrossed in hauling their seines aboard, permitted us to approach within a mile of them before they were aware of our presence. And such a presence as we must have been to them! A large white boat with outspread and ample wing, emitting strange noises, which was unlike the sounds sent out by any animal they had ever heard! They lift their hands up in dismay. One, with more presence of mind than the others, claps his hands to his paddle, and instinctively skims away. 'An admirable idea,' the others seem to cry, and all strike their paddles deep in the black water, and urge their tiny dug-outs until they appear to fly over the lake. But the other—the canoe all alone in the watery waste—in which the fisherman, profoundly abstracted in his task, sits heedlessly hauling his seines aboard? When, hark! What is that? What strange-sighing sound, and harsh grating, and plashing noise is that? He turns toward our direction, and beholds a strange structure, all white, with lofty wing, and a pair of revolving clappers striking the lake water into long trailing waves behind. He falls sideways into his little canoe completely paralysed, as if striving to realise that the vision is not all a dream. No doubt the thought flashes into his mind, 'But a moment since I swept my eyes around, and saw naught strange to inspire fear or anxiety in me. But this! Whence could this have issued? It must be a wild dream, surely.'

"But again the gentle wind bears to his ears the strong pulsating sounds, and the deep but sharp sighing; he hears the desperate whirl of the paddle-wheels; he sees the trail of rolling wavelets astern. Leaping to his feet with frantic energy, he takes one short glance around, and realises that he, insensate fool, while indulging in Waltonian reveries in midday, has been abandoned by his friends! However, there is hope while there is life; he bends his back, and draws, with long-reaching grasp, the water sideways, this way, and that, and the tiny pirogue, sharp as a spear-point, leaps over the water, obeying his will dexterously.

"Down with the sail, boys," and the wing is folded, and a tall shaft stands revealed, with a black column behind vomiting flame and smoke from its muzzle.

"Nearer and nearer the steamer draws on the fugitive pirogue, but, by a whirl of the paddle, the dark man shoots triumphantly at right angles away, while the En Avant, confused by this sudden movement, careers

madly along. In a short time, however, she is in full chase again, this time carefully watching every movement. The man has kept throwing wild glances over his shoulders; he observes the monster rapidly gaining on him, and each time it seems to loom larger and larger to his excited imagination; he hears the tremendous whirl of the wheels, and the throbbing of the engines, and the puffing of the steam. Another glance, and it seems to be overwhelming him, when he springs overboard, and we sweep past the empty canoe.

"Now, Uledi and Dualla, we will go round to the spot where he sank, and as he comes up jump overboard and catch him."

"We steered the steamer round, and proceeded slowly towards the empty canoe. The man was swimming in its vicinity. As we came up he dived, and our two sailors flashed into the depths after him. It was a pretty sight to see the graceful bodies darting like sharks towards their prey. They brought him up, each holding an arm, and swam with him to the boat. We lifted him up tenderly, and seated him on the sail, waiting patiently for his pulses to beat less wildly, and the excited heart to cease its rapid throbbing.

"Now, Ankoli, speak softly to the poor man."

"No answer was given to Ankoli's cooing tones and wooing accents.

"Try again—softer still, Ankoli."

"And again Ankoli, in soothing whispers, asked what his name was."

"What did you pick me out for? There are many better than I in our village."

"One what?" I ask. "How better? What does he mean?"

"He means," answered Ankoli, "that there are finer slaves than he in the village."

"Ah! There have been slave-catchers here, then. Where do they come from?"

Many are the strange customs described, some of them horrible enough. Here is a specimen from Equator Station. One of the neighbouring chiefs died, and the relatives set about collecting slaves to bear him company to the other world. Thinking from their discipline that the garrison of the station must be slaves, the Bakuti applied to Lieutenant Vangele for him to sell them a few of the men. The proposal was of course rejected with horror, but the Bakuti, not to be cheated of their ceremony, succeeded in getting fourteen wretched victims from the interior. Being informed by the villagers that the execution was about to take place, Vangele and some of his men, who were powerless to stop it, went as witnesses. "They found quite a number of men gathered round. The doomed men were kneeling with their arms bound behind them in the neighbourhood of a tall young tree, near the top of which the end of a rope had been lashed. A number of men laid hold of the cord, and hauled upon it until the upper part of the tree was bent like a bow. One of the captives was selected, and the dangling end of the rope was fastened round his neck; the tree sprang several inches higher, drawing the man's form up, straining the neck, and almost lifting the body from the ground. The executioner then advanced with his short broad-bladed falchion, and measured his distance by stretching his weapon from the position he intended to strike across the nape of the neck. He repeated this operation twice. At the third time he struck, severing the head clean from the body. It was whipped up in the air by the spring of the released tree and sent rebounding several yards away."

With the coming of the white man such scenes of bloodshed will no longer disgrace the river banks. The Congo throughout its course is now dotted with mission stations, and by precept and example the natives are being led out of the dense darkness in which they have for ages been contented to live.

And the civilising work has been shorn of half its difficulty by the 6th Article of the General Act of the Berlin Conference, than which in no existing treaty is there a nobler clause:—

"All the Powers exercising sovereign rights, or having influence in the said territories, undertake to watch over the preservation of the native races, and the amelioration of the moral and material conditions of their

existence, and to co-operate in the suppression of slavery, and above all, of the slave trade; they will protect and encourage, without distinction of nationality or creed, all institutions and enterprises, religious, scientific, or charitable, established and organised for these objects or tending to educate the natives and lead them to understand and appreciate the advantages of civilisation. Christian missionaries, men of science, explorers and their escorts and collections, are

to be equally the object of special protection. Liberty of conscience and religious toleration are expressly guaranteed to the natives as well as to the inhabitants and foreigners. The free and public exercise of every creed, the right to erect religious buildings, and to organise missions belonging to every creed, shall be subject to no restriction or impediment whatsoever."

(To be concluded.)

UP AND DOWN: A STORY OF THE OCEAN WAVE.

BY ASCOTT R. HOPE,

Author of "The Tell-Tale," "The Amateur Dominie," etc.

CHAPTER II.—STILL UP!

I WAS not long indeed allowed to remain undisturbed in my haven of refuge. Presently I heard Gooderidge shouting out my name, and though I took care not to answer, when the stewardess went out for a moment she brought back bad news, little knowing how bad it was.

"Your friend wants you."

My friend indeed! I did not want him, but there he was, already at the door of the cabin, too late for me to draw back out of sight.

"Oh, you are here, are you?"

"Yes, Gooderidge," I replied, with a perfunctory attempt at cordiality.

"Come out of it, then! Nice job for a fellow to have to look after the like of you! I have been hunting for you everywhere. I thought you would be falling down among the engines and getting chopped up into sausage meat! What a stupid muff you are! Don't you know that's the way to be sick, stewing down below like a baby? What are you afraid of? Come up on deck and have a jolly blow. Do you hear?"

I crept forth as willingly as a snail leaving its shell; then no sooner were we out of the good woman's sight than Gooderidge caught me by the scruff of the neck, and, shoving and shaking, roughly bundled me up the hatchway. Perhaps he thought it rather friendly of him thus to drive me into playing the true British tar, but for my part I was ready enough to face any amount of winds and waves that would keep him at a distance. For the moment, however, he offered me no further harm, as other mischief was now afoot for him to meddle in.

Meanwhile the fun on deck had begun to grow fast and furious. The captain, as he afterwards told me, had youngsters of his own at home, and was not the man to be too hard on juvenile high spirits. But soon he found the pranks of this mob of urchins getting to an unbearable pitch. He used some threats which were not altogether earnest, but which the boys took all in joke, and became more and more uproarious. When they went so far as to imitate his voice, giving orders, and puzzling the men on duty, the worthy skipper naturally lost his temper. He peremptorily ordered the whole troop below, and as they did not at once obey, was for turning the hose upon them to clear the decks. This threat proved effectual, and down they crowded into the stuffy little saloon.

Then it was the steward's turn to be driven wild. He and his minions pre-

sently took to flight, after locking up their pantry and turning down the lamps. The two grown-up passengers, seeing what they must expect from such a bear-garden, had barricaded themselves in the smoking-room on deck. We youngsters had all the saloon and cabins abandoned to us to riot in as we pleased. At first we contented ourselves with singing songs, such as "We won't go home till morning" and "The Mariners of England," roaring out the choruses at the pitch of our voices, and drumming a vigorous accompaniment on the tables.

"Rule Britannia! Britannia rules the waves!
Britons never, never, never shall be slaves!"

"I'll be hanged if some of 'em aren't!" I heard the steward's boy muttering gloomily to himself at the door as these patriotic strains came to an end.

The French fellows, naturally not taking so much interest in our favourite melodies, began for their part to dance, and capered about as well as the narrow space would allow them, to the infinite scorn of the Eton young gentleman, who still stood aloof from the common herd of us with his collar unruffled, looking as if nothing could have tempted him to make a fool of himself. But even he joined in when a pillow fight was started. The boys rushed out of their cabins, bolstering away at each other pell-mell in the dim light of the saloon. There was a crash of broken glass, and the steward came down to see what pandemonium had broken loose, to be pelted out again by a volley of his own dumpy pillows.

The poor man might well rage, but that was no good; then he took a suppliant tone, begging us to go quietly to rest, warning us that dreadful things would happen if the captain came to know of our doings, hinting at the danger of a collision—what would become of us in that case if they were forced to put out all the lights and leave us in the dark? The ringleaders of the disturbance had grown too much excited to listen, though now some of the more steady ones began to slink off, seeing how things were like to go too far.

"Come, young gentlemen, do turn in! Captain says there's a storm brewing, and some of you will be singing to another tune to-morrow morning if you don't take it quietly."

"Toss him in a blanket!" was the cry, and the steward once more took to flight, as fast as his fat would let him. It would indeed have taken a good many

hands to toss him in a blanket—fifteen stone of him at the very least!

But the fancy had taken hold of Gooderidge and certain kindred spirits, and nothing would serve them but tossing somebody in a blanket, to the dismay of myself and other small fry, who readily foresaw the part we should have to play in this amusement. I was one who tried to make away at the first word of it, but Gooderidge had his eye on me and cut off my retreat. Forgetful of his doctrine about fellows of the same school standing by each other, my playful tyrant generously offered me as the first victim, and the proposal was hailed with a shout which sent my heart into my boots. It was not the first time I had been tossed in a blanket, and naturally I did not like it.

Nobody spoke a word for me now; my Bluecoat protector had retired for the night, suspected of being prematurely sea-sick, to the great scorn of the rest. A blanket was quickly dragged off one of the bunks. Half a dozen rough hands caught hold of me and bundled me into it, struggling and kicking in vain, while the other small boys stood by, not so much pleased to be spectators as trembling to think that their turn might come next. Finding resistance useless, I shut my eyes and prepared to go through the disagreeable ordeal as bravely as might be; dignity was out of the question.

"Now, then, all together!" cried Gooderidge, in high glee over this congenial sport. "One, two, three, and off!"

Luckily for me it was not much of a blanket, nor was there room enough to perform the operation properly. All the good or bad will of my tormentors only succeeded in jerking me up a little way, and sending me sprawling sideways in a heap on to one of the saloon sofas. Then as soon as I had got over the confusion and alarm of the fall I became aware of a terrible voice commanding order. The captain had burst in just at the nick of time for me, and was vehemently addressing himself to the biggest of the roysterers.

"You ought to be ashamed of yourselves. Why, my youngest baby that isn't six months old would know how to behave himself better on board ship."

There was an attempt at a titter, but it broke down before the irate looks of the skipper, who was clearly not to be trifled with.

"To your cabins, every man Jack of you! Steward, put out the lights in five

minutes, and if one of these youngsters shows his nose out before morning just report him to me, and I'll teach him to obey orders."

"I don't want to go to bed yet," protested one of the biggest and noisiest of the band.

"You don't!" exclaimed the captain, making for him like a whirlwind. "You'll go this moment, my fine fellow, or I'll have you clapped in irons for the rest of the voyage. Take your choice, then."

Fairly overawed, the would-be defier of authority turned tail and slunk off, and the rest were not sorry to imitate his example. The exuberant spirits of most of the band had been pretty well worked out now, nor were the boldest of them without some notion of the power of a captain on board his own ship.

"Send a couple of hands aft here," was the last thing we heard him say, whereupon there was a general rush to the cabins, and at last we all saw fit to turn in. The steward presently came round and turned out our lamps, leaving us to

finish our undressing by the faint moon-light which came through the portholes.

With some misgivings I repaired to my place beside Gooderidge, not sure what he might please to do to me now that we were alone. But, to my great relief, I found him before long too sleepy to be very troublesome. Having crunched a large captain's biscuit with which he had provided himself by way of supper, he made me pull off his boots and tuck him into the most comfortable berth, after trying them all; and he told me,

"Now, youngster, be sure to be stirring early and get me some hot water from the steward. I am going to shave, if it's not too rough."

"Very well, Gooderidge," said I, meekly.

"And don't you go and be sick down here, or I'll give you something to be sick for. Do you know what's the best cure for sea-sickness?"

"Lying down, isn't it?"

"Not a bit of it. A rope's end! So you look out and let us have no sham-

ming, unless you want me to doctor you."

I climbed up to my shelf above him, fearing that I was going to have a bad time of it. Once more Gooderidge made a remark by way of good night.

"No snoring, remember, you little brute!"

Before long his own loud breathing, which I should not have liked to call snoring to his face, showed that he was fast asleep. I lay awake for some time longer, disturbed by all the unfamiliar sounds of the vessel, the trampling from time to time on deck, the hoarse cries of command, the striking of the bell, the creaking of the timbers, above all the ceaseless grinding and thumping of the screw that thrilled through the cabin at every stroke. I did not feel at all sick as yet, but I was terribly afraid I should before long; and then to be at the mercy of a fellow like Gooderidge! But in the end these noises acted as a lullaby, and I slept pretty soundly through my first night at sea.

(To be continued.)

AUSTRALIAN EXPLORERS.

ERNEST GILES.

IT is a curious fact, to which much attention has not yet been devoted, that all round the world, both in the northern and southern hemispheres, a tract of desert shuts off the torrid from the temperate zones. The patches of desert do not quite follow the latitude lines, but they divide the climates. On the northern line we have the Sahara, the Arabian Desert, and the desert of Central Asia, to which so much attention is now directed, and which on the older maps used to figure as Shamo or Gobi. On the southern line we have the Kalahari Desert and the desert of Central Australia. America affords no exception to the rule, for we have there both the northern and southern tract of desert land.

There was a time when the Sahara was thought to be the only desert worth mentioning, and from desert having been found along the Mediterranean and also to the north of the Orange, it was rashly assumed that all the interior of Africa was a sandy waste. And this impression has not yet been entirely removed, for there are hundreds of people who still believe that the magnificently fertile country now governed by the International Association of the Congo is almost as sterile as the Great Desert of the north. As regards Australia, too, a similar error prevailed, and it is only of recent years that the desert boundaries have been defined, and that the interior has been found to be by no means so uninhabitable as the early settlers were led to imagine.

Australia, however, has a good deal of desert land, particularly in the west, and the sufferings and adventures of the explorers who have gradually shown us its limits form some of the most interesting episodes in the annals of this generation. In the exploration of Western Australia the first place is undoubtedly due to Mr. Ernest Giles, whose portrait we give herewith, who between the years 1872 and 1876 led five great and important expeditions, to say nothing of several minor surveys in the western half of the Australian continent.

He was born at Bristol in 1835, and was educated at the Bluecoat School. On reaching Australia he began the roving life which

in those days was so common, and for months together hunted and dwelt with the aborigines, gaining an experience of bushcraft that was afterwards to prove invaluable. His first exploration was entered on at the suggestion of Baron Mueller, and in 1872 he started for the west from Chambers Pillar.

In our quick-moving colonies a map grows out of date in a dozen years, so that the starting-point near Charlotte Waters Telegraph Station has not yet got into many of our school atlases. It is, however, almost in the centre of South Australia.

The expedition was out six months, and the one that followed it very much over the same district was away for a year. During these two expeditions, for they are best considered together, the party was over and over again attacked by the natives, and frequently

reduced to the verge of starvation. The Glen of Palms, Mount Olga, Lake Amadeus, the Musgrave, the Alfred, and the Marie Ranges were discovered, and the arid country round them traversed for miles and miles and found unfit for settlement. Many of the discoveries read like a fairy tale. We have a long, bare,

sterile tract, and then on the horizon there rises a gentle eminence, which on being approached proves to be a smiling oasis, with picturesque hills and pleasant dales, and rocky gorges with running streams and waterfalls, bounded by green pasture lands and flowing by banks gemmed with exquisite flowers, and then in a few miles the desert again. Twice did the explorer nearly lose his life from starvation. On the second expedition with one of his men, by name Gibson, he made a daring scout of some two hundred miles from his main camp, and in consequence of the heat, the death of the horses, and the shortness of water, was landed in extreme difficulties. Only one horse survived, and this Giles sent back with Gibson to fetch the water-kegs they had left at a depot thirty miles away, while he plodded thither on foot. Gibson was lost, and was never heard of again, and Giles found his way back unrelieved. His last march took him seven days; for five of them he was without food.

On his third expedition he was away six months, and penetrated into the desert region for two hundred and twenty miles. His horses all died, and the party was almost maddened with fatigue, privation, heat, and thirst. On the fourth expedition, in 1875, he penetrated from Port Augusta, at the head of Spencer's Gulf, to Perth, in Western Australia, a journey of nearly two thousand five hundred miles. Instead of horses he took camels, and nothing but their wonderful endurance enabled him to get through. He found no country available for settlement. Very much to the contrary! In his journal he writes, "The silence and the solitude of this mighty waste were appalling to the mind, and I almost regretted that I had sworn to conquer it. The only sound the ear could catch, as hour after hour we slowly glided on, was the passage of our noiseless-treading and

spongy-footed ships as they forced their way through the live and dead timber of the hideous scrubs that environed us."

On the sixth night one hundred and forty miles from Ooldabinna no water had been seen fit to drink. Next day a plot of burnt spinifex was reached, and recent tracks of two natives seemed to promise that water was not very far off, and in the afternoon it was met with, but in small quantity, at what is now known as Boundary Dam.

The camels escaped during that night, and it took till noon next day to recover them. About forty miles farther west a similar salt lake system was found to that previously passed, and at one hundred and ninety-five miles from Ooldabinna on the shore of another salt lake they turned back. There was no water of any kind to be got; the only horizon that could be seen was about fifteen miles distant, and was simply an undulation in the dreary scrub, and was covered with the usual timber in which this region is enveloped—that is to say, a mixture of *Eucalyptus dumosa*, casuarinas, a few *Grevillea*, pakea bushes, and leguminous trees and shrubs, such as mulga and a kind of silver-wattle bush, from the latter order of which trees and plants the camels find their sustenance. Two stunted specimens of the native orange-tree (*Capparis*) were seen where two casks were left ninety miles from the dépôt. On 22nd August Giles was back at Ooldabinna; and it began to rain just as he reached it.

On August 24 Giles started again for Boundary Dam, and thence struck straight away for Perth. "We had no conception how far we might have to go, nor how many days it would be before we might next come to water; but we left our friendly little dam in high hopes and excellent spirits, as we also hoped, as well as water, to discover some more agreeable geographical features than

had yet fallen to our lot. I had set my own and all the party's lives upon the cast, and would run the hazard of the die, and I may say that each person at starting into the unknown displayed the greatest desire and eagerness for the attempt."

They found no water for three hundred and twenty-five miles, and then owing to a dispute with the man who was steering Giles bore a point or so to the southward, and happened to strike on Queen Victoria's spring in the centre of a small oasis. The sterile waste around is now called Queen Victoria Desert, and the oasis boasts quite a crop of herbs and plants sprung from the seeds that the expedition sowed as they rested there. The next resting-place was at Ularring, in latitude 29° 35', longitude 120° 31', where they were attacked in great force by the natives. The blacks were, however, ignorant of firearms, and were fortunately discovered before they got into the camp. The escape was a close one, as there was only just time to seize the guns as the long line of aborigines came rushing from the scrub.

On the 26th of October Mount Churchman was sighted, and when the first shepherd from the west was met with, their reception was that accorded to the mysterious shapes in the ghost stories. The man thought they had come from another world. Finding that they had really crossed the desert from South Australia, he welcomed them "in the name of the entire colony," and a triumphal procession began which only ended at Perth. The fifth great expedition was three hundred miles longer, two thousand eight hundred miles in all, back from Perth to South Australia by a more northerly route. Here again the track lay through the desert, and at one time the march was pressed on for ten days without finding water. At Perth Giles had had a most cordial reception; at Adelaide he re-

ceived a public welcome, for the work he had done was immense considering the difficulties.

"It is not," as he says, "the explorer that makes the country," and the route which yields fewest discoveries is that which has most hardships and requires most pluck and management to surmount them. And it was not only in Australia that his merits were recognised. In 1880 the Royal Geographical Society conferred on him its Founder's Medal; and the statement of the fact in the Earl of Northbrook's presidential address for that year will form a fitting conclusion to this article.

The President said:—"The Council of the Royal Geographical Society are anxious, in distributing the gold medals, to take into their consideration the geographical discoveries in different parts of the world, and they are especially anxious to give every due weight to the claims of explorers in the British colonies. I have great pleasure in announcing that the Founder's Medal will be awarded to Mr. Ernest Giles for having led five great expeditions through the interior of Western Australia in the years 1872-76, during which 6,000 miles of route were surveyed, and 20,000 square miles of new country discovered. Mr. Ernest Giles has performed eminent service to geography in having led expeditions which have traversed the whole western interior of Australia—from Adelaide to Swan River, and from Champion Bay to the central line of electric telegraph. He has also carried out numerous minor, but not less important, explorations. The value of his services has been testified to by our successive presidents in their annual addresses from 1873 to 1879. The interesting paper in which he described his journey from South to Western Australia in 1875 is published in the journal of the Society for 1876."

THE TROUT, AND HOW TO CATCH IT.

BY J. HARRINGTON KEENE,

Author of "The Practical Fisherman," "Fishing Tackle, and How to Make It," etc.

PART XI.

THE primary thing to do in trout-spinning is to drop the bait in the water so silently that the feeding trout may not be startled, but look upon the bait as a matter of course. To be able to do this at the end of a twelve-yards cast requires some little practice, and it is best, therefore, for the beginner to follow the advice given in reference to fly-casting—namely, practise constantly on the grass ere he trusts himself to the trout stream. As with fly-fishing, it is necessary to always throw up and out, and not down, unless under exceptional circumstances. Always fish the nearest water, and then extend your operations in a radius from you. In low, clear water the sport derivable from spinning is in my opinion equal to that of the fly, but in water which is coloured the fish are taken at a complete disadvantage, and though the reel on your back becomes rapidly heavy, I am inclined to discount this fact by saying that the method is not nearly so sportsmanlike as it was when the stream revealed because of its lucidity all the particulars of your bait and tackle. It is always an axiom that the more you handicap yourself the more acute is the genuine reason for self-laudation when the fish is caught. Who, for instance, would care to use a natural fly when the artificial of one's own manufacture is capable of killing? and who would trimmer or set a night-line even for the voracious pike when there was the opportunity for capturing him on a rod and line by your own personal devices?

In selecting your minnows for bait let it always be borne in mind that the medium

and smaller-sized ones are always better than the very large ones. Of course it is well to keep them as naturally as you can, and for that purpose a minnow-can is indispensable. A very useful form of this appurtenance is that shown in Fig. 11, invented originally by Mr.

Fig. 11.

Alfred, of Moorgate Street, I think. A is an outside receiver, B a perforated zinc internal receptacle in which the minnows are placed, of course water being added. The advantage of the arrangement is plain. B can be taken out and stood in the stream

whilst you are fishing, and so your minnows are kept fresh and lively for any length of time.

It has already been explained that the actual employment of live bait is objected to on the ground of cruelty; and the reader has already been told how to kill both worms and minnows. Now there are various expedients for keeping them fresh when dead. Some anglers sprinkle them over with dry salt, and others preserve them in glycerine or boracic acid; others believe in spirits-of-wine; but I have discarded all these in favour of "King's Preservative." I have not the remotest idea what it is composed of, but as its maker, Mr. King, 1, New Road, Commercial Road, is a very clever practical chemist as well as an angler, you may depend it is by no means dangerous to handle. It will keep baits unspoiled in look for months, and as it is portable and easily mixed it is quite a boon to the travelling fisherman. The price is quite nominal.

The pace at which you should draw in your line after delivering it varies, of course, with the rapidity of the stream and the sort of weeds and bottom as well, and this last but not least, on the colour of the water. With very small minnows and light tackle you may sometimes cast overhand as if you were throwing a fly, with great advantage, but as a rule it is best to cast from left to right, and *vice versa*. In spinning I always take the rod in my right hand, and work the line with the left, and this seems on the whole the most convenient method of doing it, unless, of course, you are entirely ambidextrous or

left-handed. Of course, if you are wading it is worth while to so arrange what you are carrying that it may in no case get in the way. To this end a basket which will contain the fish and whatever tackle, etc., you require, and yet remain on your back in an easy, accessible position, is a most desirable addition, and I think there is no better design than that figured in the illustration, Fig. 12. A is the bag to contain tackle,

Fig. 12.

refreshments, etc.; B is the basket; C C are the straps, which I would counsel should be made rather broader, and of stout webbing—not of leather, as shown. To either of these straps the landing-net should be

attached by means of a hook and ring. A common brass tenter-hook will do, but it should be deep enough in the bend to render it unlikely to slip off; a large curtain-ring will serve to receive the landing-net, somewhat as shown in the accompanying engraving. When a fish is hooked all one has

Fig. 13.

to do is to reach round and withdraw the

landing-net from its support. A good large net is always more serviceable than a small one, however neat the latter may look.

There is no substantial difference between fishing with the natural and the artificial minnow. When the fish takes you, you must strike smartly in each case, and it is well, if the trout seem to be on the feed, to keep a few fresh baits free, so that you may not be delayed by the long process of extracting three or four hooks from its mouth. A very convenient way of keeping each flight and bait separate and handy is to arrange them in a tin-japanned box—all tackle-makers keep them—coiling the attached gut in the little partition (see Fig. 14). There is no pos-

Fig. 14.

sibility of their getting out of gear, and the delay is very trifling; whereas if you keep them in any other shaped box some annoying hitch is sure to occur just when you do not want it to do so.

(To be continued.)

BOYS' PETS, AND HOW TO TAME AND TRAIN THEM.

By GORDON STABLES, M.D., R.N.

II.—CATS, PARROTS, ETC. (continued.)

Teaching Cats to be Honest.—This can only be done by feeding them well, and being altogether kind to them. Cats do know the difference betwixt *meum* and *tuum*, whatever any one may say to the contrary. What you have to do, then, is to make it worth their while to respect that difference. Let the cat be with you when at meals—I do not object to one on the table; keep a tiny morsel of whalebone, and if a paw is outstretched towards a dish, chastise her firmly, warningly, but not angrily. Do not send her away, she will only go and sulk and think hard thoughts of you. Let her remain, but remain still till she be fed. Feed her liberally. N.B.—A starved cat is never a good ratter or mouser.

Never chastise a cat immoderately, else the fright will make her forget what the punishment is for, and she will end by looking on you as a brute.

Begin her real training when about three or four months old.

She ought to learn what is useful as well as what is amusing. I will describe a few of the tricks that cats may be easily taught.

1. **Leaping Heights.**—Cats are naturally fond of fun, especially when young. Get her a hare's or rabbit's foot on the end of a string as a toy, and also an indiarubber ball. Tie the string to the end of a rod or piece of stick, and encourage her to jump for it. Give her this exercise every day; it strengthens the ham muscles, which in time get so developed that she can spring extraordinary distances.

2. **Hoop Tricks.**—These are endless. You may get her easily enough at first to jump back and fore through your arms held like a hoop, first in front of you and very low, then higher and higher, then at either side of your body, then over your shoulder, and finally held over your head. Next you substitute the hoop, held in the same fashion, low at first, then higher, and from side to side.

N.B.—It is well to reward the cat after her lesson has been successfully gone through.

For this purpose there is nothing better than a morsel of boiled lights or liver, or a bit of fish. In towns you can generally get horse-flesh, and of this pussy is very fond indeed.

You may afterwards have a succession of hoops hung in some outhouse, as a sort of cat's gymnasium, and really the fun to be got from such an arrangement is very great indeed.

3. **Retrieving.**—This is best taught with a rabbit's foot, and on the room floor. There is no difficulty in teaching this amusing accomplishment, but it needs patience and time to perfect her in it.

4. **Teaching Attitudes.**—You must put or place the cat in the attitude you wish her to retain at word of command, and, with up-lifted forefinger, forbid her to move till told. Then reward her. The attitudes may be standing up in a corner, standing to beg, lying "dead," standing on the backs of two chairs, etc. But remember the lessons should always be given in the room when the house is quiet and there is nothing to attract her attention.

5. **Fishing and Swimming.**—These are accomplishments which country cats only have an opportunity of learning. Cats are naturally fond of fish. To be sure, they object to wet their feet or soil their fur on ordinary occasions, but if a trout is to be the guerdon they do not think much of either fur or feet. To teach swimming and fishing, you need to have minnows—artificial will do, or dead ones. I do not approve of torturing poor little fishes to train a cat in tricks.

6. **Cats and Birds.**—No matter what the birds are—whether pigeons, canaries, doves, or foreign birds—if a cat is well fed and well cared for, and is brought up to respect these as her master's property, she would no more think of touching them in his absence than she would of eating live coals out of the grate.

7. **Teaching a Cat to Keep the House at Night.**—For her own and your own sake, pussy should never be a midnight prowler. She will often wish to stay out later than is

advisable, but if you make a practice of giving her supper—a good one—last thing of a night she will always come in for it.

8. **Teaching a Cat to Follow like a Dog.**—This is easily done, but in order to insure her safety from dogs, before you venture to entice her into the road or street you must teach her to jump upon your shoulder whenever told to do so. If then in her walks abroad with you some gentleman of the canine persuasion attempts to "go at" her she will immediately come home to your shoulder for safety. Many other tricks will suggest themselves to you; it will indeed be your own fault, and a proof of your want of perseverance, if, possessing a nice young tabby, you do not in a very few months render her a very accomplished cat indeed.

Parrots.—Now then, Polly, it is your turn. I have had this kind of bird before—the West Australian cockatoo, all white nearly, with hardly any crest, a bold, audacious bird, but affectionate enough at most times.

He is exceedingly fond of music, a very good talker, a capital mimic, a bit of a wag, laughs and dances, and sings songs (words and music). He can also ring a bell, play a little hand-organ, beat time to a tune on guitar or violin, and do a great many other amusing tricks.

How was he taught all this? Through kindness chiefly. He is barely five years of age. I do not know what he may be if he lives for a few years longer; probably a member of Parliament or a cheap jack. Polly is fit enough for either. He can make a speech already, and calls fowls, mimics the chasing, catching, and killing of them, and then puts them up for sale at half-a-crown each, just a shilling lower than market price, but then Polly does a *roaring* trade. Now, all birds of the parrot kind take to talking and mimicking sounds of various kinds quite naturally. They do not need their tongues cut with a crooked sixpenny piece, as some silly folks believe. When strangers hear

my favourite cockatoo talking and carrying on in his inimitable fashion they naturally give me, his master, the credit of being a very clever man. But I certainly do not deserve so flattering an encomium on Polly's account, for I do but use ordinary judgment in my treatment of the bird; in every other way he has taught himself. Let me analyse this teaching; it will give you hints.

Well then, first and foremost I got to understand the poor fellow. I felt sure that he meant no real harm by his determined attempts to deprive me of my nasal organ, or hook out one of my eyes, and I felt sure also that the sooner I could teach Sir Poll to believe that I meant no harm, and was really and truly not a bad fellow at heart, the sooner we would be able to get on well together. So I never lost my temper, even when he cut my finger. I fed him regularly and well, and gave him clean water every day, and drops of tea and milk from a spoon, also hemp, which his soul loveth, and as an occasional treat the pick of a fowl-bone. The result is that while to every one else in the world Poll is a perfect eagle, I can put my hand into his cage and shake hands with him, smooth him over the wings or under the wings, and even lift him up. In his cage even yet he is at rare times an eagle even to me; out of his cage sitting on my finger, my shoulder, or on the table in front of me while I write, he is an angel on a small scale. "Give me a kiss," he says, whenever he gets out, and I am not afraid to put my lips to his great beak, though if so minded he could cut me as if with a large pair of scissors. The slender-billed cockatoo he is called, but so strong is this beak of his, that, without any exaggeration, he could trim the gooseberry bushes with it.

But about the ringing of the bell. Well, that is easily taught. Poll will pull any string he sees handy, and he has, moreover, a little portable bell that he shakes about much to his delight and rattles along the bars of his cage. Sometimes he pulls the tongue out of it, another proof of the power of his beak.

When he gets on to the table he is never satisfied until he pitches everything into the middle of the floor—pencils, pens, letters, letter-weights, and the ink-bottle too, if I do not watch; then he settles down to make love to his master.

I must say no more about him now, but please remember that parrots or cockatoos can only be taught well by those who love and thoroughly understand them. There is no occasion to talk from behind a screen or door, only say what you wish your bird to say slowly and distinctly, and always attach the real meaning thereto. Call breakfast—breakfast, and supper—supper; don't say "Good morning" at night, and never give the bird any food without having a little conversation about it.

As for the tricks of cockatoos, there is no end to them, and they always suggest themselves. For example, Sir Poll had a habit of seizing the large brass bell-like handle on the top of the cage, and walking round with it like a horse in a mill. "If you can do that, Polly," I said, "you can turn a little hand-organ." And so he will.

Now I feel perfectly convinced that I possess the secret of teaching all tameable animals tricks suitable to their shape and capabilities. It is possible that I may be more *en rapport* with animals than some others are. Well, I love them; and because I do love them I thoroughly understand them, and I very soon get them to love me. That is the first part of my secret. The next thing I do is to get the creature I am training to understand the various intonations of my voice, and to associate it with words.

Next I watch the natural movements of the bird or beast. In these I find my raw material for working up into a pretty and effective trick. I will give you an example or two. My last pet cockatoo was fond of lifting and throwing about things that rattled.

I got him a toy tin railway-truck, and filled it with nails, and told him to empty it. This was done very satisfactorily; and Polly, or Cockie, as I called him, soon learned to reload his little truck. But he did it so methodically that he positively seemed to count them. They were those short, thick nails used for nailing up wall-fruit, etc.

But of his very methodicalness I also took advantage. I taught him to say "forty-two" after taking the nails all out, and I always put forty-two nails in the truck. When, therefore, Cockie was showing off in company, after he had counted out his nails I would ask any one in the room to prove whether the bird was right or not. Meanwhile I palmed a nail. Only forty-one were counted therefore, but while this was being done Cockie would be stepping about the table repeating the words "forty-two, forty-two" in the most decided of manners. I then managed to slip the "palmed" nail back, and asked some one else to decide. This would be done, and result in a triumph for Cockie. Then Cockie would laugh, and every one else would laugh; and the more every one else laughed, the louder laughed Cockie, till the house was like a bedlam.

This bird used to dance round and round to the sound of the fiddle till his head grew light; then he danced back in the opposite way to bring it right again. While dancing he used to emit a "whoop!" like a wild Irishman, that never failed to bring down the house.

One other example. A tame white rat I had was fond of appropriating pretty things and carrying them into her cage. I made a trick of this. I used to arrange on the table a large semicircle of apples, potatoes, pill-boxes, silver spoons, thimbles, and silver coins; then, "Now, Mary," I would cry, opening her cage-door, "see how quickly you can clear the table."

It was wonderful. In less than a minute everything was inside.

Of course all animals expect a tit-bit after they do a successful trick. But virtue may be made its own reward, as in the case of birds drawing for themselves water and seed.

If I am spared, and that cockatoo is spared, I will make it one of the most accomplished tricksters in Europe. So you may expect to hear a little more about him at some future day.

Now I have told you wherein my pet-taming secret lies. You can think upon it and enlarge upon the idea in any way that suits you.

NAMES OF SHIPS IN THE ROYAL NAVY.

By ODO W. FORD.

I.

"WHAT'S in a name?" is so very well-worn a quotation to readers of all tastes and ages that I fear I may hardly be excused for inflicting it upon the readers of the *BOY'S OWN*. Perhaps the subject may be the best apology, as it certainly will, on reflection, furnish a decided answer to the time-honoured query. A great deal is in a name for a ship of the Royal Navy; so think alike its admirers and its critics, so doubtless think the millions who follow with keen interest its movements and achievements all over the world; the same feeling pervades the breasts of Jim Spanker and Jack Spun-yarn, A.B.'s, who are as proud of the history of our Warspites and Temeraires as any of us, and would much prefer a cruise in the Achilles or Nelson to one in a Captain or a Eurydice—that is, supposing these latter names of sad memory had again been inserted in the Navy List.

That there is something in a name is, too, the opinion of my Lords of the Admiralty and their official advisers, who give careful

consideration to the christening of every fresh monster and ugly duckling a long time—often years—before the bottle of wine is broken on her sides as she slides into her native element. The names are generally proposed or suggested by the Controller of the Navy, and settled finally by the First Naval Lord, or by the First Lord himself. A list is kept of all old names unappropriated, and as soon as an old ship is sold or broken up her name is added to this list. Sometimes one of the old names is selected, sometimes an entirely new one.

Every ship in the Royal Navy gets her name before she really exists. As soon as the Constructor's drawings and "legend" are approved, and the building commences, the question of the name is decided. Thus H.M.S. Inflexible figured in the Navy List and was talked of while as yet there was none of her, and the Devastation's big sister was dubbed the Fury, and then again the Dreadnought, long before she took the water at Milford Haven. When, as is the case from time to time, a ship, already built, is purchased for the Navy, a new name is usually assigned to her. The Mareotis and British Empire (purchased about the time the Russians were pounding away at the Plevna earthworks defended by Osman Pasha) became H.M.S. Tyne and Humber, the big Brazilian ironclad Independencia became H.M.S. Neptune, and the three Turkish ironclads purchased during the same war in 1877-78 (whose original names I will not venture on) became respectively the Superb, Orion, and Belleisle. There was an Orion, by the way, which fought at Trafalgar, under Captain Codrington.

Very appropriate was the change of name of the whaler Bloodhound, purchased to take part in the Arctic Expedition in 1875, and renamed the Discovery, though now filling the inglorious but useful rôle of a store ship for home service—work for which she is as well fitted as for buffeting the ice-floes in Melville Bay. This, again, is an old name revived, for many will recollect that Captain Cook made his third voyage in the Resolution accompanied by the Discovery.

Looking through the list of our gallant ships, we may observe many names famous in history in fighting, adventure, and discovery renewed in the armour-clads and swift cruisers of the present. We still have an Agamemnon, a splendid ship of 8,500 tons, clad with 18-inch steel-faced armour, and carrying four 80-ton guns, a new ship, which has just left for China, and will be the most powerful ship ever seen there, a very different craft from her namesake of Nelson's days (which was commanded by that hero himself, when a captain, at the siege of Bastia, and at Calvi, in Corsica, in 1792, where he lost an eye), or to the Agamemnon which assisted in the siege of Sebastopol. Once more we have a Warspite, an Imperieuse, a Rodney, and a saucy Arethusa. And have we not again a brave old Temeraire?—although the second adjective does not apply, for she is the first of the new type of "barbette" ships. The title of "Fighting Temeraire" she has, however, earned, having taken part in the bombardment of Alexandria. We still have a Lion in the British Navy—a training-ship for boys at Devonport—as we had a *Lion* in the days of Charles II., which assisted in the third Dutch war at the action in Southwold Bay on May 28th, 1673, and suffered severely at the hands of that stubborn old sea-dog De Ruyter.

Who does not remember the Pelican, the tough little craft in which the brave old Elizabethan hero Sir Francis Drake circum-navigated the globe? The generation of schoolboys has not yet arrived in whose hearts (once having read the tale) the memory is not green of that little vessel and her sturdy skipper, and the Admiralty perpetuate her memory in the sloop Pelican, which for the last five years has carried the

white ensign in the Pacific, visiting doubtless some of the very spots where Drake cruised in her namesake, and "went for" the Spaniards wherever he found them. Much is there in names like this, and we cannot preserve too many of them as memory's links with that glorious period when our gallant seamen furnished the material for a stirring chapter in England's naval history. Our Pelican reminds us too of that curious scene on board Drake's Pelican, when, having returned to Deptford after her long cruise, Queen Elizabeth came down the river and knighted him on board his ship; and then it was, as an old writer tells us, that so great was the crowd which thronged to see this famous crew that a bridge of planks which had been laid between the ship and the shore fell, carrying with it one hundred men, "who notwithstanding had none of them any hurt, so that ship may seem to have been built under a lucky planet."*

Names with the prefix "Royal" the Navy has always shown. When the Dutch took such advantage of our neglected armaments in the reign of the Merry Monarch, and, sailing up the Medway, destroyed Sheerness, they burnt among other ships a Royal Oak, as well as the Loyal London and Great James, and carried off the Royal Charles, a first-rate ship of 100 guns. They even threatened London itself we find, for the inhabitants, fearing a similar fate to that of the great city's namesake, sunk a dozen ships in the Thames off Woolwich and some more at Blackwall to stay the Dutchmen's advance. This exploit of the famous Admiral De Ruyter was the greatest insult ever offered to the British Navy, but one of which the Dutch were, of course, as proud as the English were ashamed. I well recollect seeing but a few years ago among a collection of Dutch and Flemish pictures in a sale-room in London a rare and curious old engraving, having in the centre portraits of De Ruyter and De Witt, surrounded by pictures of their sea-battles, among which the above event has a prominent place. A black and disgraceful record in our naval annals.†

There was, it seems, a Royal James which blew up in the fight at Southwold Bay (there is a picture of this fight in the First Lord of the Admiralty's house at Whitehall), and a Royal Charles which about the same period carried the flag of the Duke of York (afterwards James II.) and took part in the defeat of the Dutch after the exploit in the Medway. And all my readers know the Royal George of a century later and her sad fate—

She sprang no sudden leak;
She struck upon no rock—

but turned over and sank while being careened at Spithead, with Admiral Kempenfeldt and 900 men on board. Pieces of her keel are still to be seen in some of the royal dockyards. We have still a Royal George, be it observed, though she is not in active service, being merely a "receiving-hulk" at Portsmouth. We have also a Royal Alfred, a Royal Oak, and a Royal Sovereign, all armour-plated ships, though such is the rapid march of events in naval construction that they are all practically obsolete, and will probably "stick to their port and never go to sea," until finally they are reduced to vulgar fractions by the ship-breakers.

Apropos of the Royal Sovereign of our day, I find the following in the same old work in a chapter on Chatham:—

"The Expedition that has been Sometimes used here in fitting out Men of War, is scarce credible; for the Workmen told us, That the

* Drake changed the name of his ship as he sailed through the Straits of Magellan. The Pelican then became the Golden Hind. See Article on "Drake," page 139.

† A curious old work (*temp.* George II.) says:—"At that time all was left ungarded, and there were but Four Guns that could be used at *Upnor*, and scarce so many at *Gillingham*, the Carriages being rotten and broken; and, in a word, everything concurring to invite the Enemy."

Royal Sovereign, a First Rate of 100 Guns, was riding at her Moorings, intirely unrigg'd, and nothing but her Three Masts Standing, as is usual when a Ship is laid up; and that she was completely rigg'd, all her Masts up, her Yards put to, her Sails bent, Anchors and Cables on board, and the Ship sailed down to *Black-Stakes* in Three Days, Sir Cloudesley Shovell being then her Captain."

(To be continued.)

Correspondence.

H. SMITH.—Thank you for your essay on astronomy, which we have read with interest.

520.—Read our articles on Model Yacht Building before you begin. You will find that beam and depth have no fixed proportions. To get stability you must have either one or the other, and you can take your choice between a broad boat or a deep one with a heavy lead keel.

FIDDLER.—Consult a Post Office Directory. There are several shops in Soho where you can have your violin repaired.

W. E. POTTER.—Wood for fretwork can be obtained in your neighbourhood from Melhuish, in Fetter Lane; or Churchill, in Sun Street, Finsbury.

TUBAL CAIN.—Perhaps an advertisement in two or three of the local papers in the Pottery districts might help you.

HIGH ADMIRAL FEATHERBED.—The article on "Ham-mocks and all about them" was in page 581 in the second volume—the monthly part for July, 1880.

LEONARD.—The articles on Cardboard Modelling were in the fifth volume.

WORMBOOK.—The "Wreck of the Medusa," with the coloured plate, was in the November part for 1883.

MATER.—Send your son to a drawing class in connection with the Science and Art Department. The charges are merely nominal, and the instruction the most suitable and practical that can be given.

A MANX BABY.—Buy a shilling book on etiquette, and work out the problems for yourself.

A PERPLEXED READER.—Unless you have a gift for teaching, give up all thoughts of becoming a school-master. To say nothing of your life being a misery to yourself, think of the sufferings of your pupils!

ANIMATED PERIWINKLE.—The winkle had lost its inside, and refused to perform, so that we are unable to report.

A BOY.—There is a guide to step-dancing published by French, of the Strand; but a sailor's hornpipe will never be learnt from a shilling book. You must be taught personally.

D. BARNES.—Astronomical telescopes always reverse the objects. To fit yours for land use you must add a reversing eye-piece.

S. A. W.—To clean a saddle wash it with yellow soap, but do not wet it too much. When it is dry polish it with rather a hard brush and a little beeswax. The best plan is to rub the brush with the wax, and then brush the saddle until you get the polish. If you put on too much wax the leather will be sticky.

R. A. D.—The close time on the Dart for trout is from October 2nd to February 28th. The licence duty is two shillings per day or ten shillings per season. On the Severn the close time is from September 1st to June 15th; and the licence duties are one shilling for rod and line, seven shillings for net, fifteen shillings for cruive, and five shillings for night lines. Nearly all the Scotch rivers are closed for salmon from November to the end of February.

FOREMAST.—The yacht that won most money in 1884 was the 68-ton cutter *Marjorie*, her amount being £922. The next on the list was the yawl *Lorna*, £905; the next the 40-ton *Tara*, £867. The *Genesta* came fourth, £775; *Ilex* fifth, £590. The best 10-tonner was *Ulerin*, £340.

W. N. O.—The best running high-jump, amateur, is P. Davin's 6ft. 2½in. The professional performance is E. W. Johnson's 6ft. 0½in.

A. C. LEEDS.—The best plan is to apply direct to the owners of the ship. You will be referred by them to the proper person. You would be far better as a boy before the mast.

A BRITISH BOY.—Your height is above the present standard for the Line, so that you would have no difficulty in that respect. You must choose for yourself. It is a mistake to suppose that there is any slur on a man's character owing to his having become a soldier. Such an opinion may once have been generally held, but it is so no longer. You will never please everybody.

FIORD.—You would get a good choice of guide-books, knapsacks, etc., of Adams, of Fleet Street (at the publishing office of Bradshaw's Guide); or you might try Goy, of Leadenhall Street.

AN SX CALF.—When the I. H. S. has stops between the letters it stands for the initials of Jesus Hominum Salvator; but when the stops are omitted the letters are the iota, eta, and sigma of the Greek Iesous.

ERIN-GO-BRAGH.—For the same reason that a ball thrown into the air returns to the earth, a ball dropped into a shaft that ran to the Antipodes through the centre of the earth would stop in the middle.

FELIX.—To secure the copyright you must send a copy of the book when published to Stationers' Hall and register it, and then forward the five copies to the libraries. Your printer or publisher is the proper person to attend to the business.

B. J. P.—To make a good cake take a pound of currants, a pound of mixed candied peel, half a quarter of flour, four eggs, a breakfast-cupful of milk, a tablespoonful of sugar, and a small packet of baking-powder. Beat the eggs well with the milk, and stand the mixture on the hob to get warm; chop the peel very small, and mix the things well together with the milk; bake the cake in a moderate oven for five or six hours. It is best baked in a ring—that is, a mould without a bottom, and the mould should be well greased to prevent sticking.

ATLANTA.—All the volumes are still in print, and all are still sold at the original price.

DRU.—When it is said that the water of the world has greatly evaporated it means that the evaporation has taken place into space which is now held to consist to a considerable extent of watery vapour. Space is not necessarily nothingness.

TIME AND TIDE.—The "Establishment of the Port" is its time of high water at full or change days; thus the "establishment" of London Bridge is 1h. 55m. There is no difficulty in arriving at the time of high water if you will only remember that when the moon is new or full it is always high water at London Bridge about two o'clock. Every other port has its "establishment" in the same way, and the tide is always up at establishment time at new and full moon.

A SUBSCRIBER.—Your best plan would be to advertise the fact of your possessing the envelope, say in the "Exchange and Mart," and ask for offers.

ST. FILIAN'S.—Say "carpets beaten," and avoid all chance of dispute.

No. 340.—Vol. VII.

REGINALD CRUDEN: A TALE OF CITY LIFE.

BY
TALBOT BAINES REED,
*Author of "My Friend Smith,"
etc., etc.*

CHAPTER XVI.
VISITORS AT NO. 13, SHY STREET.

THE concluding sentences of
Horace's long letter, parti-
cularly those which referred to

his mother's poor health and the straitened circumstances of the little household, were sufficiently unwelcome to eclipse in Reginald's mind the other exciting news the letter had contained. They brought on a fit of the blues which lasted more than one day.

"Love, indeed! I'd like to scratch you."

For now that he had neither companion nor occupation (for the business of the Select Agency Corporation had fallen off completely) there was nothing to prevent his indulgence in low spirits.

He began to chafe at his imprisonment, and still more at his helplessness even were he at liberty to do anything. Christmas was still a fortnight off, and till then what could he do on thirteen shillings a week? He might cut down his commissariat certainly, to, say, a shilling a day, and send home the rest. But then, what about coals and postage-stamps and other incidental expenses, which had to be met in Mr. Medlock's absence out of his own pocket? The weather was very cold—he could hardly do without coals, and he was bound in the interests of the Corporation to keep stamps enough in the place to cover the necessary correspondence.

When all was said, two shillings seemed to be the utmost he could save out of his weekly pittance, and this he sent home by the very next post, with a long, would-be cheerful, but really dismal letter, stoutly denying that he was either miserable or disappointed with his new work, and anticipating with pleasure the possibility of being able to run up at Christmas and bring with him the welcome funds which would clear the family of debt and give it a good start for the New Year.

When he had finished his letter home he wrote to Mr. Medlock, very respectfully suggesting that as he had been working pretty hard and for the last few days single-handed, Mr. Medlock might not object to advance him at any rate part of the salary due in a fortnight, as he was rather in need of money. And, he ventured to ask, as Christmas Day fell on a Thursday, and no business was likely to be done between that day and the following Monday, might he take the two or three days' holiday, undertaking, of course, to be back at his post on the Monday morning. He enclosed a few post-office orders which had come to hand since he last wrote, and hoped he should soon have the pleasure of seeing Mr. Medlock—"or anybody," he added to himself as he closed the letter and looked wearily round the gaunt, empty room.

Now, if Reginald had been a believer in fairies he would hardly have started as much as he did when, almost as the words escaped his lips, the door opened and a female marched into the room.

A little prim female it was, with stiff curls down on her forehead and a very sharp nose and very thin lips, and fidgety fingers that seemed not to know whether to cling to one another for support or fly at the countenance of somebody else.

This formidable visitor spared Reginald the trouble of inquiring to what fortunate circumstance he was indebted for the honour of so unlooked-for a visit.

"Now, sir!" said she, panting a little after her ascent of the stairs, but very emphatic, all the same.

The observation was not one which left much scope for argument, and Reginald did not exactly know what to reply. At last, however, he summoned up resolution enough to say, politely,

"Now, madam, can I be of any service?"

Inoffensive as the observation was, it had the effect of greatly irritating the lady.

"None of your sauce, young gentleman," said she, putting down her bag and umbrella, and folding her arms defiantly. "I've not come here to take any of your impertinence."

Reginald's impertinence! He had never been rude to a lady in all his life except once, and the penance he had paid for that sin had been bitter enough, as the reader can testify.

"You needn't pretend not to know what I've come here for," continued the lady, taking a hasty glance round the room, as if mentally calculating from what door or window her victim would be most likely to attempt to escape.

"Perhaps she's Love's mother!" gasped Reginald, to himself. "Oh, but what a Venus!"

This classical reflection he prudently kept to himself, and waited for his visitor to explain her errand further.

"You know who I am," she said, walking up to him.

"No, indeed," said Reginald, hardly liking to retreat, but not quite comfortable to be standing still. "Unless—unless your name is Love."

"Love!" screamed the outraged "Venus." "I'll Love you, young gentleman, before I've done with you. Love, indeed, you impudent saucebox, you!"

"I beg your pardon," began Reginald.

"Love, indeed! I'd like to scratch you, so I would," cried the lady, with a gesture so ominously like suiting the action to the word, that Reginald fairly deserted his post and retreated two full paces.

This was getting critical. Either the lady was mad, or she had mistaken Reginald for some one else. In either case he felt utterly powerless to deal with the difficulty. So like a prudent man he decided to hold his tongue and let the lady explain herself.

"Love, indeed!" said she, for the third time. "You saucy jackanapes, you. No, sir, my name's Wrigley!"

She evidently supposed this announcement would fall like a thunderbolt on the head of her victim, and it disconcerted her not a little when he merely raised his eyebrows and inclined his head politely.

"Now do you know what I'm come about?" said she.

"No," replied he.

"Yes you do. You needn't think to deceive me, sir. It won't do, I can tell you."

"I really don't know," said poor Reginald. "Who are you?"

"I'm the lady who ordered the globe and blackboard, and sent two pounds along with the order to you, Mr. Cruden Reginald. There! Now perhaps you know what I've come for!"

If she had expected Reginald to fly out of the window, or seek refuge up the chimney, at this announcement, the composure with which he received the overpowering disclosure must have considerably astonished her.

"Eh?" she said. "Eh? Do you know me now?"

"I have no doubt you are right," said he. "We had more than a hundred orders for the globes and boards, and expect they will be delivered this week or next."

"Oh! then you have been imposing on more than me?" said the lady, who till this moment had imagined she had been the only correspondent of the Corporation on the subject.

"We've been imposing on no one," said Reginald, warmly. "You have no right to say that, Mrs. Wrigley."

His honest indignation startled the good lady.

"Then why don't you send the things?" she demanded, in a milder tone.

"There are a great many orders to attend to, and they have to be taken in order as we receive them. Probably yours came a good deal later than others."

"No, it didn't. I wrote by return of post, and put an extra stamp on too. You must have got mine one of the very first."

"In that case you will be one of the first to receive your globe and board."

"I know that, young man," said she. "I'm going to take them with me now!"

"I'm afraid you can't do that," said Reginald. "They are being sent off from London."

The lady, who had somewhat moderated her wrath in the presence of the secretary's unruffled politeness, fired up as fiercely as ever at this.

"There! I knew it was a swindle! From London indeed! Might as well say New York at once! I'm not going to believe your lies, you young robber! Don't expect it!"

It was a considerable tax on Reginald's temper to be addressed in language like this, even by a lady, and he could not help retorting, rather hotly, "I'm glad you are only a woman, Mrs. Wrigley, for I wouldn't stand being called a thief by a man, I assure you!"

"Oh, don't let that make any difference!" said she, fairly in a rage, and advancing up to him. "Knock me down, and welcome! You may just as well murder a woman as rob her!"

"I can only tell you again your order is being executed in London."

"And I can only tell you I don't believe a word you say, and I'll just have my two pounds back, and have done with you! Come, you can't say you never got that!"

"If you sent it, I certainly did," said Reginald.

"Then perhaps you'll hand it up this moment?"

"I would gladly do so if I had it, but—"

"I suppose it's gone to London too?" said she, with supernatural calmness.

"It has been paid in with all the money to the bank," said Reginald. "But if you wish it I will write to the managing director and ask him to return it by next post."

"Will you?" said she, in tones that might have frozen any one less heated than Reginald. "And you suppose I've come all the way from Dorsetshire to get that for an answer, do you? You're mistaken, sir! I don't leave this place till I get my money or my things! So now!"

"Then," said Reginald, feeling the case desperate, and pushing a chair in her direction, "perhaps you'd better sit down."

She glared round at him indignantly. But perhaps it was the sight of his haggard, troubled face, or the faint suspicion that he, after all, might be more honest than his employers, or the reflection that she could get her rights better out of the place than in it. Whatever the reason was, she changed her mind.

"You shall hear of me again, sir!" said she; "mind that! Love, indeed!" where-

upon she bounced out of the office and slammed the door behind her.

Reginald sat with his eyes on the door for a full two minutes before he could sufficiently collect his wits to know where he was or what had happened.

Then a sense of indignation overpowered all his other feelings—not against Mrs. Wrigley, but against Mr. Medlock, for leaving him in a position where he could be, even in the remotest degree, open to so unpleasant a charge as that he had just listened to.

Why could he not be trusted with sufficient money and control over the operations of the Corporation to enable him to meet so unfounded a charge? What would the Bishop of S—or the other directors think if they heard that a lady had come all the way from Dorsetshire to tell them they were a set of swindlers and thieves? If he had had the sending off of the orders to see to, he was confident he could have got every one of them off by this time, even if he had made up every parcel with his own hands.

What, in short, was the use of being called a secretary if he was armed with no greater authority than a common junior clerk?

He opened the letter he had just written to Mr. Medlock, and sat down to write another, more aggrieved in its tone and more urgent in its request that Mr. Medlock would come down to Liverpool at once to arrange matters on a more satisfactory footing. It was difficult to write a letter which altogether pleased him; but at last he managed to do it, and for fear his warmth should evaporate he went out to post it, locking the office up behind him.

He took a walk before returning—the first he had taken for a week. It was a beautiful crisp December day, when, even through the murky atmosphere of Liverpool, the sun looked down joyously, and the blue sky, flecked with little fleecy clouds, seemed to challenge the smoke and steam of a thousand chimneys to touch its purity. Reginald's steps turned away from the city, through a quiet suburb towards the country. He would have to walk too far, he knew, to reach real open fields and green lanes, but there was at least a suggestion of the country here which to his weary mind was refreshing.

His walk took him past a large public school, in the playground of which an exciting football match was in active progress. Like an old war horse, Reginald gazed through the palings and snorted as the cry of battle rose in the air.

"Hack it through, sir!" "Well run!" "Collar him there!"

As he heard those old familiar cries it seemed to him as if the old life had come back to him with a sudden rush. He was no longer a poor baited secretary, but a joyous schoolboy, head of his form, lord and master of half a dozen fags, and a caution and example to the whole junior school. He had chums by the score; his study was always crowded with fellows wanting him to do this or help them in that. How jolly to be popular! How jolly, when the ball came out of the scrimmage, to hear every one shout, "Let Cruden have it!" How jolly, as he snatched it up and rushed, cleaving his way to the enemy's goal, to hear that roar behind him, "Run indeed, sir!" "Back him up!" "Well played!" Yes,

he heard them still, like music; and as he watched the shifting fortunes of this game he felt the blood course through his veins with a strange, familiar ardour.

Ah, here came the ball out of the scrimmage straight towards him! Oh, the thrill of such a moment! Who does not know it? A second more and he would have it—

Alas! poor Reginald awoke as suddenly as he had dreamed. A hideous piling stood between him and the ball. He was not in the game at all. Nothing but a lonely, friendless drudge, whom nobody wanted, nobody cared about.

With a glistening in his eyes which he would have scornfully protested was not a tear, he turned away and walked moodily back to Shy Street, caring little if it were to be the last walk he should ever take.

He was not, however, to be allowed much time for indulging his gloomy reflections on reaching his journey's end. A person was waiting outside the office, pacing up and down the pavement to keep himself warm. The stranger took a good look at Reginald as he entered and let himself in, and then followed up the stairs and presented himself.

"Is Mr. Reginald at home?" inquired he, blandly.

Reginald noticed that he was a middle-aged person, dressed in a sort of very shabby clerical costume, awkward in his manner, but not unintelligent in face.

"That is my name," replied he.

"Thank you. I am glad to see you, Mr. Reginald. You were kind enough to send me a communication not long ago about—well, about a suit of clothes."

His evident hesitation to mention anything that would call attention to his own well-worn garb made Reginald feel quite sorry for him.

"Oh, yes," said he, taking good care not to look at his visitor's toilet, "we sent a good many of the circulars to clergymen."

"Very considerate," said the visitor. "I was away from home and have only just received it."

And he took the circular out of his pocket, and seating himself on a chair began to peruse it.

Presently he looked up and said,

"Are there any left?"

"Any of the suits? Oh, yes, I expect so. We had a large number."

"Could I—can you show me one?"

"Unfortunately I haven't got them here; they are all in London."

"How unfortunate! I did so want to get one."

Then he perused the paper again.

"How soon could I have one?" he said.

"Oh, very soon now; before Christmas certainly," replied Reginald.

"You are sure?"

"Oh, yes. They will all be delivered before then."

"And have you had many orders?" said the clergyman.

"A great many," said Reginald.

"Hundreds, I dare say. There are many to whom it would be a boon at this season to get so cheap an outfit."

"Two hundred, I should say," said Reginald. "Would you like to leave an order with me?"

"Two hundred! Dear me! And did they all send the two pounds, as stated here, along with their order?"

"Oh, yes. Some sent more," said Reginald, quite thankful to have some one to talk to who did not regard him either as a fool or a knave.

"It must have been a very extensive bankrupt stock you acquired," said the clergyman, musingly. "And were all the applicants clergymen like myself?"

"Nearly all."

"Dear me, how sad to think how many there are to whom such an opportunity is a godsend. We are sadly underpaid, many of us, Mr. Reginald, and are apt to envy you gentlemen of business your comfortable means. Now you, I dare say, get as much as three or four of us poor curates get together."

"I hope not," said Reginald, with a smile.

"Well, if I even had your £200 a year I should be thankful," said the poor curate.

"But I haven't that by £50," said Reginald. "Shall I put you down for a complete suit, as mentioned in the circular?"

"Yes, I'm afraid I cannot well do without it," said the other.

"And what name and address?" said Reginald.

"Well, perhaps the simplest way would be, as I am going back by London, for you to give me an order for the things to present at your depot there. It will save carriage, you know."

"Very well," said Reginald, "I will write one for you. You notice," added he, "that we ask for £2 with the order."

"Ah, yes," said the visitor, with a sigh, "that appears to be a stern necessity. Here it is, Mr. Reginald."

"Thank you," said Reginald. "I will write you a receipt; and here is a note to Mr. John Smith, at Weaver's Hotel, London, who has charge of the clothing. I have no doubt he will be able to suit you with just what you want."

"John Smith! I fancy I have heard his name somewhere. Is he one of your principals—a dark tall man?"

"I have never seen him," said Reginald, "but all our orders go to him for execution."

"Oh, well, thank you very much. I am sure I am much obliged to you. You seem to be single-handed here. It must be hard work for you."

"Pretty hard sometimes."

"I suppose clothing is what you chiefly supply?"

"We have also been sending out a lot of globes and blackboards to schools."

"Dear me, I should be glad to get a pair of globes for our parish school—very glad. Have you them here?"

"No, they are in London too."

"And how do you sell them? I fear they are very expensive."

"They cost £3 the set, but we only ask £2 with the order."

"That really seems moderate. I shall be strongly tempted to ask our vicar to let me get a pair when in London. Will Mr. Smith be able to show them to me?"

"Yes, he is superintending the sending off of them too."

"How crowded Weaver's Hotel must be, with so many bulky articles," said the curate.

"Oh, you know, I don't suppose Mr. Smith keeps them there; but he lives there while he's in town, that's all. Our directors generally put up at Weaver's Hotel."

"I should greatly like to see a list of

the directors, if I may," said the clergyman. "There's nothing gives one so much confidence as to see honoured names on the directorate of a company like yours."

"I can give you a list if you like," said Reginald. "I dare say you know by name the Bishop of S—, our chairman?"

"To be sure, and—dear me, what a very good list of names. Thank you, if I may take one of these, I should like to show it to my friends. Well, then, I will call on Mr. Smith in London, and mean-

while I am very much obliged to you, Mr. Reginald, for your courtesy. Very glad to have made your acquaintance. Good afternoon."

And he shook hands cordially with the secretary, and departed, leaving Reginald considerably soothed in spirit as he reflected that he had really done a stroke of work for the Corporation that day on his own account.

It was well for his peace of mind that he did not know that the clergyman, on turning the corner of Shy Street, rubbed

his hands merrily together, and said to himself, in tones of self-satisfaction,

"Well, if that wasn't the neatest bit of work I've done since I came on the beat. The innocent! He'd sit up, I guess, if he knew the nice pleasant-spoken parson he's been blabbing to was Sniff of the detective office. My eye—it's all so easy, there's not much credit about the business after all. But it's £ s. d. to Sniff, and that's better!"

(To be continued.)

STANLEY ON THE CONGO.

PART II.

THERE is such a wealth of incident in the thousand pages that we confess a sore temptation to overrun our space. We have said enough, however, to awaken the interest of our readers in the great book of the year, and, as a specimen of the entertainment it offers, content ourselves with telling, in Mr. Stanley's own words, how he overcame the last opposition to the foundation of his chief settlement of Léopoldville on Stanley Pool.

"Ngoma's village, near which we were camped, was situated on a narrow but level-faced spur, extending from the eastern flank of Iyumbi Mount. It was one of several such spurs, separated from one another by wooded, scrubby gorges—the sources of several small crystal streams. On the next spur to that which we occupied stood Makoko's residential village, and it was from this direction we expected Ngalyema's approach. To approach our camp after declaration of hostilities was therefore impossible, if we chose to take him at his word, without risk of utter extermination. Ngalyema, though a barbarian, was too astute a person to commence operations in this manner. More probably, on the strength of previous brotherhood and mutual exchange of civilities, he would enter the camp with a bland face and an affectation of fraternal love, with ostentatious and noisy greeting, and trust to surprise in the midst of social drinking of palm-wine, etc., etc.

"I sent my tent-boy to tell the people to muster on the farthest side of the hill, to be out of view of any spies who might be on the watch at Makoko's hill. In a few minutes I proceeded there myself, and found the men all assembled. The instructions I gave them there were brief, and such as they could easily remember.

"Go each of you to his own hut; put your cartridge belts on. See that your cartridges are in your pouches. Place your guns under your sleeping mats or grass beds. All of you then, excepting Susi's men (twenty), scatter yourselves about in the bush on this side of the hill. Some lie down in the En Avant in the waggon; some of you behind my tent; a dozen in the store tent; some of you pretend to be sick in your huts. No matter how many people are in the camp, or what you may hear, do not stir from your places until you hear the gong; but when you hear the gong struck, then all run and seize your guns, and rush up all of you yelling like madmen; flourish your guns about wildly, and so on, like the Ruga-Ruga of Unyamwezi. Do you understand?"

"Inshallah!" they cried.

"Susi's detachment were instructed to seat themselves about in the open, and assume a listless and indifferent attitude. A quarter of an hour later a long line of men were seen descending Makoko's hill to the bottom of the valley intervening between it and our own. I counted one hundred and ninety-seven persons, inclusive of all ranks, who were in Ngalyema's expedition. Drum, trumpet, and native music announced that

the chief had assumed state and ceremony for this occasion. Before any of them had shown themselves on our hill I was seated in a chair in the front of my tent reading a book. I cast furtive glances about, and saw my own camp almost abandoned, except by a few Zanzibaris, some of whom were altogether overacting their parts by pretending to be half asleep.

"Keeping my eyes hidden by the vizard of my cap, I noted the quick glance thrown around the apparently abandoned camp by the advancing natives. When about a third of their number had entered the camp I rose, at the same time the near sound of the not inharmonious music informed me that Ngalyema was not far off.

"I advanced towards them, and when Ngalyema finally came, gave him an effusive welcome. I turned sharply round to Susi, and pretended to scold him well for not preparing mats, sails, etc., to spread on the ground for my dear brothers and friends of Kintamo.

"Ngalyema was moody-browed, stiff, most unbrotherly in his responses to my welcome, while I looked like one almost ready to leap into his arms with an irrepressible affection. Makabi was cold and repelling; Mubi grim and defiant; Ganchu seemed like a young leopard eager for bloody sport; young Enjeli acted surely like one who had suddenly come of age, so well he aped the man.

"Come, my brethren, friends, sit down. Tell Ngalyema, Susi, through Enjeli there, who knows Kikongo so well, how glad I am at seeing them all. Though it is very sudden, I take this visit and to have come so far to see Bula Matari as most kindly intended."

"Susi, who was so very clever, and could well enter into the elaborate joke I was perpetrating, did not, I am certain, interpret the welcome so well as I acted it.

"The chiefs, who kept their eyes wandering over the boat, boilers, and machinery tents, and kept up in undertones a perpetual interchange of ideas, scarcely deigned to regard me, until, after being seated, Ngalyema abruptly spoke to Enjeli, his son, in Kiteke, who translated it into Kikongo to Susi and myself.

"I have come from Kintamo to see my brother. Let him tell me what he has come here for."

"I replied, showing the brass-banded staff. 'This is what brought me. I have done exactly what you asked me.'

"At this moment another body of natives, also carrying guns, came by another path up the gorge, and seated themselves apart from Ngalyema's large force. These were Makoko's men. The appearance of this force caused Ngalyema to launch forth into a history of his acquaintance with me, beginning from 1877, which was intended for their special benefit, as they had been accusing him of an intention to overstep his proper status as a foreigner who was only per-

mitted residence on their soil to trade in ivory. He ended it in a peremptory manner thus:

"Now, my brother has been misinformed, and has misunderstood me. We Bateké are strangers living on this side of the river for trade only. The Bazambo and the Bakongo are our customers. We have no objection to trade with white men if they come for trade, but we do not think you have come to trade; therefore you cannot come to Kintamo. My brother must go back the way he came, unless he likes to stay here with Makoko. I have said it."

"Through my interpreter I replied, 'I am not a little boy, Ngalyema, and I will not use many words. You have brought me thus far yourself. Makoko is going to give me land near Kintamo, and on that land I will build my town. I know something about the country now. The land is not yours to give away, therefore be easy. I have but one tongue, and if Makoko will take me to Kintamo, I will go with him and build a fine place there, where, if you like, you may come and see me; if not, why then keep away. I have spoken.'

"Bula Matari speaks well," he responded, mockingly. "We know white men are clever, but Kintamo is still far, and in the way is Ngalyema and Makabi and Mubi, and plenty more chiefs, and the people you see here are few, and yet these people know how to shoot. How will Bula Matari reach Kintamo with those few men that he has got?"

"Adopting the tone of my friend, I said, 'Yes, white men are clever, I believe, and Ngalyema will say so before long. Ngalyema has many men and guns as I see, but Ngalyema and all his men cannot take that waggon to Kintamo; yet you see I have crossed many mountains and valleys so far as here, and in the same manner it will reach Kintamo. But, my friend, do not let us quarrel. Wait and see. I could be in Kintamo to-day if I wanted to; but I will take my time about it; meantime, be easy in your mind.'

"Now followed a consultation among the Bateké in an undertone, though once or twice some vehemence of manner attracted attention, and while they communed together I cast my eyes about the assembly. They were mostly fine-looking men, but made hideous by daubs and splash-like spots and lines and bars of white and yellow and black over their faces and bodies. They were all armed with muskets, except those who carried the ammunition, the gourds being full of powder and slugs of iron and copper.

"Suddenly Ngalyema asked, after the knot of chiefs had ceased their whispers, 'What nice thing has my brother brought me from the white man's land since I saw him?'

"Evidently Ngalyema supposed that I had been to the coast since my departure from

Mfwa; but I simply said, 'Come to my tent and see for yourself.'

"Ngalyema and his son Enjëli, with Ganchu and others, rose to their feet and followed me to the tent. Here the party inspected a quantity of red baize, bright handkerchiefs, a pile of figured blankets, and lovingly passed their hands over japanned tin boxes and iron trunks; and, after his curiosity was thoroughly satisfied, and Ngalyema had chosen a quantity of goods valued at £138 for his own perquisites, he expressed himself as follows:

"I will take these goods, but on the condition only that you stay where you are. You must make up your mind that you cannot come to Kintamo. The chiefs will not have it. If you do not promise, this must end in war, and I can no longer be your friend. Now, what do you say?"

"It is useless, Ngalyema, to talk more about this," I replied. "Make up your mind that I go to or near Kintamo. All the Wam-

"It is fetish," I answered, sententiously. "His young son Enjëli, who was much more acute than his father, whispered to him his belief that it was a kind of bell, upon which Ngalyema cried out,

"Bula Matari, strike this; let me hear it."

"Oh, Ngalyema, I dare not; it is the war fetish!"

"No, no," said he, impatiently. "Beat it, Bula Matari, that I may hear the sound."

"I dare not, Ngalyema. It is the signal for war; it is the fetish that calls up armed men; it would be too bad."

"No, no, no! I tell you to strike. Strike it, Bula Matari;" and he stamped on the ground with childish impatience.

"Well, then"—taking the beater in my hand—"remember, I told you it was a bad fetish—a fetish for war;" and as I lifted the beater high with uplifted hand, I asked again, "Shall I strike now?"

"Strike—strike it, I tell you!"

seated warriors forgot their guns and fled before this strange deluge and awful scene. The ammunition-bearers threw their gourds away—some were broken, and the powder and slugs were scattered over the ground; and as Ngalyema was standing paralysed with fear, and with his faculties benumbed, I seized him by the arm, and said softly to him,

"Be not afraid, Ngalyema. Remember Bula Matari is your brother. Stand behind me; I will protect you."

"The Zanzibaris were now a yelling crowd in front of me, calling out tauntingly and menacingly,

"Ha, ha, Ngalyema! You come to fight Bula Matari, Ngalyema! Where are your warriors, Ngalyema?"

"There could not be a better representation of relentless, bloodthirsty fury than that which was shown by these amateur black actors in the suddenly improvised scene. Their assumed frenzy was the next thing to

"A stream of frantic infuriates emerged as though from the earth."

bundu are willing. You admit that you have no right to the country; that you and the Bateké are strangers; that the Wambundu own the land. How can you stop the Wambundu from doing what they like with their own country?"

"But the village of Kintamo is mine," he said; "I and my people built it."

"That is all well. I do not want your village; I only want to get near the river and build a village of my own, whither many white men will come to trade. White men will do you no harm; you do not care to whom you will sell your ivory."

"Enough, enough!" he cried. "I say for the last time you shall not come to Kintamo; we do not want any white men among us. Let us go, Enjëli." And as he said the last words he pushed aside the tent door and strode outside, with the emotions of suppressed passion visible on his face. While standing near the tent door, for a moment irresolute, he caught sight of the large Chinese gong suspended to a cross-bar supported by two forked poles.

"What is this?" he asked, pointing to the gong.

"With all my force I struck the gong; the loud bell-like tone sounding in the silence caused by the hushed concentrated attention of all upon the scene, was startling in the extreme, but as the rapid strokes were applied vigorously the continued sound seemed to them like thunder. They had not recovered from the first shock of astonishment when the forms of men were seen bounding over the gunwale of the En Avant right over their heads, and war-whooping in their ears. From my tent, and from the gorge behind them, a stream of frantic infuriates emerged as though from the earth. The store-tent was violently agitated, and finally collapsed, and a yelling crowd of demoniac madmen sprang out one after another, every one apparently madder than his neighbour. The listless, sleepy-eyed stragglers burst out into a perfect frenzy of action. From under the mats in the huts there streamed into view such a frantic mob of armed men, that to the panic-struck natives the sky and the earth seemed to be contributing to the continually increasing number of death-dealing warriors. Every native present, would-be friend and would-be foe, lost his senses completely; the

reality. Had I not been in the secret I also should have been duped; while the valour with which I defended my poor brother, who with his two hands grasped me round the waist, danced from side to side to avoid furious strokes from the wild-eyed men, while young Enjëli clung behind his father and followed his movements, reminded me of the long-forgotten play of 'hen-and-chickens.'

"Save me, Bula Matari; do not let them hurt me! I did not mean anything," cried Ngalyema.

"Hold hard, Ngalyema!" I cried, "keep fast hold of me; I will defend you, never fear. Come one, come all. Ah, ha!" etc.

"But the camp was almost emptied of our visitors, much of the ammunition was left behind, the guns were strewn over the ground, and the play was well acted.

"Enough, boys; fall into line," and 'Silence' was cried out by Susi and his brother captains, and the obedient, well-trained fellows fell into line at 'Shoulder arms' with all the precision of military veterans. Then, as Ngalyema had allowed his hands to fall down by his side in mute surprise at this

other transformation scene, I took hold of his two hands, and said with an assuring smile, "Well, Ngalyema, what do you now think of the white man's fetish?"

"Ah, I was not afraid, was I? See, all my people are run away! Ay me, such braves! Only Enjeli and Ganchu left with me! But tell me, Bula Matari, where did all these people come from?"

"Ah, that is the bad fetish I told you of! Do you want to see any more? Come, I will

strike the gong again, and the next scene may perhaps be more wonderful still."

"What!" he shrieked, while he laid his hand upon my arm. "No, no; don't touch it. Ay, verily, that must be a bad fetish," he said, gravely, shaking his head at the round innocent face of the gong.

"Look yet again at these people, Ngalyema," said I, pointing to the long line of smiling soldier-labourers.

"Attention! right face! all of you march

forward quietly; no noise; put your guns away, and each go about his business. Forward, march!" The line vanished, and it was only when Ngalyema began to recover himself, while Enjeli and Ganchu halloed loudly to the fugitives for their return. Half an hour later they were all back again in the camp, retailing to one another, amid boisterous merriment, their individual experiences, while Ngalyema's loud laugh was heard above all others."

NAMES OF SHIPS IN THE ROYAL NAVY.

By ODO W. FORD.

(Continued from page 656.)

I DARE say we shall not again see a Captain among our war-ships. This has been an ill-omened name in the navy. A fine seventy-four of this name was burnt off Devonport in 1713, and two brass guns which she carried may still be seen in the Devonport Dockyard. An equally sad fate befell another and better-known Captain in our own days, as recently related in our "Great Shipwrecks of the World."

The Admiralty learnt wisdom from that catastrophe, and though we have at the present time in the Royal Navy nearly twenty turret ships afloat and building, such an event will assuredly never, at least from similar causes, happen again.

In 1875 we lost a fine iron-clad, the Vanguard, during a cruise of the Reserve Squadron in the Irish Sea. She collided, as our American cousins say, with the Iron Duke during a fog; the latter's ram struck her, and she went down in an hour. Happily, no lives were lost. Of another Vanguard I find the following in an old book, "The Reign of King Charles I.," printed in 1655:—

"In November (1625), Charles Prince Elector came over into England, to tender dues of honour and respect to his uncle our King, and partly to solicit towards his restoration. His passage was very turbulent, being after his embarkation, twice driven back by tempest, and when at last he came upon the English Coast, and was to be received by Sir John Pennington into the *Vant-guard*, which welcomed him with a voice of great shot, it fortuneed an unhappy boy gave fire without order to a peece of Ordinance,

whose ball entred the Ship where his Highnesse was aboard, and killed two men not far distant from him, at which he was much affrighted."

H.M.S. Resolute! What an excellent name for a ship of war! No longer "borne on the books" at Whitehall, except in old records, having been broken up at Chatham in 1878, in spite of the efforts of some who loved her memory. The Resolute, commanded by Captain McClure, was one of several ships sent out from time to time, as we all know, to endeavour to relieve, and afterwards to ascertain the fate of, Sir John Franklin and the crews of the Erebus and Terror. Unsuccessful in her search, her captain and crew may yet claim the proud distinction of having proved the existence of the North-West Passage, which poor Sir John Franklin lost his life in seeking. The Resolute, however, though afterwards abandoned (in latitude 74° N.) by her crew, who were rescued and brought home by another ship, was destined to see old England's shore again. Tossed to and fro among ice floes and bergs for many months without a soul on board, she was long afterwards found in 67° N. by a Yankee whaler, the George Henry, owned by Mr. Grinnell of New York, and brought safely into port, and after being refitted by Mr. Grinnell was returned by the United States Government to the Admiralty at Spithead, the Queen and Prince Consort going on board, and she was then sent to rest in peace at Chatham.

On its being decided in 1878 to break her up in company with several other old

ships, their lordships ordered a writing-table to be made from her timbers and presented to the President of the United States, and a similar article of furniture for presentation to Mrs. Grinnell. Her Majesty was also pleased to order an article of furniture to be made from the wood of this good old ship, and I suppose this is now in one of the royal palaces as a memento of this very remarkable incident. No doubt we shall ere long again see the name of the Resolute in the navy list, for this must surely be a name the Admiralty will not "willingly let die." I may add that I have a piece of oak from this old craft in my own possession.

One more little incident as to change of name. Every one who has read (and who has not?) of the achievements of our splendid ironclad fleet at the bombardment of Alexandria, remembers Commander (now Captain) Lord Charles Beresford and the "plucky little Condor." This vessel and her sister, the Flamingo, were built at Devonport in 1877, and when commenced were ordered to be called H.M.S. Coot and Teal, being of a type of gun-vessel which is known in the navy as the "bird class." For some reason these not very elegant titles were altered to those I have mentioned, and I think you will agree with me that the change was an improvement. I fancy the admiral's praise before Fort Marabout would not have sounded so well in "Well done, Coot," or "Well done, Teal," as in the now historical "Well done, Condor!"

(To be continued.)

ON SPECIAL SERVICE: A NAVAL STORY.

By GORDON STABLES, M.D., R.N.,

Author of "The Cruise of the Snowbird," "Stanley O'Grahame," etc.

CHAPTER XV.—BENBOW IN HIS GLORY—A BATTLE BY MOONLIGHT.

THE wind held, but by next day it had gone veering round, till at sunset it was almost right aft.

Benbow came on duty at eight bells with Colin as his midshipman. Benbow was in his glory.

"Heave the log," he said to Colin.

When the line was stowed again, Colin came back to Benbow and reported twelve knots.

"Twelve knots," cried the sailing-master, rubbing his hands delightedly. "Ha! ha! ha! I knew the old Theodora could do it. Now, Colin McLeod, it is my plain unbiased opinion that since the bottom of this ship was overhauled and cleaned at Bombay she is double the individual that she was before. I verily believe she could do fifteen."

Colin laughed.

"Ah! you may laugh. But just cast your eyes above. What do you see?"

"A bright starlight night," said Colin, "with a clipping of a moon low down in the west."

"Bother all that. I mean what canvas?"

"Oh! not much. Close-reefed fore and maintop-sails, reefed foretop-gallant-sail, bit of jib. Not much else."

"Well now, out go some of those reefs."

"All right," said Colin.

"Hands make sail!"

"Eep—eep—eep—ee—ee—" went the boatswain's pipe.

"Away aloft!"

Benbow ran forward to where Colin was doing his duty.

"Carry on," he said, "for a bit, I'm going below, else we'll have the old man upstairs. He's a bit nervous."

Benbow skipped down to the captain's cabin, knocked, and peeped in.

"Just run down to tell you, sir, that I don't think the wind is quite so strong as it was, so I'm going to stick a reef out."

"All right, Mr. Benbow, thank you," replied Blunderbore, who was sitting on one chair with his legs on another. "But, I say, you know, I'd just as soon you'd left her alone, you know. There is no very great hurry to make a passage, and— Why, he's gone!"

So he was.

Captain Blunderbore turned uneasily in his chair.

"Bother that Benbow," he said to himself; "I never saw such a fellow for carrying on. I really thought we were snug for the night. Ah! well, after all I

suppose he does know what he is about, and the sooner we get south the better."

So Benbow had his own way. He heaved the log again, and it actually marked fourteen knots an hour by the glass.

Then this irrepressible officer's eyes were turned aloft. He was wondering if she wouldn't carry even more sail.

But at that very moment a fiercer gust of wind than usual came, the *Theodora* gave a side-long plunge, righted again, and lifted. Then

"R-r-r-r-r-r-r-r-r-r."

Dear reader, imagine every one of these r's to be a nine-pounder gun, and all these nine-pounders to be fired in rapid succession, and you will have some faint notion of the noise that now took place up aloft.

One half of Benbow's sails were rent into ribbons.

The captain jumped up, and Mildmay and Gayly, and West and McGee, down in the ward-room, looked at each other with consternation.

There was plenty of row now on deck; but it gradually lulled, and by-and-by the *Theodora* was easy once more; but she did no more fast sailing that night.

"Anyhow, Gayly," said Benbow, next morning at breakfast, "I made her go, old man, and that is more than ever you did."

For Gayly had been chaffing Benbow.

The wind held for days, and the *Theodora* went rushing along on her course like a bird.

Winds of one kind or another were favourable, and in due time the equatorial calms were reached, and steam was got up.

A sea of glass, without a ripple, but a sea of molten glass, if you will pardon the simile. Great rolling smooth waves, a fiercely hot sun glaring down on them, and reflected from the glittering surface.

Everything on board now that could move kept rolling and tumbling about; there was no stability, no fixity of purpose about anything. There was no leeward, because there was no wind, and things that tumbled down to one side of the deck came tumbling back again next moment. And as to walking the decks, why no one could, without staggering and reeling and clutching at things, as if under the influence of wine.

An awning was spread fore and aft, but it could give little comfort, for the sun's beams reflected from the waves were nearly as hot as those directly from above.

The ship was right away in the very centre of the Indian Ocean too, so there was no land or sea breeze. So hot was it on deck that the pitch boiled, and the quarter-deck could not be kept clean and white, but looked all over patched with tarry feet-marks. Even Captain Blunderbore's stock of linen shirts went low, because he had to change three times a day. Fans were in great requisition, and handkerchiefs looked as dark and dirty with frequent use as bicycle rags. Men were constantly fainting all day in the stoke-hole, and being hoisted up to breathe a purer air; the doctor did nothing but manufacture aerated drinks, and — would you believe it? — while D'Austin seemed worn to a pale, aristocratic ghost, that "stupidnumery" Brown got fatter and fatter, and Benbow assured his messmates he could see a difference in him every morning.

Nobody was sorry when the line was well crossed, the fires out, and the sails once more bellying out before the trades.

The *Theodora* went as far south as the Mauritius, then westward round the coast of Madagascar, and on towards the Zambesi river, but without meeting any vessel that at all tallied with the description received of the piratical slaver.

Nor was a cruise northwards to the Comoro Islands crowned with success.

"I believe," said McGee, one evening in the mess, "that Gaspar is a thousand miles from us at this very moment."

"Indeed, I shouldn't wonder," said Mildmay. "But, doctor, as it is Saturday night, what say you to get out that old fiddle of yours and give the men a dance?"

"Hurrah!" cried everybody.

"I'm not in much form," pleaded McGee, who really was an excellent performer.

"Well, then," said Benbow, "play yourself into form."

No sooner had McGee seated himself on a gun and commenced to tune up outside on the fighting deck than the floor was speedily filled. Every officer not on duty was there, and every man also.

Gayly's watch was on deck. It was a lovely starry night, with a gentle breeze blowing off the land, which was about ten miles distant. But a good look-out had to be kept "low and aloft," for there were many small islands about, and shoals as well, so men were constantly at work in the chains.

Gayly could hear all that was going on below, but he did not long to go down. Dancing to a single fiddle was far beneath Gayly's dignity.

McGee began with soft dreamy waltzes, which minded the dancers of home, but he soon went off into a rattling gallop, and then the "fun grew fast and furious."

"Keep it up," was the cry, and "Go it, old Sawbones!" from Benbow, at which sally the men laughed uproariously.

And McGee did keep it up till his elbow ached and his fingers refused further duty.

Then after a pause a hornpipe was proposed.

Benbow himself would begin this fun, and no clog-dancer from Lancashire, or triple-shuffler from the land of coals, could beat Benbow. But he did not dance by himself long. Man after man joined the rattling jig, and cut such capers, that before long the fiddle itself could hardly be heard for the laughter and encouraging shouts of the on-lookers.

But, hark! a shout on deck of quite a different sort.

A light away out seawards, broad on the weather beam. Another moment and the bugle was sounding to quarters, and every man Jack was standing armed by his gun.

In a few moments more the moon would rise. A broad belt of light in the east already heralded her approach.

Broader and brighter and lighter it got, then a red rim peered over the sea, and up and up came the moon, wondrous in size, glorious in its crimson splendour. But, lo! ere ever her lower limb had reached the horizon there glided into her, as it were, from the yellow haze beyond, a ship with every stitch of canvas set, and hung there for a moment or two like a picture in a frame. A long, low,

full-rigged vessel with no great height of masts, but tremendous spread of cloth.

She passed, and still another vessel revealed itself against the moon's disc—a barque of much the same build.

If a-y doubt that both these vessels were pirates existed in the minds of the *Theodora*'s officers it was soon dispelled, for they had suddenly altered their course and were soon bearing down towards the ship-of-war, with the evident intention of fighting.

The fires in the *Theodora* were banked, so as quickly as possible the ship was put under steam and sails taken in.

"If those ships are anything like well armed we've got our work cut out," said Mildmay to Captain Blunderbore.

Almost at the same moment a shot tore through the *Theodora*'s rigging and carried away a stay. The battle had begun.

"Well hit!" cried Benbow. "Precious well hit! Why, those chaps will take some beating."

The *Theodora*'s guns were run out and fired just as the *Castigo* came tearing past.

A shower of iron from the guns of the latter was the speedy response, and so close was she at the time that the *Theodora* heeled over to its force till a broad band of her copper bottom showed over the water and gleamed in the moonlight. Had it been possible for the *Castigo* to have fired another broadside at that thin red line, the *Theodora* must speedily have sunk.

The *Castigo* forged ahead, and on came her consort, receiving and giving a like salute.

The marines here did excellent work, for, strange to say, all the barque's fighting men appeared to be crowded or huddled together on deck.

The *Castigo* could and did manœuvre well. She was about and back on the other tack almost before the *Theodora*'s people had time to breathe. She was evidently well commanded and answered beautifully to her helm.

And so this moonlight battle went on. But it was soon evident that the *Theodora* was fighting at a disadvantage. A consultation was hastily held on the bridge, at which Mildmay was again present. This was during a kind of lull in the fight; something had occurred on board the *Castigo*, and she had sheered farther off.

"I would do that, sir, then, if I were you," said Mildmay, preparing to descend to the deck. "And yonder she comes again. Ram her and sink her, I say. If you fail, get alongside the consort and board her, good old-fashion; you will thus, at all events, get clear of the *Castigo*'s guns, for she will hardly dare to fire into her sister ship."

"Silence fore and aft," cried Captain Blunderbore. "Steady as you go."

"Go ahead at full speed."

"Hard aport now. Round she comes."

"There she rips!" cried Benbow.

"Hard round—hard—hard."

Ah! Captain Blunderbore, your intentions were the best. Pity they should be baffled.

Gaspar himself commands the *Castigo*, and just as your iron bows are almost into her side, round goes her wheel, and you glide harmlessly past. But dreadful death is dealt from her quarter as you pass. See how your boats and bulwarks fly in staves and splinters beneath that

"The fun waxed fast and furious."

iron shower. Many men lie dead and bleeding, and even Benbow is wounded in the head.

"Only a scratch," he says, as he binds a handkerchief round his brow to staunch the blinding blood.

"Ready, boarders! Stand by with pistol, cutlass, and pike!"

Then a true British cheer goes up from the blood-wet decks of the *Theodora*. Hard at his ghastly work down in the smoke-filled cockpit the doctor heard the shout; his Scotch blood

"leaps in a' his veins,"

and he wildly responds, and even the wounded men wave feeble arms, and help to swell his ringing slogan.

Benbow, on the bridge, points with his sword to the on-riding vessel, and he looks all the hero as he does so.

"Yonder she comes!" he shouts—"Gaspar's consort! We'll have no more on-and-off fighting now, sir, shall we? Steady at the wheel! Easy starboard! Steady as you go! Well done! Hard a starboard! Bravo!"

"Boarders on deck!" cried the captain.

And while guns roar and splinters fly the vessels rasp side to side, and are speedily made fast.

"Away, boarders!"

High o'er the din of battle shrieks the bo'sain's pipe.

"Away, boarders! Now, men, now!"

Benbow leaps on board the barque from the bridge; Quentin and Colin board at the bow. They are close together—almost hand-to-hand.

Colin casts one glance at his more than brother. He can see he is saying something, but he can hear nothing.

The Arabs are taken aback. Spears are shivered by British cutlasses. Revolvers are ring-ring-ringing all along the deck. There are shouts and blows and dull, heavy thuds; there are shrieks and groans, the latter hardly heard. There is smoke and blood. Many of the *Theodora*'s men slip and fall, but pull their enemies to the deck with them, so that here and there there are terrible death-tussles, and more than one of the bluejackets get up from beside a slain Arab only to stagger and gasp and fall dead by his side or across him.

Oh, reader! a battle at sea like what I am all too feebly trying to describe is an ugly sight, and one that hardly bears graphic detail.

Now victory belongs to the *Theodora*. The Arabs who are not *hors de combat* have leapt overboard or are driven below.

The *Castigo* knows her game is up. She has left her consort to her fate, and is now far away scudding along before the wind with stunsails "low and aloft."

Benbow is sitting, tired, and sick, and faint, on a hatchway. The doctor appears and leads him away.

Colin is standing with his back against the bulwarks, his dirk still in his right hand. The moonbeams are shining full on his face, for his cap is gone. He is very pale, even his lips are white.

"I hope you're not hurt," says bold Quentin, coming up and looking anxiously at him.

"Not at all," returns Colin, with a faint made-sort-of-a smile.

"Not at all; but so tired."

Then down he drops—he has fainted. Poor boy, it was his first fight!

Duncan Robb had battled by his side all the time, though Colin did not know it, and more than once his cutlass had saved his master from an ugly thrust from Arab spear.

Big innocent Duncan, he too was among the wounded. He marched down to the cockpit, and took a seat in a far-away corner. Presently McGee went to him.

"Is it my turn?" he asked.

"Yes, my man; what is the matter?"

"Not very much, sir, but it is mighty painful; and I'm a kind of sick."

"Here, swallow that," said McGee, handing him a stimulant. "You're wounded in the hand, aren't you?"

"Little finger off," replied Duncan; "but I knocked off the Arab's head. Worse for him."

"Why, my poor fellow, one-half your little finger is clean gone."

"Not a bit of it," said the sturdy Scot, handing the surgeon something rolled up in a rag. "There it is, sir; you can stick it on again, I have no doubt. Ha! ha!" he laughed; "it took me half an hour raking about to find it."

Dr. McGee laughed too. He really could not help it.

And honest Duncan's face fell, and tears actually rose to his eyes, when told that the little finger could not be stuck on again.

(To be continued.)

UP AND DOWN: A STORY OF THE OCEAN WAVE.

BY ASCOTT R. HOPE,

Author of "The Tell-Tale," "The Amateur Dominic," etc.

CHAPTER III.—DOWN!

WHEN I awoke next morning I found myself being veritably "rocked on the cradle of the deep." The steamer rolled and shook in a way that threatened to send me flying out of my berth. It was quite a gymnastic feat to climb down and get a firm footing on the floor. Then I had the work of hunting up my things, which through the night had got pitched into every corner of the little cabin. So it was not without some difficulty that I managed to wash and dress, moving about as quietly as possible for fear of disturbing the great Gooderidge. But I did disturb him, it appeared, for from his berth came a growl of ferocious inquiry as to what I was making all that noise about.

"I am just done," said I, alarmed to think that my tyrant was like to get out of bed on the wrong side. "Shall I ask for some hot water for you?"

"Leave me alone, can't you?" grunted he. "I am not going to get up yet."

I willingly left him to himself in that stuffy hole—the ports were all closed

now, and the water came swishing against the trickling glass to show that we were fairly out at sea. Staggering and holding on to rails and tables, I reached the deck. It was a dull, damp morning, the smooth sea and the sunshine had gone together. To the right I could just make out some grey cliffs, perhaps of the Isle of Wight, with which old England was disappearing from view. On the other side I saw nothing but water and a few small vessels pitching up and down in a rough swell. I could hardly stand on the wet poop, where every now and then a wave broke over to drench any one who might not be quick enough in getting out of the way. On the bridge above I saw the captain and the steersman, wrapped in oilskins. The weather had changed, and the prospect appeared somewhat dismal for us land-men.

Presently some half-dozen of my companions came tumbling up the hatchway, looking rather depressed, not to say pale and silent. There was not much of the

midshipmite strut about them this morning; it was all they could do to hold themselves steady, desperately clutching at whatever support came to hand. Their whole energy was used up in smiling feebly to pretend that they rather liked it. Not one of them would be the first to confess that he felt bad, but almost all unmistakably looked a wish that if Britannia did rule the waves she could contrive to rule them a little straighter.

At last the Bluecoat boy fairly made a rush for the side; then as soon as he was capable of speech he thought necessary to make explanations.

"I knew that pie last night would disagree with me," he said. "I never could eat piecrust."

"The air of these cabins is so abominably close!" declared the Eton fellow, almost as white as his collar; and he, too, leant over the side.

"I have been feeling seedy for the last day or two," quoth a third, imitating their example.

One of the army-tutor's pupils had lit

"The swell appeared to be increasing."

a big pipe by way of bravado as soon as he came on deck, but he soon let it drop overboard in the sudden spasm that came upon him, and then vowed that smoking before breakfast was enough to make any fellow sick. Thus, with some pretence or other, all the party revealed their weakness, and I began to consider my stomach, expecting every moment to be taken bad like the rest. But I could detect no symptoms, except those of a good appetite.

And in due time there were signs of breakfast. The steward's boy came cautiously tacking along from the galley, carrying a succession of smoking dishes, which excited no interest among my unhappy companions. When the bell rang I went down and took my place with some dozen others, all very quiet, determined to eat, whatever might befall. There was plenty to eat, toast and curry, and greasy chops and fat bacon, and such-like. But the first mouthful choked some of the guests, who fled precipitately. Others held on a little longer, playing with their knives and forks, till the moment came when they found it well to disappear.

"What! Already!" cried the captain, with a grim laugh. "Wait till you come to the Bay of Biscay, my lad!"

By-and-by I was left nearly alone with him, and I fancied he kept watching me out of the corner of his eye, expecting me to break down every moment. But as yet I found myself all right, and I made an excellent breakfast, thinking it well to eat while I could, though it was no easy work eating when you had to hold your plate fast, and every lurch of the boat was like to spill your coffee into your lap.

After breakfast I went on deck again to find a row of most disconsolate youths sitting along the side in various stages of sea-sickness. These were the merry rioters of the night before, but how changed now, how chapfallen! The swell appeared to be increasing, and before long a heavy squall of rain came on to drive them all below. Then it occurred to me that Gooderidge had never shown himself, and I went to the cabin to see how he might be getting on.

He was lying on his back and moaning dismally.

"Can I do anything for you, Gooderidge?" I ventured to ask, though doubtful whether he would take it ill to have me notice that there was anything the matter with him.

"Tell the steward to come," he mur-

mured faintly; and seeing how the case stood I was as well pleased to get out of his way.

I wandered on deck again, fearing that my turn must soon come, and that the sights and sounds of suffering which now prevailed around could not but prove infectious. The kindly stewardess stopped to ask me how I felt. I met the captain, who winked at me, and advised me to lie down below. I found my way to the smoking cabin on deck, where the two gentlemen passengers were lying wrapped in rugs, looking far from happy. "Go away, youngster, and shut the door!" cried one of them, crossly. "This isn't the place for you to be sick in."

Everybody seemed to take it for granted that I was going to be sick. I sat down in a warm sheltered nook in the lee of the funnel, and there waited anxiously for the first symptoms, rather uneasy indeed to find them so long in coming. But after all my sensations proved rather pleasurable than otherwise. I found it quite exciting to watch the "white horses" chasing one another over the dull expanse of water, and the big waves tumbling down upon our vessel that rose to breast them just when they seemed about to drown her bows. It was nothing but fun for me to look along the sloping deck, as it went up and down, gallantly plunging over the crested billows with a motion like that of riding across country on a giant horse. We had changed our course now, and were pitching against the wind instead of rolling in the trough of the sea; but neither rolling nor pitching troubled me in the least, nor even the jarring thud that shook through the boat every now and then when the screw missed its stroke and spun out of the water, a sore trial for sick passengers.

In fact, not to keep the reader in suspense, as I was kept for a time, I never felt ill at all for a single minute. I turned out to have one of those lucky stomachs that are not liable to sea-sickness, thereby "scoring" over my unfortunate companions and walking among them as safe as an enchanted knight, had they been all tenfold as fell caitiffs and fierce ogres as Gooderidge.

A child could have bullied the biggest of them now. Before the forenoon was out they were all prostrate and helpless in the active or the passive stage of the malady. Some, pale and wretched, sat huddled up in the corners of the saloon, making an effort still not to give in; some had crawled into their berths with-

out taking off their clothes; some lay on the floor of the cabins like logs; some were not so far gone as yet, but not one was himself except little me. The stewards must have indulged in a sly inward chuckle as they ran about ministering not over gently to this downcast crew that had been so bumptious and obstreperous the night before. Groans, gasps, and other plainer symptoms of suffering, resounded from every side. "Basins" was the word now. Last night their spirits had been up like frothy ginger-beer; to-day they were all in the downs, flat and nauseous as ditchwater.

And none of them was worse than Gooderidge, who had never got up at all, trying in vain to conquer or conceal his state. Several times in the course of the day I looked in upon him. It was little thanks I got, but so much seemed to be my duty. He was too far gone even to abuse me.

"Oh!" he cried, as piteously as a small boy whining under his own ill-usage. "Oh, dear! I would give anything to be on shore. It's just like being tossed in a blanket every time that this beastly ship goes up and down. Oh—h—h!"

I could very well realise the sensation to which he alluded. Having so lately had my recollections freshened on this head, I knew what it was to be tossed in a blanket by him and the like of him. The dizzy confusion as you are jerked up, then the sickening helplessness when you turn to come down in a heap and feel for a moment as if your inside were left behind sticking in the air—it would be only justice for Gooderidge to know now for himself what such pains were, suffering in his turn at the hands of that gigantic bully the sea. I was glad that he was not able to bully me now, and yet in spite of all his brutality I could not help being sorry for him when I saw his evident misery. And I was sorry for my champion the Bluecoat boy, who seemed to suffer as much and to make less fuss about it. I had the satisfaction of taking him an orange, which he sucked at feebly, and thanked me with a look; he was too bad for words. There are occasions when the mouse can repay a good turn done for him by the lion; and here was I with a whole menagerie to minister to, of sick lions, tamed tigers, bears surly but silent, monkeys no longer mischievous, hyenas laughing now on the wrong side of their mouths, John Bulls without a bit of bellow left in them, and so forth!

(To be continued.)

THE TROUT, AND HOW TO CATCH IT.

By J. HARRINGTON KEENE,

Author of "The Practical Fisherman," "Fishing Tackle, and How to Make It," etc.

PART XII.

SOME time back I referred to "fly-fishing spinning," and, before passing on to the consideration of other ways of trout angling, I think it as well if I go rather more into detail in connection with this very attractive style of trout capture. As the name implies, the method partakes of the nature of fly-fishing, but only in so far as the method of delivering the bait is concerned. Very fine tackle is used, and small minnows, and the bait is thrown by a rod rather stiffer, but not

much so, than the ordinary single-handed fly-rod. Sometimes an artificial bait is used, and when this is the case the care in casting necessary with the fragile real bait is not required. The rod is simply taken in the right hand firmly, a length of line drawn off the winch with the left, and as the bait is delivered forwards this length is allowed to go with it. Of course the rod is upright-ringed. In drawing in the bait the left hand is again used to gather up the slack, and the move-

ment repeated as before. Many good fish are often caught by this style of fishing, especially at weirs.

Though, as might have been gathered from the tenor of this article, I am not so fond of minnow-fishing for trout, I can recall many a good day's sport with this bait, which would have resulted otherwise if the fly had alone been used. One day on the Thames—in which forsooth only one fish was caught—stands out brightly in my recollection as I

write. "One fish!" you will say; "why make a fuss about one fish?" "Ay, but such a 'fusshe' of 10lb. 2oz!" Shall I tell you about it?

Well, I was living at the time—I am afraid to say how many years ago—near that delightful stretch of water between the "Bells of Ouseley," Old Windsor, and Windsor Castle, and fished it continually. By-the-by, what glorious associations does not this beautiful length of the grand old river call up! As you float down from Boveney, on your right, the Datchet meads recall the "ducking" Sir John Falstaff endured at the hands of the merry laundresses. One hears him anew describe, in his rich, droll way, his heat and discomfort when packed in the basket of dirty clothes. "Think of that!" he says; "a man of my kidney—think of that, that am as subject to heat as butter!—a man of continual perspiration and thaw! It was a miracle to 'scape suffocation. And in the height of this bath, when I was more than half stewed in grease, like a Dutch

dish, to be thrown into the Thames and cooled, glowing hot, in that surge like a horseshoe—think of that—hissing hot—think of that, Master Brook!" One sees the fat knight spitting and spluttering, struggling out on to the greensward, and hears his muttered imprecations; and as you pass onward the green slopes of Cooper's Hill appear in sight, whereby the river flows onward, clear and sweetly—"Gentle yet not dull; strong without rage, without overflowing full." Ere, however, you reach the "Bells of Ouseley" the Old Windsor Lock interposes. See, the water is high; let us "shoot" the tumbling boggy of the weir. So, steady! It is done, and we are swiftly borne downwards round the Fleet, and onwards to the so-called Colnbrook Churchyard. Drop the weight overboard; here is the scene of the capture of the trout I began to tell you about. "Colnbrook Churchyard?" I hear you questioningly repeat. Yes; so called because it is said that at the time when that rascally highwayman Duval was perpetrating his crimes

his practice was to bury his victims in the deeps of this part of the river—and verily deep they are, and full of fish as an egg of meat, to use an expressive though not very classical comparison.

But to return to our 10lb. trout. Morning and evening had this risen at the bleak haunting the neighbourhood, and once or twice had he even rolled over my fly, to my infinite disappointment not touching it. At last I determined to spin for him, and, as I had no good minnows in stock, I attached an artificial one like Fig. 2. The sun had just burst from a cloud about eight o'clock one August morning, when I saw him rise again. In went the spinning bait, almost in the ring of the rise. There was another break of the water, a quick tug, a strike from me, which made the line sing "Tang!" like a bow-string, and in twenty minutes this glorious piece of water-going architecture lay dying in the punt. I have not preached what I cannot practise, you see!

(To be continued.)

ADVENTURES AMONG THE MASAI.

THERE, towards the base of Kilimanjaro, are those great herds of buffalo slowly and leisurely moving up from the lower grazing-grounds to the shelter of the forest for their daily snooze and rumination in its gloomy depths. Farther out on the plains enormous numbers of the harmless but fierce-looking wildebeest continue their grazing, some erratic members of the herd gambolling and galloping about with waving tail and strange uncouth movements. Mixed with these are to be seen companies of that liveliest of all large game, the zebra, conspicuous in their beautiful striped skin, here marching with stately step with heads down bent, there enjoying themselves by kicking their heels in mid-air or running open-mouthed in mimic fight, anon standing as if transfixed, with heads erect and projecting ears, watching the caravan pass. But these are not all.

"Look! Down in that grassy bottom there are several specimens of the great unwieldy rhinoceros, with horns stuck on their noses in a most offensive and pugnacious manner. Over that ridge a troop of ostriches are scudding away out of reach of danger, defying pursuit, and too wary for the stalker. See how numerous are the herds of hartebeest, and notice the graceful pallah springing into mid-air with great bounds, as if in pure enjoyment of existence. There also among the tall reeds near the marsh you perceive the dignified waterbuck, in twos and threes, leisurely cropping the dewy grass. The wart-hog, disturbed at its morning feast, clears off in a bee-line with tail erect and with a steady military trot truly comical.

"These do not exhaust the list, for there are many other species of game. Turn in whatever direction you please, they are to be seen in astonishing numbers, and so rarely hunted, that unconcernedly they stand and stare at us within gun-shot. Look now farther ahead. Near a dark line of trees, which conspicuously mark out the course of the Ngare N'Erubi in the treeless expanse around, you observe in the clear morning air columns of curling smoke, and from the vicinity strange long dark lines are seen to emerge like the dark columns of an advancing army. The smoke marks the kraals of the Masai, and the advancing lines are their cattle moving towards the pasture-ground. If you will now imagine a long line of men moving in single file across this prairie region, carrying boxes, bales, packages of iron wire, etc., headed by myself, and brought up in the rear by Martin, while a cold piercing wind blows with the freezing effect suggestive of an early spring in Scotland, you will be able to form a picture of the scene which presented itself on that memorable morning in April."

With these words does Mr. Joseph Thomson preface his account of his entry into the land of the Masai in 1883, when on his daring expedition to the great mountains of Central Africa. The objects of that expedition were "to discover a practicable direct route for European travellers through the Masai country from any one of the East African ports to Victoria Nyanza, and to examine Mount Kenia; to gather data for constructing as complete a map as possible in a preliminary survey; and to make all practicable observations regarding the meteorology, geology, natural history, and ethnology of the regions traversed." It does not come within our province to dwell on the scientific results; we are here concerned more particularly with the adventures, hunting and otherwise, which Mr. Thomson met with, and which he has so graphically related in his extremely interesting book.

In an article in the last November part we glanced at the important discoveries of the missionaries at Mombasa, the port on whose reef Vasco de Gama was nearly wrecked by his treacherous pilot in 1497, and which was described as long ago as 1530 as being to the east of the "Mount Olympus of Ethiopia." The Mount Olympus, otherwise Kilimanjaro, dropped out of knowledge until Dr. Krapf established the East African Mission station. This was in 1842, and in 1847 the doctor's colleague, Mr. Rebmann, started on the first of a series of remarkable journeys to the west of Mombasa.

With only eight men he crossed the desert barrier, and revealed to geographers the isolated mountains and picturesque ranges of Teita. The next year, with no other weapon than an umbrella, and accompanied by no more than nine men, Rebmann pushed through Teita and reached Chaga, as the cultivated country is called round the lower slopes of Kilimanjaro. For the first time the eternal snows of the mountains of East Africa were seen, though for years few believed in their existence. In the latter part of the same year the indefatigable missionary led another expedition, this time fifteen strong, which crossed the greater part of the southern aspect of Kilimanjaro, and reached Machame, then the largest and most important of the Chaga States. Two years afterwards, "having heard of a country called U-nyamwesi, and of some enormous lake in the same region," he again started for the interior. The expedition, thirty in number, marched on the 6th of April, 1849; its route was by way of Kilimanjaro, but the Machame chief plundered it of all it possessed, and Rebmann had to retreat. In the same year Dr. Krapf, with eleven men, taking a more northerly route, succeeded in

crossing Teita, touching at the mountains Maungu and Ndara, and the northern end of the Bura Range, and on leaving Kivoi's village of Kitui, caught sight for the first time of the snow-clad summit of Kenia. Thus were these two great mountains discovered by the missionaries. Kenia remained unattempted, but in 1862 Baron Van der Decken and Thornton visited Kilimanjaro, and in a second expedition Van der Decken ascended it to a height of fourteen thousand feet. He failed, however, to enter the Masai country, and had to retreat to the coast. The next to reach the mountain and ascend it, this time to the snow-line, was another missionary, Mr. New, who on his return discovered the wonderful crater-lake of Chala at the base of the mountain. Mr. New made another attempt a few years later, but, like Rebmann, he was plundered of everything, and he died on the road to the coast. After him came the naturalist, Hildebrandt, who failed to get beyond Kitui; and then came Mr. Thomson, who succeeded in making his way to the Victoria Nyanza and safely home again. How he did this his book, recently published by Messrs. Sampson Low and Co., fully relates.

And a wonderful journey it was, and through a wonderful country. On one occasion the explorer went out shooting for six hours, and as the spoil of his own gun made the marvellous bag of "four rhinoceroses, one giraffe, four zebras, and four antelopes!" Some of the experiences were not, however, so pleasant. In the following instance the hunters and the hunted seem to have changed places.

"The lion still continued to roar at intervals, and it was evidently moving in a circle round us. This kept us awake for a time, and though our fire was of the smallest, and would soon burn out, we felt comparatively safe, though we dared not go to sleep. At last, however, the roaring ceased; our fire began to glimmer fitfully; we were dead tired, and consequently too sleepy and careless to try and find more firewood, a proceeding that we all shrank from in that dark wilderness. Some, however, had to be got, and we agreed all to sally out together. Brahmin and Songoro groped about among the bushes, and I stood over them with gun held ready, peering into the intense darkness, while Toby, a small terrier half-breed, a present from Mr. Taylor, clung to my heels apparently in mortal terror. On securing a few sticks we returned, in great trepidation, feeling somewhat electrically charged. It was now arranged that one should watch while the others tried to obtain a snooze. Songoro took the first watch, and in our worn-out state we were soon sound asleep. But

people do not sleep in these situations as they do in a comfortable bed at home; and well for us it was that we had one ear open. A curious terrified whine suddenly made us all jump to our feet, and with a common impulse stir up the fire till a shower of sparks sprang into the air. Our guns, never from our hands even in sleeping, were held ready, as, turning our backs to the fire, we peered

A lively night indeed! But the days were often as fraught with danger. "We were soon within fifty yards of the ungainly brute," says Mr. Thomson in telling how he shot his first rhinoceros, "which as it slowly moved onward with head low down was quite unaware of the enemy in front, or the danger it was running into. By this time, however, I myself began to have somewhat unplea-

surely that dreadful creature might have been petrified by mine. Then ten yards were passed, and I began to read mischief in the monster's eye. For once I wholly lost faith in myself. The suspense was intolerable, and the rhino, seeming to enjoy the fun, lengthened the period out as much as possible. At last I could stand it no longer. Steadying my arm on my knee I fired my infant. The dull thud which followed told me that I had not fired in vain. As I gathered my wits together I saw that the lumbering creature was spinning round, evidently dazed. Immediately, however, it recovered itself, and went off at a grand steady pace. On seeing my adversary's tail waving in the breeze, I became as brave as I had formerly been shaky, and, with nerves braced up by seeing the rhino running away, I gave it two other bullets from my express rifle. Yelling out to Brahim to follow, I went off pellmell in pursuit, with eyes steadily fixed on the game. The consequence was that I soon battered my nose and nearly broke my leg by falling into a hole. Recovering myself with an exclamation of disgust, I tore along again to get sadly bruised a second and then a third time. The rhino soon showed signs of exhaustion, and at last I contrived to head it, and having in my excitement lost all caution, I went right for it, and gave it another ball. This, however, was too much for the monster, and it charged straight forward, I being right in front of it. This was more than I had bargained for, and I felt that the tables were turned with a vengeance. As that thought went through my brain like lightning I gave a jump backwards. The next moment I was sprawling in a horizontal position, and seeing unusual stars in the heavens though it was broad daylight. It was a bush and not the rhino that had thus floored me, and I was now at that brute's mercy. I thought it was time to take farewell of life, and forgive all my enemies. The next moment there was a shaking of the ground, and a crashing of bushes. A dark body went lumbering past, and I rose from my prostrate position unhurt but breathless, delighted to see once more a tufted tail waving in the air, and to find that it disdained to hoist a fallen foe. It passed, however, only to die, and presently I was striking a heroic attitude with foot on the rhino, trying to adopt the expression proper to a man who is accustomed to that sort of thing."

It was not all the rhinos that gave this trouble, however. Later on we found one killed in double-quick time. "As usual I was considerably ahead with my advance guard, stepping out at a great pace, through tall grass, which reached my knees, when we were greeted by a shout of 'Kifaru! kifaru!' (rhinoceros). Turning round, our equanimity was considerably upset by the sight of a fine big fellow tearing down upon us within forty yards. My gallant men scattered like startled deer, and even Brahim, who carried my gun, was showing me his rear when I yelled at him to give the weapon to me. Ere I received the gun the rhinoceros was within ten yards. I instantly fired right in its face. This was not sufficient to bring it down, but it had the effect of making it swerve, and as it went puffing past me within three yards I gave it the second bullet in the neck. Down it dropped with the most astounding velocity, squealing with a ludicrous resemblance to a pig. My Andorobbo guide was so amazed at my performance that for a moment he stood like one paralysed and then made as if to run away in absolute fright." No wonder that the reputation of the medicine-man stood high!

For it was as "the White Lybon of the Lajomba" visiting the country to find out for the traders by occult means where ivory was to be got that the explorer coaxed his way through the dreaded Masai. "Could any one but a great medicine-man have a skin like mine or hair like mine? 'Now, you there!' I said, 'come to me and I will take off your

A Masai on the War-path.

with suppressed breath, body held down and face forward into the darkness. Not a creature was to be seen, but a faint rustling from the grass beyond told us that we had had a dangerous visitor—without a doubt, the lion. Looking round, we found that the whine had proceeded from Toby, who was shaking in every limb, and still emitting a terror-laden noise. He had certainly saved some of us from a horrid death, as Songoro had succumbed to his weariness and fallen asleep, leaving the fire to die almost out. Brahim now took his turn, and we were soon asleep, heedless of everything; but happily we remained undisturbed till a twilight-like light, passing into a deep crimson glow, told us morn had come."

sant sensations, and to wonder whether my game or myself was in the greater danger. I concluded that the odds were decidedly against me, and wanted accordingly to fire at once, so long as there was a chance of escape. My man Brahim, however, did not know my inward feelings, and as he had greater faith in my shooting powers than myself, he made me hold on a bit till it came nearer. Beginning to feel dreadfully shaky, though ashamed to be outdone in coolness by my servant, I waited with dread expectancy. My heart throbbed with wild pulsations, my fingers twitched, great drops of perspiration trickled down my face, and then with a general want of backbone I counted each footstep. If a glaring eye can fix any animal,

"I gave it the second bullet in the neck."

nose and put it on again. Come, you need | how firm they are' (here I tapped them with | shrunk back in intense amazement, and the
not be afraid. Ah! very well. Just look | my knuckles). 'You see there is no fraud | whole party were on the point of flight. Re-

"I was promptly propelled skyward."

here for a moment, and I will show you a | there. Just wait, then, till I turn my head. | assuring them, I once more turned my head,
thing or two. You see my teeth? Observe | Now, look, they are gone!' Here every one | put matters to rights in a twinkling, and,

bowing and smiling to my wondering spectators, I once more rapped the teeth. Here let me inform the gentle reader (in the strictest confidence, of course) that I have a couple of artificial teeth, which at this juncture were perfect treasures. These I manipulated to the astonishment of the Masai, and as they thought I could do the same thing to my nose or eyes they hailed me at once as a veritable 'lybon n'ebor' (white medicine-man)."

The cattle-plague was raging, and the lybon was welcomed in order that he might stay it. "A medicine had to be prepared for the disease, which I did by laying out a small medicine-box with the lid open, showing all the array of phials, etc. Taking out my sextant, and putting on a pair of kid gloves—which accidentally I happened to have, and which impressed the natives enormously—I intently examined the contents. Discovering the proper *dawa*, I prepared a mixture, and then getting ready some fruit-salt, I sang an incantation—generally something about 'three-bluebottles'—over it. My voice not being astonishingly mellifluous, it did duty capably for a wizard's. My preparations complete, and Brahim being ready with a gun, I dropped the salt into the mixture. Simultaneously the gun was fired, and lo! up fizzed and sparkled the carbonic acid, causing the natives to shrink with intense dismay. Little bits of paper were next dipped in the water, and after I had spat upon them the ceremony was over, and the pieces were handed round as an infallible cure, warranted not to fail."

Slowly, and with much diplomacy, but without the slaying of a man, the expedition cleared its way through the Masai—the great warrior race of Eastern Africa. Past Kilimanjaro it toiled to Lytokitok, and on past the Ngiri Swamp to Lake Nawasha, past the hot spring at Kekupe and Lake Elmeteita to Thomson's Falls, thence eastwards to Keina and westwards again to the mysterious lake of Baringo, on to Seremba, on the shores of the Victoria, thence northwards to the cave-dwellers of Elgon, eastwards to the Chibcharagnani Range, southwards to Kapte, past the salt lake of Nakuro, and at Ngongo-a-Bagas, on the slopes of Mount Lamuya, strik-

ing off eastwards out of the power of the Masai. Of a Masai warrior we are fortunate in being able to give a portrait, and Mr. Thomson favours us with his description. "First there is tied round his neck, whence it falls in flowing lengths, the naibere, a piece of cotton six feet long, two feet broad, and a longitudinal stripe of coloured cloth sewed down the middle of it. Over his shoulders is placed a huge cape of kite's feathers—a regular heap of them. The kidskin garment which hangs at his shoulder is now folded up and tied tightly round his waist like a belt, so as to leave his arms free. His hair is tied into two pigtails, one before and one behind. On his head is placed a remarkable object formed of ostrich feathers stuck in a band of leather, the whole forming an elliptically-shaped head-gear. This is placed diagonally in a line beginning under the lower lip and running in front of the ear to the crown. His legs are ornamented with flowing hair of the colobus, resembling wings. His bodily adornment is finished off by the customary plastering of oil. His simé, or sword, is now attached—it does not hang—to his right side, and through the belt is pushed the skull-smasher or knob-kerry, which may be thrown at an approaching enemy, or may give the quietus to a disabled one. His huge shield in his left hand and his great spear in his right complete his extraordinary equipment. For the rest you must imagine an Apollolike form and the face of a fiend, and you have before you the beau-ideal of a Masai warrior. He takes enormous pride in his weapons, and would part with everything he has rather than his spear. He glories in his scars, as the true laurel and decorative marks of one who delights in battles."

For the habits and customs of this truculent gentleman we must refer our readers to the book, one more quotation from which must now suffice us. "At last we were rewarded by the sight of a couple of buffaloes feeding some distance ahead. Gliding up warily till I got within fifty yards, I gave one of them a bullet close to the region of the heart. This was not sufficient to bring the animal down, and off it lumbered. Following

it up we were soon once at close quarters, with the result that a bullet from my express passed through its shoulder. With the obstinacy and tenacity of life characteristic of its kind, however, it did not quietly succumb. I next tried it with a fair header. This obviously took effect, for after it had struggled forward some distance it lay down, clearly, as I thought, to die. My belief was quite correct, only I should not have disturbed its last moments. Concluding, very foolishly, that the buffalo was *hors de combat*, and that the game was mine, I, with the jaunty air of a conqueror, tucked my rifle under my arm and proceeded to secure my prize. Brahim, with more sense, warned me that it was not finished yet; and, indeed, if I had not been a fool—which the most sensible people will be sometimes—I might have concluded that with so much of the evil one in its nature the brute had still sufficient life to play me a mischief, for it still held its head erect and defiant though we were unseen. Heedless of Brahim's admonition, I obstinately went forward, intending to give it its quietus at close quarters. I had got within six yards, and yet I remained unnoticed, the head of the buffalo being turned slightly from me and I not making much noise. I was not destined to go much farther. A step or two more and there was a rustling among some dead leaves. Simultaneously the buffalo's head turned in my direction. A ferocious, blood curdling grunt instantly assured me of the brute's resolution to be revenged. The next moment it was on its feet. Unprepared to fire, and completely taken by surprise, I had no time for thought. Instinctively I turned my back upon my infuriated enemy. As far as my recollections serve me, I had no feeling of fear while I was running away. I am almost confident that I was not putting my best foot foremost, and that I felt as if the whole affair was rather a well-played game. It was a game, however, that did not last long. I was aware of Brahim tearing away in front of me. There was a loud crashing behind me. Then something touched me on the thigh, and I was promptly propelled skyward."

PROBLEM No. 104, page 510.—1, P—Q 4. In reply to the twelve moves of the two Kts there is only one mode of mating. To five attacks there is each time only one defence, namely, B—Q 4, B—B 5; B—Kt 3, Kt—B 5; B—K 6, B—R 3; P—Q 3, Kt—B 3; and Q×Q, Kt—Kt 5.

GO-BAN.

GAME No. 5, page 495.

WHITE.

BLACK.

- | | |
|------------------|-------------|
| 1. g 4—f 3 | g 3—g 2 (a) |
| 2. f 3—e 2 | d 2—e 1 |
| 3. e 3—d 2 | a 5—a 4 (b) |
| 4. b 4—b 3 | (any move). |
| 5. b 3—b 2=five. | |

(a) He must prevent the man going from f 3 over g 2 to g 1.—If he were to play g 3—g 4, White would answer e 4—f 5, and win in two more moves by making a "five" in the diagonal a 7 g 1.

(b) Any other move would not prevent White from making "five" in the second row, for Black must not move the man e 3, as

White would obtain "five" (or even six) in the e file.

To Chess Correspondents.

J. T. C. (Edinburgh.)—Please send your problem on a diagram, for in your description there is a white Kt at White's K R 4, and a black Kt at Black's K R 5, and there never can be two pieces on one square.

THE SALT-WATER AQUARIUM.

By THEODORE WOOD,

Author of "Our Insect Allies," etc.

PART II.

DIFFICULT as it is to lay down any strict rules to be observed when stocking the salt-water aquarium, there are yet one or two hints which may well be given to the novice, and which may save him from many a disappointment until a little practical experience has been acquired. Everybody falls into certain mistakes at first, unless carefully warned of them beforehand, and these very mistakes form the most frequent cause of the waning zeal which is only too evident in the generality of aquarium-keepers after the first novelty of their pursuit has worn away.

One of these errors is that most fatal one of overcrowding. Ninety-nine out of every hundred persons who take to themselves an aquarium seem blindly to put their trust in the very false principle that "what is enough for one is enough for two," and carry it into effect so enthusiastically that each vessel is peopled with about five times as many captives as it ought to contain. The natural result follows. Very shortly after their admission into the aquatic Black Hole the captives begin to sicken and die off, the water rapidly becomes tainted and impure, death follows death with ever-increasing frequency, and at the end of a week or so the whole thing is thrown up in disgust.

As an almost invariable rule, far too much prominence is given to the fish. Eight or ten of these are placed in a tank which can support but two or three at the most, while no provision whatever is made for the increased air-supply which alone can keep them in health. And it is astonishing how much air a fish requires. Place a minnow or a stickleback in a small vessel, and in a very short time you will find him gasping for breath at the surface of the water. Transfer

him to a somewhat larger vessel and the result will be the same, excepting, of course, that it will ensue less quickly. The fish, indeed, is in exactly the same position as a man shut up in an air-tight chamber, suffocation following in both instances unless the supply of air be renewed.

It is tantalising, I admit, to be compelled to discard so large a proportion of one's captures, just as the gardener often finds it when compelled to thin out his seedling plants, but the process in either case is a very necessary one, and cannot be neglected without the certainty of direst consequences. For an ordinary bell-glass, say one of twelve inches in diameter, two moderately small fish are amply sufficient, and it is very bad policy to crowd in six or eight, and thus to ruin the health of all. If you cannot bring yourself to part with any of your captives, provide additional vessels for their reception, but never allow yourself, however great the temptation, to place in each one single inmate more than it is fitted to maintain.

A VERY interesting fish to select for the aquarium is the One-spotted Goby, a small shrimp-like creature which is tolerably common in the shallow pools left among the rocks by the retreating tide. When once this active little creature is caught he can be identified without the smallest difficulty, for upon his dorsal fin is the single dark spot which has earned for him his popular title.

There are two great advantages which should always recommend this little fish to the aquarium-keeper, the first being that he possesses a very hardy constitution, and thrives well in the narrow confines of his prison, and the second that he is very easily

fed. All that he requires by way of diet consists of the minute creatures with which seaweed is always more or less infested, so that by placing a handful or so of fresh weed in the tank you will supply him with a plentiful meal.

And then, too, he is such a bright and active little being, dashing to and fro with astonishing speed, and very quickly becoming accustomed to his new life. By degrees, even, he will become quite tame, and will all but take food from the fingers as they are dabbled in the water. And his habits are so interesting to watch. Like all the gobies, he possesses a very remarkable structure of the ventral fins, which are joined together at their edges, and form a kind of sucker of considerable clinging power. To those not in the secret no little wonderment will be caused by the singular manner in which the fish checks its course, even during its most rapid movements, for the sucker-like fins are instantaneous in their action, and anchor their owner firmly to any stone or other object over which it may happen to pass. Taking him all in all, indeed, there is no fish which can be better recommended for the salt-water aquarium than the One-spotted Goby.

Then there is the curious little Pipe-fish, which is equally interesting, and equally easy to obtain. All that you need do is to pass the net to and fro among the seaweed left in the rock-pools at low water, and you will probably capture more specimens than you can possibly accommodate. They will give you but little trouble, and may be fed in just the same manner as the goby, a little fresh seaweed being supplied every two or three days.

(To be continued.)

ENTOMOLOGY AT THE SEASIDE.

By THE AUTHOR OF

"Beetles, and Where to Find Them," "An Evening at the Sallows," etc.

ONE of the great events in an entomologist's career is undoubtedly his first experience of collecting at the seaside. Almost every insect that he meets with is something that he has never taken before, and, provided only that the weather be suitable, he must be a careless worker indeed if he does not return home with his boxes full of good things. Speaking without exaggeration, insects are so plentiful in many parts of the coast as almost to bewilder one by their numbers, and to render it next to impossible to select the specimens required for the collection before they succeed in making their escape.

And just see what rarities there are among these seaside insects! The Queen of Spain Fritillary (*Argynnis Lathonia*), for instance, is a butterfly of decidedly maritime tenden-

cies, for half a dozen specimens at least are taken near the coast to one found inland. Only three years ago no less than eight examples of this insect were taken in a single morning by a collector staying at Dover, and seventeen others were recorded from the same neighbourhood in the course of the season. Amongst other numerous seaside localities for the Queen of Spain are Yarmouth, Southend, Margate, Ramsgate, Walmer, Deal, Folkestone, Brighton, and Ventnor, at most of which the insect has been met with more than once.

Then there is the Bath White (*Pieris daplidice*), which has been captured almost exclusively on or near the coast of Kent and Sussex, and which is well worth looking out for by entomologists at the seaside. Being a

slow flier, it is easily caught, provided that it is not passed by as one of the commoner species. By far the best plan is to net every white about which there is the least shadow of doubt, and to release those which are not wanted as soon as they have passed muster. Once more, almost all the British examples of the greatly-coveted Long-tailed Blue (*Lampides batice*) have been taken within a very short distance of the sea, while, to descend to lesser fry, the Clouded and Pale Clouded Yellows (*Colias Edusa* and *Hyale*) are often exceedingly abundant in clover and lucerne fields, the variety *Helice* of the former insect turning up by no means infrequently. There are few things more calculated to excite a collector than the sight of these two beautiful butterflies flitting in multitudes from flower

to flower, and if he can bring himself to leave the spot before his boxes are completely filled his entomological enthusiasm must be of a very mild and limited character.

Nor are the moths unrepresented, numbers of species being found on the coast alone, among them many of the greatest rarities with which it is possible to meet. Those two beautiful creatures, the Spurge and Bedstraw Hawks (*Deilephila euphorbie* and *galii*), for instance, are never found far from the shore. The Ichneumon Clearwing (*Sesia ichneumoniformis*) frequents the cliffs between Rams-gate and Margate in June and July, and should be looked for among the Stinking Hellebore. The Crimson-speckled (*Deiopeia pulchella*), one of the most exquisite of all our moths, is generally taken near the sea, in stubble-fields or among flowers. The Belted Beauty (*Nyssia zonaria*) is almost wholly confined to three or four localities upon the Cheshire coast, and so also with numbers of others, which appear to find the sea breezes a necessity of existence, and seldom or never to venture upon a tour of discovery into inland districts. Many of these, no doubt, are but accidental visitors, stray wanderers from the Continent, but no one is likely to refuse them admission to his cabinet upon that account.

As regards the methods of seaside collecting, there are one or two facts which it is as well to bear in mind. Sugaring, for instance, cannot as a rule be carried on in the ordinary manner. Many parts of the coast are almost destitute of trees, and the treacle must consequently be applied wherever a spot can be found for it—on palings, posts, walls, and even upon large stones. If the grass is long and rank, it is not a bad plan to tie it together in large bunches, looking something like sheaves of corn, and to apply the sugar to the sides of these. Or, if everything else fails, small squares of rag may be soaked in the mixture, and hung up in suitable situations.

The stubble fields and pieces of waste ground adjoining the foreshore are nearly always productive, and moths may be knocked out in numbers from the low herbage with very little trouble. Flowers should always be examined, both during the day-time and after dark; ragwort especially is very attractive when in full bloom.

If you happen to visit a part of the coast in which sand-hills form a prominent feature of the shore, devote as much time as you can to working them thoroughly. There are many moths which are scarcely ever found anywhere else, and you may at any time come across an insect new to Britain or even to science itself. Several new noctuæ have turned up at odd times near Brighton, and there is no reason at all why other localities should not be equally prolific.

(To be continued.)

Correspondence.

A. L.—Almost any second-hand bookseller could get you a copy of More's "Eutopia." Try Mr. B. Quaritch, of Piccadilly.

D. J. LUST.—For dealers in foreign stamps consult our wrapper, or any advertisement sheet. We never recommend any particular firm, or guarantee any statement in any advertisement. You must buy or sell at your own risk.

ENQUIRING READER.—It is customary to stamp both paper and envelope. The paper gives the address, the envelope shows whence the letter comes, and the device on it takes the place of the old seal.

H. THURLOW.—The marks on the lamps are guides to the nearest hydrant. The arrow shows the direction, the first number gives the distance in feet, and the second the distance from that point at right angles out into the road. Thus 69+11 means sixty-nine feet along the kerb and eleven feet out from that spot at right angles to the pavement.

H. H.—The address of the Willesden Paper Company is Willesden Junction, N.W., or 34, Cannon Street, E.C.

A. W. B.—You can get patterns of fretwork from Faulkner, Cheapside; Melhuish, of Fetter Lane; Churchill, of Sun Street, Finsbury; and almost every tool shop.

O. S. S.—Lay the pages of your stamp album between sheets of clean damp blotting-paper until the gum or paste gives way. Do not be in a hurry, but keep the paper damp.

A. SMUDGE.—Clean the grease off the glass by washing it with ammonia—and then paint in varnish. See Index.

A. WILLOUGHBY CAPTAIN.—1. You can get Milton's poems for eightpence in the Chandos Classics, published by Messrs. Warne and Co. 2. Messrs. Macmillan are Lord Tennyson's publishers. He is Mr. no longer.

COLWYN BAY.—In our second volume we gave three large diagrams showing all a clipper's sails, all her spars, and all her standing rigging.

NUMBER ONE.—Order the "Bijou Gazetteer," by W. H. Rosser, of your bookseller. It costs eightpence, and gives thirty thousand references to countries, towns, mountains, rivers, lakes, etc., etc.

CRICKET.—The "Laws of Cricket" are not likely to deal with such an absurdity. If you like to hold your bat with both hands behind it, pray do—and get out. You will be a most popular cricketer—with your opponents.

VOX POPULI.—The parts are not out of print, the numbers are; hence you can only procure the missing numbers in part form.

A. Y. Z.—"Punch, brothers, punch," and "Leedle Yawbok Strauss," are in Cassell's "Selections of American Humour," published in their two-shilling Red Library.

STUDENT.—1. An edition of Lavater's "Physiognomy" is published by Ward, Lock, and Co. 2. Angora is the ancient Ancyra, now a town in Anatolia, 39° 56' N, 32° 41' E. Perhaps your map calls it Enguri.

ONE OF THE FIDDLERS THREE.—1. Keep your unused strings in an airtight tin canister, and leave them untouched. If you grease them you will not be able to play them. Grease stops friction, and friction means sound. 2. No special preparation is required before using a string, but keep it free from kinks, and do not twist it as you take it out of coil. 3. Unscrew the nut of your bow, and shake the hairs apart. Any of the violin dealers in Soho will repair your bow for you for a trifle. 4. Steeping the fingers in vinegar is said to harden, but the best plan is to practise until they get "corny."

F. J. D. SKINNER (Plymouth).—If you will inform us what you mean by the "Dark Arches of London," we will endeavour to discover their "origin, use, extent, entrances, etc.," but at present we are unable to do so. Do you mean the Adelphi arches, now shut in by the Thames Embankment?

J. H.—You can obtain books on athletic sports from any of the cricket outfitters. Try any of the Lilly-whites; Wisden, of Cranbourne Street, Leicester Square; or Goy, of Leadenhall Street.

CAEDMON.—We never answer legal questions, but we may say at once that your intended proceedings are opposed to all notions of justice and common honesty. Never shuffle out of a promise; and never make a promise unless you can keep it.

PISCATOR, X. Y. Z.—May is a close month for all the coarse fishes under the statute, so that you must leave the roach alone.

GIMLET.—One very good way of arranging your tools is to make a set of three or four shelves, and perforate them with different-sized holes just large enough to hold the various tools when upright. You can thus see all your tools at a glance, and every one of them has its place. You can put a front to your shelves and form a cupboard, or you can design a chest on the principle with the front and top both opening, and which latter is the best plan of the three.

J. J.—Try Montagu's "British Birds," published by Van Voorst, or any edition of Yarrell. There is no cheap book giving all the information you require. A complete list of the British Birds was given with our coloured plate in the June part for 1882.

YATCHMAN (we suppose you mean YACHTSMAN).—There is no need to worry yourself with calculations as to the amount of lead you will have to put on a model's keel. All you have to do is to hollow out your boat until she is as thin as you intend her to be, and then place her in the bath and fill her up with water until she floats to her load-line. The weight of the water she holds is the weight of the lead she should have on her keel; and you have only to measure it off and remember that "a pint of fresh water weighs a pound and a quarter." Of course you should allow for the deck and spars, and also for the fact that lead in water weighs less than it does in air, and it is better to have too much lead than too little, as you can easily cut it down. Do not, however, cut it until you have had a trial cruise.

G. S.—The discovery, like a good many others, was made "in ages prehistoric, in the days when we were young." Colin has the accent on the "Col."

J. S. C.—All such complaints are curable. Go to a doctor. No matter what your complaint may be, rest assured that you are not the only sufferer.

MAURICIUS.—1. Leave the ball alone. 2. It is not customary in England to fill footballs with gas, whatever it may be in Belgium. There is just a chance that the lifting power would be so very much improved that a kick-off would send the ball aloft, and leave it there like a balloon.

PHILATELIST.—The packets of stamps would be sent at the latter rate, and they would weigh under the half-ounce. The dealers would take a few new Canadian stamps, but not many; and we would advise you not to think any more about the matter.

C. CHASE (Cape Colony).—The instances are curious, and we quote them, but the description is not exact enough to enable us to give an explanation. What are the species of shells? Are they recent or fossil? Was the "stone vessel" an ironstone nodule?—"In the Zitzisramma Forest (which is about ten miles from the seashore) stood a large yellow-wood tree. It became necessary that this tree should be cut down. This was done, and on cutting the stem up into blocks, a small cavity was found in the centre of one of these blocks, and in this cavity was found a number of sea-shells. The wood and bark all round this cavity were quite sound; in fact, the whole stem is perfectly solid. How would you account for the shells being found there? The following curious discovery was made at the same place. In digging into the ground we came upon a stone vessel about the size and shape of a cocoa-nut, iron-colour, and in it was found little balls about the size of a plum, all of different colours; and on being crushed into a powder make excellent paint. Many more are to be found at the same spot."

MASTER GOBANG.—"Good ginger-beer that will go off a jolly good bang"! Is, then, the bang the best of the beer? Get five lemons, and five pounds of loaf-sugar, three ounces of powdered ginger, and three gallons of water, a slice of toasted bread from the cook, and a quarter of a teacupful of yeast from the baker. Boil the ginger and the sugar in the water for an hour, and let the solution cool. Then add the juice and peel of the lemons, and put in the yeast spread on the toasted bread. Cover the pan with a thick cloth, and leave it alone for three days. Then strain the liquor through a cloth and bottle it; at the end of a week you will find it all up and ready for drinking, bang and all complete. If you think the powdered ginger is not so strong as it might be, use four or even five ounces instead of three.

REGIMENTAL GOAT.—A George III. threepenny-piece is worth threepence, plus as much more as you can persuade a person to give for it. Current coin is worth no more than its face value.

HORSE.—The articles on Double Chess were in the July and August parts for 1882. Circular Chess was in the September part for 1883.

CLAN CHATTAN.—You can obtain full particulars as to entering a volunteer corps by applying to its headquarters.

L. E. B.—1. Green for inconstancy, yellow for jealousy, blue for constancy, white for purity, purple for royalty, brown for grief, and black for death. That is "the symbolism of colour" according to the ancients; the symbolism according to the moderns is "for caution green, for danger red, and white for clear and drive ahead." 2. To macadamise a road is to cover it with stones broken to about the same size, and to arrange them so as to form an arch instead of a hollow, like the roads of old. The method was invented by Sir John MacAdam eighty years ago—hence the name.

GWALIA.—Messrs. Heywood, of Manchester, publish a guide to the London University Matriculation. It is by Mr. W. Dodds, and costs eightpence.

POSTMAN.—Apply to the Secretary, General Post Office, St. Martin's-le-Grand. Your best plan is to enter at once as a telegraph messenger.

CLAUDIO.—1. The Latin dictionary is worth only a few pence. Elizabethan school-books are of little value. 2. So far from thinking it "foolish" for a boy to prefer Shakespeare and Sir Walter Scott to the current literature of the day, we should think it showed his good sense.

COLUMBA.—For bay-salt apply to an oilman, or a hay and straw dealer. It is often sold on barrows in the streets.

CARVER AND GILDER.—The time we are in the press prevents replies in such matters being of use.

G. P. H.—There is a Handbook to the Learned Societies to which you could refer, but to none of them do you obtain admittance by examination. It is simply a question of good report and personal knowledge. B.C.L.=Bachelor of Civil Law; D.C.L.=Doctor of Civil Law; F.R.S.E.=Fellow of the Royal Society of Edinburgh; F.R.C.S.E.=Fellow of the Royal College of Surgeons of England; F.C.L. is new to us. You have to pass in all subjects for the B.S.C.

AUNT NELL.—You can encourage rooks to build in your trees by securing the young birds in the nests, and then fixing the nests in the trees you wish them to resort to next year.

T. AITKEN.—The subjects of examination for the Institute of Chartered Accountants are advertised in "The Accountant," price sixpence; and "The Accountants' Students' Journal," price ninepence, both published by Gee and Co., Telegraph Chambers, E.C., who also publish a "Chartered Accountants' Examination Guide," by G. P. Norton, price eight shillings and sixpence.

No. 341.—Vol. VII.

SATURDAY, JULY 25, 1885.

Price One Penny.

TALBOT BAINES REED,
*Author of "My Friend Smith,"
etc., etc.*

CHAPTER XVII.
SAMUEL SHUCKLEFORD FINDS
HIMSELF BUSY.

"JEMIMA, my dear," said Mrs. Shuckleford one day, as the little family in No. 4, Dull Street, sat round their evening meal, "I don't like the looks of Mrs. Cruden. It's my opinion she don't get enough to eat."

"Really, ma, how you talk," replied the daughter. "The butcher's boy left there this very afternoon. I saw him."

"All serene—I'll be done with it in about an hour."

"I'm afraid, my dear, he didn't leave anything more filling than a bill. In fact, I 'eard myself that the butcher told Mrs. Marks he thought No. 6 'ad gone far enough for 'im."

"Oh, ma! you don't mean to say they're in debt?" said Jemima, who, by the way, had been somewhat more pensive and addicted to sitting by herself since Reginald had gone north.

"Well, if it was only the butcher I heard it from I wouldn't take much account of it, but Parker the baker 'as 'is doubts of them; so I 'eard the Grin-son's maid tell Ford when I was in 'is shop this very day. And I'm sure you've only to look at 'Orace's coat and 'at to see they must be in debt: the poor boy looks a reg'lar scarecrow. It all comes, my dear, of Reginald's going off and leaving them. Oh, 'ow I pity them that 'as a wild son."

"Don't talk nonsense, ma," said Miss Jemima, firing up. "He's no more wild than Sam here."

"You seem to know more about Reginald than most people, my dear," said her mother, significantly.

To the surprise of the mother and brother Jemima replied to this insinuation by bursting into tears and walking out of the room.

"Did you ever see the like of that? She always takes on if any one mentions that boy's name; and she old enough to be his aunt, too!"

"The sooner she cures herself of that craze the better," said Sam, pouring himself out some more tea. "She don't know quite so much about him as I do!"

"Why, what do you know about 'im, then?" inquired Mrs. Shuckleford, in tones of curiosity.

"Never you mind; we don't talk business out of the office. All I can tell you is, he's a bad lot."

"Poor Mrs. Cruden! no wonder she takes on. What an infliction a wicked son is to a mother, Sam!"

"That'll do," said the dutiful Sam. "What do you know about it? I tell you what, ma, you're thick enough with No. 6. You'd better draw off a bit."

"Oh, Sam, why so?"

"Because I give you the tip, that's all. The old lady may not be in it, but I don't fancy the connection."

"But, Sam, she's starving herself and 'Orace is in rags."

"Send her in a rump-steak and a suit of my old togs by the housemaid," said Sam; "or else do as you like, and don't blame me if you're sorry for it."

Mrs. Shuckleford knew it was no use trying to extract any more lucid information from her legal offspring, and did not try, but she made another effort to soften his heart with regard to the Widow Cruden and her son.

"After all they're gentlefolk in trouble, as we might be," said she, "and they do behave very nice at the short-and class to Jemima."

"Gentlefolk or not," said Sam, decisively, spreading a slice of toast with jam, "I tell you you'd better draw off, ma—and Jim must chuck up the class. I'm not going to have her mixing with them."

"But the child's 'eart would break, Sam, if—"

"Let it break. She cares no more about shorthand than she does about county courts. It's all part of her craze to tack herself on that lot. She's setting

her cap at *him* while she's making up to his ma; any flat might see that; but she's got to jack up the whole boiling now—there. We needn't say any more about it."

And, having finished his tea, Mr. Samuel Shuckleford went down to his "club" to take part in a debate on "Cruelty to Animals."

Now the worthy captain's widow, Mrs. Shuckleford, had lived long enough in this world to find that human nature is a more powerful law even than parental obedience; she therefore took to heart just so much of her son's discourse as fitted with the one, and overlooked just so much as exacted the latter. In other words, she was ready to believe that Reginald Cruden was a "bad lot," but she was not able to bring herself on that account to desert her neighbour at the time of her trouble.

Accordingly that same evening, while Samuel was pleading eloquently on behalf of our dumb fellow-creatures, and Jemima, having recovered from her tears, was sitting, abstractedly over a short-hand exercise in her own bedroom, Mrs. Shuckleford took upon herself to pay a friendly call at No. 6.

It happened to be one of Horace's late evenings, so that Mrs. Cruden was alone. She was lying wearily on the uncomfortable sofa, with her eyes shaded from the light, dividing her time between knitting and musing, the latter occupation receiving a very decided preference.

"Pray don't get up," said Mrs. Shuckleford, the moment she entered. "I only looked in to see 'ow you was. You're looking bad, Mrs. Cruden."

"Thank you, I am quite well," said Mrs. Cruden, "only a little tired."

"And down in your spirits, too; and well you may be, poor dear," said the visitor, soothingly.

"No, Mrs. Shuckleford," said Mrs. Cruden, brightly. "Indeed, I ought not to be in bad spirits to-day. We've had quite a little family triumph to-day. Horace has had an article published in the 'Rocket,' and we are so proud."

"Ah, yes; he's the steady one," said Mrs. Shuckleford. "There's no rolling stone about 'Orace."

"No," said the mother, warmly.

"If they was only both alike," said the visitor, approaching her subject delicately.

"Ah! but it often happens two brothers may be very different in temper and mind. It's not always a misfortune."

"Certainly not, Mrs. Cruden; but when one's good and the other's wicked—"

"Oh, then, of course, it is very sad," said Mrs. Cruden.

"Sad's no name for it," replied the visitor, with emotion. "Oh, Mrs. Cruden, 'ow sorry I am for you."

"You are very kind. It is a sad trial to be separated from my boy, but I've not given up hopes of seeing him back soon."

Mrs. Shuckleford shook her head.

"'Ow you must suffer on 'is account," said she. "If your 'eart don't break with it, it must be made of tougher stuff than mine."

"But after all, Mrs. Shuckleford," said Mrs. Cruden, "there are worse troubles in this life than separation."

"You're right. Oh, I'm so sorry for you."

"Why for me? I have only the lighter sorrow."

"Oh, Mrs. Cruden, do you call a wicked son a light sorrow?"

"Certainly not, but my sons, thank God, are good, brave boys, both of them."

"And who told you 'e was a good, brave boy? Reggie, I mean."

"Who told me?" said Mrs. Cruden, with surprise. "Who told me he was anything else?"

"Oh, Mrs. Cruden! Oh, Mrs. Cruden!" said Mrs. Shuckleford, beginning to cry.

Mrs. Cruden at last began to grow uneasy and alarmed. She sat up on the sofa, and said, in an agitated voice,

"What *do* you mean, Mrs. Shuckleford? Has anything happened? Is there any bad news about Reginald?"

"Oh, Mrs. Cruden, I made sure you knew all about it."

"What is it?" cried Mrs. Cruden, now thoroughly terrified and trembling all over. "Has anything happened to him? Is he—dead?" and she seized her visitor's hand as she asked the question.

"No, Mrs. Cruden, not dead. Maybe it would be better for 'im if he was."

"Better if he was dead? Oh, please, have pity and tell me what you mean," cried the poor mother, dropping back on to the sofa with a face as white as a sheet.

"Come, don't take on," said Mrs. Shuckleford, greatly disconcerted to see the effect of her delicate breaking of the news. "Perhaps it's not as bad as it seems."

"Oh, what is it; what is it? I can't bear this suspense. Why don't you tell me?" and she trembled so violently and looked so deadly pale that Mrs. Shuckleford began to get alarmed.

"There, there," said she, soothingly; "I'll tell you another time. You're not equal to it now. I'll come in to-morrow, or the next day, when you've had a good night's rest, poor dear."

"For pity's sake tell me all now," gasped Mrs. Cruden; "unless you want to kill me."

It dawned at last on the well-meaning Mrs. Shuckleford that no good was being done by prolonging her neighbour's suspense any further.

"Well, well! It's only that I'm afraid he's been doing something—well—dreadful. Oh, Mrs. Cruden, how sorry I am for you!"

Mrs. Cruden lay motionless, like one who had received a stab.

"What has he done?" she whispered, slowly.

"I don't know, dear—really I don't," said Mrs. Shuckleford, beginning to whimper at the sight of the desolation she had caused. "It was Sam, my son, told me—he wouldn't say what it was—and I ope you won't let 'im know it was me you 'eard it from, Mrs. Cruden, for he'd be very— Mercy on us!"

Mrs. Cruden had fainted.

Help was summoned, and she was carried to her bed. When Horace arrived shortly afterwards he found her still unconscious, with Mrs. Shuckleford bathing her forehead and tending her most gently.

"You had better run for a doctor, 'Orace," whispered she, as the scared boy entered the room.

"What is the matter? What has happened?" gasped he.

"Poor dear, she's broken down—she's— But go quick for the doctor, 'Orace."

Horace went as fast as his fleet feet

would carry him. The doctor pronounced Mrs. Cruden to be in a state of high fever produced by nervous prostration and poor living. He advised Horace, if possible, to get a nurse to tend her while the fever lasted, especially as she would probably awake from her swoon delirious, and would for several days remain in a very critical condition.

In less than five minutes Horace was at Miss Crisp's, imploring her assistance. The warm-hearted little lady undertook the duty without a moment's hesitation, and from that night and for a fortnight to come hardly quitted her friend's bedside.

Mrs. Shuckleford, deeming it prudent not to refer again to the unpleasant subject which had been the immediate cause of Mrs. Cruden's seizure, waited till she was assured that at present she could be of no further use, and then withdrew, full of sympathy and commiseration, which she manifested in all sorts of womanly ways during her neighbour's illness. Not a day passed but she called in, morning and afternoon, to inquire after the patient, generally the bearer of some home-made delicacy, and sometimes to take her post by the sick-bed while Miss Crisp snatched an hour or so of well-earned repose.

As for Horace, he could hardly be persuaded to leave the sick-chamber. But the stern necessity of work, greater than ever now at this time of special emergency, compelled him to take the rest necessary for his own health and daily duties. With an effort he dragged himself to the office every morning, and like an arrow he returned from it every evening, and often paid a flying visit at midday. His good-natured companions voluntarily relieved him of all late work, and, indeed, every-one who had in the least degree come into contact with the gentle patient seemed to vie in showing sympathy and offering help.

Young Gedge was amongst the most eager of the inquirers at the house. He squandered shillings in flowers and grapes, and sometimes even ran the risk of disgrace at the "Rocket" by lingering outside the house during a doctor's visit, in order to hear the latest bulletin before he went back to work.

In his mind, as well as in Horace's, a faint hope had lurked that somehow Reginald might contrive to run up to London for a day or two at least, to cheer the house of watching. Mrs. Cruden, in her delirium, often moaned her absent son's name and called for him, and they believed if only he were to come her restless troubled mind might cease its wanderings and find rest.

But Reginald neither came nor wrote.

Since Horace, on the first day of her illness, had written, telling him all, no one had heard a word from him.

At last, when after a week Horace wrote again, saying,

"Come to us, if you love us," and still no letter or message came back, a new cloud of anxiety fell over the house.

Reginald must be ill, or away from Liverpool, or something must have happened to him, or assuredly, they said, he would have been at his mother's side at the first breath of danger.

Mrs. Shuckleford only, as day passed day and the prodigal never returned, shook her head and said to herself, it was a blessing no one knew the reason, not even the poor delirious sufferer her-

self. Poor people! they had trouble enough on them not to need any more just now! so she kept her own counsel, even from Jemima.

This was the more easy to do because she knew nothing either of Reginald or his doings beyond what her son had hinted, and as Samuel was at present in the country on business, she had no opportunity of prosecuting her inquiries on the subject.

Sam, in fact, whether he liked it or not, happened just now to hold the fortunes of the family of Cruden pretty much in his own hands.

A few days before the conversation with his mother already reported, he had been sitting in his room at the office, his partner and the head clerk both being absent on County Court business.

Samuel felt all the dignity of a commander-in-chief, and was therefore not at all displeased when the office-boy had come and knocked at his door and said that a lady of the name of Wrigley had called and wished to see him.

"Show the lady in," said Sam, grandly, "and put a chair."

Mrs. Wrigley was accordingly ushered in, the dust of travel still on her, for she had come direct from Liverpool by the night train, determined to put her wrongs in the hands of the law. Mr. Crawley, Samuel's principal, had been legal adviser to the late Mr. Wrigley; it was only natural, therefore, that the widow, not liking to entrust her secret to the petty-fogging practitioner of her own village, should make use of a two hours' break in her journey to seek his aid.

"Your master's not in, young man?" said she, as she took the proffered seat. "That's a pity."

"I'm sure he'll be very sorry," said Sam; "but if it's anything I can do—"

"If you can save poor defenceless women from being plundered, and punish those that plunder them—then you can."

Here was a slice of luck for Samuel! The first bit of practice on his own account that had ever fallen in his way. If he did not make a good thing out of it his initials were not S. S.!

He drew his chair confidentially beside that of the injured Mrs. Wrigley, and drank in the story of her woes with an interest that quite won her heart. At first he failed to recognise either the name of the delinquent Corporation or its secretary, but when presently his client produced one of the identical circulars sent out, with the name Cruden Reginald at the foot, his professional instincts told him he had discovered a "real job, and no mistake."

He made Mrs. Wrigley go back and begin her story over again (a task she was extremely ready to perform), and took copious notes during the recital. He impounded the document, envelope and all, cross-examined and browbeat his own witness—in fact, did all a rising young lawyer ought to do, and concluded in judicial tones, "Very good, Mrs. Wrigley; I think we can do something for you. I think we know something of the parties. Leave it to us, madam; we will put you right."

"I hope you will," said the lady. "You see, as I've been all the way up to Liverpool and back, I think I ought to be put right."

"Most certainly you ought, and you shall be."

"And to think of his brazen-faced impudence in calling me 'Love,' young man. There's a profligate for you!"

Samuel was knowing enough to see that it would greatly please the outraged lady if he took a special note of this disclosure, which he accordingly did, and then rising, once more assured his client of his determination to put her right, and bade her a very good morning.

"Well, if that ain't a go," said he to himself, as he returned to his desk. "I never did have much faith in the chap, but I didn't fancy he was that sort. Cruden Reginald, eh? Nice boy you are. Never mind! I'm dead on you this time. Nuisance it is that ma's gone and mixed herself up with that lot. Can't be helped, though; business is business; and such a bit of practice too. Cruden Reginald! But you don't get round Sam Shuckleford when he's once round your way, my beauty."

To the legal mind of Sam this transposition of Reginald's name was in itself as good as a verdict and sentence against him. Any one else but himself might have been taken in by it, but you needed to get up very early in the morning to take in a cute one like S. S.!

He said nothing about the affair to his principal when he returned, preferring to "nurse" it as a little bit of business of his own, which he would manage by himself for once in a way.

And that very evening fortune threw into his way a most unexpected and invaluable auxiliary.

He was down at his "club," smoking his usual evening pipe over the "Rocket," when a man he had once or twice seen before in the place came up and said,

"After you with that paper."

"All serene," said Sam; "I'll be done with it in about an hour."

"You don't take long," said the other.

"Considering I'm on the committee," said Sam, with ruffled dignity, "I've a right to keep it just as long as I please. Are you a member here?"

"No, but I'm introduced."

"What's your name?"

"Durfy."

"Oh, you're the man who was in the 'Rocket.' I heard of you from a friend of mine. By the way," and here his manner became quite civil, as a brilliant idea occurred to him; "look here, it was only my chaff about keeping the paper; you can have it. I'll look at it afterwards."

"All right, thanks," said Durfy, who felt no excuse for not being civil too.

"By the way," said Sam, as he was going off with the paper, "there was a fellow at your office, what was his name, now—Crowder, Crundell? Some name of that sort, I forget."

"Cruden you mean, perhaps," said Durfy, with a scowl.

"Ah, yes—Cruden. Is he still with you? What sort of chap is he?"

Durfy described him in terms far more forcible than affectionate, and added, "No, he's not there now; oh, no. I kicked him out long ago. But I've not done with him yet, my boy."

Sam felt jubilant. Was ever luck like his? Here was a man who evidently knew Reginald's real character, and could, doubtless, if properly handled, put him on the scent, and, as he metaphorically put it to himself, "give him a clean leg up over the job."

So he called for refreshments for two,

and then entered on a friendly discourse with Durfy on things in general, and offered to make him a member of the club; then bringing the conversation round to Reginald, he hinted gently that he too had his eye on that young gentleman, and was at the present moment engaged in "bowling him out."

Whereupon Durfy, after a slight hesi-

tation, and stipulating that his name should not be mentioned in the matter, gave Sam what information he considered would be useful to him, suppressing, of course, all mention of the real promoters of the Select Agency Corporation, and giving the secretary credit for all the ingenuity and cunning displayed in its operations.

The two new friends spent a most agreeable evening, Sam flattering himself he was squeezing Durfy beautifully into the service of his "big job," and Durfy flattering himself that this bumptious young pettifogger was the very person to get hold of to help him pay off all his old scores with Reginald Cruden.

(To be continued.)

ON SPECIAL SERVICE: A NAVAL STORY.

By GORDON STABLES, M.D., R.N.,

Author of "The Cruise of the Snowbird," "Stanley O'Grathame," etc.

CHAPTER XVI.—A BATTLE AND A CHASE—THE CORAL REEF—A HURRICANE SQUALL—A FIGHT ON A CORAL ISLAND.

THE fight on board the barque had been unexceptionally severe, and long before morning broke and the moon dipped towards the west it was evident the captured vessel could not be kept afloat.

The wounded and prisoners were therefore speedily removed, and, steaming off a little way, the Theodora lay by to see the last of her. She floated longer than any one could have imagined. She died hard. At eight bells in the morning watch she was still afloat, moving slowly through the water, with tattered sails, splintered yards and ropes, and rigging all awry.

"I think," said Mr. Mildmay, "it might be just as well to put that craft out of pain."

"I was thinking so myself," replied Captain Blunderbore.

But as he spoke a puff of wind, almost a squall, came across the sea. For a time the barque could hardly be seen. When quite visible once more it was evident she was in *extremis*. She was taking weary lurches or rolls from side to side; finally the stern slowly sank, and she tipped up forward; then the fo'c's'le blew up with a dull, heavy report, and next minute she was dragged beneath, the bubbling waters closed over her, and the barque was no more.

It was a busy day that for the Theodora, and especially for Dr. McGee. The whole of both sides of the main deck was turned into a hospital. Cots were hung under canvas, and there the wounded were placed, the Arabs being treated with just as much kindness and attention as the British.

Nearly a month passed away. The Theodora had been to Zanzibar with her prisoners, and was once more back on her cruising ground between Comoro and Madagascar.

A good look-out was kept nightly for the piratical slaver. It was evident from reports that had reached Captain Blunderbore's ears at Johanna, that she was still in these seas.

Men were constantly kept in the chains too, for the shoals in the sea and the coral reefs all round here are dangerous in the extreme, and but imperfectly laid down in the charts.

Late one evening a light was reported, and although it might be only that of another cruiser or an honest trader, the bugle at once sounded to quarters. It was clear and starry, as on the eve of the battle described in last chapter.

The light, however, disappeared as suddenly as it had shone out, and nothing more was seen for fully an hour, when to

the surprise of every one a ship under full sail was noticed coming down towards them like an avalanche.

"That's the Castigo," cried Benbow. "No ship on this coast can move like that but—"

The sentence was never concluded. The approaching vessel yawed for a moment, a line of fire and smoke ran along her black hull, then came thunder and a rain of shot that tore through the rigging and bulwarks of the Theodora and wounded more than one man.

The response was immediate from the war-ship, and it must have been a telling one. When the smoke cleared away the Castigo—for it was she—was seen still staggering and reeling and apparently almost unfit to proceed. There was time for the Theodora to almost rake her. But in the darkness probably little damage was done by the second broadside, and before another could be fired the Castigo was beyond range.

The brief battle now resolved itself into a chase. Away went the Castigo in a line with the shore, and the Theodora followed at full speed, firing every now and then with her bow gun.

"By all that is lucky," cried Benbow, wild with excitement, "we are gaining on the Castigo. See, sir, she is setting sail, and that last shot went slick into her stern."

A little sail was now clapped on the Theodora, which both steadied her and increased her speed.

But on went the Castigo, and it was soon evident that Barclay's shots were falling short.

The first lieutenant took several turns up and down the bridge, casting anxious eyes skywards. Strange to say, the clouds that were banking up and up, and blotting out the stars, were not coming from the same direction as the wind, but from nearly the opposite point of the compass.

On board the Castigo the pirate captain stood anxiously on his bridge. Hope in his breast was bounding very high now. He saw his enemy coming on after him, on and on to certain destruction, for both vessels were already on the edge of a reef, which the Castigo, with her light draught of water, might get over in safety, the Theodora never. This was the revenge which Gaspar Moravo had been planning and plotting for a month. There was hardly a mile of shoal water in the Indian Ocean or channel of Mozambique unknown to this old piratical slaver.

It was nearly or quite high water, too

—the pirate had chosen his time well—so that if the Theodora struck there would be no higher tide to float her off.

Still the sky was becoming overcast, and what meant those ominous drift-clouds so high up in the zenith?

No matter, no matter; it was now or never. Gaspar felt as he clutched the bridge-rail and glanced back in the direction of his hated foe that he would be content to die if he could be sure of accomplishing the destruction of that ship.

"Eugenio," he said to his lieutenant, "in half an hour, if the wind holds, your vessel will be hard and fast on these rocks, and when daylight comes we will but have to stand by and see them perish!"

"Your excellency is right," replied Eugenio; "but still, capitano, I do not like the looks of the night. How dark and black it gets! I believe a squall is coming!"

"Stand by! Ready about!"

The wind went suddenly down; there was an ominous flapping of the sails. A few drops of rain came pattering down on deck as if the goddess Nox were shedding tears for the death and ruin so soon to follow.

Blacker and darker grew the night. The ship rolled unsteadily, and seemed to quiver as if she were a living thing in fright, not knowing where to run, not knowing from which direction the danger was coming.

Gaspar himself rushed aft and stationed himself by the men at the wheel.

He turned the wheel himself a point or two. "Keep her there!" he cried; "one point off that means destruction to all on board!"

The sails continued to flap intermittently.

Then from over the sea came a low moaning sound like the roar of surf on a far-off shore.

The night grew blacker still; nothing could be seen a yard ahead, and the light even from the binnacle and from the dead-eyes shot far up into the sky.

But, see! yonder, on the near horizon, is a long white line; it comes nearer and nearer.

Then a flash of lightning darts quickly through the gloom, but the thunder that follows is never heard in the terrible roaring of the hurricane-squall that now sweeps downwards with a fury that cannot be described.

The Castigo is thrown on her beam ends, yet she rights again slowly and steadily; but, blinded by the surf and

spray, the men at the wheel have for a moment lost command of her. For some time she goes tearing on before the awful squall, and next moment strikes with terrible violence on the very rocks to which she was trying to lead her enemy, the Theodora.

"To cling to slippery shrouds
Each breathless seaman crowds."

In less than a minute, with a series of crashes, down go masts and funnel, and

ship, for not one timber of her shall fall into the hands of our enemies."

"Ay, and we will stand by to see her blaze too."

In half an hour more the pirate ship was in flames from stem to stern, then away shorewards went her boats.

They were hardly a mile away when the old Waterwitch blew up, scattering her burning beams and timbers across the water; then all was silence and darkness once again.

Presently up rose the moon, silvering

beach was of coral sand, and shone like silver in the clear moonlight.

The boats pulled round and round it, but never a sign of life was visible.

Gayly, however, who was in command of this little expedition, determined to wait till daylight and thoroughly search the place.

So the boats were drawn up, sentries placed, and a bivouac formed on the sands. And thus the night was spent.

Proof of the presence of the pirates on the island was found next morning early.

A Terrible Moment.

the waves break on and over the doomed Castigo.

As suddenly as it came, so did it pass; both wind and sea went down, clouds drifted overhead still, but among them ever and anon stars could be seen.

"Eugenio!" cried Gaspar; "our vessel is lost! Have we boats enough left to take us away? The island of Pratto is but a short distance off. Can we manage?"

"We have boats enough," answered Eugenio, "to take away all the men we have left. Those terrible seas cleansed our decks."

"Then get them out. Death is welcome, if death *will* come, but we shall not be the prisoners of the cruiser. Man the boats."

"And now, Eugenio, if you are ready we will leave; but first let us fire the

the few remaining clouds, and casting a broad belt of shining light across the water.

"A narrow shave for us," said Blunderbore, of the Theodora.

"A narrow shave indeed!" replied Benbow.

"Can any have escaped, think you?" said Captain Blunderbore to Mildmay.

"I think it is highly probable there may be," was the reply; "and if so they have taken refuge on yonder little island."

In a few minutes more five boats filled with armed men were rapidly leaving the ship's sides and pulling straight for the island.

It was hardly a mile in circumference, but covered almost entirely with low trees and scrubby bushes, and quite an entanglement of wild creepers. The

They had attempted to conceal their boats, but in vain. These were soon pulled out and taken possession of; then search was commenced for the owners. It was found almost impossible, however, to penetrate into the interior of the island, which, according to Benbow's description, contained nothing but scrubby jungle and scrubby snakes.

The Theodora, lying at anchor about a mile off, was communicated with, and orders were received to fire the bush. This it was believed would bring the pirates down to the only piece of clear ground there was near the beach. The wood was accordingly fired, and in less than an hour from end to end the island was a mass of flames and smoke.

But two whole hours went by, then three, and four, yet the pirates made never a sign. "Is it possible," Colin re-

marked to Benbow, "the wretches have perished in the flames?"

"Heaven forbid," said Benbow; "it is too dreadful to think of."

Several blue-jackets and marines attempted to find their way into the interior, but were obliged to come back without having made any discovery.

"I have it," cried Benbow, "my little black rascal Othello; he's a Salamander, nothing can hurt him. We'll send him in."

"Good," said Gayly, laughing somewhat sarcastically; "if you think your Salamander can accomplish anything, you'd better signal for him."

A blue-jacket who had acted as signalman soon let them know on board the Theodora what was wanted. So soon after Othello came on shore in the dingy.

"Golly, massa," he cried, rejoiced at being able to do a service. "I no hurt. De fire never lighted yet hot enough to burn Othello. But, sah! I not go into dat bush with my best clothes."

"No, certainly, Othello, it would really be a pity to spoil so splendid a suit."

Othello grinned from one of his big ears to the other, speedily commencing undressing, and when he had reduced himself to very scanty raiment indeed he received his orders and off he went to reconnoitre.

A very bold little chap was Othello, and quite a "curio" in the way of niggers. Ever since his arrival on board the Theodora—Benbow had brought him from Sierra Leone—he had been a favourite with every one.

The tailor had earned for himself undying fame as a tradesman by making Othello a suit of clothes that a duke's servant might have worn, had any duke's servant been small enough.

As for Othello, there certainly wasn't much of him. He was so small he could have gone to bed in the coal-scuttle, and so black that if you had opened the lid you wouldn't have seen him.

But he had created quite a sensation the first day he had entered the gun-room in those new clothes of his. It was just lunch-time.

"Ho! ho!" said Benbow, "the tailor has made your clothes then?"

"Yes, sah! and they fits like a glove,

sah. Dat am de ver' remark de tailor make hissef, sah."

"Stand up on that chair till we see you. Ha! ha! ha!" laughed Benbow, "what a caricature upon humanity! Why, my little Koh-i-noor, you're a regular black Jeames in miniature. Plush waistcoat, white tie, dress coat, knee breeches and all!"

"Come down, Othello, come down, sir."

"I'se a-goin' to be call Othello, now, sah?" asked the blameless Ethiopian;

"all dat long name, sah?"

"Yes, my boy. What did they call you at St. Helena?"

"Dey never called me nuffin. Dey allers kicked me, sah!"

Off went Othello then, and Benbow grew very anxious indeed as a very long time seemed to elapse, and still there were no signs of his reappearance, for Benbow really had considerable regard for his black mite of a servant.

But Othello returned at last. He came out with a rush and a run; the only garment he wore was a white one before he entered; it was black enough now; and his hands and feet and face were torn, burned, and bleeding. His story was simple and satisfactory enough.

"In de middle ob de bush," he said, "der am one big, big clearing. All roun' he am, dis clearing. No fire der, 'cause no bush der to burn. And der all de bad white men sit down. Dey had plenty sword, plenty spear, and dey no make much bobbery, only one small palaver, only one little sing-song. All de same as dis, Massa Benbow."

Down on his knees on the coral sand went little Othello, with his face thrown forward and buried in his hands—the attitude of prayer used by the Arabs.

"Enough, my lad," said Benbow, kindly. "Get away on board again, I don't want anything to come over you."

"What does it mean?" said Quentin.

"It means," was Benbow's reply, "that those fellows are preparing for death, and will die with their swords in their hands."

"You're right, I believe, for once, Benbow," said Lieutenant Gayly.

"For once, yes, thank you."

And Benbow lifted his hat in mock courtesy to his superior officer.

It was getting on towards four bells in

the afternoon watch, the men had dined on the beach, and both marines and blue-jackets were lying down beside their piled arms, laughing, joking, and talking as easily as they would have done on Southsea Common, when a wild shout was heard, and from the still smouldering jungle the foe leapt on them.

So quick was the onset that they had hardly time to form and fire a volley.

Then the fight went on hand to hand, a terrible *mêlée* with bayonets and clubbed muskets on the one side, with sword and spear on the other.

Gaspar Moravo and Eugenio, his lieutenant, were the first to fall. It seemed as though they actually courted death.

* * * *

Reader, as I wrote that last sentence my morning paper was laid on my study table, and pausing for a moment to open it (January 22nd, 1885), I read the account of the fierce engagement between General Stewart's troops and the wild hordes of the False Prophet at the wells of Abu Klea. I can see it all in imagination, that fearful struggle against overwhelming odds; for well I know the fanatic fury of the Arab tribesmen.

* * * *

Nay, I will not finish the description of the fight on the sands of Pretto between the Arab pirates and our men of the Theodora.

But—no prisoners were taken. And side by side with the foe were stretched more than one brave blue-jacket and marine. And a cross marks their graves on that lonely isle of the ocean.

The little rough-hewn cross, generally of wood, sometimes even of stone, and always with rudely-carved initials, where is it not to be seen? Far away north on the surf-tormented shores of Greenland, draped in a mantle of snow and fringed with icicles; far away south on the stern and rocky coasts of Del Fuego, or the Cape; westward among the isles of the Pacific, and eastward on the coral islands of the Indian Ocean, half hidden at times in a wealth of creeping greenery and wild flowers, but always visible.

How that little cross speaks to the heart sailors alone know.

(To be continued.)

UP AND DOWN: A STORY OF THE OCEAN WAVE.

By ASCOTT R. HOPE,

Author of "The Tell-Tale," "The Amateur Dominie," etc.

CHAPTER IV.—GETTING UP AGAIN.

DING-DONG went the dinner-bell along the deserted deck. Then the captain and I sat down alone, with a great joint apiece for each of us, and steaming dishes of vegetables and two or three puddings, all spread in vain, so far as the rest of the passengers were concerned. They seemed likely to make a bad bargain of their contract for victuals. It was dining under difficulties. The fiddles had been rigged out to keep our dishes and glasses in their places, but every now and then there would be quite a little storm among the gravy, and we had plenty of work in conveying the soup safely to our mouths, so that conversation flagged between us

for a time; indeed, we hardly knew what to say to each other. The skipper still eyed me suspiciously, as if doubtful whether I were not only pretending to be at ease. By-and-by, however, taking note of my unmistakably hearty appetite, he grinned approval, and remarked that I ought to have been a sailor, by which I felt duly flattered, beginning to think not a little of myself as one superior to the common lot of landsmen. With the cheese he became still more confidential.

"Quiet enough now!" he chuckled, jerking his thumb towards the cabin-doors on either side of us, from which issued at intervals a subdued groan or

other still more unmistakable sound of trouble. "They were carrying on finely last night, but I thought half a gale of wind would bring them up with a round turn. Lying under close-reefed canvas to-day; tails between their legs, eh?"

I grinned, having indeed some cause to agree with the skipper in his satisfaction.

"Never had such a set of passengers in my life! Why, even the Sunday excursionists aren't so bad—Jim and 'Arry, and the rest of 'em. Well, I'm glad I never went to school, if there's no more sense to be got there. My youngsters shall go to sea as soon as they can pull a

rope—that's where boys learn how to behave themselves!"

"Were you never at school, captain?" I ventured to ask.

"Not much, my lad; boys didn't waste their time in my day. I served aboard a Newcastle collier when I was twelve years old; and look at me now!"

There was no answering such an argument, even if I had been prepared to discuss theories of education. My own private opinion at that age was much the same as his, and it astonished me for once to find a grown-up person agreeing with me. But here our conversation was interrupted by the appearance of Gooderidge standing half dressed by his cabin-door, clutching desperately at the handle to keep himself on his legs, as he gasped out, in lamentable accents,

"Captain! captain! is this wind not going to stop, please?"

"I hope not. Won't you come and have a bit of dinner?"

"Oh!" was Gooderidge's only reply.

"It's worse than wind I am afraid of."

"Worse!" echoed Gooderidge, dolefully, and sympathetic murmurs arose from other sufferers, who had overheard what was said.

"Fog! That's what we have to look out for if the wind drops. How would you like to lie off Ushant for a couple of days, rocking in the swell of the Atlantic, eh?"

The captain winked at me, cruel in his hour of triumph. Gooderidge opened his mouth once more, but at this moment there came a terrible heave and rattle of crockery, and he disappeared precipitately, like a perturbed spirit vanishing into the tomb at cockerow.

After dinner there was not much to tempt me to remain below in that close, ill-smelling atmosphere of the cabin. Most of the fellows appeared to ask nothing but to be left alone; as for Gooderidge, he was quite speechless; so I went on deck and spent the rest of the day there, watching the foaming sea and the few vessels which could be seen trying to beat up against the wind or running gallantly before it. Towards evening the captain, coming down from the bridge in dripping oilskins, took me under his wing and became quite communicative. He showed me Alderney looming through the clouds, and the Casket rocks and other landmarks. We had tea together cosily in his cabin, and he talked to me a great deal about "Number twenty-nine," by which I found he meant a certain house at Steyne where his wife and children lived. That was how the rough skipper had a soft spot in his heart for youngsters like me. Then he advised me to shake myself down for the night in a snug little place beside the cabin hatchway, generally reserved for ladies. There I turned in with my clothes on, and slept like a top through all the heaving and pitching.

I was awakened by the sailors washing the decks, a very unnecessary proceeding, as appeared to me. Land appeared close at hand. We had passed Ushant, and were making our way by a group of low rocky islands, hardly noticeable except for the lighthouses that marked them, which the captain told me were called the "Saints," but ought to have a worse name for the trouble they gave to mariners. Here we rounded the corner of France, and came fairly into the Bay

of Biscay, that, in spite of its evil repute, proved not so bad for us as the English Channel. The wind had gone to the north-west, blowing strong and sharp, but favourable to us now that we must run south. Some sail was set, which helped to steady the boat, and on we went with wind and steam, catching sight here and there of the rocky shores of Brittany on our left, then, later in the day, of Belleisle, and other islands off the French coast.

The great waves, chasing us now from behind, did not shake the vessel about so much as on the day before; still there was quite enough motion to keep the invalids from getting their sea-legs. A few of them ventured to crawl on deck for a little, shivering in the cold wind. Others might be seen faintly nibbling at a biscuit, but most of them continued prostrate. Gooderidge lay on his back all day, having reached that stage of seasickness in which he seemed neither to know nor care what happened to him, and for my part I was well satisfied that he did not recover too quickly. I had nothing to fear from any of them that day. No more mischief, no more chaff, no more singing; but if these woeful wights had found voice for song, their quavering chorus would have surely been—

"As we lay,
In the bay,
In the Bay of Biscay—Oh-ah!"

If it is so much misery to be sick in the first-class cabins of a passenger steamer, what, I have often asked myself, must have been the sufferings of our Peter Simples and Midshipman Easys in their gloomy cock-pit berths?

Thus the day passed away. After dark a light was seen from a boat close ahead, and we slackened speed.

"I hope this is one of the frog-eaters, to let me turn in and get a quiet night," quoth the captain.

We burned a blue light at the bows, there was a hail from the boat, the steamer stopped, and a man scrambled on board—my first Frenchman! He was the pilot for the bar of the Gironde, but he looked such a ferocious character, with his big cloak, his fur cap, and his scraggy beard, that I thought him much more like a pirate.

Now our voyage might be considered as almost at an end, and I went snugly to bed, full of pleasant expectations of seeing foreign parts. Gooderidge was, or pretended to be, asleep, and to-morrow I should be done with him—happy thought!

Next morning we found ourselves in the calm waters of the Gironde, with the low shores of La Belle France on either hand, not very enchanting, certainly, in this part; a somewhat monotonous scenery of flat fields and naked vineyards. But the wind had gone down, and the sun had come out to light up the spring green, and any land would have appeared beautiful to most of my pining fellow-passengers.

Up they came to enjoy the sunshine, very much subdued, no longer making any show of familiarity with the ocean. They had had enough of that for a time. The Eton boy was civil, the Bluecoat was silent, the army tutor's pupils had no heart to display their big pipes; the tourists addressed themselves to serious study of their guide-books; the French

boys kept longing eyes fixed on the familiar shore. The acrobats crept up to sur themselves, looking more dishevelled and unshaven than ever, but had not an antic left in them to celebrate their approach to firm land.

And Gooderidge! All his bullying and bumptiousness had been washed out of him for the nonce. After his recent experiences he seemed quite meek, even evinced a certain surly thankfulness to me for the various attentions I had paid him in his hour of need. When he talked of making me fag for him, he had little thought how dependent he should be on my voluntary services; and indeed I can wish no worse fate to a tyrant than being badly sea-sick before the eyes of his victim.

This day, for the first time, we all sat down to dinner, and did ample justice to our last meal in good substantial British style. Foreign kickshaws must henceforth be our fare till again we should face the briny ordeal that lay between us and the roast beef of Old England. The boys were all on their best behaviour now. There was very little conversation among them, for they all attended strictly to the business of eating, having indeed to make up a long leeway, as the captain facetiously remarked, glancing round at the active knives and forks of his reunited party.

"Had enough playing pitch and toss, eh?" he asked them, more than once, with a chuckle and a wink to me. The skipper evidently "fancied himself" for his wit, and was not magnanimous enough to refrain from crowing a little over those fallen rebels.

It was slow work ascending the pea-soup-like flood of the Gironde. We had to wait for the tide, and to take two fresh pilots on board at different points, but at last, towards evening, we were safely moored at the quay of Bordeaux; and among the little mob of curious idlers, red-legged soldiers, blue-bloused workmen, turnip-headed children, and so forth, who had gathered to watch our disembarkation, I caught sight of my father looking out for me. I waved my hand, and he waved back, hurrying towards the gangway; and now, what need I care for all the Gooderidges in the world!

Then came a great confusion: porters gesticulating and shouting to secure a job; custom-house officers boarding the boat; luggage being dragged up from below and opened on deck for their inspection. In the middle of it Gooderidge accosted me with a slap on the back, in a tone that was meant to be friendly,

"Good-bye, you young Smout! Hope you will enjoy yourself in the holidays. See you again next term?"

"Yes," replied I, not very enthusiastically.

I never saw him again. After the holidays, for some reason or other, he did not come back to school, and nobody that I know of was sorry; at least, I for one was certainly not so. But at this time I thought nothing more about him, for there was my father pushing his way across the deck, who could now protect me as surely as, during the voyage, old Father Neptune had paralysed the hand of a bully. *Oh, si sick omnes!*

(THE END.)

TIGER TALES;

OR, THE ADVENTURES OF A HOLIDAY.

"MISSED, I believe!" shouted Norman, as he began to reload. "Keep a good look-out at the end of the jungle, Mac."

Mac did so, for the animal was only in sight for a few tremendous leaps, and he did not think it worth while to fire. But nothing broke from the end.

At the first roar some of the beaters had scrambled into low trees, but most of them huddled together like a flock of frightened sheep; and in this form they were now led by old Rugonauth out of the jungle on the side opposite to the sportsmen, with the object of beating from the remote end and driving the tiger from the thick patch in which he had disappeared.

Advancing in a compact body, and not scattered as heretofore in parties or singly, they approached the place, throwing stones and an occasional rocket or flower-pot as skirmishers in front.

This was evidently not to the tiger's taste, for he slipped down a few feet of bank into

the river, and partly in water, partly on the shingly shore, galloped back down the river side in a direction almost straight towards Mackenzie. Having a good command from his position on the bank, Mac let him come on; and, when within some thirty or forty yards, let drive. The bullet told, evidently behind, for the beast, pulling up in his headlong career, performed a regular waltz, partly rose on his hind legs, springing round several times as if to get at the wound, roaring with full tiger power during this gymnastic performance. But Mac's left barrel warned him of the propinquity of danger; so he abruptly reascended the bank and turned into the jungle, receiving right and left from Norman before he became concealed in the friendly cover.

The beaters were again withdrawn to the outside of the jungle, opposite to the place in which he was now supposed to be lying. A lucky and well-directed flower-pot stirred him up, however, and again he sneaked to the

end; but this time quietly glided down the bank into the deep water, and commenced swimming directly across.

Once on the other side, the same as that on which the hunters were stationed, the dense jungle in their rear, which extended for miles, afforded a secure retreat. That attained, there would be small chance of recovering him, wounded though he was. The effort was a bold one, but it was not fated to be successful.

The distance was over a hundred yards, but Mac's deadly heavy rifle was quickly brought up, and, after a momentary steadying, growled forth its anathema. Swimming as the beast was, with only the head, line of back, and the tail visible, it was a good shot to strike it. But the aim was true. Rearing half out of the water, he pawed at the air, receiving from Norman also a well-planted bullet. Turning round, he gave up his intention of forcing the passage of the river, and again retreated to the dense cover of the bushes at the end of the jungle.

"Well done, Mac, old fellow; well shot!" Norman had shouted as the first bullet told; "just stopped him in time."

"Same to you," was the reply, as Norman followed suit; "that's another for his nob."

"He got it severely there," said Norman, as he joined his friend when the tiger disappeared. "I don't like allowing the men to go in again."

"I don't think there will be any danger, if they'll only stick together and shout from the end of the patch, and be liberal with the crackers and flower-pots. But let us hear what Rugonauth says. I see Hawkes has gone round to the other side too."

It was soon ascertained that the tiger was lying about a dozen yards from a small tree, in which one of the markers was standing, whitey-brown with funk; for although he had crept as high as the branches would bear him, he was not more than twelve feet from the ground.

"We can't get the marker to speak, Sahib," shouted Rugonauth, "but he is pointing towards the tiger; and on this side we can

The First Tiger—A Swimming Shot.

see the bushes moving where he is tearing them in pain." And in effect the two friends also saw from their place the tops of some of the larger jow bushes swaying to and fro.

After a brief colloquy it was determined that all three of the hunters should join on the other side; and, should the beast not prove amenable to all their persuasive efforts to rouse him, advance directly on the place of his retreat. But before performing this dangerous manoeuvre, they decided to exhaust all possible means of inducing him to show.

It occurred to Norman that if the marker could be induced to get the brute to charge up to his tree, they might roll him over as he crossed an intervening open space. At any rate the man was safe, covered as he was by the three sportsmen then standing not more than twenty yards from him.

The man was appealed to in affecting terms by Rugonauth; but, shivering with fright, he steadily declined to hold any verbal communication whatsoever.

"He is ready to drop out of the tree with funk, Sahib," said the old shikaree; "there

The brute immediately started up and made towards the tree; but ere he had covered half the intervening space three rifle bullets crashed into his body, and he rolled over into a dip in the ground, where the bushes concealed him.

"Is he dead?" was shouted to the marker; and that individual, plucking up spirit as he saw the dreaded beast lying prostrate before him, managed to find a husky voice, and answered that "he thought it was, though still gasping."

"I'll go and see, and make sure," Mackenzie said, "while you be ready here to cover me in case of need." Accordingly he went to the tree, climbed into it, fired a shot to make certain, and then proclaimed the tiger to be dead.

Not a bad opening for the holiday trip of the three officers from Jehangerpore, whose adventures have been so graphically related by Captain Newall! His "Eastern Hunters" is one of the pleasantest of books dealing with jungle life in India, and from it we pur-

gentlemen, and have your day's pay without deduction. Keep that in mind. To-day I shall give you an extra half-day's pay; and so I will always do when we kill."

After a buzz of approval as the speech was translated by the shikaree out of the Hindustani in which it was spoken into the dialect of the district, and various ejaculations in which "Cherisher of the poor" was generally distinguishable, the money was paid and the ring broke up.

As the sun went down the three friends strolled down to the pool, and found they had not deceived themselves as to the delight afforded by a plunge after the hard day's work. A swim and roll about in the water invigorated them immensely, and they shortly sat down to dinner in a state of mind and body it is rarely given to the dyspeptic shunner of air and exercise or the contemner of energetic inuring sport to enjoy.

Before and during dinner the noise of many voices indicated where the process of skinning the dead tigress was being effected by the choomars (tanners), who had been summoned

The Camp.

is no getting anything out of him, but I'll try and get him to break off a bit of branch and throw it towards the tiger, while you be prepared in case he gets up."

Sending the beaters to a distance, and standing shoulder to shoulder, the hunters advanced to the nearest spot attainable, at the same time covering the opening I have spoken of, and Rugonauth commenced exhorting the marker in the most moving and feeling manner. "Why, look here!" he said; "do you think you can be in any danger with these three tiger-slaying lords to defend you? What animal dare show itself before them without being made to eat their invincible bullets? Arree! wah! You are like a miserable crow in a tree. Find courage, you poor wretch, and then you will receive much honour and *baksheesh* for being the means of causing that infidel tiger to die."

Several of his fellow-villagers also chimed in from a distance, entreating him to do as desired.

Whether it was owing to the moving eloquence of Rugonauth, the exhortations of his brethren, or the magic name of "*baksheesh*," the wretched man did at last, hesitatingly, snap off a large twig and throw it at the tiger.

pose quoting freely, more especially with regard to the shooting of tiger and other big game. But before entering on another incident we may as well appropriately finish the first day's work.

The tiger proved to be a splendid tigress, and loud was the chattering among the beaters as they gathered round and boasted of what each had done towards the result, the hero of the tree being prominent in telling with great volubility and much repetition the story of his danger and escape. After a short rest under a tree the ponies were sent for, and Mackenzie, Norman, and Hawkes cantered off to camp; but it was nearly sunset before they were joined by the beaters, who, in relays, staggered under the weight of the tigress, which had been tied by the legs to a long branch. Having deposited their burden with much grunting and rubbing of shoulders, they were, under the captain's orders, marshalled into line and then desired to sit down in a ring. This being accomplished, the captain, with a bag of money in his hand, thus addressed them:

"You have all done well. The other sahibs and myself are pleased. You shall always be fairly paid by myself or one of the other

from a large village about three miles off. A spot had been selected for this purpose a little to the leeward of the camp, and to this, after dinner, the hunters betook themselves personally to superintend the stretching and pegging down of the skin.

When the hide is taken off, and the pieces of flesh and fat still adhering are carefully scraped away, it is pegged to the ground by means of a number of little wooden pegs, two or three inches long, driven through the skin at intervals, just within its outer edge, all round. This is done with the hairy side of the skin downwards, so that, after being well washed and scraped, the interior may dry from the exposure, and thus the hide retain, without shrinking, the dimensions it has been stretched to. It therefore follows that a skin is somewhat longer in measurement than the animal who at one time actually wore it.

Cheroot in mouth, and lolling in their chairs in loose undress, the hunters sat and superintended, smoking and chatting over the incidents of the day, in the pleasant light of a young tropical moon. The hum of many insects was around, seeming to pervade the air. Bats fluttered to and fro, and fireflies glittered in the shady nooks about the pool.

A hungry impatient family or two of jackals set up their clamorous demands for supper, having already scented death on the still air. And more than once the ghost-like form of one more daring than the rest would approach, only, however, to glide away, followed by a stone or stick from one of the village watch-

men or other detector of the intruder. An owl, flitting about, hooted its low wailing notes, like some ubiquitous demon; and all listened as, once or twice, the distant roar, or rather grunt, of a tiger came borne on the gentle night air. The hot sirocco wind, which had blown strongly during the day, had given

place to one, not cool certainly, but now in comparison fresh, gentle, and balmy, though even yet puffs came laden with the furnace heat of the parched and desiccated soil. Occasionally a thump would be heard, causing a general rush and scramble among some of the followers, as a ripe mango fell to earth.

(To be continued.)

THE SALT-WATER AQUARIUM.

By THEODORE WOOD,

Author of "Our Insect Allies," etc.

(Continued from page 671.)

IF you can get a Dragonet, do so by all means, if only for the sake of its singular appearance. It is by no means an uncommon fish, but seldom visits the shore, and prefers to remain near the bottom of the sea beyond low-water mark. When young, however, it is rather more venturesome, and is occasionally found in the nets of professional shrimpers, who invariably discard it in company with other "rubbish" of a similar character. If you are on good terms with one of these gentry, you ought to have no difficulty in supplying yourself with as many examples as you want.

There are few of our British fishes more striking in aspect than the dragonet, or "sculpin" as it is often called, whose dorsal fin is exceedingly narrow, and is prolonged to such a degree that it reaches as far as the base of the tail. This curious fin is boldly arched, and is in itself quite sufficient to point out the identity of its owner. Nor is the fish lacking in beauty, for its scales glitter at every movement as though set with gems, for which the golden ground-colour of the body affords a kind of setting. Only the adult male, however, is thus gorgeously clad, his gentle spouse and the young of both sexes being very dingy creatures in comparison.

If you are lucky enough to obtain a dragonet, you may feed him upon small molluscs and marine worms. He will not require very many, and you must be very careful to remove those which he does not devour before the water becomes tainted by their dead bodies.

Flat-fish are interesting creatures, and may often be caught by the aid of the hands alone. If you wade into the water at a spot where the sand is mingled with a little mud, you will often feel the fish wriggling away from beneath your bare feet. Wait until your foot is firmly placed upon one of these, stoop quickly down, grasp it firmly with your hands, and transfer it to your bottle before it can contrive to make its escape.

It is best to put a little sand in the vessel containing these fish, as they are very fond of lying motionless at the bottom of the water, and will be sadly disconcerted if they have nothing but metal or glass upon which to rest. It is also advisable to isolate them as far as possible, for they are gifted with tolerably large appetites, and will almost certainly prey upon their fellow-captives if you give them the opportunity.

Another animal that is well worth keeping, even at the expense of a little trouble, is the well-known Cuttle-fish, or Squid, which is plentiful enough upon most parts of our coast. This is also one of those beings for which solitary confinement is advisable, for it is decidedly a creature of prey, and is not averse even to a meal upon its own species.

You may sometimes find the eggs of the cuttle-fish, looking not unlike a bunch of purple grapes, and can frequently hatch out the young animals by keeping them in water for a short time. It is well worth while doing so, if you have the chance, for then you can watch the entire life-history, and make yourself acquainted with the habits of the animals during every stage of their growth.

Notice especially the manner in which they swim. You will very likely find it somewhat difficult to do so at first, for they seem to propel themselves through the water without any visible means, and to move to and fro merely by the exercise of their will alone. If you can manage to startle one, however, as he is resting at the bottom of the vessel, you will notice that the sand in front of him is disturbed as he darts away, just as if the contents of a small syringe had been discharged along it. And this, in fact, is exactly what has taken place. By examining the body of the animal you will discover that it is furnished with a small tube called the "siphon," which is connected with the breathing organs, and through which water is continually passing. By forcibly ejecting the contents of this tube the animal is of course driven backwards, for the water which is expelled acts on that around it, and jerks the creature for some little distance, just as the gases rushing from the interior of a sky-rocket drive the case into the air by their action upon the surrounding atmosphere. This is the entire secret, and by the exercise of a little care and patience you may easily see it in operation for yourself.

There is another habit for which most of the cuttles are famous, and that of a rather peculiar character. If one of these animals be alarmed in any way, the water around it suddenly becomes as dense as ink, without any apparent reason. The fact is that the little creature is furnished with a reservoir containing a supply of a thick black fluid, which can be ejected at will, and darkens the water with which it mixes so thoroughly that the cuttle-fish is concealed for a moment or two from the sight of its foe, and so has time to make its escape. It is from this singular fluid that the colour known as "sepia" is manufactured.

Still another point of interest we may find in the arms, or "tentacles," of the cuttle-fish. These, it will be found, are studded with a number of small but powerful sucker-like organs, each composed of a kind of fleshy cup, and provided with a piston, so to speak, which can be worked to and fro at will. It will thus be seen that, when the disc of one of these suckers is placed against the body of the victim, and the piston withdrawn, a vacuum is formed, and the prisoner held securely until it is carried to the mouth and devoured.

Sea-anemones, which of course must be represented in every aquarium, capture their prey in a somewhat similar manner. Their long wavy tentacles are not furnished with suckers, it is true, but nevertheless possess weapons even more deadly, in the shape of multitudes of venomous darts, which can be shot forth when their owner has need of their services. Each of these darts, when not in use, lies coiled away like a piece of watchspring in a tiny cell, so small, indeed, that a tolerably powerful microscope is needed in order to distinguish it. But woe betide the shrimp or even the small fish that comes into contact with one of the tentacles! As if by magic, it is arrested in its course, its struggles grow fainter and fainter, and before very

long it disappears into the stomach of the anemone, the poisoned darts having done their work and slain their victim almost before it was fairly seized. So powerful are these thread-like weapons, indeed, that they can make their influence felt even by the human finger, and will raise painful blisters upon the hand which touches them if the skin be at all sensitive.

In transferring anemones from the rocks upon which they are resting, force must never be employed, for they are delicate creatures, and may be fatally injured if not treated with the utmost care. By far the best plan is to chip off the fragment to which they are attached by means of a chisel, and to place them in the aquarium without attempting to remove them from their hold. They will not require food very often, and will eat scraps of raw meat if living victims cannot be obtained.

Crabs, as a general rule, are unsatisfactory creatures to keep in confinement, for their appetites are so insatiable that they will devour all their fellow-captives in the course of a day or two, and, moreover, they require far more space than can generally be allotted to them. There are one or two of the molluscs, also, which *must* be excluded, such as the common Dog Winkle, which has a bad habit of attacking his shell-bearing relatives, perforating their shells by means of his "tooth-ribbon," and extracting their bodies piece-meal through the aperture. Another of the whelk tribe—namely, the Sting Winkle—which may be known by its peculiarly corrugated shell, is equally destructive, and must be sentenced to solitary confinement if it is kept at all.

Two or three examples of the common Periwinkle should find place in each vessel, however, for they will prove invaluable in keeping the sides free of the vegetable growth which is so apt to overspread them. These may generally be procured in multitudes by searching the rocks at low water. Other molluscs you will probably find in company with them, and may admit by far the greater proportion to your aquarium without any fears as to possible consequences. As a general rule, however, it is as well to select the smaller specimens only, and to pass the larger by.

Shrimps you will want, of course, for they are most interesting creatures to watch, and may be obtained without the smallest difficulty. Notice, if you can, the peculiar manner in which they swim, jerking the broad fan-like tail sharply towards the head by a sudden contraction of the body, and so driving themselves *backwards* through the water. Lobsters, by the way, swim in precisely the same manner, and dart along with wonderful speed and precision. Get one or two Prawns, also, if possible, for the sake of their beauty, if for no other reason, and feed them upon the dead bodies of small shrimps, sand-hoppers, etc., or upon tiny morsels of raw meat.

By carefully searching the rock-pools near low-water mark you will most likely come upon a number of Sea-urchins, each with its array of bristly spines. Take two or three of these by all means, for, although they are

somewhat sluggish in their movements, they are nevertheless most interesting creatures, and are worth a little trouble, if only to see the singular manner in which they travel along. By way of food you can supply them with very small molluscs, etc., and they will also eat fragments of vegetable matter.

Star-fish, if kept at all, must be doomed to solitary confinement, for, inoffensive though they may appear, they are terribly voracious creatures, and are sure before long to devour most of the other occupants of the tank. Even oysters are not safe from them, in spite of their almost impregnable habitations, as many a fisherman can testify to his cost. The star-fish cannot get the oyster into his stomach, it is true, but there is another plan which is almost equally simple, and that is to put his stomach round the oyster. This, accordingly, he does, first turning it out of his mouth in order to render his task more easy of accomplishment. Probably by means of some irritant liquid, the oyster is then induced slightly to open his shells, the stomach is inserted between them, and the body of the mollusc wrapped in its folds.

Digestion takes place at leisure, and, finally, the star-fish, having first turned himself inside out, reverses the process and turns himself outside in, whereupon he is in perfect readiness for another meal of a similar character. This statement reads rather like a story from the adventures of Baron Munchausen, but it is none the less a fact, and one which the owner of an aquarium may verify for himself without any very great difficulty.

The Sea-mouse, which is far more like a bristle-clad slug than anything else, is also a dangerous creature to introduce into society, and must always be placed in a vessel by itself. In spite of its mud-dwelling proclivities, it is a wonderfully beautiful creature, its spines, when thoroughly cleansed from the dirt which invariably clings to them, glistening with all the colours of the rainbow, which change and intermingle as the light plays over the bristles in a manner which must be seen to be appreciated.

Lastly, we come to the Jelly-fish, and these, although many of them are of singular beauty, are beings which can scarcely be

recommended as inmates of the aquarium. It is not that they are unduly voracious, or that they give any particular trouble, but merely that they refuse to live in confinement, and are perfectly sure to die before they have been prisoners for many days. These, therefore, you had better let alone, or, if you specially desire to keep them, you must be always on the watch to remove their dead bodies when the inevitable result ensues.

In conclusion, let me once more urge you not to be discouraged by a few failures. You cannot expect to become an adept without first gaining a little experience, either in aquarium-keeping or in any other pursuit, and until this experience has been acquired a few mistakes must be regarded as inevitable. Each error, however, will teach you a lesson, and before very long you will find that your difficulties clear away as if by magic, and that your tanks are stocked with healthy and interesting captives, in watching whose habits you may find an unfailing source of interest and amusement.

BOY LIFE AFLOAT.

BY CAPTAIN H., LATE R.N.

IV.—DHOW-CATCHING.

TO England belongs the honour of having given the death-blow to that nefarious traffic the slave trade. For although it is not entirely dead, slaves are no longer imported by civilised nations, and the small trade that is still carried on by water is almost entirely confined to the East Coast of Africa and the Persian Gulf.

No longer is the "saucy schooner" or the "rakish-looking brig" employed in carrying away the unfortunate negro condemned to a life of labour and servitude; they are dreams of the past, and the business is now carried on in native vessels, which are termed dhows.

An average dhow is about the size of a large fishing smack, the planks of which it is composed being sewn together with cocoanut fibre instead of being fastened with nails. They carry large triangular sails, and make very good weather at sea in spite of their awkward appearance.

But their interior economy is the most wonderful, for although the space is so limited, they manage to carry a wonderful number of slaves, as many as two hundred and fifty having been captured in one dhow.

The way in which they succeed in economising their space is as follows. They make the slaves sit down all round on the lower flooring of the vessel, with their backs to the side and facing inwards. Then about two inches above their heads is fixed a plank which runs all round the dhow, and on which are seated another layer of prisoners; and finally in the largest dhows there is sometimes a third plank containing a third lot of these human sardines. A plank runs down the centre, on which a man walks up and down armed with a bamboo in order to maintain discipline, and from this plank the poor wretches receive their allowance of rice and water, upon which they are fed during the voyage.

Of course the passage is generally short, but as the slaves are never allowed to move, the reader may imagine—for it is impossible to describe—the state of dirt and filth they are usually in when captured by our cruisers or their boats.

In order to instigate the commanders and crews of our men-of-war to greater efforts, and also reward them for the extra work and danger that the service entails, prize money is paid for every slaver captured.

We believe that it can be claimed either by "tonnage" or "head money"—i.e., if the vessel is a large one, but only scantily filled with slaves, the capturer may claim to receive the five pounds a ton; if, on the contrary, it is a small dhow crammed with slaves, they may

claim the three pounds per head for the slaves captured.

This is divided according to classes, from the admiral of the station down to a ship's boy, the former receiving a thirtieth part of the whole sum, and the latter getting one share of the remainder.

The greater number of dhows are caught by ships' boats, the boats being armed and provisioned for a fortnight's or three weeks' cruise, and a rendezvous having been appointed, they are dropped close to the coast and allowed to hunt for themselves.

This permits of examining bays, creeks, the mouths of rivers, etc., which would be impossible for a large ship to do, besides which the knowledge of a man-of-war being in the neighbourhood would keep the slavers quiet, while they would probably not be aware of the vicinity of a boat.

Lately steam launches have been much used for the suppression of the slave trade, but when we were in the service they were only curiosities, and were not in general use even at home, much less abroad.

Nevertheless we managed to get along pretty well without them, as the following short account of a cruise in which we participated nearly twenty years ago will testify.

For some days previously the lieutenant who was going in charge of the boat had been superintending the preparations necessary for our safety and comfort.

When a boat is detached from the ship in the manner we have mentioned, she is supplied with a stove, an arm-chest, containing cartridges, rifles, and revolvers, and a small gun which is mounted in the bows.

In addition to this she carries biscuit, meat, water, etc., sufficient to last for the time she is going to be away.

The ship was hove-to after breakfast one morning, just in sight of the coast, and the launch was hoisted out. The arms and provisions were placed in her, and then her crew took their places. "Shove off" was the order, then we hoisted the lugs and stood in for the shore.

The lieutenant had been on the station before, and knew all about boat-cruising, and as he was a cheerful agreeable fellow the time passed away pleasantly enough relating anecdotes of bygone dhow-catching.

It was a lazy time, however, for there was but little to do beyond sleeping, eating, and looking out for the dhow, which it seemed to us never would appear. We had been hugging the coast for about a week, running a little way up every creek and river, and hunt-

ing bays and behind points, so that it was impossible for anything larger than a walnut-shell to have escaped us.

We had been at anchor all night, and breakfast was just over as we rounded a high projecting headland, and at length beheld the sight for which we had been straining our eyes so long.

A large dhow lay at anchor within a hundred yards of the shore, and from her depth of water it was easy to see that she was well laden with *something*. In five minutes every one was armed and eager for the fray.

As we neared the dhow we looked in vain for anybody on board, she appeared to be entirely deserted.

The lieutenant ordered a Krooman who could speak a little of the language to hail her, and he did so three times but without any response.

"This is very funny," remarked the lieutenant; "there must be somebody on board. I hardly like it."

Hardly were the words out of his lips when suddenly about a dozen heads appeared in different quarters, and the next moment we received the contents of their firearms.

Fortunately, they were old-fashioned weapons and did not carry particularly accurately, for we were so close that every shot might have told. As it was we had only one man wounded. Another minute and we were alongside.

"Follow me, lads!" cried the lieutenant. "We'll pay the cowardly scoundrels out in their own coin."

But they did not give us much opportunity for that. They struck about half a dozen blows, and then, as though with one consent, turned tail and sprang overboard, swimming to the shore.

As soon as we recovered our breath we inspected the prize and found that she contained one hundred and twenty slaves.

They had evidently not been long on board, most likely only just received, and were all well and healthy.

Weighing anchor we made sail and steered for Zanzibar—our rendezvous—where we arrived ten days later with our cargo all in good health.

The ship was there waiting for us, and the dhow was speedily condemned, the slaves removed on to our upper deck, and we sailed for Seychelles Island. On our arrival there we landed our passengers, each of whom received a portion of ground with a hut, food, and seeds for planting; and last, but not least, they were instructed in the truths of Christianity.

THE TROUT, AND HOW TO CATCH IT.

By J. HARRINGTON KEENE,

Author of "The Practical Fisherman," "Fishing Tackle, and How to Make It," etc.

XIII.—WORM FISHING FOR TROUT.

THE last style of fishing for trout is termed "swimming the worm," and though if it be practised in coloured or flood water it ranks in the opinions of true sportsmen with the poacher's arts, yet if practised in the low clear streams of summer it requires almost as much finesse as the fly, and indeed in manipulation requires a somewhat similar method. The worm fisherman always should cast the worm as he would the fly, and not let it float down stream from him.

The rod to be preferred for worm fishing is one some ten feet or so long and made with rather a stiffer top than that of the fly-rod. The spinning rod will serve admirably if you provide yourself with a rather more pliant top joint, for in casting you are to be very

careful not to break or injure the worm in any way. The winch and line may be the same as that used for the fly-rod, but it need not be added that the bottom tackle is altogether different.

Fig. 15 roughly indicates the tackle known

Fig. 15.

as Stewart's, and consists, as will be seen, of three hooks tied one below the other on fine gut. The worm is looped on this, and so as it comes down the stream forms an almost irresistible lure. The only drawback to the tackle consists in the facts that it easily entangles in weeds and other obstructions, and that when the fish are feeding rapidly so much time is wasted in taking the hooks out of the mouths of those you catch. Taking

this into consideration, it has latterly been my practice to use only the single-hook tackle represented in Fig. 16 with a bristle tied at the end of the shank so that when the worm is threaded it cannot slip down. If the former three-hook tackle is most attractive, I am certain that the time saved renders the one-hook arrangement quite as deadly, besides also not allowing the worm to break so readily when the cast is being made. Fig. 16 shows it.

Fig. 16.

Fig. 17.

There is a device recently adopted in the making of hooks which obviates this bristle. The hook itself is slit in the shank (Fig. 17), and, of course, it is impossible for the bait to slip. If this slip of wire does not weaken the

original shank from which it was cut in the making, it promises to be a very useful little adjunct. Not having tried it, I am quite unable to say how this is.

The worm itself next claims our attention, and here I must indulge in a few remarks on the natural history of this useful bait. Of course, every one knows the big garden lob-worm. Well, there are two sorts of this particular worm—namely, the worm with a yellow band near its head, and the dew-worm, as it is termed, without this marking. The latter I look upon as only the miniature form of the other, and, perhaps from its superior beauty—it is a pearly pink with a bright line of scarlet down the middle from head to tail—it is also called the “maiden” lob. Well, that is the one you must use, and not the banded worm. Then there is the brandling. This is a lively yellow-banded worm with a yellow tip to its tail, and is usually found in rotten heaps of tan or manure. It is pretty enough, but, laugh! there is an indescribably nasty odour about it when handled. Nevertheless, it is a very attractive bait. Then there is the cockspur or gilt-tail, which is perhaps the prettiest in colour of all, found in rotten manure also. This is often found to be the best of all the worms for trout. Another class of worm is found under old cow droppings. I do not mean the cow-dung bob, though that is often very useful, but a reddish-brown earthworm with a darkish head. Finally there is the larva of the beetle, *tenebrio molitor*, which is found in old flour mills. This is best kept in bran or flour, and will keep a very long time.

The earthworms, however, require a much different treatment to render them fit for the hook. Some clean moss should be procured and damped and squeezed close between the hands, and the worms strewn over it so that they crawl in, which they will speedily do. This scouring process renders them more transparent and tougher, so that when you are fishing they do not come off so readily or break. If you previously put them in bran for an hour or two they may be prepared more readily. When they are to be taken out fishing be careful to let there be plenty of damp moss, or in the sunshine you will speedily find they become almost baked. There is to be procured at the tackle-maker's a specially made tin to hold your worms (Fig. 18), which is remarkably handy. Of course, it is not indispensable, but being inexpensive it doubtless would be found to offset its cost by its convenience. A strap passes through the bands A A, and is drawn tight to the side.

Fig. 18.

(To be continued.)

OUR BUOYS.

THE buoy at Spithead is said by the poet to be engaged to the bell off Ryde Pier; and the bell on the Incheape Rock, placed there by the Abbot of Aberbrothock, and the buoy at the Nore, “The rolling Nore, the stormy Nore, where the waves go tumbling o’er and o’er,” have also been immortalised in song. But no one, as far as we are aware, has yet told us how all the other buoys and bells started in life, and what is the object of their ceaseless work. The buoy’s occupation is no child’s play, and as there are about a thousand of them continually making themselves conspicuous, heaving and ducking and bobbing round Britain, it is only reasonable that many of their namesakes, excepting “u,” are anxious to have some account of their origin and profession.

Buoys are of many varieties—plain, belted, striped, and chequered; nun buoys, can buoys, cylinder buoys, drum buoys, spar buoys, mast buoys, cask buoys, convex buoys, conical buoys, spiral buoys, spherical buoys; in fact, they are almost of all colours, patterns, and sizes, varying from four feet long to twenty feet, and bearing almost every figure in applied geometry. And all of them are of very serious import to the mariner. In the old days a buoy was any old barrel, tub, or spar that was handy, but now he has to be specially built for the purpose, and built as carefully as a passenger steamer. For the buoy has a rough time of it, and as he is one of the few correct guides to coastal navigation, it is most important that he should stick to his post as long as possible. He is built in watertight compartments, so that if one side is stove in he can still float; and he is weighted, like the newest ironclads, with water ballast, so that he can ride properly and keep his head out of water. To prevent him straying from his beat he is anchored to a flat sinker, or cup-shaped anchor, and the iron chain that holds him is just three times as long as the vertical depth of the water in which he floats, so that his constant jerking and tumbling may not snap its links and set him free. For a very roving customer is a

British buoy when he has broken loose; and when our buoys manage to escape from their monotonous sentry-go, started by a collision probably, they swim off on a long cruise, some to make a tour up Norway, others to look in at Denmark, others to visit Belgium, France, and the Continent in general, a few to get into the Baltic, and here and there one to steer boldly north, get gripped in an ice-floe and ride to and from the Pole. Our buoys are all twin brethren, and every one afloat has his counterpart ashore waiting to take his place; built like him of riveted three-eighths iron, shaped and painted like him, and identical in every particular, so as to be able at any moment to do duty for the runaway.

Wherever there is a harbour, or a shoal, or channel, there is the buoy to mark it, and from the shape and colour of the buoy the direction of the fairway can be made out. Unfortunately we have not yet got all our harbours marked on the same system, but much has been done towards proper organisation in the matter; and not so very long ago a representative congress met under the presidency of the Master of Trinity House, H.R.H. the Duke of Edinburgh, and drew up the following uniform system of buoyage for the education and regulation of the buoys of the future.

Having cleared the ground by defining the starboard side to be that on the right hand of the mariner as he sails with the stream of the flood tide or enters a harbour or estuary, this code proceeds to define a conical buoy as a “buoy showing the pointed top of a cone above water,” a can buoy as a “buoy showing a flat top above water,” a spherical buoy as one “showing a domed top above water,” a pillar buoy as one “with a tall central structure on a broad base,” and a spar buoy as one only showing a mast. And then it lays down that all conical buoys shall be to starboard, and all can buoys to port; that spherical buoys shall mark the ends of middle grounds; and pillar buoys, bell buoys, gas buoys, automatic sounding buoys, *et hoc genus omne*, shall be placed to mark special posi-

tions. Further, it enjoins that starboard buoys shall always be painted in one colour only, while port buoys “shall be painted of another characteristic colour, either single or parti-colour;” that spherical buoys at the ends of middle grounds shall always be distinguished by horizontal stripes of white colour; that surmounting beacons shall always be painted of one dark colour; that staff and globe shall only be used on starboard-hand buoys, staff and cage on port-hand, diamonds at the outer ends of middle grounds, and triangles at the inner ends, and that buoys for moorings may be of any shape or colour, but that those used for submarine cables should be green, and lettered “Telegraph.” Wreck buoys are also dealt with. They are always to be painted green, just as a vessel marking a wreck is painted green; and if the vessel is employed she is to have three balls aloft on a yard, one of the balls to be towards the wreck and two away from it, so as to give a sort of vane to show where the obstruction lies; and this yard, like the corresponding lights at night, is to be twenty feet above sea level.

In the good time coming all our harbours and channels will be buoyed on this method, but at present the various local authorities round the coast have not seen their way to adopt the new system, and their own peculiar arrangements, known only to their own pilots, are in many cases still retained. One very common system of buoyage is that wherein colour plays a conspicuous part. If in entering a harbour you find that the buoys are not of the can and conical shape, so as to agree with the recommendations already alluded to, but that one of them is red and another black, and another red and black, and so on, you may safely conclude that the following is the system. The red buoys are all on the starboard side of the channel, and the black buoys are all to port. When you come up with a red and black in horizontal stripes you may be sure you are in the centre of a narrow channel, and that the nearer you pass the buoy the safer you will be. Should

the red and black be in vertical stripes, a different state of affairs altogether prevails, and it is most important that you should remember this once for all: horizontal always means something different from vertical—in other words, a level differs entirely from an upright, for an upright means shallowness, while a level means depth. A red and black vertically striped buoy, then, marks the end of a reef or spit with a channel on both sides of it, and you can give him a wide berth to right or left. Sometimes, instead of stripes, you will meet with chequers, and come across a buoy all painted over with red and black squares like a chess-board. Avoid him! He is a delusion and a snare, bobbing about on the top of a dangerous solitary rock or obstruction, and set there to warn you to heed him not but pass by on the other side.

All chess-board buoys are objectionable, so never seek a close acquaintance with them. Sometimes you will light upon a pair of them, one with red and white chequers, the other with black and white chequers, and you will then know that there are two obstructions, and that the red is on the starboard side of the channel. It is a great pity that the red should not be on the same side as the red light, but the idea is that the buoy is an "approacher," and that to pass him you keep "red to red" as if he also was coming down on you at full steam. When you get a couple of green buoys, as you occasionally do, you may look out for your figures, for the buoys show a wreck, and the even number is on the starboard side and the odd number is to port.

Always look out for the name on the buoy, and check it with your chart so as to be sure of your bearings. And at night keep your ears open for the bells. We have not yet reached the point which requires that all buoys round our coasts should be lighted with the electric light, and luminous paint fails at long distances, so that we have to trust to compressed gas such as is used in Pintsch buoys, one of which keeps alight for six months, after being started at a pressure of one hundred and fifty pounds to the square inch. But as soon as the pressure is equal

only to that of the air, out goes the light and the night warning ceases. Hence if the Pintsches were generally used there is a risk of their subsiding into darkness, and the only safe course after all is to give ear to sound as well as doing your best with your eyes.

Sound buoys are of two kinds, bells and whistles. A bell buoy shakes about like a dumpy figure in unstable equilibrium with a cage on its base instead of a man. In the centre of the cage is fixed a bell, and round it on the outside ring are hinged the four clappers, so that at every heave of the wave the one on the highest side will fall on the bell and give the sound. In a curiously irregular manner this harsh clangour breaks on the ear at night. It seems to take every pains to prevent its being the "rhythmical sound" we always hear it called. Nothing more unrhythmical can be well conceived than the bang! ching! clang! clang! cluck! boong! ching! of a bell buoy on a lively night.

But bad as is the irregular clang of the bell, it is as nothing compared to the ghastly squeak of the Yankee whistle, which we are confidently told is to be the sound signal of the future. This "screamer of the seas" is a buoy a dozen feet in diameter, with a thirty-three-inch tube run down its centre. This tube is thirty-two feet long, and extends to some twenty feet or so beneath the water level, so as to reach to the depths where the waters are still and the waves cease from troubling. In the top of the tube is a whistle, and just beneath it is an arrangement of valves. As the waves rise and fall the buoy moves with them. As they go up the valves of the tube open and in rushes the air; as they descend the valves close, the air in the tube is compressed, and the whistle gives a wailing squeal like the cry of an expiring porker. Anything more melancholy than the cry of the Courtenay it is difficult to conceive; the mermaids' dying scream must have been music itself to it. Once you have heard it you will begin to hope, as we do, that in these days of the advance of science the sea whistle, by some arrangement similar to that

of our own never-to-be-forgotten "mechanical penny whistle," may be some day induced to substitute for its squeal some lively popular tune.

These noisy buoys are danger-signals like the beacons on land. Mysterious things are beacons at high water, but at low water their purpose becomes clearer. Take Lymington Harbour, for instance. What a strange array of trees, sticks, and baskets the waters seem dotted with when the tide is in; but when the ebb has run its course, and all the mud is visible, these singular marks are seen to show the narrow channel and lead the steamer into safety. Up the Thames, too, at the end of each reach, and oftener, we get some singular beacons, whose purpose is best seen when the tide is out. On the British coasts there are over two hundred and fifty such beacons to mark the passages, some of them specially built, some of them church towers like the Reculvers and St. Helen's; obelisks like Lord Yarborough's on Bembridge Down, and other monuments kept in repair for the convenience of mariners; and others triangles, globes, diamonds, rings, ovals, and crates specially built on prominences and headlands. Some of these beacons are fixed away from shore. That on the Shingles off Margate is a thirty-inch tube which was lowered on to the sand, and then the men went inside it and dug out the sand until it gradually settled down. When it had sunk far enough another length was screwed on, and so the work was continued until a steady foundation was reached. In conclusion we may note the wonderful beacons at Ayr on the Clyde, at Grangemouth on the Forth, and at Stornoway on Lewis, from which the light streams out at night. A highly ingenious arrangement is that of this light. It looks as though it came from a lamp in the beacon. Nothing of the sort! In the beacon is a mirror, and round the mirror are a set of prisms; a beam of light is kept playing on the mirror from the lighthouse on shore, and this, split up by the prisms, gives the beacon light a "borrowed light that lights the fisher home."

(THE END.)

ENTOMOLOGY AT THE SEASIDE.

BY THE AUTHOR OF

"Beetles, and Where to Find Them," "An Evening at the Sallows," etc.

(Continued from page 672.)

THE beetle-collector at the seaside is perhaps even more fortunate than the lepidopterist, for he will experience almost the delight of working in a new and unknown country, so different are the maritime coleoptera from those found inland. Whether he searches the shore itself, or the cliff, or the fields, or even the roads, he is sure to come across something worth having at almost every step, and his captures upon his first expedition or two will probably be so numerous that setting them will be found an utter impossibility. In order to meet with success, however, it is necessary to set to work in the right way, or many profitable localities will be passed by, and others more or less neglected. Let us therefore briefly describe the several methods of seaside collecting, as far as beetles are concerned, in order that opportunities may not be lost by the young collector owing to his lack of special knowledge.

Beginning with the shore itself, Seaweed is very productive, especially that which lies above high-water mark, and is sufficiently fresh not to have become half buried in the sand. Shake this, a handful at a time, into the sweep-net, or over a large sheet of paper, or even a stretch of level sand, and you will probably be surprised at the result. If the

weed you have lit upon is a productive one, beetles, flies, earwigs, etc., will come tumbling out in such abundance that you will find it scarcely possible to examine them all, and one pair of hands will seem quite unequal to the task of bottling those which you require. The most attractive weed to beetles is generally that which is lying at the very base of the cliffs, but this is by no means an invariable rule. Even that to be found in layers, mixed with shingle, etc., below high-water mark is well worth working, for many beetles are found nowhere else.

Turn every stone you meet with, and examine its under surface as well as the sand beneath. Sometimes you may find a loose heap of large pebbles at the top of the cliffs, and will probably be surprised to find how little they yield in the way of captures. Do not be disheartened, however, but scatter them loosely about in the grass, taking care that they do not lie more than two or three inches from one another. Next day come again, before the sun is high, turn them once more, and look, not on the ground upon which they have been resting, but upon their lower surfaces, and you will be astonished at the number of visitors. Some stones will have twelve or thirteen insects clinging to them, by far the greater number being

beetles, which have there sought refuge from the unwelcome daylight, and some of which very few collectors would care to pass by. Only last year, at Bognor, I was fortunate enough to take in this way three specimens of one of our very rarest beetles, which scarcely any one had ever met with in England before.

If you can find a dead bird, or other small creature, you will almost certainly discover some of the shore-loving carrion beetles hard at work beneath him. Take him up by his tail, hold him over the sweep-net, and give him a sharp tap or two with a stick. This will have the effect of bringing out those which were feasting inside him, and which you would otherwise have been unable to capture. If he was lying upon the sand, turn up the ground just beneath him. Many beetles retreat into their burrows at the first sound of an advancing footstep, and these, if you do not dig them out, you will never get at all.

Sand-hills are always very productive. If the weather is suitable, the grasses and other plants growing upon them often swarm with beetles, among them some of the best of our British species. Sweeping in such places, however, is seldom of much use, for the herbage is so thick and stiff that most of the in-

sects resting upon it are jerked off long before the net comes near them. A far better plan is to violently shake the leaves, etc., covering a small patch of ground, and then to carefully examine the soil beneath, when the fallen beetles may be picked up without trouble. If you can pull up some of the weeds bodily, and shake the roots over paper, do so by all means. Numbers of beetles take refuge in such situations during the day, and others reside there altogether. There is a certain weevil, for instance, which you will only find at the roots of the Yellow-horned Poppy, another at those of the Kidney Vetch, or Lady's Fingers, a third at those of the Stork's-bill, and so on. If you care for bugs, you will find many specimens in like situations.

When the sun is hot, and there is little or no wind, large numbers of beetles may be found climbing the cliffs, or sunning themselves upon large stones and lumps of chalk. Any little hollow or depression in the sand should also be carefully examined, for insects of various kinds are pretty sure to tumble into it by dozens, and to find great difficulty in scaling its loose and yielding sides. When beetles are plentiful, indeed, it is quite worth while digging out a shallow trench or two for the express purpose of capturing these wandering specimens.

Leaving the shore itself, a great deal is to be done upon the cliffs, or in the neighbourhood of the sea, both with the sweep-net and otherwise. Flowers in bloom should be carefully examined first, and swept afterwards. There is a rather scarce blue weevil, for in-

stance—yept *Baris abrotani*—which has a trick of burrowing into the blossoms of the wild mignonette, and if he is not dislodged before the net is used you will hardly be able to take him without destroying the flowers. Umbelliferous plants, such as hemlock, etc., are always very productive, and the interior of the net, after a few minutes' work, presents a scene of an especially lively character. Take care how you examine your captures. Many of the leaping *Chrysomelidae*, near relations of the destructive Turnip-flea, are sure to be present, and if you are not very cautious will be out and away before you can even recognise their species. The best plan of capturing these active little gentry is to give the contents of the net a slight shake before examining them. This will have the effect of bewildering the beetles for a moment or two, and if you are quick you will be able to bottle them before they recover their senses.

Many good beetles are to be taken in the sandy hollows which are often found near the sea. Some of the cocktails belonging to the genus *Bledius*, for example, are frequently common in such situations, and may be found burrowing into the sand, or crawling leisurely upon the ground. There are also certain small, narrow, and highly-polished ground-beetles (*Dyschirius*) which feed upon these burrowers, and follow them into their tunnels just as a ferret follows a rat. These, of course, you must look out for in the same places and at the same time.

(To be continued.)

DOINGS FOR THE MONTH.

AUGUST.

AS regards the POULTRY RUN, all we said in last month's DOINGS with respect to the care and cleanliness of the run to prevent disease is applicable for this month of August. We generally have two kinds of weather in August, however, for during the first or middle part of the month the heat is often extreme; and towards the end rain, storms, and generally unsettled weather often set in. The middle of the month, therefore, will not be too soon to see after autumn repairs. And if limewashing be deemed necessary that also should be set about.

Continue to weed out the birds it will not pay to keep; fatten and kill, or send off to market. Your fowl-run, if you have been sitting many birds from the beginning of the season, will now contain some of all sorts and sizes. The young are very apt to be snubbed and starved by the bigger and older; be careful, therefore, to see that all get enough to eat.

The older birds will be moulting. If your run is well seen to they will need little attention, except a good allowance of generous diet. But if you see any one moping take it in hand at once. Put the ailing bird in a place by itself where it will be very warm and comfortable. Feed it at first as it was fed in the run; if it still continues to all give warm, soft food, and a dust of cayenne in it. Feed often, too, and put an iron nail or two in the water. A little butcher's meat, such as boiled lights, helps to hasten the moult. Some give two or three grains of quinine in a bolus. This is hardly needed unless the weather is cold, which it will not be for some time. A dose of castor-oil—it is to be had in capsules, and is very easily administered—helps to hasten the moult. It may be given to valuable birds about once a week. Do not forget green food. If the birds have no grass run it is essential to their health that they be supplied with this necessity of healthful life.

If you have birds that you intend to show, do not forget our previous instructions. Keep them by themselves, for any fighting or scrambling is very likely to spoil the plumage. They should be kept well sheltered, etc., and they will do far better if the soil on which they run is clean and dry gravel. There is little else to be done this month. Ducks may be hatched whenever you have the chance.

Turkeys, we believe, are seldom kept by any of our young readers; but, nevertheless, those who are ambi-

tious might do far worse than attempt the breeding of them. They will not do well, however, unless they have a good large range, and the housing must be dry and warm.

Spratts' food is handy to feed young ones on, but they should have in addition a mixture of egg and chopped chives. More about turkeys another day.

THE PIGEON LOFT.—Read over the DOINGS of July and June. It will be time shortly to separate the birds and allow no more matchmaking, else you will succeed well only in one thing, viz., in weakening your stock. Continue to feed well, and beware of getting your loft overcrowded. It is highly dangerous. Weed out, therefore, and go in for pigeon-pies if you do not succeed in selling the birds so weeded out.

Look out for cases of illness. If you find any birds going light take them in hand at once, else you will not have the slightest chance of saving them. Put the bird away in a place by itself, namely, in your hospital pen; scatter the floor of it plentifully with old mortar and gravel. Put a dish of salt-cat in a corner. This should always find a place in the hospital pen. If there be running at the bowels your sheet-anchor will be laudanum, about three drops thrice a day in a little water. Do not forget that laudanum is poison. Feed on oatmeal and milk, cramming the bird; but take care not to overdo it. Give also about ten to fifteen drops of cod-liver-oil twice a day.

We shall treat of cold and canker next month.

THE AVIARY.—Put away breeding-cages now; you may have already done so as advised in last month's DOINGS. The principal work for the month will consist in the usual attention to the comfort of the birds, regularity in feeding, and supplying the fountains with clean water, etc., tidying up and putting away all breeding paraphernalia, thoroughly cleaning out the breeding-room, and attending to cases of moult. If the cages have stood upon shelves, these latter must be carefully scoured. It will be well, if before turning your birds into their flight-cages, you thoroughly clean these. Vermin in birds is much more easily prevented than banished after they once get a footing, and no bird can be healthy where they exist. We trust that many of our boys have been moderately successful this year in their breeding attempts. They may have bred some that are quite fit to keep all winter with a view of breeding from next season. Well, let them not forget that success depends much upon the constitution of the birds, and they are very often neglected from this time forward till spring-time. Be extra careful with them during moult. They then need to have more warmth; the cages should be covered over all night and partially during the day, the water always fresh, and the food more nutritious than usual, not forgetting the cayenne, if you mean to go in for K. N. breeding for colour. Give also an allowance of green food.

THE RABBITRY.—Get rid of all extra stock. Overcrowding the rabbitry is a fruitful cause of disease. Continue to feed well. Let your eye tell you whether

you are doing right by your bunnies or not. A healthy rabbit is merry, clean, sleek, and moderately fat.

Mange in rabbits is by no means an uncommon disease where they have been neglected. It is recognised by a general scurfiness of the skin, and scabiness, with falling off of the hair. The hair should be cut off entirely over inflamed parts, and an ointment composed of oil and brimstone rubbed well in. Some use glycerine and sulphur. At all events, whichever is used, the rabbit must be kept away from the others, and well fed. Meanwhile, alter your management of the others. Clean and wash the hutch out thoroughly one by one, and let the last water contain carbolic acid in the proportion of a wineglassful to a gallon. Dry them well before you put in the dry bedding. Then you may restore the inmates. Mange is infectious in that it is caused by a parasite. Sore hocks will form a subject to be noticed in our next month's DOINGS.

DOMESTIC PETS.—Hedgehogs may be captured now if one is wanted as a pet. They get very tame, but we would not advise their being kept in constant confinement. Let them have the run of the yard. We have known them often get quite as tame as cats. They sleep a good deal during the day, but are lively enough in the evening, and often keep awake all night. They are fond of bread-and-milk, but beetles, garden-worms, etc., are their food in the wild state, and should be partially so when tame. They are very amusing.

THE KENNEL.—Just a word about washing dogs. Do not do so too often; if you brush your favourite every day, once in a fortnight will be often enough to wash, and once a month in cold weather. Remember the water must be lukewarm, and the soap the mildest and best procurable. We use Field's Sapphire soap. It keeps the gloss on the hair. Always wash the soap out of the coat, and rinse down with cold water, then dry thoroughly, give the dog at once a little food, and take him out for a run to make the blood circulate and prevent his catching cold.

THE KITCHEN GARDEN.—Keep celery earthed up. Plant cabbages. Plant out endive as soon as fit. Sow lettuces. Store onions. Sow spinach and turnips. Keep down weeds. Water if needed. Make mushroom beds.

THE FLOWER GARDEN.—Tie up all flowers that trail and look untidy. Cut off withered blooms. Gather flower-seeds; dry and store in a bag, which may be labelled and hung up. Sow silene, forget-me-nots, Canterbury bells, etc. Continue to bud roses.

THE WINDOW GARDEN.—Read DOINGS for last month. Transplant blooming flowers from the garden, and do everything to keep up a show. Take away all dead leaves from the plants and from the boxes as they fall.

OUR PRIZE COMPETITIONS.

(SEVENTH SERIES.)

III.—Fretwork and Carving Competition.

IN announcing this competition subject we wrote, it may be remembered (see p. 15), as follows:—

"So great was the interest shown in our previous Fretwork Competition, that we have determined to give further Prizes in connection with the subject. We now therefore offer *Three Prizes, of Two Guineas, One Guinea and a Half, and One Guinea* respectively, for the best blotting-case or blotting-pad cover. The size, wood, tools, etc., are left entirely to competitors' own choice, but the natural difficulties presented by some woods over others will of course be taken into due consideration by the adjudicators. The cover may be entirely fretwork, or carving—whether sunk or in relief—may be combined with it."

We have now much pleasure in publishing our Award:—

JUNIOR DIVISION (ages up to 14).

In this Division three competitors run each other so closely with some admirable specimens of work that we have been led to increase the first prize by half-a-guinea, and divide it amongst them. We have also given a smaller additional prize.

Prizes—10s. 6d. each.

BENJAMIN LEAFE (aged 13), 18, Post House Wynd, Darlington.

HERBERT G. NORRIS (aged 13), 32, High Street, Nottingham Hill Gate.

WILLIAM HALLIDAY (aged 13), 4, Northampton Terrace, Harrow, N.W.

Prize—5s.

GEORGE SPEYER (aged 12), 48, Sterndale Road, West Kensington Park, W.

Certificates.

WM. C. SIMPSON, Clyde View, Partick, Glasgow.

GEORGE ELLIOTT, Newland, Sherborne, Dorset.

WALTER A. DENSHAM, Wareham, Dorset.

A. E. HALLIDAY, 4, Northampton Terrace, Harrow.

CHAS. E. SPEAIGHT, 13, Granville Road, Finsbury Park.

HERBERT H. SMITH, care of Mrs. Wayling, Lord Street, Gainsborough, Lincolnshire.

FRANK LENEY, Buckland House, Dover.

GEORGE HORNE, The College, Inverness, N.B.

PATIENT LEARNER.—1. You will do no good unless you have a certificate from the Science and Art Department, and to get that you must attend the classes. There is no opening for outsiders. 2. The plates are given with the parts.

A COLLECTOR.—1. It is currently reported that a cuckoo lays its own eggs, but we cannot personally vouch for the fact. We are content to take the statement on trust. 2. Why not try the experiment? It is not usual to hard-boil a bird's egg before you blow it, but we live and learn, and you might solve what to others may seem an impossibility. If you do succeed in blowing a hard-boiled egg we shall be glad to hear full particulars as to how you managed it!

LILY.—You can estimate the cost of a boat at about a sovereign per foot over all. You could get a good angling outfit for a sovereign from almost any London maker.

NEWCOMER.—The diagram of a cutter's sails and rigging was in the second volume, not the fifth.

IGNORANCE.—"Uto" is an abbreviation for "ultimo," and means the last month. "Curt" is an abbreviation for "current," and means the present month. "Inst." is an abbreviation for "instant," and also means the present month.

J. WILLIAMS.—The pressure in the binding has caused the plates to stick. You can get them apart by ironing the backs of the pages with a warm iron.

A. RUMSEY (Oporto).—1. The bicycle is faster than the tricycle, and better times have been made on it. 2. The Coventry Machinists' Company, 15, Holborn Viaduct.

H. A. F.—The makers of the Kangaroo safety bicycle are Hillman, Herbert, and Cooper, of 14, Holborn Viaduct.

BRITON.—For a list of athletic clubs apply to G-y, of Leadenhall Street.

M. ADLER.—There is no such word as "roundation." The word in Isaiah xlviii. 13 is "foundation," and you must have got hold of a copy with a battered f, as misprints in the Bible are not now probable.

T. F. S.—The best time to start for India or Ceylon is in December. Try "The Coffee Planter in Ceylon," by Sabonnadiere, published by Stanford; or "Tropical Agriculture," by P. L. Simmonds, published by Spon.

TENNISUN.—For the singlehanded game the court is twenty-seven feet in width and seventy-eight feet in length. The height of the net is three feet in the centre and three feet six inches at the posts, which stand three feet outside the court on each side. The service lines are twenty-one feet from the net. For the three and four-handed games the court is thirty-six feet wide, and the service side lines are four feet six inches from the side lines of the court. See our series of illustrated articles on Lawn Tennis in the fourth volume.

F. C. G.—1. Try Professor Coleman's "Cattle of Great Britain," and "Sheep and Pigs of Great Britain," costing eighteen shillings each, and published at 346, Strand. 2. To clean a sponge give it a good rinsing in Condy's Fluid.

M. Y. L.—If you can use a camera so deftly why draw the plans? All you have to do is to put a foot rule along the deck of the boat and photograph it. Photograph the boat all round, and in every photograph let the rule be introduced, so as to afford a scale. Remember that the rule must be at the same distance from the lens as the boat.

C. R.—To clean copper use soft soap and rottenstone, made into a stiff paste with water, and dissolved in a water bath. Rub on the mixture with a woollen rag, and finish off with rottenstone and dry whiting.

DOVEKEEPER.—Your feeding will do. Give rice and small grey peas also. The wounds are probably well by this time, if not use a little vaseline.

G. W. V.—Don't attempt to make dog-biscuit. You can buy them cheaper. If a small dog, a suet dumpling, or dumpling made of fatty scraps and flour, is a great treat, and very nourishing.

J. BEVERLEY.—Like almost all those who send us birds' eggs to identify, you selected a box of the most fragile description, and packed it, moreover, without the least consideration for the energetic proceedings of the post-office officials. The natural result followed, and your eggs reached us in a condition of almost impalpable powder.

EGG COLLECTOR.—It is very difficult, and often impossible, to name birds' eggs from drawings. Of the six sketches you send us, the first is that of the egg of the robin. No. 2 belongs to the greenfinch; No. 3 to the thrush; No. 4 to the whitethroat; No. 5 probably to the yellowhammer; and No. 6 possibly to the sparrow. The colouring of the last two is rather peculiar.

NELLIE.—We cannot suggest any improvement on your treatment of doves, except in the feeding. You must give small peas and barley rice, and grains of that size. Give hemp but seldom, and plenty of clean water.

H. B. K.—The places of the outriggers in a boat depend upon the seats, and the places of the seats depend upon the weight of the crew. The crew should be in the centre, with the seats so placed as to keep the boat on an even keel, and the distance between the seats should be such as to allow full working space for the oars inboard. Do not scatter your men; do not cramp your men.

HALSTEAD.—1. To preserve flowers in shape and colour do as follows: Get a vessel with a movable cover. Fit to the top a bit of metallic gauze and replace the cover. Pass through a sieve into an iron pot sand enough to fill this vessel, and heat it with half per cent. of stearine, carefully stirring. Put the flowers on this gauze, and, removing the bottom of the vessel, pour in the sand to cover them. Place on the top of the oven for forty-eight hours. Then remove the cover and let the sand run away from the flowers through the gauze. It is altogether a pretty experiment. 2. Use plenty of absorbent paper and a good weight on top. But the paper must be frequently changed.

D. L. C.—Certainly. No doctor would pass a boy into the Royal Navy whose teeth were not perfect.

S. P. L.—1. About sixpence to a shilling. 2. Vegetable food.

C. A. O.—Best disinfectant for fowls is fresh air and cleanliness. But you may use Sanitas, or carbolic acid, in places where the food does not lie.

AVIS.—A little sulphur in neck of bird, camphor in the cage, and perfect cleanliness.

ANXIOUS ENQUIRER.—Eat but very little bread. No pudding, potatoes, or starchy food, and no sugar. Take plenty of exercise. Save your pocket-money and buy a bicycle or tricycle.

E. C., M. C. L.—The poem is "In the Signal Box," by Mr. George R. Sims. We gave it in the Christmas Number for 1884.

DIDO.—1. The chief water-colour makers are Winsor and Newton, of Rathbone Place; Reeves and Sons, of Cheapside; and Rowney, of Oxford Street; and your best plan would be to refer to our articles on Water-Colour Painting, and get a tin box with the colours therein named. Colours in pans, cakes, and tubes are sold separately, and you can get the prices from the catalogues of the colourmen. 2. Engraving on steel has almost died out, and engraving on wood is being seriously menaced by the various processes.

R. M. H.—You can only get the first volume complete in volume form. Some of the parts are now out of print.

OSWESTRIAN.—In the September part for 1883 we gave an article on making pantographs. Refer to it.

REGINALD CRUDEN:

A TALE OF CITY LIFE.

BY TALBOT BAINES REED,

Author of "My Friend Smith," etc., etc.

CHAPTER XVIII.—POVERTY AND LOVE BOTH COME IN AT THE DOOR.

WE left Reginald in a somewhat comfortable frame of mind after his interview with the pleasant clergyman and the stroke of business he had transacted on behalf of the Corporation. It had been refreshing to him to converse in terms of peace with any fellow-mortal; and the ready satisfaction of this visitor with the method of business adopted by the Com-

"My eye, gov'nor, we'll let 'em 'ave it!"

pany went far to dispel the uneasy impressions which Mrs. Wrigley's visit had left earlier in the day.

After all, he felt that he was yet on probation. When Christmas came, and he was able to discuss matters personally with the directors, he had no doubt his position would be improved. He flattered himself they might think he was useful enough to be worth while keeping; and in that case of course he would have a right to ask to be put on rather more comfortable a footing than he possessed at present, and to be entrusted with a certain amount of control over the business of the Corporation. He would also be able mildly to suggest that it would be more convenient to him to receive his salary monthly than quarterly, so as to enable him not only to live respectably himself, as became their secretary, but also to give regular help to his mother at home. As it was, with a beggarly 13s. a week to live on, he was little better than a common—

Office-boy, he would have said to himself, but at that particular moment the door opened, and the very individual whom his thoughts connected with the words appeared before him.

It was the very last apparition Reginald could have looked for. He had given up all idea of seeing the young desperado any more.

Though he could not exactly say "Poverty had come in at the door and Love had flown out of the window"—for the young gentleman had departed by the door—he yet had made up his mind that Cupid had taken to himself wings and flown away, with no intention of ever returning to the scene of his late struggle.

But a glance at the starved, emaciated figure before him explained very simply the mystery of this strange apparition. The boy's hands and lips were blue with cold, and his cheek-bones seemed almost to protrude through his pallid, grimy cheeks. He looked, in fact, what he was, the picture of misery, and he had no need of any other eloquence to open the heart of his late "governor."

"Say, what's yer name," he said, in a hollow imitation of his old voice, "beg yer pardon, gov'nor—won't do it no more if yer overlook it this time."

"Come in out of the cold and warm yourself by the fire," said Reginald, poking it up to a blaze.

The boy obeyed, half timidly. He seemed to be not quite sure whether Reginald was luring him in to his own destruction. But at any rate the sight of the fire roused him to heroism, and, reckless of all consequences, he walked in.

"Don't do nothink to me this time, gov'nor," whimpered he, as he got within arm's length; "let us off, do you hear? this time."

"Poor boy," said Reginald, kindly, putting a stool for him close beside the fire; "I'm not going to do anything but warm you. Sit down, and don't be afraid."

The boy dropped almost exhausted on the stool, and gazed in a sort of rapture into the fire. Then, looking up at Reginald, he said,

"Beg your pardon, gov'nor,—ain't got a crust of bread you don't want, are yer?"

The hint was quite enough to send Reginald flying to his little "larder."

The boy devoured the bread set before him with a fierceness that looked as if he had scarcely touched food since he had gone away. He made clear decks of all Reginald had in the place; and then, slipping off the stool, curled himself up on the floor before the fire like a dog, and dropped off into a heavy sleep.

Reginald took the opportunity to make a hurried excursion to the nearest provision shop to lay in what store his little means would allow. He might have spared himself the trouble of locking the door behind him, though, for on his return the boy had never stirred.

The little sleeper lay there all night, until, in fact, the coals could hold out no longer, and the fire went out. Then Reginald woke him and carried him off to his own bed, where he dropped off into another long sleep which lasted till mid-day. After partaking of the meal his benefactor had ready for him on waking, he seemed more like himself, and disposed to make himself useful.

"Ain't got no envellups to lick, then?" said he, looking round the deserted room.

"No, there's nothing to do here just now," said Reginald.

The boy looked a little disappointed, but said, presently,

"Want any errands fetched, gov'nor?"

"No, not now. I've got all I want in for the present."

"Like yer winders cleaned?"

"Not much use with this frost on them," said Reginald.

Thwarted thus on every hand, the boy asked no more questions, but took upon himself to go round the office and dust it as well as he could with the ragged tail of his coat. It was evidently his way of saying "Thank you," and he seemed more easy in his mind when it was done.

He stopped once in the middle of his task as he caught Reginald's eyes fixed half curiously, half pityingly upon him.

"Say—gov'nor, I ain't going to read no more books; do ye hear?"

There was something quite pathetic in the tones in which this declaration of renunciation was made. It was evidently a supreme effort of repentance, and Reginald felt almost uncomfortable as he heard it.

"That there Noogate Calendar made a rare flare-up, didn't it, gov'nor?" continued Love, looking wistfully towards the grate, if perchance any stray leaves should have escaped the conflagration.

"Not such a flare-up as you did," said Reginald, laughing. "Never mind, we'll try and get something nicer to read."

"No fear! Never no more. I ain't agoin' to read nothink again, I tell yer," said the boy, quite warmly.

And for fear of wavering in his resolution he went round the room once more, rubbing up the cheap furniture till it shone, and ending with polishing up the very hearth that had served as the sacrificial altar to his beloved Newgate Calendar only a few days before.

There was little or no work to be done during the day. A few letters had come by the morning's post, angrily complaining of the delay in delivering the promised goods. To these Reginald had replied in the usual form, leaving to Love the privilege of "licking them up." He also wrote to Mr. Medlock, enclosing the two pounds the pleasant clergyman had left the day before, and once more

urging that gentleman to come down to Liverpool.

He went out, happily unconscious of the fact that a detective dogged every step he took, to post these letters himself, and at the same time to lay in a day's provisions for two. It was with something like a qualm that he saw his last half-sovereign broken over this purchase. With nine shillings left in his pocket, and twelve days yet to Christmas, it was as clear as daylight that things were rapidly approaching a crisis. It was almost a relief to feel it.

On his way back to the office he passed a secondhand bookstall. He had lingered in front of it many times before now, turning over the leaves of this and that odd volume, and picking up the scraps of amusement and information which are always to be found in such an occupation. To-day, however, he overhauled the contents of the trays with rather more curiosity than usual; not because he expected to find a pearl of great price among the dust and dog's ears of the "threepenny" tray. Reginald was the last person in the world to consider himself a child of fortune in that respect.

No! he had Master Love on his mind, and the memory of that blazing Newgate Calendar on his conscience, and, even at the cost of a further reduction of his vanishing income, he determined not to return provided with food for Love's body only, but also for Love's mind.

Accordingly he selected two very shabby and tattered volumes from the "threepenny" tray—one a fragment of "Robinson Crusoe," the other Part I. of the "Pilgrim's Progress," and, with these in his pocket and the eatables in his hands, he returned to his charge as proud as a general who has just relieved a starving garrison.

After the frugal supper the books were triumphantly produced, but Master Love, still mindful of his recent tribulations, regarded them shyly at first, as another possible bait to his own undoing; but presently curiosity, and the sight of a wonderful picture of Giant Despair, overcame his scruples, and he held out his hand eagerly.

It was amusing to watch the critical look on his face as he took a preliminary glance through the pages of the two books. Reginald was half sorry he had not produced them one at a time; but it being too late now to recall either, he awaited with no little excitement the decision of the young connoisseur upon them. Apparently Love found considerable traces of what he would call "jam" in both. The picture of Crusoe coming upon the footprint in the sand, and that of the great battle between Christian and Apollyon, seemed to gather into themselves the final claims of the two rivals, and for a few moments victory trembled in the balance. At last he shut up "Robinson Crusoe" and stuffed it in his pocket.

"Say, what's yer name," said he, looking up and laying his finger on the battle scene; "which of them two does for t'other?"

"The one in the armour," said Reginald. "Thought so—t'other one's a flat to fight with that there long flagpole. Soon as 'e's chucked it away 'e's a dead'un. Say, what did they do with 'is dead body? No use a 'idin' of it. If I was 'im I'd a cut 'is throat, and left the razor in 'is 'and, and they'd a brought it in soosan-

side. Bless you, coroner's juries is reg'lar flats at findin' out them sort o' things."

"Suppose you read what it says," said Reginald, hardly able to restrain a laugh; "if you like you can read it aloud; I'd like to hear it again myself."

The boy agreed, and that evening the two queerly assorted friends sat side by side in the dim candlelight, going over the wonderful story of the Pilgrim. Reginald judiciously steered the course through the most thrilling parts of the narrative, carefully avoiding whatever might have seemed to the boy dull or digressive.

Love stopped in his reading frequently to discuss the merits of the story and deliver himself of his opinion as to what he would have done under similar circumstances. He would have made short work with the lions chained by the roadside; he would have taken a bull's-eye lantern through the dark valley; and as for the river at the end, he couldn't understand anybody coming to grief there. Why, at Victoria Park last Whit Monday he had swum three-quarters of a mile himself!

In vain Reginald pointed out that Christian had had his armour on. The young critic would not allow this as an excuse, and brought up cases of gentlemen of his acquaintance who had swum incredible distances in their clothes and boots.

But the story that delighted him most was that of the man who hacked his way into the palace. This was an adventure after his own heart. He read it over and over again, and was unsparing in his admiration of the hero, whom he compared for prowess with "Will War-spite the Pirate," and "Dick Turpin," and even his late favourite "Tim Tiger-skin." His interest in him was indeed so great that he allowed Reginald in a few simple words to say what it meant, and to explain how we could all, if we went the right way about it, do as great things as he did.

"Why you, youngster, when you made up your mind you wouldn't read any more of those bad books, you knocked over one of your enemies."

"Did I, though? how far in did I get?"

"You got over the doorstep, anyhow; but you've got plenty more to knock over before you get right into the place. So have I."

"My eye, gov'nor," cried the boy, his grimy face lighting up with an excited flush, "we'll let 'em 'ave it!"

They read and discussed and argued far into the night; and when at last Reginald gave the order to go to bed, there were no two friends more devoted than the Secretary of the Select Agency Corporation and his office boy.

Love's sleep that night was like the sleep of a pugilistic terrier, who in his dreams encounters and overcomes even deep-mouthed mastiffs and colossal St. Bernards. He sniffed and snorted defiance as he lay, and his brow was damp with the sweat of battle, and his lips curled with the smile of victory. As soon as he awoke his hand sought the pocket where the wonderful book lay; and even as he tidied up the office and prepared the gov'nor's breakfast, he was engaged in mortal inward combats.

"Say, gov'nor," cried he, with jubilant face, as Reginald entered, "I've done for another of 'em. Topped him clean over."

"Another of whom?" said Reginald.

"Them pals a-waitin' in the 'all," said he; "you know, in that there pallsis."

"Oh! in the Beautiful Palace we were reading about," said Reginald. "Who have you done for this time?"

"That there Medlock," said the boy.

"Medlock! What are you talking about?" said Reginald, in blank amazement.

"Oh, I are give him a wonner," said the boy, beaming. "He says to me, 'Collar all the letters your gov'nor writes 'ome,' he says, 'and I'll give you a tanner for every one you shows me.'"

"Love, you're talking rubbish!" said Reginald, indignantly.

"Are I? don't you make no mistake," said the boy, confidently; "I knows what he says; and that there letter you wrote home last night and leaves on the table, 'That's a tanner to me,' says I to myself when I sees it this morning. 'A lie,' says I, recollecting of that chap in the story-book. So I lets it be; and my eye, ain't that a topper for somebody—oh no!"

Reginald stared at the boy, half stupefied. The room whirled round him; and with a sudden rush the hopes of his life seemed to go from under him. It was not for some time that he could find words to say, hoarsely,

"Love, is this the truth, or a lie you are telling me?"

"Lie—don't you make no error, gov'nor—I ain't on that lay, I can tell you. I'm goin' right into that there pallsis, and there's two on 'em topped a'ready."

"You mean to say Mr. Medlock told you to steal my letters and give them to him?"

"Yes, and a tanner apiece on 'em, too. But don't you be afraid, he don't get none out of me, not if I swings for it."

"You can go out for a run, Love," said Reginald. "Come back in an hour. I want to be alone."

"You aren't a-giving me the sack?" asked the boy, with falling countenance.

"No, no."

"And you ain't a-goin' to commit soonside while I'm gone, are yer?" he inquired, with a suspicious glance at Reginald's blanched face.

"No. Be quick and go."

"Cos if you do, they do say as a charcoal fire—"

"Will you go?" said Reginald, almost angrily, and the boy vanished.

I need not describe to the reader all that passed through the poor fellow's mind as he paced up and down the bare office that morning. The floodgates had suddenly been opened upon him, and he felt himself overwhelmed in a deluge of doubt and shame and horror.

It was long before he could collect his thoughts sufficiently to see anything clearly. Why Mr. Medlock should take the trouble to prevent his home letters reaching their destination was incomprehensible, and indeed it weighed little with him beside the fact that the man who had given him his situation, and on whom he was actually depending for his living, was the same who could bribe his office-boy to steal his letters. If he were capable of such a meanness, was he to be trusted in anything else? How was Reginald to know whether the money he had regularly remitted to him was properly accounted for, or whether the orders were being conscientiously executed?

Then it occurred to him the whole

business of the Corporation had been done in his—Reginald's—name, that all the circulars had been signed by him, and that all the money had come addressed to him. Then there was that awkward mistake about his name, which, accidental or intentional, was Mr. Medlock's doing. And beyond all that was the fact that Mr. Medlock had taken away the only record Reginald possessed of the names of those who had replied to the circulars and sent money.

He found himself confronted with a mountain of responsibility, of which he had never before dreamed, and for the clearing of which he was entirely dependent on the good faith of a man who had not a week ago played him one of the meanest tricks imaginable.

What was he to make of it—what else could he make of it, except that he was a miserable dupe, with ruin staring him in the face?

His one grain of comfort was in the names of some of the directors. Unless that list were fictitious, they would not be likely to allow a concern with which they were identified to collapse in discredit. Was it genuine or not?

His doubts on this question were very speedily resolved by a letter which arrived that very afternoon.

It was dated London, and ran as follows:—

"Cruden Reginald, Esq. Sir,—The attention of the Bishop of S— having been called to the unauthorised, and, as it would appear, fraudulent use of his name in connection with a company styled the Select Agency Corporation, of which you are secretary, I am instructed, before his lordship enters on legal proceedings, to request you to furnish me with your authority for using his lordship's name in the manner stated. Awaiting your reply by return, I am, Sir, yours, etc., A. Turner, Sec."

This was a finishing stroke to the disillusion. In all his troubles and perplexities the good Bishop of S— had been a rock to lean on for the poor secretary. But now even that prop was snatched away, and he was left alone in the ruins of his own hopes.

He could see it all at last. As he went back over the whole history of his connection with the Corporation he was able to recognise how at every step he had been duped and fooled; how his very honesty had been turned to account; how his intelligence had been the one thing disliked and discouraged.

And what was to become of him now?

Anything but desert the sinking ship—that question never cost Reginald two thoughts. He would right himself if he could. He would protest his innocence of all fraud or connivance at fraud. He would even do what he could to bring the real offenders to justice; but as long as the Corporation had a creditor left he would be there to face him and suffer the consequence of his own folly and stupidity.

Young Love got little sympathy that day in his reading. Indeed he could not but notice that something unusual had happened to the "gov'nor," and that being so, not even the adventures of Christian or the unexplored marvels of Robinson Crusoe could satisfy him. He polished up the furniture half a dozen times, and watched Reginald's eye like a dog, ready to catch the first sign of a want or a question.

Presently he could stand it no longer, and said,

"Say, gov'nor, what's up, 'taint no thing along of me, are it?"

"No, my boy," said Reginald.

"Is it along of that there Medlock?"

Reginald nodded.

It was well for Mr. Medlock he was not in the room at that moment.

"I'll top 'im, see if I don't," muttered the boy; "I owes 'im one for carting me down 'ere, and I owes 'im four or five now; and you'll see if I don't go for 'im, gov'nor."

"You'd better go back to your home," said Reginald, with a kindly tremour in his voice; "I'm afraid you'd get into trouble by staying with me."

It was fine to see the flash of scorn in the boy's face as he said,

"Oh yus, me go 'ome and leave yer! Walker—I stays 'ere."

"Very well, then," said Reginald, with a sigh. "We may as well go on with the book. Suppose you read me about Giant Despair."

(To be continued.)

ON SPECIAL SERVICE: A NAVAL STORY.

By GORDON STABLES, M.D., R.N.,

Author of "The Cruise of the Snowbird," "Stanley O'Grahame," etc.

CHAPTER XVII.—WARDROOM TALK AND GUNROOM CHAFF—ST. HELENA—A PICNIC ON SHORE—THE MADCAP GALLOP.

ABOUT two months after the events recorded in last chapter, and the expenditure of the usual amount of red tape at the Cape of Good Hope, and the writing home of many despatches and private letters as well, the Theodora was ordered round to St. Helena, there to lie and await further instructions.

Everybody was elated at the prospect of a change of scene, and there was plenty of laughing and talking, both fore and aft, at the fo'c's'le-head, in galley, in stokehole even, hot though it was, in gunroom and wardroom, and even in the captain's cabin, for Captain Blunderbore loved society.

The Aurora—the old Roarer—had been sent off before them. The Theo's officers would be delighted to meet them again, and as their vessel neared the island there was a deal of talk in the mess about the commodore's ship and her fellows.

"Of course," said McGee, "we'll give a party of some kind?"

"A dance!" suggested West.

"Why, West," exclaimed Benbow, elevating his brows in surprise, either feigned or real, "has the pea-soup gone to your head?"

"It does seem funny," replied West, smiling, "but the fact is, Benbow, Dr. McGee has advised me to go in for plenty of exercise, dumb-bells, dancing, and all kinds of capers, else I'll get so stout, he says, that I won't be able to get in at my cabin-door."

"Or down the ladder," said Mildmay, laughing, "like Commander Romeike. You knew Romeike, Benbow?"

"That I did. One of the best fellows out. Such a rare one to tell a good story; kept you laughing for hours, all through dinner and dessert, in fact, but never laughed himself."

"Well," continued Mildmay, "Romeike applied for the Cleaver, an iron store-ship that was fitting out at Pembroke for Bombay. The appointment was made, and Romeike was a happy man. He always said he liked a separate command. He didn't join till the vessel had up steam and was preparing to go out of harbour. His servant had seen to his traps, and everything was all ready, but didn't the ladder creak as he was getting on board!"

"Let me see," put in Mr. Benbow. "How much did he weigh? Fifty-six stone, wasn't it?"

"Now then, Benbow," said McGee, "you're drawing the long bow; don't."

"Well," continued Mildmay, "Romeike actually weighed twenty hundred-weight."

"That is a ton," said West, quietly; "what a Jumbo he must have been!"

"No, no, no," cried Mildmay, "I mean twenty stone; it is this countryman of yours, McGee, who is confusing me, this gunroom servant; he is sticking a dish of potatoes in front of my nose. I tell you, Duncan Robb, that in this country people don't hold potatoes in their fingers, nor do they eat them with soup. But, gentlemen, Romeike saw to getting the ship well clear before he thought of going below, indeed he stayed on deck for hours. Then he asked the doctor to come below to his cabin and see his arrangements."

"Go down first, doctor," said Romeike, with a suspicious glance at the companion ladder.

"Down the doctor slipped, like an eel; he was an active wee man. The doctor slipped down, but the commander stuck fast by the hips, and they do say they had to rig a block and tackle to hoist him up again. Anyhow, he never again ventured to try his luck in that hole. Forward it was no better, and he would have had to remain on deck all the voyage if the carpenter and armourer had not succeeded in rigging a special ladder for him at the main hatchway."

Now James Town, St. Helena, where they soon after arrived, is a pretty little town; from the beach it goes straggling away up through a glen in a thoroughly romantic kind of style; rocks and forts frown over it, to say nothing of the grand old hills, and along the seaside is many a charming villa with porticos and verandahs, and creeping plants and flowers of every hue. And from rose-covered balconies on moonlit nights comes the dulcet sound of guitar or lute accompanying sweet girlish voices singing. Often of an evening, when tender-eyed stars were shining, and fire-flies flitting from bush to bush, have I lazily floated in my skiff, listening dreamily to the music that trembled on the waves 'twixt me and the shore.

There was hardly a villa there I had not woven the web of a story round, hardly one I had not encircled with the glamour of romance.

Yes, a nice wee place is James Town, only—well, it is a little dull. But two man-o'-war ships lying before it at the same time! What a joyful sight! I can assure you, reader, that the day after the Theodora's arrival, soon after sunrise, many a blind was drawn a tiny bit to one side and many a bright eye gazed seaward.

The gallant bluejackets, and the offi-

cers in white and blue and gold that came on shore so frequently during the day, were objects of great attraction. Many of the latter brought introductions, so that the Aurora's and Theo's people in a day or two, socially speaking, had the freedom of the town presented to them. They could drop into this place or that, lunch and take tea, and lounge and talk as long as they pleased. The officers of the garrison were a set of good-natured, easy-going fellows, else they might have been piqued and jealous at being ousted, as they now were, in favour of the sailors.

It was a lovely morning, and early. How bright and sparkling the sea was! How blue the sky! Quentin and Colin were walking the deck.

"Breakfast is ready and waiting," said sturdy Duncan, coming up and saluting the young officers.

At that moment, on the quarterdeck of the Aurora, or the "Roarer," as the blue-jackets insisted on calling the corvette, the band struck up the National Anthem, and, as if with one impulse, both Quentin and Colin lifted their hats. The effect of the music of the grand old lines coming floating over the water on this bright, calm day was spirit-stirring in the extreme. And handsome, too, looked the corvette herself, lying so peacefully on the water, with her long black hull gently rising and falling, the white line of hammocks over the bulwarks, and the rigging square and taut.

"It's going to be a day on shore, isn't it?" said Colin, as the two went below to breakfast.

"I believe so," replied Quentin Steele.

"How jolly!" cried Colin, jubilantly.

Both of these young officers had already done ladder-hill again and again, and their legs ached in consequence, as if they were threatened with rheumatics. It is no joke, I can assure the reader, running or even walking up this giant staircase. It goes right up the face of a precipitous cliff that rises over the pretty little town of St. James—a wall of adamant. A fort stands at the top of the cliff, and to get at it in any other way would entail a walk of about two miles round, so all but the aged and infirm go up the ladder. There are about four hundred steps, and as each step is fully a foot higher than the one below it, it is not any wonder one needs to pause for breath when half-way up, but here there is a seat.

Benbow was in fine form in his own mess that morning. It may be noted, however, that as a rule Benbow was

always in fine form, whether in his own or in any other mess. Benbow suffered from no constitutional shyness, he was invariably on good terms with himself, and this made him feel on good terms with every one else.

As to the wound in his head, Benbow confessed it did him more good than

"I wasn't grinning, sir," began the poor middy; "I was—"

"Don't prevaricate, sir!" interrupted Benbow. "Ask a blessing!"

"Now, Duncan, off lids! What! curry and rice, and a 'spatch' cock and soft tack and butter! Duncan, you're worth twenty of that Portuguese chap that so narrowly

No? Good thing, Brown; one o' your sort's enough in a family. Some more curry, Brown? That's a man! Eat and get stout. By-the-by, Brown, nobody seems to have seen you on deck at all during the row with that pirate. Did you draw your dirk at all, Brown?"

"Oh yes, sir, I drew it."

"From the top of the peak the view well repaid them."

harm. "It let out a little of the bad blood," he said, "and I feel all the lighter for it."

"Now then, Duncan," cried Benbow, as he entered the gunroom and began squeezing himself up to his place, for the midshipmen's mess was certainly not as big as Guildhall, and Benbow, being the last to enter, everybody else was seated. "Bring the breakfast, Duncan. Boys, make room for your father! Here, you boy Brown, what are you grinning at? I won't permit a stupid 'numerary to grin at me, I can tell you! I'm thirty years of age, mind you, and I'm not going to be thirty years of age for nothing!"

escaped being shot! Duncan, you're an invaluable fellow! Colin McLeod, your countryman is a treasure! You look rather white yet, though, Duncan. Do you miss your little finger very much?"

"Not so very much. It has healed nicely. I've only got to hold it up as much as I can, sir."

"That's right, Duncan, keep it up; and if you hold up your head also you'll never die. I declare there is that stupid 'numerary grinning again! Just look at him! Why, he's all mouth! He looks at you with his mouth, and shuts his eyes when he laughs for fear of catching cold in them! Brown, have you any brothers?

"About all you did do, I dare say. But heave round with your breakfast."

By-and-by there was a smart knock at the door, and the quartermaster's head appeared beneath the curtain.

"Cutter just called away, gentlemen."

"Thank you," cried Benbow. "Now then, you youngsters, if you're going on shore off with you and tumble into your mufti. Brown, my warlike little pumpkin-squash, are you going with us? Yes? Well, go and dress. I've never seen you in plain clothes. I know I shall be delighted with your appearance. Duncan, you're to bring our gunroom basket on shore; you'll get plenty of niggers in the town to carry it to Longwood."

"It's all ready packed, sir."

"Well, I trust it is well filled with good things, Duncan. We must keep up the dignity of the gunroom mess, you know."

"By-the-by, Brown," continued Benbow, when the boat had shoved off, "that plaid suit becomes you admirably. Fits like a glove. Jacket-tails stick out a trifle, and legs of trousers are a trifle too short. But that's nothing. Ever served in the tropics before, Brown?"

"No, sir; coast of Ireland chiefly."

"The Green Isle, eh? Well, that accounts for a considerable amount of your charming vividness. Now, Brown, you're fond of natural history. There, don't deny it; I can see it in your eyes—or at least in your mouth. Starboard a little, cox'ain. Look, Brown, do you see that lovely little airy, fairy, sky-blue object floating along on the water, rising and falling on the waves like a thing of beauty and a joy for ever, eh?"

"Yes," cried Brown; "whatever is it?"

"That, my dear young friend, is a nautilus, called by the ordinary blue-jacket a Portuguese man-of-war."

"Is it alive?"

"That it is, bless your innocence."

"Then I should like to catch a specimen."

Benbow gave the coxswain a wink.

"Keep the boat down towards it," he told him. "Stand by, Brown, to pick it up as soon as it comes under the quarter."

Brown tucked up his sleeves, and stood by as advised, and no sooner did he have a fair chance than he seized the frail thing.

"I shan't miss it," he had told Benbow before he made the plunge.

Well, he did not miss it, and most assuredly the nautilus did not miss him. Brown flung it from him as if it had been a hornet. He got suddenly red in the face, and compressed his lips as if trying to keep from crying.

"Poor boy!" said Mildmay, smiling; "those things *do* sting. Be careful next time. Let it be a lesson to you. Never tackle an enemy until you have some notion what guns she carries."

There was not a cloud to-day in the sky, but once up among the hills a gentle breeze fanned the travellers' faces and tempered the sun's rays. To their right lay hills above hills, the lower parts cultivated, the upper green with waving trees, while above them towered the lofty peak of Diana. Bare and craggy and nearly three thousand feet above the level of the sea, this mountain has been a landmark for the sailor for centuries, and mayhap will be for ages yet to come.

The tomb of the Great Napoleon was faithfully visited, then the beautiful villa on the cliff-top where he had been a prisoner so long, and where he died.

As they all stood together in the lofty room with its bare whitewashed walls in which Napoleon had breathed his last, a feeling of depression almost akin to gloom stole over them, and no one was sorry when they were once more out on the breezy cliff, with the blue sea, dotted with many a white sail, far down beneath them, stretching away and away and away to the illimitable horizon.

A glorious day was spent roving among the hills and rocks. Benbow, Colin, and Quentin got to the top of the peak, and the view well repaid them. Mildmay, with D'Austin and Stupid-numerary Brown, as Benbow would call him, remained below and did not know the treat they had missed.

On their return Duncan's basket was called into requisition, and ample justice was done to the good fare there. Certain it is that, lying around them beneath that green tree's shade, everybody seemed very contented and very happy. The sun sank lower and lower towards the horizon; nobody appeared to mind it, or even notice it. Captain West showed his sketches, Colin and Quentin brought out the ferns they had collected, and last, but not least, Middy Brown exhibited his shells.

"Conchologist, are you, Brown?" cried Benbow. "Bother me if I don't think there is something in the boy after all. Mildmay, tell us a story."

Mildmay did as requested. Then Benbow spun a yarn a yard long at least, a yarn that made every one laugh. For Benbow's yarns had this peculiarity, nobody but himself could have told them

half so well; there was something funny in the little man's face, something right merry in the twinkle of his little bright eyes that caused you to wait and listen even when the story was flagging, sure in your own mind that the fun was to follow, and you never were disappointed.

When Benbow had finished he called on the doctor for a song, and "Ye Banks and Braes" was the immediate consequence.

Next there was a sea-song with a chorus that made you imagine you were being tossed on the bosom of the heaving ocean, now down in the trough of the sea, with the wave-walls rising up on each side of you, now away up high high on the crest of a mighty billow. This was Quentin's contribution to the general jollity.

Then Colin's turn came.

Colin had a sweet tenor voice, though neither strong nor deep, but his song was much appreciated. It led his listeners far away from the scene around them, far away to their island home; it breathed of innocence and rural beauty, of throistles fluting in the limes, of larks singing high o'er fields of tender green, of winds that sighed through summer trees, of ploughboys, of milkmaids' song—all all of home.

There was an interval of fully a minute, during which no one spoke. Each was wrapped in thought. Then Colin looked around him and smiled upon Brown.

Brown coloured up, and looked most interestingly shy.

"Come, come," cried Benbow, pretending to look severe, "there is no use of trying to get out of it, Mr. Brown. Duty is duty."

"Duty?" said Brown, in some surprise.

"Yes, certainly."

"Oh! I hadn't looked upon it in that light before, so here goes."

Very much to the astonishment of everybody, a comical kind of a smile commenced to play around Brown's by no means classical features, while he quietly dived his hand into his pocket and fetched out a pair of bones—real negro-minstrel bones.

Mildmay was looking at him somewhat regretfully. He was wondering if the poor boy, as he called him in his own mind, meant making a fool of himself.

But stupid-numerary Brown was quite as self-possessed now as he had formerly appeared confused.

"It's the correct thing, you know, gentlemen," he said, "to take your music with you when invited to a party where you may have to sing a favourite song. Them's my moosic."

"Oh! you can look at them, gentlemen," he added, handing them round. "Look at 'em, feel of 'em, convince yourselves there is no deception."

"Bravo! Brown," laughed Benbow, encouragingly.

"And did you really bring these to sea with you?" asked Mildmay, smiling.

"Yes, sir," replied Brown, pretending to look solemn. "Nobody in our family could play on 'em except me. Takes an artist to play the bones, though any fool can fiddle, sir. Marvellous what can be done on the bones, sir! At home, sir, I used to call the cows, and frighten away the stray cats, and scare the rats, and, better still, sir, whenever our baby began to squall my mother would say, 'Tommy,

my boy, come and beat them bone things, and the dear infant would smile and go off to sleep in an ecstasy. Bless you, yes, sir, there is moosic in the bones. Now, gentlemen, just listen and you'll hear the night express starting north from Euston Square to take the letters to Colin McLeod's father. Any more going! Right for'ard? Whew—w—w. Now she's off."

Puff—puff—puff—went the bones, it really was marvellous; quicker—quicker—quicker, till the sound settled into a steady roar. Louder and harsher now, the express is going over a long iron bridge; once more the steady rattling roar; now she is going through a cutting; now she is out again, and away across the clear country. Whew—w—she is entering a tunnel, and now she is in it, and the roar is subdued and dreamy; then it suddenly increases, she is clear of the tunnel, and soon after begins to slow, and slow, and slow, till she pulls up at—

"York? gentlemen," says Brown, and sits down.

The applause that followed would have been enough to turn the head of an actor on any stage. Mildmay felt so pleased, and patted Brown kindly on the shoulder.

From that day forth Brown with his bones was quite a favourite in the gun-room, and even the wardroom mess; and little Othello, the blameless Ethiopian, and he gave many a humorous entertainment.

There was a "big" dinner on board the Roarer that night, to which the Theodora's fellows were invited. The table was laid on the main or fighting deck under canvas lined with flags. It was quite a family affair between the two friendly ships, no strangers being on board, so all the talk at table was about the service. This after part of the main deck was screened off from the fore, and the band played outside.

After dinner the officers strolled up and down the deck in twos and threes, conversing and listening to the sweet music.

Now, I have often been amused on board ship at scenes like what I am about to describe suddenly taking place. It seems to happen by magic, but the music has a good deal to do with it. On this occasion the band suddenly struck up the "Madcap" Galop, and in a moment more, Quentin, with Colin as partner, was whirling round to it; then stupid-numerary Brown and a Roarer midgy as plump and shapeless as himself started; even D'Austin for the time being forgot his *bon ton*, and found a partner; big McGee and West sailed together, and there were four more couples of the Roarer's officers at least to join this Madcap Galop.

But this wasn't all, for away for'ard, behind the dividing screen, every man Jack, from the cook to the Krooboy, went at it with a will, and for the time being you might have imagined all hands had been bitten with the mythical tarantula, so fast and furious was the dancing.

Then the music suddenly ceased, and decorum was once more resumed, but poor West was fain to drop almost helpless into a chair. He was far too fat for tripping it in this way.

Colin was very happy that evening, but sorrow was even then winging its way towards him.

(To be continued.)

BOY LIFE AFLOAT.

BY CAPTAIN H., LATE R.N.

V.—SHARK-CATCHING.

SEAMEN invariably look upon a shark as an enemy, and indeed they have good reason to do so, for it is but small mercy that the unfortunate mariner who has been unlucky enough to fall overboard meets with from the hungry-looking, snub-nosed tiger of the sea. A sudden rush through the water, a moment's pause while the voracious monster turns over on to his side in order to use his jaws, which are placed underneath, a vicious snap, and the unhappy man disappears beneath the surface, while the sea all around is crimsoned with his life's blood.

It is not often that Jack Tar obtains an opportunity of "squaring yards," as he terms it, with Mr. Shark, and we cannot wonder that the chance is always seized with avidity and made the most of.

In a sailing ship during a long voyage there are but few circumstances likely to arise to break the monotony of the daily routine, and among them one of the most popular has always been shark-catching.

Of course this, with many other things, has gone out of fashion with the advent of swift steam-ships. They have no time to fish for sharks; it might delay their arrival in port a few minutes, and that could not be allowed.

Some years ago vessels usually carried a shark-hook with them—a large iron hook with a small barb, and attached to a fathom of chain in order that the brute might not bite it off.

Many wonderful tales have been written and told about sharks, the majority of which may be taken *cum grano satiss*. For instance, there is the yarn of the young captain who was carrying home an elderly uncle who had gained a fortune and lost a liver in the East Indies. The story runs that he had made a will leaving everything to his nephew, but owing to a difference of opinion, which led to an argument, during which the old gentleman lost his temper, he determined to destroy the will and make another leaving his money to a hospital.

But on reaching his cabin he felt too ill to tear the will up, so he flung it through the port, whence it fluttered into the sea and was immediately swallowed by a shark that had been following the vessel for some days.

The captain was looking over the side and beheld the roll of paper emerge from his uncle's cabin, and immediately came to the conclusion that it was the will.

So he issued orders for the vessel to be hove to, and sending for the shark-hook, had it baited with a tempting-looking piece of pork and flung over the stern. The pilot-fish swam up and inspected it (as he invariably does anything that is likely to provide a meal for the brute that he attends upon), and then returning made his report to the shark.

The latter came up lazily and swam round it two or three times suspiciously, and finally turning over, swallowed the pork, hook and all. He was soon hauled up on to the deck, killed, and cut open, and the will, but little the worse for its immersion, extracted from his maw.

The uncle was taken seriously ill that evening, and died a week later without having been able to make another will, so that his nephew inherited his property, and no doubt, as the fairy tales say, lived happy ever after.

Sharks are not pleasant eating, but they afford a change after a constant diet of salt meat, and are sometimes made use of in that way. We remember eating a portion of the tail of a small shark once that was far from unpalatable, flaked like cod, and eating *some-what* like coarse fishy pork. In many parts they harpoon them, and cut them up for the sake of the liver, which yields a large supply of oil.

A shark is very tenacious of life, and it is wonderful to see how long the brute will continue to struggle after he has been caught.

But now let us endeavour to describe the act of catching one, as we have seen it done. Let us suppose, then, that we are in a sailing vessel becalmed on or close to the line. The sun is shining brightly and makes everything on deck, even through the awning, as hot as a furnace; the men are lounging about, and every one is devoutly wishing for a breeze. Suddenly somebody wakes up to the fact that a big shark is cruising about under the stern. Somebody else suggests catching him, and with what little energy the intense heat has left them the others take up the idea.

The captain is applied to for permission, which he at once grants, and comes on deck to see the fun. The hook is obtained and baited, and then fastened to the spare end of a brace or other small rope; and pitched carelessly overboard.

The pilot-fish inspects it and reports as usual, and finally his royal highness, after coquetting with it, makes a sudden rush and is caught.

The next thing is to get him on board, but for that there are always willing hands and to spare, and in a few minutes the shark is lying on his side on the deck. His mouth is partially open ready to snap at anything or anybody, and his eye has the most evil and malignant expression of any animal living.

It is necessary to take care of his tail, for he can and does flap it about with a force that would easily break a man's leg.

The carpenter now approaches with his adze, and with a couple of blows separates the vertebrae, and the shark is powerless to harm any one. The butcher has his turn now, and in a few minutes the shark is dead and is being cut open. And now every one crowds around, for many seamen have a belief that any and every thing that they have lost during the previous fortnight is sure to be found in the shark's maw.

And certainly in the case we are describing there was a strange conglomeration of articles exposed to view. A saucepan lid is the first thing brought to light; then a portion of a scrubbing-brush, an old shoe partially digested, an iron spoon, and many other similar

things too numerous to mention, some of which, moreover, did not belong to our ship.

Finally, Mr. Shark is cut up, the officers have the choice of the tid-bits, that is, the tail end, and the remainder is divided among those men who desire to retaliate upon their natural enemy.

One more incident that we can vouch for, although we were not present at the time, and we shall have finished with the shark for the present. The West Indies are notorious for being the paradise of sharks; the warm seas around the islands appear to be their native water, and it was in this hotbed of sea-tigers that the following little tragedy occurred.

Charles G— was a merchant's clerk in Liverpool, and by honesty and industry he had worked himself up into a position of trust and confidence.

One evening he was introduced at the house of a mutual friend to his employer's only daughter, an amiable and accomplished girl of about his own age. After this they met frequently and a mutual affection arose, and ultimately Charles asked his employer for his daughter's hand in marriage.

The merchant at first would not hear of it, but at length, perceiving that his daughter's heart was set upon him, he consented, conditionally that George should go out to Jamaica and take charge of his branch establishment there for five years.

George consented, and after a very painful parting with the object of his affections he started out and arrived safely in Kingston.

A year went by and the young people corresponded frequently, but the merchant discovered that his daughter was losing her health. A celebrated doctor was applied to, who gave it as his opinion that she was pining and fretting, and that unless something was speedily done for her, consumption would ensue.

The father was still obdurate, and she grew worse. At length, unable to stand it any longer, he determined to take her out to Jamaica himself, hoping that the voyage and the sight of George might effect an improvement.

George received the news that they were coming by a previous vessel, and when the ship they were in anchored in Port Royal his boat was one of the first to row towards them.

The passengers were disembarking as he arrived alongside, and the young lady, who was too weak to manage otherwise, was being lowered in a chair. Suddenly the tackle broke and she was precipitated into the water. Regardless of the warning cries of the natives, for Port Royal harbour swarms with sharks, George plunged overboard after her.

He succeeded in grasping her round the waist, and was returning to the ship's side, when all at once a cry of horror arose from the assembled spectators. They could perceive the great dorsal fin of a big shark making towards the burdened swimmer.

George redoubled his exertions, but all in vain. "Oh, my daughter!" groaned the unhappy parent, who was watching from the gangway; "oh, merciful Father, spare my daughter!"

The next moment George threw up his unoccupied hand, and uttered a scream of agony as he and his burden disappeared from view.

The water for some distance round was discoloured with gore, but nothing more was seen of the unhappy couple, who were thus destined to be united only in death.

TIGER TALES;
OR, THE ADVENTURES OF A HOLIDAY.
PART II.

A Dangerous Moment.

UP in the morning early, and away under the guidance of the old shikaree went the three officers on a somewhat doubtful quest; for Rugonauth, though he had seen no tiger, had come upon traces, and had thrown out his beaters on speculation.

"Now, Sahib," he said, as he reached a point which commanded a gorge and a nullah which ran into it, "this is one place and the other is there," and he pointed to another similar position a couple of hundred yards farther on. "If there is a tiger above this, he will very likely either come up one of these two nullahs, or sneak down the ravine itself. If neither of you should see him do that, then Mackenzie Sahib, who is nearly half a mile lower down, may have a chance. But my hope is the two nullahs."

Saying this, he left Norman where he was, and took Hawkes on to establish him in his assigned position. That effected, he moved on to take personal command of the beaters and see that his directions were acted on.

The wary and self-reliant old shikaree, fatalist though he was, appeared himself so sanguine, that he impressed the two sportsmen with strong hopes that, in spite of the adverse chances attending so extensive and speculative a beat, it might after all prove a successful one.

Before half an hour was past, distant shouts reverberated among the crags and rocks, and were banded from side to side, announcing the commencement of the beat. Soon a blank shot or two was fired at intervals, and was caught up sharply by the echoes and repeated, with a progressive diminution of rattle and hardness, till lost in a soft, undefined murmur. The beating of the tom-tom occasionally swelled into a deeper cadence, as some opening allowed its freer egress, or a favourable puff of wind wafted it down to the listeners.

Hawkes, who was farthest up, could now see the men on the opposite side moving along, and by their position guess at that of the beaters below.

His attention was shortly after attracted to a troop of monkeys in the bottom of the ravine, somewhat higher than his station. Their movements evinced some unusual excitement, as they skipped from tree to tree, gesticulating, chattering, and screeching, as if in great anger. He had heard that these creatures do, for some reason of their own, hold tigers in great aversion, which they never fail to display when they happen to discover the object of their wrath, by some such exhibition as he was now witnessing. In his boyish days he had seen the movements of magpies give a clue to the line of the fox; and he presumed that he was, perhaps, now observing a similar natural instinct on a larger scale. There was evidently some special cause for the commotion which prevailed, so unusual in the heat of the day. As he was pondering this, and wondering if a tiger was really a-foot, his gun-bearer whispered the word "Bagh" (tiger).

"Where? Where is he?" he ejaculated quickly, making ready at the same time. "I don't see him."

"No, Sahib," replied the attendant. "I only spoke for you to be prepared. I have not seen him, but the monkeys must have done so."

The chattering soon diminished. Hawkes, however, kept a vigilant look-out near the spot where the monkeys were still moving about the trees, but in an undecided sort of way. He was beginning to think there must have existed some other cause for their excitement, when he felt a twitch at his coat.

He turned sharply, and his gun-bearer pointed down into the nullah, which entered the ravine nearly at right-angles, and which formed a portion of his watch and ward. He followed the direction of the man's finger, and peered into the thick undergrowth at the foot of the trees which grew plentifully at the spot, without, for a few seconds, discerning anything. Quickly, however, he caught sight of an object moving in the shade; and, as it passed across a more open space, saw it was

a tiger sneaking along with the head and body low; its whole back, from the snout to the setting on of the tail, appeared to form one straight line, the latter appendage being carried in a drooping state.

His rifle was quickly brought to bear, and he let drive both barrels in rapid succession, rolling the tiger over; but it immediately recovered itself, sprang up roaring with rage and pain, and, catching a sight of his adversary on the rock-faced bank above, came bounding towards him over the boulders and stones at the foot of the low cliff on which Hawkes stood. The hunter seized his second gun, and poured in its contents as the tiger came on, but without the effect of stopping his headlong charge. The beast reached the base of the rocky height, and, making a desperate spring, managed to gain a hold with his fore-paws on its top, but its flat and slippery face presented nothing on which to fix his hind feet, or give it purchase to assist in dragging itself bodily to the top. As Hawkes turned to seize his third gun from the attendant, he perceived that individual some distance in the rear, racing with full power on towards the nearest tree. It was too late for him to follow suit; retreat was now out of the question; so he clubbed his gun and brought it down with force on the head of the tiger as it rested snarling between its paws within a few feet of the striker. The beast winced, but did not let go its hold; indeed appeared to redouble its efforts to effect a lodgment. The stock flew into splinters as it came in contact with the hard skull of the tiger; but Hawkes continued to belabour him with the barrels. He laid on with a will, but the result was yet doubtful. Despite the desperate blows, the beast maintained his position; and, had he not been weakened by his wounds, would probably have made good his object.

All this time it had been growling, with rage depicted in every line of its countenance. Suddenly it emitted a short low roar, a quiver seemed to run through it, its jaws relaxed, its

eyes lost their fire, its hold of the rock gave way, and it fell back crashing among the boulders of rock and bushes into the nullah below, a distant rifle crack accompanying its downfall.

"Hurrah!" Hawkes shouted, in mad excitement, brandishing his gun-barrels. "Hurrah! He's cooned. Yoicks! Tally ho!"

"Run for it. Get into a tree!" shouted Norman, from the other side of the nullah, in eager, anxious tones. "He may get up, and be at you again by some path."

"No, no, it's all right. He's cooned. Tul-lul-lul-laietee!" and Hawkes continued to make excited demonstrations as he stood on the rock and looked over.

"Get back, man, get back. Are you mad?" Norman again shouted, with much anxiety. "Perhaps he's only stunned. I can't answer for hitting him again. Run off, confound you; run away, will you!"

"It's all serene, old fellow," was the reply. "I see him lying quite still, and dead as a door-nail. There he is under the tree."

"Ah! I twig him," ejaculated Norman, and again the rifle spoke. But this time there was no responsive roar. "Dead, I believe," he said. "Quick there, gun-bearer, the other gun," and he seized his second gun from the man, who now came running up.

It now occurred to Hawkes that he too might as well provide himself with another weapon. So, while Norman was reloading his rifle, with his gun lying cocked before him all ready for use, in case the tiger showed any signs of life, he looked about for his attendant.

"If you have quite recovered from your mad fit of dancing and howling," said Norman, "I recommend you, Hawkes, to get hold of another gun, and we can then go down to the beast."

This Hawkes was soon able to do; for the gun-bearer, seeing that the danger was past, descended from his perch in a neighbouring tree, and approached his master with considerable misgivings as to the nature of his reception.

Hawkes took his gun, and both the sportsmen descended, each from his side, to the prostrate tiger, which they found lying quite dead.

This narrow escape led to the evening chat

being chiefly concerned with hunting adventures of a startling nature that had come under the notice of one or other of the party.

"I remember," said Norman, "a story told me some time ago, relating to an acquaintance of my own. He is a queer fellow, full of fun, and always ready for a joke; and has a ludicrous way of making faces and emitting curious howls. The nature of the man renders what I am going to tell you appear more absurd than the real narrative itself justifies; but as I can't convey a proper idea of that, I will just tell you what was told to me. I must state first, though, that the poor fellow got a bad fall with his horse some years ago, by which his leg was broken, and he has been obliged ever since to wear some iron apparatus to assist it, for the broken leg is considerably shorter than the other. But though this necessarily obliges him to hobble, he can scuttle over the ground at a wonderful pace. In other respects he is a tall, good-looking man."

"He was out once lion-shooting in Kattiarwar. In some parts of the district, where it is tolerably open, the sportsmen used to follow the game on horseback, ride up within range, and then dismount to get a shot, unless their beasts were steady enough to stand fire from their backs. After the shot they quickly remounted and galloped off. In fact something in the manner that the African way of conducting the sport is described."

"On one occasion my friend had turned up a couple of full-grown lions, and was following them on the plain. He managed to get within range, and, as his horse would not stand quiet enough for him to fire from its back, jumped off and threw the bridle over his arm; by some chance, however, omitting to slip his hand through it. Well, he got a fair shot, and hit one of the lions hard; but the noise startled the horse, and, as there was nothing to check it, away it galloped, leaving my friend standing. He fired his second barrel, and then had the horror of seeing the wounded lion come charging down towards him, all head, tail, and legs, and roaring tremendously. His rifle was empty and useless, and of course there was no time to load. His first impulse was naturally to bolt as hard as he could; and, accordingly, away he stumped for the nearest tree. But long before he could reach it the roars came

closer and closer behind him; and he felt that he had not the slightest chance of reaching the tree before being overtaken by the angry brute. Still he sped on with the instinct of self-preservation; but the lion was fast closing with him. What could he do? There was no time to be lost. In a few more bounds his head might be crushed in by the blow of a paw, or his mangled limbs be quivering in the animal's relentless jaws. It suddenly occurred to him to try and startle the beast by some unusual combination of form and sounds. His resolve was immediately taken, and acted on without delay. Stopping short suddenly in his race, with his back still towards the charging lion, now drawing very close, he ducked his head and body till he looked at it reversedly from between his legs, and in that position made some of his most hideous face, and gave utterance to some of his most appalling yells, and at the same time gesticulated wildly with his arms.

"This was a metamorphosis for which the savage beast was quite unprepared. Just before there had been a runaway man, legging it as hard as he could go in front; but now there was a fearful shapeless creature, stationary and unyielding, and howling in the most awful way, quite beyond all lion experience. The brute was staggered, and hesitated in his headlong career, then pulled up and looked, advanced a step and looked more closely, heard a frantic yell of extra power, the last despairing effort of the hunter, turned, and with lowered tail trotted off to join his companion, now disappearing in the distance. After a short space my friend arose, almost purple in the face from the violence of his exertions, and the unpleasantly low position of his head, but much gratified, and chuckling greatly at the success of his ingenious ruse."

"Oh, come, Norman!" said Hawkes, laughing; "that is a good one."

"I tell you what," observed Mackenzie, "if you have got many more like that, you might edit a new edition of Munchausen with much interesting and additional matter never heretofore made public, as the advertisements would say. Where on earth did you pick that story up?"

And, in reply, Norman gave his authority and told a still more extraordinary story of a bear being put to flight with a bottle of soda-

A Fair, Clear Shot.

water. The bear, he said, came bearing down along the jungle path, and was not more than four or five yards off.

"The man was perfectly aghast; he had no time to bolt, or even to seize his gun, which was resting against another tree; so, in the desperation of the moment he raised his bottle to hit the bear over the head or nose, for he remembered their peculiar sensitiveness in that prominent feature. At that very moment the cork flew out with a sharp bang, hit bruin, as luck would have it, right on the nose itself, and the contents of the bottle, being well up, flew fizzing and spluttering over his face and eyes. This was a reception he had not calculated on. Instead of seizing my friend, he hastily turned aside in terror, and made the best of his way into the jungle, while my friend hastened his exit with the bottle, which, truly and correctly aimed, and yet half full of soda-water, hit him on the stern, and scattering its cold contents over him, caused him to redouble his speed. Now, you see, that story rests on my bare assertion, so I don't often tell it."

One morning, shortly afterwards, the hunters were aroused by news that a tiger had been seen close by. Off they started to take up their positions. Mackenzie and Hawkes scrambled on to a high rock, which enabled them to see a little over the jungle, and then waited.

Norman, who had much farther to go, was longer in reaching the place selected by his guide; and when he had arrived there, debated whether he should also sit on a rock—of which there were several rising above the surrounding low jungle—or climb into a small tree which grew near. The man recommended the latter course; for from the tree, he stated, could be covered several open places not discernible from the rocks. Norman accordingly took his station in the tree.

He had not been there very long before he saw a jackal trot underneath. From this the native argued that the tiger would be very likely to follow, if he had any intention of leaving the jungle.

This he communicated in a whisper to Norman; and himself had probably a real

belief that the jackal was in truth no other than an advanced attendant or satellite of the nobler beast. If he really entertained such a belief—as many do—his views of the subject were probably irrefutably confirmed by the appearance shortly afterwards of the tiger itself.

He was sneaking quietly along with his head low, the upper line of his whole body, from nose to setting on of tail, forming one long undulating line. It was evident he was in no great hurry, but stalking slowly through the thicket, either not finding the present cover to his taste, or deeming it desirable to avoid the near neighbourhood of the men who were busily employed in the other direction with their sticks and axes.

He passed behind one of the rocks I have referred to, and was for a few seconds lost to sight; but he quickly reappeared, and gave a fair clear shot as he crossed an opening in the bushes. Norman carefully covered him, fired, and the beast dropped dead without a groan.

(To be continued.)

THE SEA KINGS OF OLD ENGLAND.

SIR JAMES LANCASTER.

THE pioneer of our Indian Empire was James Lancaster. He was the first Englishman to take his ship round the Cape of Good Hope to India, and he it was who commanded the first fleet dispatched by the East India Company.

He was born at Basingstoke, in Hampshire, and after considerable experience of the sea, had settled at Lisbon as a merchant, where he earned much and learnt more. In 1591 he set out from England on his oriental voyage, and went back along the track that Drake and Cavendish had taken on their way home. His ship was the *Edward Bonaventure*, and he started with two consorts. The "skurvie," however, broke out, and one of the vessels was sent back loaded with sick, while the other was lost with all hands off Cape Corrientes.

Lancaster's voyage was a perilous one. The weather was so tempestuous that the men could not keep dry for three hours together. After leaving South Africa, where he found amongst other curiosities "great store of overgrown monies," he on the 18th of September ran into a storm. Its fury was appalling. There came a clap of thunder, he says, which "slew foure of our men outright, their necks being wrung in sonder without speaking any word, and of 94 men there was not one untouched, whereof some were stricken blind, others were bruised in their legs and arms, and others in their breasts, others were drawn out at length as though they had been racked. But (God be thanked) they all recovered sauing onely the foure which were slaine outright. Also with the same thunder our maine maste was torne very grievously from the head to the decke, and some of the spikes, that were ten inches into the timber, were melted with the extreme heate thereof."

He made his way northwards, however, sailed to the south of Ceylon, and stayed at Pulo Penang "till the winter was overpast." "Our refreshing in the place was very smal, onely of oysters growing on rocks, great wilks, and some few fish which we tooke with our hookes." At Penang he stayed till December 8, 1592, and then he set sail for the Cape. Out of his crew of ninety-nine there were only thirty-three survivors.

In the following April he left St. Helena on a trip to the West Indies. At Mona, between Porto Rico and St. Domingo, he watered his ship, and then laid his course for Newfoundland. A gale caught him. The sails, though furled, were blown from the yards and only one was left. Then came a calm, and then another storm, and Lancaster, whose

crews had been reduced to eat the hides he carried, took the ship back to Mona.

He and Barker and May went ashore for water, and the *Edward Bonaventure* parted her cable and drifted off with five men and a boy on board. The island was almost a desert one, and the castaways were living on sea purslane and slowly starving, when two French ships came into the bay. Lancaster and Barker went on board one; May joined the other. Lancaster's party got safely home on the 24th May, 1594. But May's ship was wrecked off the north-west of Bermuda.

A raft was made and May escaped with twenty Frenchmen. "Before our ship did split we saued our carpenters' tooles, or els I thinke we had been there to this day; and hauing recovered the aforesaid tooles we went roundly about the cutting downe of trees, and in the end built a small barke of some 18 tun for the most part with tronnels and a very few nailes. As for tackling, we made a voyage aboard the ship before she split, and cut doune the shrowds, and so we tackled our barke and rigged her. In stead of pitch we made lime, and mixed it with the oile of tortoises; and as soone as the carpenters had calked, I and another, with ech of us a small sticke in our hands, did plaister the mortar into the seams: and being in April when it was warm and fair weather we could no sooner lay it on, but it was dry, and as hard as stone."

They left the island on this craft loaded with thirteen live turtles as food and two large chests of rain water; and after undergoing much hardship were eventually picked up off the coast of Newfoundland by an English barque and landed from her at Falmouth, three months after Lancaster had got home.

Such was Lancaster's first voyage. It could scarcely be called a success, and yet it showed the sterling stuff of which the Hampshire hero was made. One month after May's landing at Falmouth, Lancaster and Barker were off again on what was neither more nor less than a piratical expedition to Pernambuco. Joined by some English and other vessels as he went along—the English under Venner, the French under the captain that had brought him home from Mona, whom by one of those curious coincidences of the sea he happened to fall in with off the coast of South America—he reached the town and prepared for the attack in the early morning. The tide, however, took him down the coast during the night, and it was not till two o'clock in the afternoon that he landed.

Lancaster led the way with his sword in his hand. The batteries did their utmost, but the shot fell short into the sand, and the fort was taken. A rich booty fell to the captors. The defenders retired, but not to any considerable distance, and did their utmost to dislodge their foes. They tried fireships.

"About 11 of the clocke at night came driuing doune other great raftes burning with the hugest fires that I haue seen. These were exceeding dangerous, for when our men approached them thinking to clap their grapnels upon them as they had done upon the caruels the night before they were preuented; for there stooke out of the raftes many poles which kept them from the body of the raftes, that they could not come to throw their grapnels into them, and yet they had this inconvenience worse than al the rest which most troubled us. There stooke out among the poles certain hollow trunks filled with such prouision of fireworkes that they ceased not still (as the fire came doune to those trunks to set them on fire) to spout out such sparkles that our boats hauing powder in them for our men's vse, durst not for feare of frying themselves with their owne powder come neerer those sparkles of the raftes, but seeing them to driue neerer and neerer our ships, they wet certaine clothes and laid upon their flasks and banelers and so ventured upon them, and with their grapnels tooke holde of them, and so towed them on ground, where they stooke fast and were not burnt out the next next day in the morning."

At last it was resolved to retire, and as a fort was seen to be building so as to attack the ships as they left, a party was sent against it. The party drove out the Portuguese and pursued them, but meeting with more resistance than they expected, had to retire. Barker was killed, and the loss was serious. However, Lancaster thought it best to leave the defeat unavenged, and, hoisting his anchors, made sail home, a wealthy and famous man.

Six years afterwards, on the advice of Dr. Thorne, Sir Thomas Smith established the East India Company. "The merchants of London in the yeare of our Lord 1600 ioyned together and made a stocke of seuentie-two thousand pounds, to bee employed in ships and merchantdizes, for the discovery of a trade in the East India, to bring into this realme spices and other commodities." Of the seventy-two thousand pounds forty-five thousand was spent on the ships, and the balance on cargo in charge of a score of mer-

chants who were to open the trade and establish factories.

The Lord Treasurer suggested that the command should be given to Sir Edward Michelborne, a very undesirable specimen of the ancient mariner. The merchants, however, "did not want to go beyond themselves," and offered the command to Lancaster. With him as second went Middleton, and the chief pilot was that famous old seaman John Davis.

The flagship was the Dragon, of six hundred tons and two hundred men. Her portrait is still in existence. "She had ports pierced in her hull with the muzzles of the guns peeping out of them. On the fore and mainmast there were courses, topsails, and topgallant sails, a spritsail under the bowsprit, but no jib or foretopmast staysail; these were not introduced until the time of Queen Anne. The Dragon had two mizenmasts with a lateen sail on each. Flags and pennants fly not only from each masthead, but from the yardarms and the bowsprit end." So, in his "Sea Fathers," says Mr. Clements Markham, who gave the picture as the frontispiece to Sir John Middleton's Voyages published some years ago by the Hakluyt Society.

Queen Elizabeth gave letters of recommendation to the sovereigns of India that might be met with. Amongst others, to the Sultan of Acheen and Sumatra, whose name is familiar in "another place." It was Aladdin!

Middleton was in the Hector, a three-hundred-ton ship. The other vessels were the Ascension, of two hundred and sixty tons, under William Brand; the Susan, of two hundred and forty tons, under John Heywood; and "the victualler," the Guest, of one hundred and thirty tons. The Guest took the stores the others could not carry, and three months after the departure of the fleet was unloaded, dismantled, and set adrift.

Lancaster left Woolwich on February 13, 1601, put into Torbay, and departed thence on the 16th of April. On the 7th of May he left the Grand Canary, and on the 30th of June was on the line. On the 9th of September he put into Saldanha Bay, now known as Table Bay, the modern Saldanha Bay being quite a different place. Here he went ashore "to seek some refreshing for our sickle and weak," and he procured it. He "spoke to them in the cattels language, which was never changed at the confusion of Babel, which was moath for oxen and kine and baa for sheepe, which language the people understood very well without any interpreter!" When such simple means sufficed there was little occasion to worry about Kaffir dialects.

The fleet pursued their way in prosperous monotony. At the Nicobar Islands they found upon the sands by the seaside "a small twigge growing up to a young tree, and offering to plucke up the same it shrunked downe into the ground, and sinketh unless you hold very hard. And being plucked up, a great worme is the roote of it, and looke how the tree groweth in greatnesse the worm diminisheth. Now as soon as the worme is wholly turned into the tree it rooteth in the ground and so groweth to be great. This transformation was one of the strangest wonders that I saw in all my trauailes. For this tree being plucked up, the leaves stripped off, and the pill by that time it was dry, turned into a hard stone much like to white corall, so that this worme was twice transformed into different natures;" which is an interesting example of how a description can be true and at the same time quite misleading. The "small twigge" being no other than the polyp *Virgularia mirabilis*, the leaves being seaweed or fungus parasites, and the roots being the animal's intestines.

At last they reached Sumatra, and Lancaster desired to deliver her Majesty's letter

to Aladdin. The sultan sent a messenger for it, but Lancaster insisted on handing it to the king himself. And so a grand embassy was sent to take him.

Six great elephants thirteen or fourteen feet high came to accompany the general to the court, where he was received in sumptuous style and duly dined. Aladdin was graciousness itself, and returned Elizabeth a reply in Arabic. Lancaster proved himself an able diplomatist, outwitted "the Portugals," secured the privileges he wanted, and, after a run to Bantam for pepper, came home.

Before he reached the Cape he was caught in a storm which swept away the Dragon's "rother." He tried to steer his ship with a spar, but the sea was too rough. Then he made another rudder, which was also washed away. Meanwhile the Hector stood by him, although in his expectation that the Dragon would founder he sent her captain his last report. Finally the tempest abated, and the Dragon reached St. Helena, and with another rudder steered for home.

The fleet dropped anchor in the Downs on the 14th of September. The cargoes were rich ones. The trade had been opened; the factories had been established. The first voyage of the East Indiamen had been a great success, and Lancaster had immortalised himself.

He was knighted, became a permanent director of the East India Company, lived in affluence at his house in St. Mary Axe, died unmarried in 1618, and left his money to found a school in his native town of Basingstoke.

He was one of Smith's supporters, who under the name of "Merchant Discoverers of the North-West Passage" did so much for Arctic exploration. And it was after him that Baffin named the strait which was afterwards to prove the highway to the north, "Sir James Lancaster—his Sound."

ENTOMOLOGY AT THE SEASIDE.

BY THE AUTHOR OF

"Beetles, and Where to Find Them," "An Evening at the Saltings," etc.

(Continued from page 687.)

IN some parts of the coast there are large salt-water basins, so to speak, quite close to the sea, the contents of which partly evaporate during hot and dry weather, and leave a broad border of mud round the margins. This mud is a grand hunting-ground for beetles, and you are almost sure to take several species that you have never before met with. It is a curious fact that almost all the mud-loving beetles are exceedingly swift in their movements, and rush about with the most wonderful activity, just as though some terrible beast of prey were in pursuit of them and they were doing their best to escape. Until some little experience has been gained it is most difficult to catch these little fellows, who elude the outstretched hand with the greatest ease, and dive into a hole or a crack before a second attempt can be made to secure them. The best plan is to make a smart dab at them with the tip of one finger as they are racing along, so as to force them partially into the mud. For two or three seconds they will be unable to recover their footing, and can be picked out without difficulty. Strangely enough, the mud very seldom seems to adhere to them, and they emerge as fresh and bright as though they had but just left the pupal shell.

Sometimes the land bordering the sea is little better than a marsh, partially drained by a series of dykes running through it at intervals, and rich in plants that one never sees elsewhere. If you can find such a spot, make the most of your opportunities, and work it as thoroughly and as often as you can. The ditches will yield plenty of water-

beetles, provided that you select those which are not directly connected with the sea. A very good sign to go by is the long ribbon-like green weed which is so plentiful in very brackish water. If you see this in a ditch you may save yourself the trouble of working it, for scarcely a single insect will repay you for your labours. The fresh-water ditches, however, are tolerably sure to yield you captives in plenty, and you ought to be quite set up in water-beetles before your visit comes to an end.

Nor is the fishing-net only of use, for the sweep-net may often be employed with great results in the very same ditches.

Reeds and other plants growing in the water itself are the chosen resorts of the *Donacia*, whose glittering, metallic bodies may be seen from some little distance. Many rare weevils, etc., bear them company, and a few minutes of steady sweeping ought to result in a haul which will go far towards filling your bottles. Look out for your footing, however: the side of a ditch is not the easiest place in the world from which to wield a sweep-net, and a ducking is by no means an unlikely result of one's exertions. I speak from practical experience, having more than once returned home in an unpleasantly moist condition after a day of marsh-collecting.

At certain seasons of the year you will probably find bundles of newly-cut reeds lying beside the larger dykes. These are sometimes almost alive with insects, and especially with beetles, and will produce a rich harvest if you can shake them over a patch of bare and dry ground. A sheet is

better still, but is rather too cumbrous an article to carry about with one when on a long expedition. Some very nice beetles indeed may be obtained in this way, and, as far as numbers are concerned, there are few methods of collecting which come up to it. The only necessity is that the reeds must be tolerably fresh. If they have been lying long enough to become dirty and half rotten, it is scarcely worth while to examine them at all.

SUCH are some of the principal modes of collecting to be adopted in the neighbourhood of the sea, and, as I have already remarked, there are few parts of the coast in which they will not prove extremely profitable. Much, of course, depends on the weather, a certain amount of sun and the absence of easterly or northerly winds being as indispensable as elsewhere. A good deal also depends on the character of the shore, but a steady and persevering worker will almost always manage to turn up good things in tolerable plenty, whether he confine his attentions to the butterflies and moths, or whether he devote his energies to the less generally understood but far more interesting beetles. Whichever group he prefer, there are two points which he will do well to bear in mind. The first of these is, that it is better to work a small piece of ground, and work it thoroughly well, than to hurry through mile after mile of country in the hope of finding a more productive spot. The second is, that where one specimen of a rare insect is found, others are almost sure to be about, and by steadily and carefully work-

ing in the manner in which the first was taken the species may very likely be captured in abundance. It is also a good plan to return

to the place, after leaving it for awhile, for many insects which are passed over at the first visit may be taken at the second, when

they have had time to shift their whereabouts, and so, perhaps, to occupy more prominent positions.

FRANK BUCKLAND.

is to be hoped that the name of the late Frank Buckland is familiar to most of our readers. His bright and eminently characteristic article in one of our earlier numbers on "My Monkeys and how I trained them" will hardly, we should think, have been forgotten by those who enjoyed its fun, and many there are, we feel sure, even among boy readers, who must have had a feeling of quite personal loss when it was announced in the daily press that the genial and clever naturalist was no more.

All who came in contact with him, or even who read his published works, espe-

cially his "Curiosities of Natural History," must have felt desirous to know more of him, and we confess that it was with genuine interest that we hailed the biography ("Life of Frank Buckland," Smith, Elder, & Co.) by his brother-in-law, Mr. George C. Bompas, issued a few weeks ago. To our mind it is far and away one of the most entertaining books of the year, and we hasten, therefore, to transfer the salient points of the eventful history to our columns.

Buckland was born a naturalist, though his godfather was a sculptor. In a moment of enthusiasm, while he was weighing the child in the kitchen scales against the family leg of mutton, Sir Francis Chantry proposed to present him with a library. But beyond a characteristic piece of advice, never to be without a knife, a sixpence, and a bit of string in his pocket, it does not appear that Canon Buckland's boy ever profited much from bearing the name of the thrifty artist. A tree was, however, planted in honour of the occurrence—as he had reason to remember, for in after life he "knew the taste of the twigs" full well.

The boy grew up amidst characteristic surroundings. At home, the hall was lumbered with stuffed beasts, the sideboard groaned with layers of fossils, and the candle-sconces were ichthyosaurus vertebrae. Cages of green frogs stood in the dining-room, guinea-pigs ran over the table, and occasionally the pony, having trotted down the steps from the garden, would push the door open, and career round the room with three laughing children on his back. Graver Dons were scandalised at the canon driving in his family carriage, known as the "bird's nest,"

to range Bagley Wood for moles, and nests, and fish for minnows; and nervous visitors would sometimes rush shrieking out of the house at the sight of a snake gliding familiarly down the professorial stairs. In the stable-yard were foxes, rabbits, and ferrets, hawks and owls and magpies, and jackdaws, besides dogs, cats, and tortoises, and toads immured in various pots to test the truth of their supposed life in rock-cells.

Sent to school at Winchester at the age of twelve, Frank Buckland's individuality immediately asserted itself, even as one of the smallest of the boys. He took his share of the "tunding" and other traditional forms of bullying with a pluck and good-nature which went far towards disarming school tyranny. "Fat Buckland," after attaining the dignity of "rod-maker" and "basin-cleaner," was permitted to settle down to his chosen avocations. He made plum-puddings in his neck-cloth (and ate them); kept ferrets in his cupboard, and sometimes added a snake, a mouse, a guinea-pig, or a hedgehog to his domestic establishment. His rat suppers were the despair of the masters and the delight of the chambers, and his maceration pots at Amen Corner, with heads of hares, rabbits, and cats being reduced to skulls, something to be avoided. At Oxford it was the same. His rooms had "an odour of physical science about them." They swarmed with living creatures, and his breakfast-table was alive with adders, dormice, tortoises, and other disagreeable things. His cockatoos were filled with slowworms, and, as likely as not, a harmless snake would be produced from the same quarter. Tiglath Pileser, his bear in cap and gown, grew to be such a scandal that when the question came to be whether he or his master should go "down," Tiglath was sent to Islip, with an eagle and a monkey which had also been rusticated, after scaring several tutors half out of their wits, and committing misdemeanours which no Don could overlook. But the marmots still hibernated in the cellar, and at Buckland's college parties a chameleon, which used to stand upon an inverted glass with its tail round the stem, convulsed the undergraduates, especially when it concluded its performance by tumbling head foremost into the preserved ginger. But more of Oxford presently.

He came in his enthusiasm even to scrutinise his schoolfellows with a professional eye. One R—, a boy with a dolicephalous head, used to relate with a slight shiver that he had overheard Buckland muttering to himself, "What wouldn't I give for that fellow's skull?" Often he would head a little party on a natural history ramble through the fields. "It was a rare treat," writes one of his schoolfellows, "to walk with him in the beautiful water-meadows of the Itchen, into which, on summer evenings, the bounds of school imprisonment were extended. He knew every bird in the hedges, every snake, shrew, or water-rat in the banks, every eel or crayfish in the pleasant streams."

Going to Oxford, and finding himself back as an undergraduate in his old haunts of Christ Church, he seems to have used and abused his special privileges as son of the distinguished Canon Buckland. His rooms were swarming with snakes, adders, marmots, squirrels, and such "small deer;" but, besides these, he kept his tame eagle in the Quad, with his monkey Jacko and his bear Tiglath Pileser. On one occasion the marmots, having made their escape, had to be cleared out of the Chapter House before a meeting of the Chapter; and more than once it occurred to the eagle to attend Divine ser-

vice in the chapel. A breakfast Buckland happened to give chanced to become the celebration of a great event. For the marmots, who had been hibernating in the cellar, had "thawed" that very morning. "There was great excitement. The creatures ran about the table as entitled to the honours of the day, though there were other beasts and reptiles in the room too, which in later life would have made breakfasting difficult."

Having decided for the profession of a doctor, he left Oxford for Giessen to study chemistry under Liebig. Here he worked indefatigably, as was his wont. When he was first coming home from Giessen he was importing a choice assortment of tree-frogs, collected with extreme difficulty and labour. They were enclosed in a wide-necked bottle, which was stowed away in the pocket of the diligence. With the first bright beams of daybreak, the intelligent animals struck simultaneously into the shrill chorus of their morning song. All the slumbering Germans awoke in fury; and Buckland, who found that shaking the bottle silenced the songsters, was compelled to keep awake himself that he might be ready to charm them into silence. The second time, though he recollected the former misadventure, he thought himself safe. He had merely brought a bottleful of fine red slugs, and assuredly he had nothing to fear from their melody. Awaking with an easy mind, he glanced at the bald-headed gentleman opposite, when, to his horror, he saw a couple of his slugs crawling leisurely across the shining cranium. It was clear that the cork of the bottle had come out, and for once Buckland's *aplomb* failed him. He got out of the *cilwagen* at the next relay, preferring not to assist at the elucidation of the phenomenon.

He had come back to study surgery at St. George's Hospital, and as his father was at that time Dean of Westminster and in residence at the Deanery he had the advantage of being introduced to the most distinguished society. He talks of German University education to Prince Albert; he discusses chloroform—then newly discovered—with the Duke of Wellington; he entertains Sir Edwin Landseer when the great painter comes to pay his respects to the monkey and the eagle. Full of the new anæsthetic, on the occasion of a great luncheon party he treats the eagle, the snakes, and the gold-fishes to doses of chloroform. There is a droll account of one of these successful experiments, which must have been more amusing to the spectators than to the victims, we fear.

"The eagle was sent to sleep, and could be lifted up by his feet like a dead bird, or when half asleep was walked round the room by two persons holding him by his wings. One day the eagle was slowly recovering from his stupor and walking unsteadily upon the floor when Jacko was brought in to take his turn. He came in with a suspicious and melancholy expression, expecting that something was going to take place; but when he saw the condition of his old enemy the eagle he jumped out of his master's arms with a scream of delight, and seizing the eagle by the tail paid off old scores by dragging him about the room in a most ludicrous and undignified manner. . . . Jacko chattered pitifully, however, when his turn came, and then he succumbed."

In the summer of 1854 he was gazetted assistant-surgeon to the 2nd Life Guards, and so far as his time was taken up by his professional duties one cannot help feeling that his powers were wasted. But his passion for natural history in all its branches had got

the better of his medical enthusiasm, and even within the barrack-yard he turned special opportunities to account. He was once casting and modelling from a dead mare which lay partially dissected behind the stables. "Where is the surgeon-major?" demanded the colonel of the sentry on duty. "Inside the charger, your honour," was the ready answer. His unwitting, eccentric, and promiscuous hospitality sometimes disturbed the decorum of the service. One Sunday, at church parade, for instance, the men all burst out laughing, to the rage of the colonel, who angrily appealed to the adjutant. The adjutant, turning round, roared with laughter, as did the sergeant-major. A glance at Buckland's quarters solved the mystery, for there he was, just off duty, strolling out of the door, attended by Brice, the French giant, and a dwarf then exhibiting in London, who had come to breakfast with him.

Foreign celebrities were always welcome to him, whether savage New Zealanders or tame Zulus, hairy ladies or two-headed Nightingales. "Cheap Jacks," "wild beast shows," "talking fish," "elephant horses," "learned pigs," "edible dogs," "living skeletons," and "fat women," were all steadily patronised by Buckland. It was "great fun" to get some New Zealanders to lunch with him, and still greater fun to hear the grateful Polynesians offering to tattoo their host in return for his hospitality. In Albany Street his dinner-parties made him the idol of all the boys for a mile round. Chinamen and Zulus, Eskimos and Aztecs, Siamese Twins and the Two-headed Nightingale, Julia Pastrana the Hairy Woman, and Tomati Haperomani Wharinaki, the Maori Chief, formed a rather mixed company, and sometimes slightly scandalised the respectability of Regent's Park. The fare was equally unconventional. At the Deanery there was, no doubt, often a queer menu. Puppies were occasionally served, while potted ostrich, rats, and snails were among the delicacies offered to Dr. Buckland's visitors. "Party at the Deanery," one guest notes, "tripe for dinner. Don't like crocodile for breakfast." But at Albany Street, when the secretary of the Acclimatisation Society began to experiment, his friends groaned for weeks afterwards. Here are some of his diary entries:—"B. called: cooked a viper for luncheon. To Weybridge; out fishing; cooked perch and frog on the shore. Had some elephant-trunk soup." (The trunk itself was boiled for days, if not weeks, without being sensibly affected by the process.) A plentiful supply of roast giraffe appeared when the giraffe-house at the garden was burned, and other deceased animals were occasionally experimented on. Chops from a panther two days underground were, however, pronounced "Not good."

But although we are necessarily attracted by what is most amusing in the biography, we should give a very false idea of Buckland were we to dwell only on these eccentricities. They were simply the signs and tokens of the indefatigable energy with which he educated himself for important scientific objects. Happily gifted both as a writer and lecturer, knowing well how to blend instruction with amusement, no man did more to awaken public interest in the matters he took under his especial charge. In the spring of 1861 he first betook himself to fish-culture—"in a few days there were lots of men in my rooms looking at the fish-hatching;" and he was immediately placed on the Council of the British Fisheries Preservation Society. Thenceforth—and thanks in great measure to his successive connection with the "Field" and with "Land and Water," for which he acted as natural-history editor—he kept himself, his experiments, and his researches constantly before the public. Light-hearted and playful in manner as he always was, he nevertheless took his mission in life very seriously. He writes in his private note-book in 1865: "I really cannot help thinking that

the Almighty God has given me great powers both of thought and of expressing those thoughts. Thanks to Him; but I must cul-

very slow to forgive their master for torturing, and murdering their poor little playfellow. Then there is a laughable story of the laugh-

Frank Buckland.

tivate my mind by diligent study, careful reflection in private, and intense and quick observation of facts out of doors, combined with quick appreciation of the ideas of others: in fact, strive to become a master-mind, and thus influence others of weaker minds, whose shortcomings I must forgive."

When he had been appointed Inspector of Fisheries, in the beginning of the following year, his dearest ambition was realised. On reading the note announcing the news, he says, "I felt a most peculiar feeling, not joy, not grief, but a pleasurable stunning sensation, if there can be such a thing. The first thing I did was to utter a prayer of thanksgiving to Him who really appointed me, and who has thus placed me in a position to look after and care for His wonderful works. May He give me strength to do my duty in my new calling."

We cannot bring ourselves to take leave of him without a glance at him among his pets, in the house he occupied for so many years, near the Albany Street Barracks. Identifying himself absolutely with the idiosyncrasies of these "poor relations" and *protégés* of his, the notes on them are alternately ludicrous and pathetic. We have read much about his monkeys in his "Curiosities of Natural History," and he came to have a real affection for the Hag. "When she was lying in front of the fire, warming herself, her pretty brown eyes were always fixed on mine, and, when writing, many an idea I have obtained from looking into the dear Hag's brilliant eyes." There was a touching scene when Tiny was bereaved of her cage-companion, though it must be owned that the departed one was quickly forgotten. Both monkeys had become greatly attached to Jemmy, the suricate, a frisky little South African beast, of a breed something between a big rat and an ichneumon. When Jemmy was on his death-bed Buckland had been treating him medically, as he lay between the fireplace and the monkey's cage. The Hag and Tiny, watching the proceedings curiously, evidently misunderstood the situation altogether, and were

ing jackass. Buckland, while he kept the bird in close confinement, could never tempt it to anything more pronounced than a hysterical giggle. One fine morning the jackass gave him the slip, and when it took flight triumphantly out of his window for the first time it treated him to a ringing laugh. He recovered the bird, by the way, and subsequently it resigned itself and grew more hilarious.

He spent his strength only too unsparingly, or at least he tried his vigorous constitution to excess, and thenceforward his life was to become one of incessant bodily movement and unresting intellectual activity. Once, when he observed that a little seal he was adding to his social intimates was shivering, he immediately stripped himself of his fur waistcoat to wrap it in; and so it was with him all his lifetime. Thus the end came all too soon, and the generous soul who "loved both man and bird and beast," and was in his turn loved by the world at large, passed away like the Christian gentleman he never ceased to be. "God," said the devout naturalist, as he lay dying, "is so very good to the little fishes that I do not believe He would let their inspector suffer shipwreck at last. I am going a long journey, where I think I shall see a great many curious animals. This journey I must go alone." The museum he left to his country, the Chair of fish culture which he founded, and the many important inquiries in which he took part, cannot fail to keep his "memory green." Boys will revere his memory.

NAMES OF SHIPS IN THE ROYAL NAVY.

By ODO W. FORD.

PART II.

IN 1877 the decision was come to by the Admiralty to create a flotilla of swift torpedo boats in order to meet the new conditions of warfare imposed by this new and fearful engine of war. The first of this class was aptly named the *Lightning*, and the fitness of her name would be at once admitted by those who have seen her rapidly shooting hither and thither at the rate of sixteen knots an hour, as she was seen by thousands on the occasion of the review by the Queen in 1878 of the large squadron at Spithead under the command of Sir Astley Cooper Key, now First Naval Lord of the Admiralty.

Other vessels whose duties are more immediately connected with this diabolical invention have equally appropriate names—to wit, the *Vesuvius*, an iron torpedo vessel acting as tender to the torpedo-school ship *Vernon*, and the *Hecla*, a large steamship specially purchased during the Eastern crisis to serve as a torpedo depot in the Mediterranean. Never did a ship leave these or any other shores laden with such a terrible cargo as the last-named, consisting of a large number of the famous Whitehead or fish torpedoes, "spar" torpedoes to be dropped from the bows of steamboats, and the many and various descriptions of gear and stores necessary for their use in war. The perusal of the list of scientific instruments and apparatus as they appear on the *Hecla's* establishment of torpedo and electric stores would sorely have puzzled Blake or Nelson, and, indeed, many a later naval hero as well. That mysterious monster, the torpedo ram "*Polyphe-mus*," which was suggested by the late Admiral Sir George Sartorius, is also well named.

Looking generally at the names of many existing ships in the Navy, together with some of those building, it is to be noticed that of late years something approaching a system has to a large extent been followed in giving a class of names to a distinct class of ships, a plan which will help any observer of naval matters to form some idea of any ship of a certain class by her name alone. Thus we have, all added to the Navy within the last ten or twelve years, a "*Gem*" class, a "*Bird*" class, a "*C*" class (every name having the initial letter C), two "*River*" classes, an "*F*" class, and (now building) a splendid "*Admiral*" class of steel-armour-plated barbette ships of the newest type. This plan of naming, it will at once be seen, aids the memory in recollecting by a ship's name what manner of craft she may be. When we know that the "*gems*" are corvettes the knowledge serves for the *Opal*, *Pearl*, *Diamond*, etc. Reading in the newspapers of the movements of the *Wild Swan* or *Gannet*, we shall not expect to read of her turrets or armour-plating if we are aware that all the "*birds*" are small vessels, either sloops or gunboats. Among the older vessels of similar type, weight, or rig there is no corresponding similarity of meaning in the name. The *Devastation* and *Thunderer*, sister turret-ships of 9,330 tons, have certainly some affinity in name, and they remind us of the *Dreadnought* and *Inflexible*, larger ships of a similar type. The *Inflexible* really stands alone; she is the heaviest ship of the Navy (11,880 tons), and she was the first ship built with steel-faced armour. But there is little in common between the names of the older ironclads and frigates of a class. Some of them have classical names, as the *Hercules*, *Hector*, *Bellerophon*, *Minotaur*, *Achilles*, *Penelope*; titles or historical names, as the *Monarch*, *Lord Warden*, *Iron Duke*, *Sultan*, *Shah*, *Rupert*, *Raleigh*, *Boadicea*, *Black Prince* (but only one battle—

Agincourt); and others fighting qualities, etc., as the *Audacious*, *Superb*, *Valiant*, *Swiftsure*, *Invincible*, *Repulse*, and *Triumph*. These, you see, have affinity in name, but they are not always similar in size or construction.

Now let us see where they are so, as referred to above. Among them are the following:

1. The "*Admiral*" class of steel-clad barbette ships to carry breechloading guns, viz.—*Collingwood*, *Rodney*, *Benbow*, *Howe*, *Anson*, *Camperdown*.

2. The "*Gem*" class (corvettes without armour)—*Emerald*, *Diamond*, *Opal*, *Turquoise*, *Tourmaline*, *Ruby*, *Sapphire*, *Pearl*, *Garnet*, *Amethyst*.

3. The "*Bird*" class, or rather classes, of sloops, gun-vessels, and gunboats, such as—*Sloops* (of about 1,000 tons).—*Penguin*, *Pelican*, *Osprey*, *Kingfisher*, *Wild Swan*, *Cormorant*, *Albatross*, *Gannet*, *Seagull*, etc.

Gun-vessels (about 700 or 800 tons).—*Flamingo*, *Condor*, *Lapwing*, *Kestrel*, *Griffon*, *Falcon*, *Linnæ*, *Plover*, *Swift*, *Seagull*, etc.

Gunboats (450 tons).—*Mallard*, *Raven*, *Stork*, *Redwing*, *Moorhen*, *Cygnets*, *Starling*, etc.

Other ships of these classes are named after fishes, as the *Bonetta*, *Dolphin*, *Flying Fish*, *Albacore*, and *Whiting* (the list has not yet extended to *Mackerel* or *Herring*); and a very large number of gunboats, mostly smaller than those named above, some bearing names of insects, but all highly suggestive of the *stinging* and *worrying* for which they are intended in actual warfare—e.g., the *Gadfly*, *Wasp*, *Hornet*, *Bouncer*, *Insolent*, *Tickler*, *Griper*, *Grappler*, *Mosquito*, *Scourge*, *Teaser*, *Pike*, *Snap*, *Pincher*, *Bulldog*, etc.

The "*River*" class of gunboats, twelve in number, are distinct from the above. They are flat-bottomed, so that they may ascend rivers, and each carries a "*Woolwich Infant*." Names—*Medina*, *Medway*, *Dee*, *Don*, *Spey*, *Sabrina*, *Esk*, *Slaney*, *Tay*, *Tees*, *Trent*, *Tweed*.

Another "*River*" class has also been commenced, of swift steel-armour-clad cruisers designed to carry a large stock of coal and keep the sea. They are each of 3,550 tons, and carry twelve guns. The *Mersey*, *Severn*, *Thames*, and *Forth* are of this class, and we shall ere long have additions to the list.

The two classes mentioned above, which

have each a common initial in the names, are the *Comus*, *Carysfort*, *Curaçoa*, *Conquest*, *Champion*, *Cleopatra*, *Constance*, *Canada*, *Cordelia*, *Calliope*, *Calypso*, which are corvettes of about 2,500 tons (the two last-named being somewhat heavier), carrying ten, fourteen, or sixteen guns, and the *Firm*, *Foam*, *Forester*, *Forward*, *Firebrand*, *Firefly*, and *Foxhound*, which are similar gunboats to the "*Mallard*" class.

Finally comes quite a new class of fighting ship which has recently been much talked of. These are the *torpedo cruisers*, or *Scouts*, and a better general name I doubt if they could have, as their mission will be to look out for torpedo boats and act for the larger and heavier war-ships of the squadron like scouts or skirmishers for an army. The "*Scout*" herself, the forerunner of this class, and the "*Fearless*," are somewhat smaller than their six sisters which are now on the point of being commenced, having a displacement of about 1,400 tons. These two will carry four guns. The others, known as the *New Scouts*, or "*Archer Class*," will be of about 1,600 tons, and carry six guns, and will be called the *Archer*, *Brisk*, *Cossack*, *Mohawk*, *Porpoise*, and *Tartar*.

It must not be supposed, however, that all new ships of similar size and rig receive similar names. Sometimes no attempt is made in this direction. For instance, the *Arab* and *Lily* and the *Cygnets* and *Contest* are sister ships (gunboats), also the *Heroine* and *Hyacinth* (composite sloops), the *Warspite* and *Imperieuse* (steel-armoured cruisers), the *Colossus* and *Edinburgh* (steel turret ships), and the *Nelson* and *Northampton* (ironclads), which last were built together on the Clyde by Messrs. Napier, of Govan: and all these and many more I might quote are very wide apart in meaning, the associations which the two last names especially suggest being in striking contrast.

But although we *do* love the time-honoured names which recall and keep alive the battles and the heroes of the past, names are not everything after all. We must still rely on well-built and well-found ships, on scientific seamanship, on the gallant hearts of our sailors, on the intrepidity, the courage, the heart-whole devotion to *duty*, which have played so prominent a part in "*Britannia's* story."

(THE END.)

THE TROUT, AND HOW TO CATCH IT.

By J. HARRINGTON KEENE,

Author of "*The Practical Fisherman*," "*Fishing Tackle*, and *How to Make It*," etc.

XIII.—WORM FISHING FOR TROUT (continued).

SO much for *Lumbricus terrestris*. We now approach the subject of how to use the worm. As I have before intimated, worm fishing in discoloured water is not sportsmanlike, but either of the following methods is admissible. First, where there are many bushes, the worm-fisher, doing his best to keep entirely out of sight and to fish up-stream, pitches his worm into all the likely spots he can see, such as behind stones, near old stumps of trees, etc., and if he is deft and workmanlike he will probably meet with more sport by this method than the ordinary fly-fisher could hope to find. It is not necessary to cast more than once in a place, as if the lure is to be taken at all it will be taken at once. A couple of split shots may often be advantageously placed on the gut about a

foot above the hook if the stream is unduly rapid.

The next and most artistic style of all obtains, as I have before hinted, when the water is clear. The gut is of the finest description, and the hooks or hook of comparatively small size. The worms or worm should be of the most comely and tough character, and they are cast by the fisherman in a precisely similar way to the fly, and thereafter worked with a sink-and-draw motion. Of course fish up-stream. Fish of the heaviest description are usually taken by this method when they will not look at surface food. Especially is the worm-tackle indicated when the trout is said to be "*grubbing*." If ever you hear an old fly-fisher complain of this, on with your worm-tackle—if it be allowed, of

course—and your success is in nine times out of ten assured. Fig. 19 shows the method of baiting the worm on Stewart's tackle.

Fig. 19.

The attentive tyro will perhaps wonder why no float is used to indicate a bite, or be at a loss to know how that bite, in the absence of the float, can be distinguished when it comes. Let him, however, be under no apprehension in this connection. The fish, when it does take the bait, does so determinedly, and though it is quite likely that Piscator junior may miss a few fish from not striking at the right moment at the outset of his career, it is equally certain that no such ill luck will befall after he has caught a few. Generally speaking, the grip of the trout reveals itself unmistakably by two or three tug, tugs. Sometimes the arresting of the course of the line shows its presence. After drawing a breath the angler strikes, but not too sharply, and, having hooked the fish, let him take care to keep his line taut on it, so that no slack line be allowed the wily fish to play with. Coolly and deliberately he should be played until the landing-net is placed under its "panting bulk" and the fish lifted to the regions of air to be unhooked and creoled. Fig. 20 shows an artificial

Fig. 20.

worm, which is sold by Messrs. Foster, of Ashbourne, for those who do not like to use the natural worm. In no case, however, is the imitation so good as the actual bait, for the trout instantly detects the counterfeit and blows it out, though, of course, in some cases a bag may be made. It is of india-rubber, and looks likely enough to kill, but in using it one must be very quick.

Thus at some length I have discoursed of trout-fishing, and I now conclude with the hope that my young readers may have profited by my instructions. I know of no sport which is at once so free from abuses and of so healthful a character, and even as the good Sir Henry Wotton says concerning it so say I. It was, he confesses, "an employment for his idle time, which was then not idly spent, for angling was after tedious study a rest to his mind, a cheerer of his spirits, a diverter of sadness, a calmer of

unquiet thoughts, a moderator of passions, a procurer of contentedness, and that it begat habits of peace and patience in those that professed and practised it." "Indeed," adds dear old Izaak Walton, "indeed, my friend, you will find angling to be like the virtue of humility, which has a calmness of spirit and a world of other blessings attending on it."

(THE END.)

CHESS.

(Continued from page 671.)

Problem No. 109.

By S. GOLD.

White to play, and mate in three (3) moves.

ROWLAND'S PROBLEMS.

To the eight new books mentioned on page 351 must now be added a ninth, called "Chess Fruits," which contains problems, poems, and amusing tales. Most of the pieces are by Mr. T. B. Rowland, and a few by Mrs. Frideswide B. Rowland (née Miss Beechey), of Dublin. Some of the problems might have been more perfectly constructed, but others, especially the self-mates, are very pleasing. One of the best compositions by T. B. R. is the following:—

PROBLEM NO. 110.

White: K—K R sq.; Q—Q Kt 6; B—Q R 5; Kt—K Kt 5; Ps—Q Kt 4 and K Kt 2. —Black: K—K 4; Ps—Q B 5, K 6, K Kt 3 and 5. (6+5=11 pieces.) White to play, and mate in three moves.

To Chess Correspondents.

D. M. (Koenigsberg).—We intend to publish one of your two games.

G. C.—Only the Kt can be used in order to attack ten pieces in one move. The move with the Kt must be a triple or a quadruple discovery. Place four white pieces thus:—the Kt at K 4, the Rs at K 2 and K R 4, and the Q at K Kt 2; then ten black pieces on K sq., Q B sq., Q Kt 2, K 2, K B 2, Q B 3, Q Kt 4, K B 4, Q B 5, and Q 5; and move the Kt from K 4 to Q 6.—Remove the black piece from B 4 to Q Kt 8, add a white B at White's K R 7, and then the same move with the Kt shows a quadruple discovery.

OUR NOTE BOOK.

FAITHFUL UNTO DEATH.

In 1858 a man named Gray was buried in Old Greyfriars Churchyard, Edinburgh. Nothing was known of him except that he was poor and lived in a quiet way in some obscure part of the town. One of the most conspicuous mourners at the funeral was the poor man's little dog, a rough Scotch terrier; and next morning Bobby—so he was called—was found lying on the new-made mound. Old James Brown, the custodian, could not permit this, for an order at the gate clearly stated that dogs were not admitted. So Bobby was driven out; but the next morning he was there again, and for the second time was sent away. The third morning was cold and wet, and when the old man saw the faithful animal, not minding any punishment, still lying shivering on the grave, he took pity on him and gave him some food. This reward of Bobby's devotion gained him the right to make the churchyard his home; and from that time, for fourteen years, he never left his master's grave for any distance. At almost any hour during the day he might be seen in or about the churchyard; and no matter how rough the night might be, nothing could induce him to leave the hallowed place where his dead master lay. Bobby had many friends—one sent him a weekly treat of steaks, and others, when the dog tax was levied, were anxious to pay it for him; but Lord Provost Chambers exempted him, and gave him a handsome brass-nailed collar, bearing this inscription: "Greyfriars Bobby: presented to him by the Lord Provost of Edinburgh, 1867." As time went on, and the damp and cold of the open air began to tell upon him, kind old James prevailed on him sometimes to spend the nights in his cottage at the churchyard gate; and in the family of Mr. Traill, who keeps a neighbouring restaurant, at 6, Greyfriars Place, Bobby found other life-long friends who were worthy of his love. At the sound of the midday Castle gun he went to this house for his daily dinner for eleven years; and here at length, on a Sunday evening, January 4th, 1872, he crept upstairs to die. He was buried by Mr. Traill in a flower-pot in the old churchyard, near the stained-glass window of the church. The old man's grave was soon levelled by time, and no stone has ever marked it; but it will never be forgotten nor confused with other graves. A handsome granite drinking-fountain, surmounted by a lifelike figure of the faithful little dog by the sculptor Brodie, has been erected near the church by the Baroness Burdett-Coutts, inscribed—"A Tribute to the affectionate Fidelity of Greyfriars Bobby."

OUR PRIZE COMPETITIONS.

(SEVENTH SERIES.)

III.—Fretwork and Carving Competition.

MIDDLE DIVISION (ages 14 to 18).

In this case, too, some excellent work has been sent in, but on the whole those at the head of the list hardly excel the leaders in the Junior Division. We have, therefore, increased the total amount of the prize, but divide it as follows:—

Prizes—10s. 6d. each.

THOMAS S. GOODCHILD (aged 16), Bradenham, near High Wycombe.

ALFRED D. ZAIR (aged 17), Arden Grange, Solihull, near Birmingham.

Prizes—7s. 6d. each.

HERBERT C. BOLTON (aged 14), 33, Regent Street, Lancaster.

ARTHUR GLENDENING (aged 15), Bourne, Lincolnshire.

HENRY SCAMMELL (aged 14), 16, Babmaes Mews, Wells Street, Jernyn Street, S.W.

PERCIVAL NORMAN (aged 15), 26, Vivary, Taunton, Somerset.

Certificates.

JAMES WATKINS, 27, Union Street, Stourbridge.
 GEORGE FRED LEICESTER, Moerend House, Hambrook, near Bristol.
 FRANK L. ROWE, 42, Speldhurst Road, Edgbaston, Birmingham.
 HENRY C. ARRAH, 2, Speldhurst Road, King Edward Road, South Hackney.
 R. J. GRASSBY, Maumbury Road, Dorchester.
 ALLEN HUSSELL, 27, High Street, Ilfracombe.
 CHARLES H. ILES, The Close, Lichfield.
 CHARLES H. L. PUNFIELD, 17, Roslyn Terrace, Redland, Bristol.
 ALBERT E. HINDE, The Studio, Huntingdon.
 SAMUEL WOODMAN, draper, etc., Tingewick, near Birmingham.
 H. E. MATHEWS, 18, Milner Square, N.
 GEORGE THOMSON, Oakwood, Uddingston, Glasgow.
 CHAS. B. FLOCKTON, Woodleigh, Worksop, Notts.
 C. W. S. THOMSON, 8, College Road, Clifton, Bristol.
 A. EDWARDS, Allerton House, 19, Allerton Road, Tranmere, Cheshire.
 ROBERT W. LUNT, 145, Strand Road, Bootle, near Liverpool.
 A. H. HARDCASTLE, Clifton Green, York.
 GEORGE F. MANSELL, 1, Brooklyn Villa, Mersea Road, Colchester.
 JOHN COLLINS, 17, St. George's Residences, Railton Road, Herne Hill.
 TOM ROWE, 2, Cavendish Terrace, Wellesley Road, Torquay.
 ARTHUR IBBITT, 204, Hanover Street, Sheffield.
 HENRY MATTHEWS, JUN., 48, Parkholme Road, Dalton, E.
 JAMES CATERER, Model Farm Cottage, Shirburn, Tetsworth, Oxon.
 EDGAR ATKINSON, 136, Egerton Street, Oldham.
 CHARLES P. NOBLE, 73, High Street, Fraserburgh.
 JOHN M. WELLINGTON, 153, Newington Butts, S.E.
 FRANK HADLEY, Cambridge Road, Moseley, near Birmingham.

Correspondence.

N INQUIRER. — As you live in London your best plan would be to buy from the nearest oilman a bottle of Stephens's mahogany stain and half a pint of French polish. This will save you much trouble and expense, as it is not easy to make small quantities satisfactorily. A good common stain for mahogany is made by boiling two parts of madder with one of ground logwood for an hour in a

little water, and applying the liquor when hot. Another stain is made by boiling logwood, filtering the solution, and adding a little chloride of barium.

J. G. TURNER (South Australia). — All the volumes are kept in print. We quote your invitation about the rabbit shooting, but it would seem to be a case of early amortisation: "If your correspondents aren't proud and want real bushwork, I guess they can just come down our way and help exterminate the rabbit pest. The rabbits swarm in millions (fact!). Some men get as much as twelve shillings a day, and I am personally acquainted with the man that has earned a pound, but this is exceptional. The Government cannot get enough men to do the business."

C. and J. — All applications for appointments under the African International Association of the Congo should be addressed to the President, Colonel Strauch, 7, Rue Brederode, Brussels.

J. E. HATHERELL. — 1. Gymnasium originally meant a school for the higher branches of knowledge; the athletic signification is the later one. 2. Dress the canvas with boiled linseed-oil.

A. JONES and Others. — We gave a long series of articles on signalling in our sixth volume, and you must refer to them.

STUART. — For Cooper's Hill College you have to pass an entrance examination in English Composition, History, and Literature; in Mathematics pure and mixed; in Latin translation, in Greek translation, in French translation and dictation; in Inorganic Chemistry, Heat, Light, Electricity, Magnetism, Geology, Physical Geography, and Mechanical and Freehand Drawing. The compulsory subjects are English, Arithmetic, Algebra, Geometry, Mensuration, Plane Trigonometry, and the elements of Statics and Dynamics. The fees are £150 per year. The admission is by competitive examination, open to all British-born subjects between seventeen and nineteen on the 1st of July, of sound constitution, free from any serious physical defects that would render them unfit for service in India. Forms of application and all particulars are obtainable from Civil Service Commissioners, Cannon Row, S.W.

ANXIOUS INQUIRER. — We do not know the poem, but the "Little Hero" is by Bishop Walsham How, and can be obtained from Gardner, Darton, and Co., of Paternoster Buildings, E.C.

W. E. SPERRY. — 1. It is not usual for moles to appear above ground in broad daylight. 2. The certificate takes the place, as the medal notion was found to have objections. 3. Mr. Ruskin's books are obtainable from most first-class booksellers. They are published by Mr. Allen, of Orpington, Kent.

ASTRO. — Mere star-gazing is not astronomy. To be an astronomer you must be a good mathematician. Your best plan would be to join the Science and Art Classes for mathematics and physiography, and then work up through the popular books till you get to such works as those by Loomis, Chambers, etc. The "Nautical Almanac" is published by John Murray, Albemarle Street, price half-a-crown.

INQUISITIVE. — Because the grammar follows the language, and not the language the grammar. The comparative and superlative of good have dropped out of use; and better and best, the comparative and superlative of another word having the same signification, now take their places. So it is with irregular verbs, each irregular verb being merely a combination of fragments of different verbs now obsolete in their complete form.

CLAN CHATTAN. — The London Scottish are the only killed volunteers in London. You can obtain full particulars by applying to their headquarters in John Street, Adelphi.

W. P. E. — White lead is carbonate of lead. Its manufacture is a long and unhealthy process, which, as you could not undertake it, we need not here describe.

B. F. and J. S. (South Wales). — 1. You must paint two slides and use two lanterns. Show one of the slides first, and then throw the other picture on to the screen from the other lantern. 2. What do you mean by "America"? North? South? As well ask for a book on Europe.

MANX. — 1. The tails gradually decreased, the shortest having been found the fittest for the peculiar conditions. 2. All *bond fide* readers can compete.

E. CLARKE. — The articles on how to make gas balloons were in the third volume.

JOLLY TAR. — Commissions are not bought in the Navy, nor are they now bought in the Army. A candidate for a naval cadetship has to be nominated by a naval officer, and he must pass an examination, and is ineligible after he is thirteen.

J. CROOKES. — The Science Directory and the Art Directory can be had on application to the Secretary, Science and Art Department, South Kensington. The postage need not now be prepaid, but you must apply by letter, as post-cards are objectionable.

INQUIRER. — 1. We should take no notice of your letter, as we do not send answers by post, so that your stamp would be wasted. 2. An edition of a book is the stock printed. When that is exhausted, if there is any chance of a further sale, another stock is ordered from the printer, and so on. But the "edition" may consist of a hundred copies, or ten thousand, or any number thought advisable. 3. You will find a "Week on the Thames" in the third volume.

D. D. R. — In the part for February, 1882, in the fourth volume, we described how to make a perpetual calendar. Refer to that article, make the calendar, and find out the dates for yourself.

I. O. W. H. A. — You can recognise the arms of the Duke of Edinburgh by the Cadency mark and the bearings of Saxe Coburg Gotha.

A. H. W. — The divisional marks on the regulator of a watch are merely guides to the eye, and have no definite meaning as to rate. They differ according to the maker's fancy, but are always equally spaced.

T. W. KERR. — You should invest in one or two of the Cricket Annuals for the year, and select a name that does not appear therein. The fullest list is in James Lillywhite's book—the red one. We do not answer questions by post.

A SPORTSBOY. — It is interesting to know that you found a caterpillar of *Botrys urticae* under a copper beech at Slough, and that it changed to the moth in due course. It may, however, have come to this country in the hammock you speak of. It requires more than one individual to prove that the species has become acclimatised.

C. C. L. — It has been calculated that the attractive or lifting power of the earth is about sixty pounds per cubic yard, which totals out in tons to 4,231 with sixteen noughts after it.

T. VARDE. — The difference is simply that the tax on spirits is ten shillings per gallon, while that on beer is twopence per gallon.

G. L. E. — The article was by Mr. Forster in the "Nineteenth Century" for February, 1885. It is now republished, price threepence, obtainable of the publishers of the magazines, Kegan Paul, Trench, and Co., 1, Paternoster Square. You should join the Imperial Federation League; the subscription to it is merely nominal, and it was formed especially to disseminate such opinions. Its offices are 43, St. Margaret's Offices, Victoria Street, S.W.

S. FOSTER. — The thirteen stars in the American flag were originally adopted from the constellation of Lyra, and arranged in the same way. But why the Americans should select the lyre as a symbol we do not know. The stripes are the red and white of the English national colours. There are thirteen red stripes, a red one coming at each edge; and the blue field with the stars on—one for each State—is a square of the dimensions of seven of the stripes.

J. FLETCHER AND FRIENDS. — A coloured plate, giving the uniforms of the British Army, was given away with the June part in 1880.

A. H. L. — 1. The "Adventures of a Three Guinea Watch" was in the third volume. The "Two Cabin Boys" was in the fourth. 2. Yes.

IVANHOE. — Why not take part in our competitions? Other invalids similarly situated to yourself have done so with success.

T. H. C. — Messrs. Cassell publish a "Pigeon Book," and there is a weekly publication called "Poultry," which devotes some attention to the matter. But you will never get either book or paper to treat only of one breed.

THE "BOY'S OWN" GORDON FUND.

WE are happy to be able to report that the Collecting Cards are now being daily applied for, and a goodly number have already been furnished.

Ours is essentially a *Boy's Memorial* to one whose memory English-speaking boys the world over may well delight to unite to honour. Our Fund is intended to be essentially representative of British boyhood—a memorial raised by boys for boys, in fond memory of a noble boy-lover. We hope, therefore, that boys of all ages and conditions of life will take it up heartily and make it their very own. It will be specially graceful on the part of our leading public and private school-boys thus to stretch out a friendly, helping hand towards lad less happily circumstanced than themselves.

Collecting Cards are furnished to all who, in applying for them, enclose a properly addressed and stamped envelope, accompanied by a letter of recommendation from some responsible person. All cards thus sent out are duly numbered, and registered with the names and addresses of the applicants, and thus the chances of any cards getting into the wrong hands are guarded against.

Donations should be sent at once, and all amounts received will be acknowledged in the columns of the BOY'S OWN PAPER. Cheques should be crossed, and P.O.O. made payable to H. WILLIAMS. Office: 56, Paternoster Row, London.

No. 343.—Vol. VII.

SATURDAY, AUGUST 8, 1885.

Price One Penny.
[ALL RIGHTS RESERVED.]

"The next moment Blandford was clinging to the railings."

compunction whatever in deciding upon a course of action which he knew would involve the ruin of Reginald Cruden.

He did not like it at all. It was a nuisance; it was a complication likely to hamper him. He wished his mother and sister would be less gushing in the friendships they made. What right had they to interfere with his business prospects by tacking themselves on to the family of a man who was afterwards to turn out a swindler?

Yes, it was a nuisance; but for all that it must not be allowed to interfere with the course that lay before the rising lawyer. Business is business after all, and if Cruden is a swindler, whose fault is it if Cruden's mother breaks her heart? Not S. S.'s, at any rate. But S. S.'s fault it would be if he made a mess of this "big job"! That was a reproach no one should lay at his door.

Samuel may not have been quite the Solomon he was wont to estimate himself. Still, to do him justice once more, he displayed no little ability in tracing out the different frauds of the Select Agency Corporation and establishing Reginald's guilt conclusively in his own mind.

It all fitted in like a curious puzzle. His sudden, mysterious departure from London—his change of name—the selection of Liverpool as headquarters—the distribution of the circulars among unsuspecting schoolmistresses in the south of England—the demand for money to be enclosed with the order—and the fiction of the dispatch of the goods from London. What else could it point to but a deliberate, deeply-laid scheme of fraud? The further Samuel went the clearer it all appeared, and the less compunction he felt for running to earth such a scoundrel.

But he was going to do nothing in a hurry. S. S. was not the man to dish himself by showing his cards till he was sure he had them all in his hand. Possibly Cruden was not alone in the swindle. He might have accomplices. Even his mother and brother—who can answer for the duplicity of human nature?—might know more of his operations than they professed to know. He might have confederates among his old companions at the "Rocket," or even among his old school acquaintances. Yes; there was plenty to go into before Samuel put down his foot, and who knew better how to go into it than S. S.?

So he kept his own counsel, and, except for cautioning his mother and sister to "draw off" from the undesirable connection, and intimidating the maid-of-all-work at No. 6, Dull Street, by most horrible threats of the penalties of the law, to detain and give to him every letter bearing the Liverpool postmark which should from that time forward come to the house, no matter to whom addressed—for in his zeal it was easy to forget that by such a proceeding he was sailing uncommonly close to the wind himself—showed no sign of taking any immediate step either in this or any other matter.

Had he been aware that one Sniff, of the Liverpool detective police, had some days ago arrived, by a series of independent and far more artistic investigations, at as much knowledge as he himself possessed of the doings of the Corporation, Samuel would probably have been content to make the most of the cards he

held before the chance of using them at all had slipped by.

It is doubtful, however, whether, in any case, he would have succeeded in forestalling the wary Mr. Sniff. That gentleman had discovered in a few hours what it had taken Samuel days of patient grubbing to unearth. And his discoveries would have decidedly astonished the self-complacent little practitioner. He would have been astonished, for instance, to hear that the Liverpool post-office had received instructions from the Home Office to hand over every letter addressed to Cruden Reginald, 13, Shy Street, to the police. He would also have been astonished if he had known that a detective in plain clothes dined every evening at the "Shades," near to the table occupied by Mr. Durfy and his friends; that the hall-porter of Weaver's Hotel was a representative of the police in disguise, and that representatives of the police had called on business at the "Rocket" office; had brushed up against Blandford at street-corners, and had even taken the trouble to follow him—Samuel Shuckleford—here and there in his evenings' perambulations.

Yes, small job as it was in Mr. Sniff's estimation, he knew the way to go about it, and had a very good notion what was the right scent to go on and what the wrong.

The one thing that did put him out at first was Reginald's absolutely truthful replies to all the pleasant clergyman's questions. This really did bother Mr. Sniff. For when a swindler is face to face with his victim the very last thing you expect of him is straightforward honesty. So when Reginald had talked about Weaver's Hotel and Mr. John Smith, and had mentioned the number of orders that had arrived, and the amount of money that had accompanied them, and had even confided the amount of his own salary, Mr. Sniff had closed one of his mental eyes and said to himself, "Yes; we know all about that."

But when it turned out that, so far from such statements being fabrications to delude him, they were simply true—when the letter Reginald had written to Mr. Medlock that very evening lay in his hands and corroborated all he had said—when he himself followed the poor fellow an hour or two later on his errand of mercy, and stood beside him as he spent that precious sixpence over "Robinson Crusoe" and the "Pilgrim's Progress," Mr. Sniff did feel for a moment disconcerted.

But, unusual as it was, he made the bold venture of jumping to the conviction of Reginald's innocence; and that theory once started, everything went beautifully.

On the evening following Mrs. Cruden's sudden illness, Mr. Durfy strolled down in rather a disconsolate frame of mind towards the "Shades."

Since his expulsion from the "Rocket" office things had not been going pleasantly with him. For a day or two he had deemed it expedient to keep in retirement, and when at last he did venture forth in the vague hope of picking up some employment worthy of his talents, he took care to keep clear of the haunts of his former confederates, whom, after his last failure, he rather dreaded meeting.

It had been during this period that he had made the acquaintance of Shuckle-

ford, and the prospect of revenge which that intimacy opened to him was a welcome diversion to the monotony of his existence.

But prospects of revenge do not fill empty stomachs, and Durfy at the end of a week began to discover that there might be an end even to the private resources of the late overseer of an evening newspaper and the part proprietor of an Agency Corporation. He was in fact getting hard up, and therefore putting his pride in his empty pocket, he strolled down moodily to the "Shades," determined at any rate to have a supper at somebody else's expense.

He had not reckoned without his host, for, after about half an hour's impatient kicking of his heels outside, Mr. Medlock and Mr. Shanklin appeared on the scene, arm in arm.

They appeared by no means elated at seeing him, but that mattered very little to the hungry Durfy, who followed them into the supper-room and took his seat at the table beside them. If he had been possessed of any sensitiveness it might have been wounded by the utter indifference, after the first signs of displeasure, they paid to his presence. They continued their conversation as though no third party had been near, and except that Mr. Medlock nodded when the waiter said "For three?" seemed to see as little of him as Hamlet's mother did of the Ghost.

However, for the time being that nod of Mr. Medlock's was all Durfy particularly coveted. He was hungry. Time enough to stand on his dignity when the knife and fork had done their work.

"Yes," said Mr. Shanklin, "time's up to-day. I've told him where to find us. If he doesn't, you must go your trip by yourself. I can safely stay and screw my man up."

"Think he will turn up?"

"Can't say. He seems to be flush enough of money still."

"Well, he can't say you've not helped him to get rid of it."

"I've done my best," said Mr. Shanklin, laughing. "I shall be glad of a holiday. It's as hard work sponging one fool as it is fleecing a couple of hundred sheep, eh?"

"Well, the wool came off very easily, I must say. I reckon there'll be a clean £500 to divide on the Liverpool business alone."

"Nice occupation that'll be on the Boulogne steamer to-morrow," said Mr. Shanklin. "Dear me, I hope it won't be rough, I'm such a bad sailor!"

"Then, of course," said Mr. Medlock, "there'll be your little takings to add to that. Your working expenses can't have been much."

Mr. Shanklin laughed again.

"No. I've done without circulars and a salaried secretary. By the way, do you fancy any one smells anything wrong up in the north yet?"

"Bless you, no. The fellow's pretty nearly starving, and yet he sent me up a stray £2 he received the other day. It's as good as a play to read the letters he sends me up about getting the orders executed in strict rotation, as entered in a beautiful register he kept, and which I borrowed, my boy. Ha! ha! He wants me to run down to Liverpool, he says, as he's not quite satisfied with his position there. Ho! ho! And he'd like a little money on account, as he's had to buy

stamps and coals and all that sort of thing out of his own thirteen shillings a week. It's enough to make one die of laughing, isn't it?"

"It is funny," said Mr. Shanklin. "But you're quite right to be on the safe side and start to-morrow. You did everything in his name, I suppose—took the office, ordered the printing, and all that sort of thing?"

"Oh yes, I took care of that. My name or yours was never mentioned, except mine on the dummy list of directors. That won't hurt."

"Well, the Corporation's had a short life and a merry one; and your precious secretary's likely to have a merry Christmas after it all—unless you'd like to go down and spend it with him, Durfy," added Mr. Shanklin, taking notice for the first time of the presence of their visitor.

Durfy replied by a scowl.

"I shall be far enough away by then," said he.

"Why, where are you going?"

"I'm going with you, to be sure," said he, doggedly.

Messrs. Medlock and Shanklin greeted this announcement with a laugh of genuine amusement.

"I'm glad you told us," said Mr. Shanklin. "We should have forgotten to take a ticket for you."

"You may grin," said Durfy. "I'm going for all that."

"You're a bigger fool even than you look," said Mr. Medlock, "to think so. You can consider yourself lucky to get a supper out of us this last night."

"You forget I can make it precious awkward for you if I like," growled Durfy.

"Awkward! You've a right to be a judge of what's awkward after the neat way you've managed things," sneered Shanklin. "It takes you all your time to make things awkward for yourself, let alone troubling about us."

Durfy always hated when Mr. Shanklin alluded to his blunders, and he scowled all the more viciously now because he felt that, after all, he could do little against his two patrons which would not recoil with twofold violence on his own head. No, he had better confine his reprisals to the Crudens by Mr. Shuckleford's assistance, and meanwhile make what he could out of these ungrateful sharpers.

"If you don't want me with you," said he, "you'll have to make it worth my while to stay away, that's all. You'd think it a fine joke if you found yourself in the police-station instead of the railway-station to-morrow morning, wouldn't you?"

And Mr. Durfy's face actually relaxed into a smile at this flash of pleasantry.

"You'd find it past a joke if you found yourself neck-and-crop in the gutter in two minutes," said Mr. Shanklin, in a rage, "as you will do if you don't take care."

"I'll take care for fifty pounds," said Durfy. "It's precious little share I've had out of the business, and if you want me mum that's what will do it. There, I could tell you a thing or two already; you don't know—"

"Tush! Durfy, you're a born ass. Come round to my hotel to-morrow at eight, and I'll see what I can do for you," said Mr. Medlock.

Durfy knew how to value such pro-

mises, and did not look by any means jubilant at the prospect held out. However, at this moment Blandford and Pillans entered the supper-room, and his hosts had something better to think about than him.

He was hustled from his place to make room for the new guests, and surlily retired to a neighbouring table, where, if he could not hear all that was said, he could at least see all that went on.

"Hullo!" said Shanklin, gaily, "here's a nice time to turn up, dear boys. Medlock and I have nearly done supper."

"Couldn't help. We've been to the theatre, haven't we, Pillans?" said Blandford, who appeared already to be rather the worse for drink.

"I have. You've been in the bar most of the time," said Pillans.

"Ha! ha! I was told Bland was studying for the Bar. I do like application," said Mr. Medlock.

Blandford seemed to regard this as a compliment, and, sitting down at the table, told the waiter to bring a bottle of champagne and some more glasses.

"Well," he said, with a simper, "what I say I'll do, I'll do. I said I'd turn up here and pay you that bill, Shanklin, and I have turned up, haven't I?"

"Upon my honour, I'd almost forgotten that bill," said Mr. Shanklin, who had thought of little else for the last week. "It's not inconvenient, I hope?"

Blandford laughed stupidly.

"Sorry if a trifle like that was inconvenient," said he, with all the languor of a millionaire. "Forget what it was about. Some take in, I'll swear. Never mind, a debt's a debt, and here goes. How much is it?"

"Fifty," said Mr. Shanklin.

Blandford produced a pocket-book with a flourish, and took from it a handful of notes that made Durfy's eyes as he sat at his distant table gleam. The half-tipsy spendthrift was almost too muddled to count them correctly, but finally he succeeded in extracting five ten-pound notes from the bundle, which he tossed to Shanklin.

"Thanks, very much," said that gentleman, putting them in his pocket. "I find I've left your bill at home, but I'll send it round to you in the morning."

"Oh, all serene!" said Blandford, putting his pocket-book back into his pocket. "Have another bottle of cham.—do—just to celebrate—settling—old scores. Hullo, where are you, Pillans?"

Pillans had gone off to play billiards with Mr. Medlock, so Blandford and Mr. Shanklin attacked the bottle themselves. When it was done the former rose unsteadily, and, bidding his friend good night, said he would go home, as he'd got a headache. Which was about as true an observation as man ever uttered.

"Good night—old—feller," said he; "see you—to-morrow."

And he staggered out of the place, assisted to the door by Mr. Shanklin, who, after an affectionate farewell, sauntered to the billiard-room, where Mr. Medlock had already won a five-pound note from the ingenuous Mr. Pillans.

"Your friend's in good spirits to-night," said Mr. Shanklin. "Capital fellow is Bland."

"So he is," said Pillans.

"Capital fellow, with plenty of capital, eh?" said Mr. Medlock; "your shoot, Pillans, and I don't mind going a sov. with you on the cannon."

Of course Pillans lost his sovereign, as he did several others before the game was over. Then, feeling he had had enough enjoyment for one evening, he said good-bye and followed his friend home.

But some one else had already followed his friend home.

Durfy, in whose bosom the glimpse of that well-lined pocket-book had roused unusual interest, found himself ready to go home a very few moments after Blandford had quitted the "Shades." It may have been only coincidence, or it may have been idle curiosity to see if the tipsy lad could find his way home without an accident, or it may have been a laudable determination that no one should take advantage of his helpless condition to deprive him of that comfortable pocket-book. Whatever it was, Durfy followed the reeling figure along the pavement as it threaded its way westward from the "Shades."

Blandford may have had reason enough left to tell him that it would be better for his headache to walk in the night air than to take a cab, and Mr. Durfy highly approved of the decision. He was able without difficulty or obtrusiveness to follow his man at a few yards' distance, and even give proof of his solicitude by an occasional steadying hand on his arm.

Presently the wanderer turned out of the crowded thoroughfare up a by-street, where he had the pavement more to himself. Indeed, except for a few stragglers hurrying home from theatres or concerts, he encountered no one; and as he penetrated farther beyond the region of public-houses and tobacconists into the serener realms of offices and chambers, and beyond that into the solitude of a West End square, not a footstep save his own and that of his escort broke the midnight silence.

Durfy's heart beat fast, for he had a heart to beat on occasions like this. A hundred chances on which he had never calculated suddenly presented themselves. What if some one might be peering out into the night from one of the black windows of those silent houses? Suppose some motionless policeman under the shadow of a wall were near enough to see and hear! Suppose the cool night air had already done its work and sobered the wayfarer enough to render him obstinate or even dangerous! He seemed to walk more steadily. If anything was to be done every moment was of consequence. And the risk?

The vision of that pocket-book and the crisp white notes flashed across Durfy's memory by way of answer.

Yes, to Durfy, the outcast, the dupe, the baffled adventurer, the risk was worth running.

He quickened his step and opened the blade of the penknife in his pocket as he did so. Not that he meant to use it, but in case—

Faugh! the fellow was staggering as helplessly as ever! He never even heeded the pursuing steps, but reeled on, muttering to himself, now close to the palings, now on the kerb, his hat back on his head and the cigar between his lips not even alight.

Durfy crept silently behind, and with a sudden dash locked one arm tightly round his victim's neck, while with the other he made a swift dive at the pocket where lay the coveted treasure.

It was all so quickly done that before

Blandford could exclaim or even gasp the pocket-book was in the thief's hands. Then as the arm round his neck was relaxed, he faced round, terribly sobered, and made a wild spring at his assailant.

"Thief!" he shouted, making the quiet square ring and ring again with the echo of that word.

His hand was upon Durfy's collar, so fiercely that nothing but a hand-to-hand struggle could release its grip; unless—

Durfy's hand dropped to his pocket. There was a flash and a scream, and

next moment Blandford was clinging, groaning, to the railings of the square, while Durfy's footsteps died away in the gloomy mazes of a network of back streets.

When Pillans got home to his lodgings that night he found his comrade in bed with a severe wound in the shoulder, unable to give any account of himself but that he had been first garrotted, then robbed, and finally stabbed, on his way home from the "Shades."

Mr. Durfy did not present himself at

Mr. Medlock's hotel at the appointed hour next morning.

Nor, although it was a fine calm day, and their luggage was all packed up and labelled, did Mr. Medlock and his friend Mr. Shanklin succeed in making their promised trip across the Channel. A deputation of police awaited them on the Victoria platform and completely disconcerted their arrangements by taking them in a cab to the nearest police-station on a charge of fraud and conspiracy.

(To be continued.)

ON SPECIAL SERVICE: A NAVAL STORY.

By GORDON STABLES, M.D., R.N.,

Author of "The Cruise of the Snowbird," "Stanley O'Grahame," etc.

CHAPTER XVIII.—LENT TO A GUNBOAT—ROUGHING IT IN THE SERVICE—COLIN'S TRIALS BEGIN.

EARLY next morning Captain Blunderbore sent for Colin.

He was seated at breakfast with a bundle of letters before him—despatches had come in a few hours before in the gunboat Whitterit.

"Come away, Mr. McLeod, and sit down; I have something here that interests you."

The captain talked in a very kind tone of voice, and poor Colin's heart throbbed violently to hear it. Why should he speak to him thus? He seldom did so. What could it mean? He had not yet had his own letters from home. Was his mother dead? or his father, brother, or uncle?

"No bad news?" he asked. "No bad news, I trust, sir?"

"My dear lad, no! In fact, it ought to be very good news for you; only we'll all be sorry to lose you."

"It is grief of some kind, then," thought Colin.

"Bad news?" continued the captain. "No; to a youngster like you it ought to be the best of news, though you'll have to rough it in the little Whitterit."

Colin's face fell; he was going away from the good old Theodora; from Mildmay, whom he loved so well; from his "brother" Quentin, and the best of messmates.

He could not help a sigh escaping him.

The captain looked at him kindly. "Keep up your heart, my lad," he said. "You're *not* appointed to the Whitterit, you're only going to be *lent* for a year. Poor young Ruskin died on the passage out."

A few minutes after Colin was hurrying below to his mess to tell the fellows the news.

"Ha, ha!" cried Benbow, slapping Colin on the shoulder in his usual hearty mirthful manner. "Going to be lent! going to become a stupid-numerary. Ha, ha!" But Benbow added, more seriously, "Well, well, Colin; we'll all miss you. Good luck to you, and soon may you return."

The Whitterit was to sail in a week. She was going straight away across the Atlantic, southward and westward ho! to call with letters and despatches at Buenos Ayres, and then to run round to the coast of Peru, on somewhat serious business—namely, to make private inquiries concerning an alleged insult to our flag by the Peruvians.

It was a duty that required some tact as well as diplomacy, and in appointing Lieut.-Commander Channing to the Whitterit the Lords of the Admiralty thought they had the right man in the right place. Perhaps they had; he was a smart officer, as we shall see.

She was to sail in a week. How quickly that week fled away!

And that last night in the little gun-room mess—why, Colin could not have believed he could have felt so "foolishly sad," as he called it. But he could not keep his heart up. He laughed at Benbow's yarns and jokes mechanically; he listened to Brown with his bones, and little nigger Othello; but he did not laugh, as he used to, till the tears came in his eyes. If tears had come to-night they would have been tears of quite another sort.

But the evening passed away somehow, as evenings will, whether we be sad or gay.

"Lights out, gentlemen, please."

It was nine o'clock. It was the quartermaster's voice.

"Shall we ask for another hour?" said Quentin.

"No," replied Colin; "let us go on deck."

So on deck the two went together, and what a deal they had to talk about and say to each other, to be sure! But with all this we have nothing to do.

It was seven bells before they parted, Quentin to get ready for his watch on deck, Colin to turn in.

It was hours before he slept, though; and when he did sleep it was only to dream strange, confused, wearisome dreams, with little meaning in them perhaps, but very harassing nevertheless. He was back home again in the dear old favourite parlour in his father's castle; it was a lovely summer's evening; in at the open window floated the vesper song of the robin, the pink-pink, and thrush, mingling with the low whirring sound of partridges in the corn. His mother was quietly knitting; his father, in his easy-chair, reading the paper; his uncle, Captain Peter, walking up and down the floor as if it were a quarter-deck. Suddenly his mother raised her face, and Colin saw she was weeping. Then all was dark, and the scene changed. He was toiling up inaccessible mountains and across interminable moorlands, with some definite object, he knew not what, with

some burden weighing him down that he could not shake off. And now he was in the midst of a deep, dark forest, lost—for there was never a path and never a mark to guide him through it, and the trees seemed endless in multitude. But he found himself at long last by the brook—the old brook side. Oh, it was his own dear old forest after all, and here—yes, here—was the Latin grammar! He must master his gerunds—his gerunds in *dum* and his gerunds in *do*. Yet he had never, never felt them so difficult before. Why should a voice from the forest sing out, "All's well!" in that mournful voice? He was partly awake now; it was the sentry's call.

He slept again, and once more the scene was changed; he was on the wide, wide ocean now, alone it seemed, and in a boat—alone, yet not alone; forms appeared around him, with him; there was no wind either, but the boat heaved up and down, up and down, in a strange mysterious kind of a way, which he could not understand; and hark! was that not the sound of waves breaking on a sandy beach not far off?

"Hullo! old man," cried Quentin, "why it's five bells."

Colin sat up in his hammock and laughed.

"So it was you swinging my hammock after all, was it? But you made me dream; and the marines are scrubbing decks overhead, that was the sound of breaking waves I heard. Well, it is funny. I'll be up in a minute."

"All right," said Quentin; "I'm not going to turn in, I've had an hour all standing. Come soon, and we'll have a talk before breakfast."

"So much for dreams," thought Colin; "if I were superstitious now—"

He really was slightly so, though he would not own to it. Nearly all Highland boys are, and the inhabitants of most wild mountain lands.

Colin could not shake off the feelings his dreams gave rise to.

He was going away to-day, to his new quarters, that in itself was enough to make the poor boy sad—for boy he was, though it really seemed many, many years since he left his home.

He remained on his knees a much longer time this morning, beside his sea-chest, than usual, and he found comfort. Oh! the comfort one has in knowing that wherever he may be, in the

lonely wilderness, or far away on the ocean, in storm or danger, or amid pestilence, the great Father is ever near him to appeal to—to comfort him.

Colin found comfort in mind, but there was an oppressed feeling of body, born of his restless night and weary dreams, that he was unable to shake himself clear of.

three lines of the conversation between West and Colin on this particular morning. Two hoses were being used, and at this moment one was turned on West, the other on Colin.

"Hullo, Colin, my—ugh—my—bo—hoy—so you're—ugh—ugh—go—ing away to-day, are you?"

seeing him going off thus, and gazing back, somewhat sadly it must be confessed. The Whitterit was anchored nearly a quarter of a mile from the Theodora. Colin got leave from his commander to spend the evening with his old messmates, and he dined in the wardroom.

Colin changes his quarters.

He went on deck and had a sailor's douche. Captain West was there also, early though it was. It was part of the régime he was undergoing under Dr. McGee's instructions, by way of holding in check his growing obesity.

A sailor's douche? What is it? you ask. Oh, it is great fun; you go up when the men are washing down the decks, and have the hose played all over you. The donkey engine sends the water too with such force that it is quite a difficult matter to speak. Just listen to

And Colin replies, "Augh—ugh—yes—sir—and right sorry I—ugh—ugh—am for—ugh—it." "Isn't this a—ugh—ugh—a glorious—ugh—bath, my bo—hoy?"

"Yes—sir—it is, augh—ugh—splendid." And more to the same purpose.

Colin's sea-chest was lowered over the port side of the Theodora that same forenoon, and he himself soon went down after it, and seated himself on top of it, for the boat was a whaler, and she was laden fore and aft. But it did look funny,

Benbow, as usual, was full of chaff, Mildmay happy-looking and affable. This good officer never permitted himself the latitude of chaff, a good deal too much of which goes on in the service; but he dearly liked to listen to, and join in, pleasant conversation.

Young Brown and Quentin dined with the rest in the wardroom.

Benbow never did spare poor Brown. "But bless you, sir," he said to Mildmay this evening, "I've hopes of the boy yet. A boy that can perform as he does

on the bones is bound to make an admiral. That's Benbow's opinion. Pity he is so fat. Beg your pardon, West."

West laughed.

"You make matters worse," he said, "by apologising."

"Colin, dear lad," he continued, "I don't know how the old Theodora will get on without you. But, I say, old man, you did look funny perched on top of that sea-chest of yours. Put me in mind of What-his-name's picture, you know, of the dog in the flood floating away on top of his kennel. You looked just as pitiful."

There was a general laugh at this, and Colin looked half vexed; for which Mildmay was sorry, and remonstrated with the navigating lieutenant.

"Don't be too hard, Benbow," he said, "it's the last night."

"That's just the thing," replied Benbow, "just the reason I want to cheer the boy up. It's the last night, and we may not see him again, for you ken, sir, *Scotchmen never gang back*."

"No," said McGee, "you English chaps couldn't get on without us."

Colin smiled. He had his answer also.

"No," he said, quietly, "you're right, Scotchmen never gang back, they never gang back—in a promise, they never gang back in their word, they never gang back if they meet a foe. They didn't gang back at Bannockburn, Benbow, did they? I almost forget, but if my memory serves me it was the other party that suddenly remembered they had an engagement down south."

Everybody was pleased at this sally, for though he was well liked on board, Benbow was so constantly chaffing other people that nobody was sorry when he had his own toes trodden on.

Lieutenant Mildmay went on shore with Colin after dinner to stretch his legs, as he called it. They went early, about eight o'clock. But the moon was well up all the hills and braes, and the little town itself seemed to slumber beneath the gauze-like veil it had drawn over them. Only the fort stood out bold and clear, and the far-off peak of Diana, while all the sea was a-shimmer in the golden light. It was, as Byron says, "a goodly night."

"Now for a good walk," said the lieutenant. "I feel young again, my lad, when I get my legs on the solid land. One has no more exercise on board a ship than a bird has in a cage. What say you to get right away up the hill, and half-way to Longwood?"

"Just what I should like," replied Colin.

Away they went side by side, youth and manhood, the sailor youth and his sea-daddy. And really Lieutenant Mildmay had been all a sea-dad to Colin. He had been to him everything that his Uncle Peter could have wished him to be, and, if the truth must be told, there was more in Mildmay's wish for a walk to-night than the simple stretching of his legs. For he wanted to have a parting word with Colin.

They sat down together on the edge of a rock, the town far beneath them, and away beyond the moon-gilded sea, and the ships with their port lights only half visible, so bright was the moonlight.

When they rose to go,

"Well," said Mildmay, "you'll do as I've told you, I know. And I have a

strange presentiment you will find my daughter. The Theodora may be round Lima way. We are on special service, ready to go anywhere, but we may never go that length."

"I'll do what you've told me, sir, and I've you to thank for all I know of service. I just feel now as if I were going out into the world again—alone. I'm sure I shall not be happy. But I'll try to be so."

"No, you mustn't try. Remember the words of President Nott, 'Don't try to be happy. Happiness is a shy nymph, and if you chase her she will fly from you. But go quietly on and do your duty, and she will come to you.'"

"I'll do my duty, sir."

"I know you will, boy. And now let us go below."

*

*

*

*

The happiness and comfort of the officers and crew of a ship in the service depend in a very large degree upon its commander.

We know by this time what sort of a person Captain Blunderbore was. By no means a very dashing character, sometimes apt to be cross or snappish, but withal simple-minded and good at heart. Commander Channing* was an officer of quite another sort. Happily there are few like him in the Royal Navy. But there are some at least, and—who knows?—they may do good indirectly, for those who have to serve under them soon come to know that life in the navy is not all *couleur de rose*, and so they learn to do their duty even under difficulties.

Being transposed to a small gunboat like the Whitterit was a sad trial for Colin. Bad boy that he was; I fear he went on board her with no very amiable feelings.

Well, it was a great change for him. His career in the service had been but a short one, it is true, but it was also a happy one, and the ships he had served in were both large and comfortable.

The Whitterit was a sturdy little gunboat, but she was wondrous small. Her armament was but three guns; a man with long legs could have stepped easily from the thwart of a boat on to her deck.

Nevertheless she was very fleet. She was built for speed, and had been employed previous to her present commission as a despatch-boat on different stations.

Her gunroom was her wardroom; abaft this was the commander's cabin.

Colin's new messmates would be but three, the surgeon, a junior lieutenant, and an assistant paymaster.

Much to our hero's horror, he found that the whole vessel was overrun with gigantic cockroaches. The Whitterit had been home, it is true, but not long enough to get rid of these awful pests. With the exception of the clerk, the others, including the commander, had been "shipmates" with these unsavoury creatures before. So Colin was laughed at when he expressed his loathing of such questionable companionship the first night. It was during one of their periodical rushes, when they crowd out suddenly almost as thick as locusts, covering the bulkheads almost black. On these occasions they are literally in thousands—I

might say tens of thousands. One or two of these monsters flew against Colin's face and neck, and he shuddered at the contact.

Before he was three days at sea he discovered there were worse things than cockroaches on board this merry wee Whitterit—scorpions to wit. Old sailors think nothing of these, or even of centipedes, but Colin was not yet hardened to them.

So great was his dread of these creepy-creepies that for nights and nights he hardly slept a wink, and when he did he awoke with a start and a half-frightened scream. He was ashamed of himself, but he could not help it.

About a week after Colin joined the Whitterit the weather became very boisterous indeed; she had been under sail nearly all this time. Nor was any attempt made to ease her when it came on to blow. Considering the strength of wind and the awful force of the seas that tumbled on board with the weight of avalanches, the Whitterit was really doing very well indeed. But she almost lived under water. Neither officers nor men were ever dry on deck, while down below everything was as comfortless as it well could be. The little wardroom was nearly always dark, and the green seas washing across the skylight windows had a most depressing effect upon the nerves.

Colin had to keep watch at night without either oilskin or sou'-wester—the latter is most useful—so he was always drenched to the skin. One night he turned into his hammock quite cold as well as wet—indeed, his teeth were chattering.

Next morning he was in a fever, head aching, eyes and skin burning, but cold withal. He would have got up, but the surgeon advised him to go on the sick-list.

"I'll try," said the doctor, "to make it all right with the commander."

Colin looked at the surgeon's serious face in mute surprise.

The doctor answered the look. "You're astonished," he said, with a kind of forced laugh, "that I should talk thus."

"Our Dr. McGee," replied Colin, "was master of his duties, master of himself, and master of his patients."

"Perhaps," replied the surgeon, colouring slightly; "but our commander is master here, and monarch of all he surveys. I'm sorry—it isn't my fault, and I don't think perhaps he means to be harsh, but he is, and I shan't be sorry when I quit the little ship."

"I'll do my duty," said Colin, with sparkling eyes, "and then I fear no one."

The doctor laughed. "Your duty at present," he said, "is to lie there."

Then he went on deck. Two hours afterwards he came back. He was almost pitched headlong into the steerage where the hammock hung, and a great green sea followed him.

"The captain," said the doctor, "insists upon seeing you. Is it possible, think—"

Before he had finished his sentence Colin had swung himself on to the deck and stood there swaying about and holding on by the hammock-lashings.

When the ship steadied a little more he managed to reach his sea-chest and dressed, and in a few minutes more was in the commander's cabin. By no means an unpleasant face had the commander, but there always hovered around his

* Commander Channing is sketched from life. His prototype has left the service, but old messmates of mine who read this story will remember him.

mouth when talking to his inferior officers, a sarcastic, unbelieving kind of a smile.

"So, Mr. McLeod," he said, with a laugh, "the weather is rather bad for you? Gone on the sick-list, eh?"

"Sir," replied Colin, "Dr. Johnson put me on the list because I feel ill."

"Feel ill, eh? Well, let me tell you this, youngster: you don't look ill, and I'll have no malingering on this ship while I am her commander."

One half of this cruel little speech was lost on Colin. His head swam with sudden faintness, the cabin and commander

appeared to sail round him, and he would have fallen had not the surgeon, who was close behind, caught him in his arms.

When he recovered consciousness he was in his hammock.

(To be continued.)

HEROES OF THE BACKWOODS.

VI.—DANIEL BOONE.

THE story of Daniel Boone is so remarkable that it is difficult to realise we are not dealing with a romance. The adventures and feats of woodcraft are so extraordinary, and the character of the simple son of the wilderness throughout his long life is so pious and true, that we are tempted to treat the pioneer of Kentucky as a mere creature of the imagination "founded on facts." Boone, however, was no hero of fiction. He was not only the patriarch of backwoodsmen, but he holds a far higher place in the history of his country as her "pioneer"—the first to move out of the thirteen States of the seaboard to that unexplored country in the west which now forms the bulk and the strength of the Republic.

He was born in Buck's County, Pennsylvania, on February 11, 1735. His father was Squire Boone, the son of George Boone, who in 1717 emigrated from Exeter. When Daniel was about ten years old his father moved down to Holman's Ford on the Yadkin River in North Carolina. The education he received may be described as purely a Biblical one. There were not many books in those days in an American backwoodsman's hut, or in a bush school, but the Boones belonged to the Society of Friends, and with them the one book was always present. If Daniel Boone had little book learning, he had "the forest primeval" to teach what to him was of equal value, and of that teaching he fully availed himself.

Before he was ten years old he was thoroughly versed in all the ways of woodcraft. On the banks of the Yadkin he fell in love with Rebecca Bryan, and in 1755 he married her and built a house of his own. This was his second hut, the first he built when he was quite a lad as a retreat during his hunting excursions into the forest.

The house was built of logs in the ordinary way, and for some years Boone lived in it the ordinary settler's life. The life was a busy and a pleasant one. The family had to do everything for itself. A block of wood with a hole burnt out of it gave a mortar, and another block furnished the pestle with which the flour was pounded from the corn when the querns used by the Redskins were not available. The sheep were sheared for their wool, and the plants macerated for their flax, and in a rough sort of loom the housewife wove her own cloth with a linen warp and a woollen woof. Troughs were sunk and filled with bark and lye, and the men tanned the deerskins into leather. The men built the hut, and found the materials for food and clothing, the women did the spinning and weaving and milking and cooking and all the indoor duties.

With the Indians always lurking round, the log hut was practically a fortress, and it was built and managed as such. Every person in it had his or her place in case of an attack, and even the lads of twelve years old had each his loophole and his rifle. As the forests teemed with game but few domestic animals were kept, and the daily dinner was provided by the gun. Skill in the use of firearms was thus acquired very early in life, and constant practice made perfect. Holiday gatherings partook of the "Wappenshaw" character, in which rifle-shooting played an important part.

One of these trials of skill was that known as driving the nail—at forty paces. A nail was driven into the target for a little over half its length with a hammer, and for the rest of its length with rifle bullets. To move the nail it had to be shot fairly on the head, and this was done on an average once out of every three attempts. Another test of marksmanship was shooting oranges as they were thrown across an open doorway; another was the squirrel barking practised to prevent the skin being injured, which we will let an eye-witness describe as he saw it performed by Boone himself. "We moved not a step from the place, for the squirrels were so thick that it was unnecessary to go after them. Boone pointed to one of these animals which had observed us, and was crouched on a tree about fifty paces distant, and bade me mark well where the ball should hit. He raised his piece gradually, until the head, or sight of the barrel, was brought to a line with the spot he intended to strike. The whip-like report resounded through the woods and along the hills in repeated echoes. Judge of my surprise when I perceived that the ball had hit the piece of bark immediately underneath the squirrel, and shivered it into splinters, the concussion produced by which had killed the animal and sent it whirling through the air as if it had been blown up by the explosion of a powder magazine." Snuffing the candle was another performance frequently indulged in, the point of the game being that the candle had to be snuffed without being extinguished. It is not to be wondered at that some of the feats of marksmanship accomplished by these backwoodsmen at short distances are almost incredible when we consider that they were kept in practice by such amusements as these, and that they had daily to go out and shoot their dinner with as much coolness and deliberation as the housekeeper now orders it from the butcher. Boone, however, was not to spend his life on the banks of the Yadkin. He was to open up the "Far West," which in his days meant Kentucky.

The first to visit Kentucky, then known under its Indian form of Kain-tuck-ee, was Jamie McBride, who cut his name on a tree, and, like the Scotchman of Joe Miller's orchard, went "back agen." The next to make his way across the Alleghanies was John Finley, who in 1767 saw from the mountain range at Cumberland Gap the rolling plains with their herds of deer and buffalo. Finley returned to North Carolina and told the story of his adventures.

An exploring party was formed to cross the mountains and select a site for a new settlement. The party consisted of six picked men, Boone, Finley, Stewart, Holden, Monecy, and Cool. They started in May, 1769. "Daniel Boone's First View of Kentucky," that famous old engraving found on so many American cottage walls, represents the pioneer in full costume contemplating the landscape from the Cumberland Ridge.

On the 22nd of December the party divided, Boone and Stewart going off by themselves. As they were passing through a cane brake the Indians surprised and captured them. Boone was the most placid of men. Seeing escape impossible, although the Redskins were only armed with bows and arrows, he

immediately set to work to make himself agreeable to his captors, and with his rifle supplied them with food.

For seven days the Indians marched their prisoners to the west. Each night was spent around the camp fire, and, deceived by the apparent contentment of Boone and the readiness to please displayed by Stewart, the watch on the captives became each night less vigilant. On the seventh night Boone caught all the Redskins asleep, and quietly woke Stewart. Making their way stealthily out of the camp, they got clear off into the woods, and safely reached their old camp, which they found deserted, for Finley and his party were never heard of again. Here they were soon joined by Boone's brother and another adventurer that had come in search of them.

The four men camped together, and the explorations and hunting expeditions were resumed. Not for long, however, as Stewart was soon afterwards shot in an ambuscade, tomahawked, and scalped, Boone escaping the same fate by his swiftness of foot. The news that the Indians were up around them proved too much for the third hunter, and he went back, leaving the Boone brothers alone in the woods.

He never reached the Yadkin. A skeleton and some pieces of clothing were found years afterwards near a swamp, which is supposed to have dried up and left them on the firmer ground. These were in the line of his route, and are considered to have been his, but no details of his fate were ever discovered. On the 1st of May Squire Boone went back for some horses, and then accompanied his brother to the Cumberland River.

They then went back to the Yadkin to bring away their wives and families, and in September, 1773, led them across the mountains. The party consisted of forty in all, and the baggage was carried on four horses. Slowly in single file the march went on until Cumberland Gap was reached. The Indians, unknown to them, had been gathering round and following them for days. As the emigrants were passing through the defile there came a whoop and a shower of arrows, and the six young men who were leading were killed. One of them was Daniel's eldest son, a fine young lad of seventeen.

The attack was so sudden and fatal that, notwithstanding the remonstrances of Boone and his brother, the party resolved to retreat to the valley of the Clinch. There in the extreme south-west of Virginia was the new colony founded on the banks of the river which, uniting with the Holston from the other side of Powell's Ridge, forms the Tennessee. With the mountain range on either hand and the rich meadows around them, the emigrants would seem to have chosen a most appropriate site. The Boones had, however, set their hearts on moving into Kentucky, and their stay at the Clinch was only regarded by them in the light of a visit.

In 1774 a party of some forty surveyors, under Captain Harrod, were sent by Governor Dunmore to the Falls of the Ohio. A formidable conspiracy was organised amongst the Indians to destroy them and all the other whites who at any time might arrive in the Redskins' hunting-grounds. This conspiracy included the Indians among whom the surveyors were working, and who were sup-

posed to be friendly towards them. To warn his men of their danger the governor sent off Boone, and he started on his nearly five hundred miles' tramp through the enemy's country. He reached the party in safety, and guided them home.

One day they were attacked by the Indians, and one of the men fled to the Ohio and jumped into a canoe. The current bore him along, and the shower of arrows failed to hurt him. He tried in vain to stem the stream, and then resigned himself to the inevitable. He drifted down the Ohio to the Mississippi, and down the Mississippi into the Gulf of Mexico. There he took ship to Philadelphia, after a canoe voyage of over two thousand miles, one of the most adventurous on record.

In 1775 Boone brought his wife and family from the Clinch into Kentucky, and built the ten log huts which formed the nucleus of Boonesborough. "The Proprietors of the Colony of Transylvania in America," as the colonising company was called that appropriated the country as its own, made Boonesborough its capital, with their three other settlements at Harrodsburg, St. Asaph, and Boiling Spring. The Transylvanian Republic was to be independent, owing fealty to no other power, and expecting help from none, and although it only boasted a population of one hundred and fifty, yet it had its legislature and its church. The session of its legislature, which was opened and closed by a prayer from the Rev. John Lythe, was not very lengthy. All the business was

transacted in three days, and acts were passed prohibiting Sabbath-breaking and profane swearing, improving the breed of horses, and preserving the game. The Transylvanians had but a short existence; the Virginians laid claim to their territory, and their title was declared null. Henderson, the president of the colony, received a grant of land, about twelve miles square, on the Ohio, and the forts the company had built passed under the control of the British Crown. Attention had, however, been directed to the wealth of Kentucky, and the stream of emigration began to flow. But the Indians began to swarm round the forts. The settlers were to pass through a baptism of fire.

(To be continued.)

TIGER TALES;

OR, THE ADVENTURES OF A HOLIDAY.

PART III.

"THERE'S a tiger lying in that clump!" yelled a black object in great excitement, as he came springing towards his comrades. "I saw him with my own eyes, and he's all ready, and is wagging his tail."

As the man reached his neighbours, who huddled together on the first intimation, he pointed to a small isolated patch of jow, consisting of not more than half a dozen bushes, and which stood apart from the cover just beaten. It was only by accident the man had approached it, no one having thought it worth while to examine a place so unlikely to be preferred to the more concealed and shady recesses of the main jungle.

Rugonauth quickly reappeared, and marshalling the men, took them back in a body, so as to get on the farther side of the little clump, and endeavour to drive its occupant towards the hunters.

The retrograde movement was effected without the tiger moving, though he was doubtless furious at being disturbed, and quite prepared to visit his wrath on any intruders.

Having gained a sufficient distance to the rear, the beaters, in one solid body, now again advanced, and made free use of stones and fireworks.

With a tremendous roar the tiger sprang up, leapt from the bushes which had concealed him, and dashed straight towards the advancing column. Luckily the men remained compact and firm, waving their sticks and swords in front, and of course redoubling their shouts. When within some eight or ten yards, the brute, intimidated by the determined appearance of the wedge of human beings, shirked the attack, and turned aside into the jungle. Had it, however, been but a small party, or had any stray outsiders been separated from the main body, it would probably have gone hard with them. Not for a moment did the animal now loiter in the cover, but, turning back, broke from it in nearly the same place as the others had done on the previous day.

Catching sight of the two hunters standing on the bank, he changed his direction—which was along the bed of the river—and

charged right at them, tail on end, and roaring with full tiger power.

Perfectly steady, the wary hunters waited till he had passed one or two intervening bushes, and then, when he was distant from them about fifteen or twenty paces, touched their triggers, and a couple of bullets crashed into his body. He sprang into the air, stood for a moment on his hind legs, and then commenced dancing round and round. A second time a brace of bullets sped their way, and he rolled over. Quickly seizing their second guns, another volley was fired, and the tiger's further charging was stopped for ever.

"That's a settler," said Mackenzie, as the two instinctively reloaded before going up to the dead foe.

"Yes, rather a neat job altogether," was Norman's reply, as he drove home a bullet, and then shouted to Rugonauth that the game was bagged.

"Sharp, short, and decidedly decisive," observed Hawkes, as he joined them over the body of the striped beauty, now so still, but within so brief a space exulting in the un-

A Spread Eagle Shot.

equalled combination of power and agility belonging to its kind. "You 'slacked his limbs in death' pretty sharply. All I could

lost to view. It made no attempt to ascend in his direction, but turned down the gorge and made direct for the positions of the two

was there, and with his scholar, or disciple, whom he was instructing in the rudiments of his devotional exercises, came forward to

A Charging Shot.

see after he appeared out of the bushes was a yellow streak, then a slight dance, a roll over, and muteness succeeded his roaring. He was straight between myself and you, so that I couldn't have fired even if I had had time."

And later on we have another shot on a charging tiger under a different shikaree—Roopur by name.

Taking a couple of flower-pots, without making an observation to any one or demanding any assistance, the hunter descended the hill by a circuitous path, which led him to the foot of the cliff on which he had been lately standing. Stationing himself behind a boulder, he lighted one of his fireworks and threw it into a recess which gaped black and dim a few yards from him. It fizzed and spluttered, then died out. He approached somewhat nearer, and, lighting the other, threw it beyond a ledge which his closer position enabled him to discern. It had barely touched the ground when a roar came from the recess, and a tiger sprang out, passed within a few yards of him, and, after bounding over the boulders of rock in front, went galloping down the steep hillside.

When Roopur saw the success of his operation, and that the tiger was well clear of him, he jumped on to a rock in the sight of all the beaters, except those immediately above. Pointing with one hand triumphantly to the descending tiger, and with the other gesticulating wildly towards Rugonauth, he shouted, in tones of exultation, "I knew well! I knew well! There he goes! Who said that he wasn't here, and that Roopur was a deceiver? Ha! ha!" And he laughed a laugh disdainful yet triumphant.

His pean was echoed from some three-score dusky throats as the tiger broke in view of those assembled above. It did not require old Rugonauth's yell of warning to announce to the hunters the fact of the animal being on foot.

Hawkes, from his position opposite, at once caught sight of it, and had only time to fire one ineffectual shot before the beast became

lower sportsmen. From out of some bushes it emerged, like a flash, in front of Norman, and bounded into the nullah at full speed. Catching a glimpse, between the stems of two trees, of the meteor-like mass of stripes and yellow shooting by, he fired, but without checking the beast, and in another moment it had passed.

He had just time to shout, "Look out, Mac!" when that individual, seated on a stump not more than six feet above the ground, viewed the tiger dash out of the nullah and take a path which led right up to and past his position. The trigger of his trusty heavy rifle was touched, and a bullet crashed into the advancing body, which, turning a complete somersault, rolled over like a stricken hare. The left barrel was discharged at the doubled-up lump of quivering flesh; but it was unnecessary, for the first had proved fatal.

Norman, who had turned in his tree, now managed to bring his gun to bear, and inquired if he should fire.

"No, no," was the reply. "It's all right. He is as dead as a door-nail."

Hit within a distance of seven or eight yards, the first bullet had struck the tiger in the head, passed through, and, after traversing half the length of the body, lodged just within the skin of the belly.

The whole affair was seen by the beaters from their commanding position on the cliffs and upper ground, and the fall was welcomed with a chorus of approving and congratulatory howls.

Roopur was still standing prominently forward on his rock; and he now again turned his gaze upwards towards Rugonauth, as, pointing with his lean, scraggy arm down to the gap below, he asked him, with a derisive shout, if he was satisfied. He seemed to be so.

Not very long after this there occurred a curious adventure with bears.

A bear was viewed into some jungle considerably beyond the devotee's hut, past which the path took the hunters. The gosein

salute the gentlemen as they passed. But they did not linger there, for they had yet a long way to go.

To each sportsman was assigned a separate spot overlooking a large tract of jungle; but either the beat was not so well arranged as usual, or they were less fortunate, for the bear broke away through the beaters at a place unguarded by any of them, and, unfortunately, not without some damage to one man, who with a few fellows endeavoured to turn him back. Resenting their interference in his plans, he charged at them, knocked one over and passed over his body, luckily without staying to inflict any further injury than that he had already caused.

When the shout arose that a man was attacked, all three of the hunters ran from their positions towards the spot to which they were directed. They found the man lying on the ground and moaning; but though the bear had left the impress of his claws on the fellow's chest, making several deep holes in the flesh, they soon saw that he was not dangerously wounded, and indeed he was more frightened than seriously hurt. Giving orders that he should be conveyed to the gosein's hut and there have the wounds well bathed with cold water, they continued in pursuit of the bear under the guidance of one or two men who exchanged a running fire of questions and answers with the look-outs, now springing along from point to point and marking the bear's course. Dubious though the directions and signals thus given might appear to the uninitiated, they were quite understood by the men who accompanied the hunters.

Stopping now and then for guidance as to their further course, the party went along at a fast walk or jog trot. They had been told to make a short cut across to a large ravine, which they reached; and, after a few half-intelligible shouts, were assured by their guides that the bear was said to be in the ravine and moving parallel with them. Accordingly they kept along one side of it, hoping for some opportunity of getting a shot. The place was filled with trees, and above

their tops on the other side could be discerned the upper part of the cliff which formed its boundary.

The hunters could now distinctly hear the beast as, having slackened his pace, he made his way apparently along the base of the cliff. The crackling of the dried leaves and sticks plainly indicated his whereabouts, but as yet no view of his body was afforded them. Any attempt to approach him by descending into the ravine would have been useless, and only caused his more rapid flight, leaving them far in the rear before the manœuvre could be executed. All they could do was to keep on their present course and await some chance of a view.

Mackenzie had been unable to keep up with his lighter companions, and was now lagging considerably in the rear; when the leaders pulled up to listen, as the sound of the animal's progress had ceased.

Suddenly Norman cried, "There he is!" and Hawkes in the same instant caught a sight of the bear appearing above the tops of the trees. It was visible in its whole length and breadth, stretched to its utmost extent, as it strove to drag itself on to the top of the broken cliff, and presented a most tempting shot. It had surmounted all but the last ledge, and was in the very act of scrambling up that—in which case it would probably have escaped in the neighbouring jungle—when the two rifles, fired so exactly together as to give but one sound, simultaneously sent forth their death messengers.

Up went the animal's fore-paws, and with a loud roar he toppled over and disappeared behind the foliage of the trees. Headlong he fell into the underwood at the foot of the cliff; nor did his progress stop there, for the crashing of bushes and his incessant growling announced that his involuntary career was unchecked, and continued down the slope into the lowest depths of the ravine. There he managed to recover himself, and slunk

back on the line by which he had advanced. He was shortly viewed by some look-outs, and marked into a thick bit of jungle of small extent, where he lay up.

The hunters were quickly again in pursuit; and, as a man declared he could take them up to the very spot in which the wounded beast was lying, they prepared to assail it in the recesses of its stronghold. Leaving Hawkes to guard an outlet in one direction, the other two crept in, and, with much difficulty forcing their way through the tangled undergrowth, soon came upon him, looking nearly expended. He was evidently awaiting their close approach, and directly he saw them, jumped up and charged at them. But a couple of bullets at close quarters effectually stopped his onslaught.

"Don't fire any more," said Mackenzie. "He's meat;" and meat he proved to be.

But it was with tigers that we began this article, and with a tiger we will conclude. The narrow escape of the wretched native is one of the best things in this remarkable book of big game pursuits. It is even better than the chase of the man-eater and the right and left shot, for which we have no space.

The preparations had been duly made. Hawkes, who was stationed in a tree just within the confines of the cover, soon caught a sight of the tiger with his head turned towards the beaters, and evidently listening, quite unconscious of the proximity of any other danger. He levelled and fired, and the beast acknowledged the compliment by turning and darting down the jungle towards Mackenzie in a series of tremendous bounds, at the same time giving audible signs of his dissatisfaction at the treatment he had met with.

The beaters continued on; and when they had reached the level of Hawkes's tree, he descended and joined Norman by a circuitous path. He had hardly done so, and from the bottom of Norman's tree was exchanging with

his friend above a few brief inquiries, when a man was seen to advance into the jungle and move across an opening, as if to communicate with a marker in an adjacent tree.

"What is that fellow doing there, I wonder?" remarked Norman, angrily. "The man is mad. Do you see him, Hawkes?"

The words were hardly spoken, when the tiger sprang out of a thick clump of bushes, and charged straight at the man, who, apparently petrified, made no effort to escape. Indeed there was no time to do so.

The man was unfortunately directly between the enraged beast and the two spectators, so that they were unable to fire, and there seemed no hope for the wretched creature.

"He'll be on him in a moment," ejaculated Norman, with horror. "I must risk it,—I'll fire."

But even as he thus rapidly spoke, and, suiting the action to the word, brought his rifle to bear, the tiger rolled over in a heap, and a rifle crack sounded sharp and ringing.

"Bravo! That dear old fellow, Mac, spoke there. Do you see him, Hawkes, from where you are?"

"I can see Mac," was the reply. "He has changed his place. But I can't make out the tiger; he must be down, for the man has bolted."

"Here, hold aside this bough," Norman said to his gun-bearer. "Let me see! Ah! There he is struggling. I have him now. Steady!"

It was a long, a very long shot; but the bullet sped on its way, and the wounded animal ceased to struggle. The beater, released from the numbing effects of his terror by the overthrow of the tiger, had already, with monkey-like agility, climbed into a tree. The crisis was over, and the man saved; and it mattered little whether Mackenzie's or Norman's bullet had given the death wound.

(THE END.)

TIT FOR TAT: A BREAKING-UP STORY.

BY PAUL BLAKE,

Author of "School and the World," "The Two Chums," etc.

ALLY, it was a blazing afternoon, but the members of the lower forms did not seem to mind the heat much. They were, to a boy, roosting on a paling that ran along the eastern side of the town cricket-field, looking like a row of

magnified swallows on a magnified telegraph wire.

It was a splendid spot to watch the game from; they could see over the

heads of the thin line of spectators who were bold enough to face the sun. Besides, on this side of the field they were out of reach of monitors and masters, who hung about the pavilion or lay in the shade by the hedge.

The match was an event of some importance, the school against the town. It was closely contested too; the town were in for their second innings and had twenty-five runs to make and two wickets to fall.

"They'll do it yet," cried Godfrey, as he rose to his feet in his excitement and nearly went over backward.

"Who is that man, Lambert?" asked Whittingham; "I seem to know his face, but he's never played for the town before."

"I know," chirped Fox, a little chap; "he's the fellow that sells the tickets at the station."

"So he is," exclaimed Godfrey. "Are our men going to be licked by such chaps as he?"

Apparently they were, for Lambert at this moment hit a four, the ball travelling to within ten yards of where the boys were sitting.

"Go it, Parker!" they all shouted as that hot and flushed long-leg came tearing after it. He fielded it neatly and sent it back with a long, low shot; the

boys heard the "ouf!" which accompanied it. The town had given long-leg his quantum of leather-hunting.

The score slowly rose, and the temper of the youngsters rose with it. Not content with encouraging their own side with shouts of applause, they commenced chaffing their opponents, in the hope presumably of making them excited and so bringing about a catastrophe.

Lambert was naturally singled out for most of the wit; he was the most dangerous opponent, and his partner, the doctor to the school, was too important a personage to be treated to chaff. Who could tell what awful revenge he might inflict on them? Suppose he were to order draughts all round!

So the unfortunate Lambert became the butt of all the lower-form wit. Godfrey was the leader, and seemed to have an unending supply of appropriate jokes.

"First-class, Lambert!" he shouted, as a two was hit.

The boys shouted with delight.

"Go it!" cried Fox; "turn the steam on."

Then Godfrey made a joke "expressly," and Smith made an allusion to "puffing," which Godfrey capped by hoping for a "collision" as the batsmen crossed.

By this time Lambert could not help being aware that he was being chaffed.

This was his first match, and he was excited at finding himself the top scorer of his side. He hoped to carry out his bat, but to do that it was necessary he should keep as cool as possible. The shouts and cries of the impertinent boys were irritating to him to the last degree; he would have been more than human if he could have borne them with equanimity. It was a high honour to him to play in the same eleven with several of the chief gentlemen of the town, and to have his comparatively humble station made fun of in this public way was more than he could bear.

He turned round savagely to the horde of tormentors and shook his fist at them.

"Look out! he's making danger signals," cried Godfrey, a remark greeted with roars. However, Parker, who was within earshot, shouted out to the joker that if he did not shut up he would lick him, which rather damped his flow of spirits, for Parker had a heavy hand.

"But it was too late for Lambert to recover his coolness. The laughter and jeers had upset him. He swiped wildly, and came to grief at the hands of long-on.

He was mad with rage, and instead of making for the pavilion, ran across the field towards the row of boys. But the umpire was too quick for him, and caught him.

"That's the way to the pavilion," said Mr. Underwood, pointing to the cheering mass, who were unconscious of what had happened, and only knew that Lambert had played well for his side.

"I'm going to lick those young rascals!" cried Lambert. "They made me lose the game. I know who's the ringleader."

He shook his fist at Godfrey, who was leading the ironical cheering. But Mr. Underwood took him firmly by the arm, and walked him towards the pavilion.

"You've played a good game," he said, soothingly; "don't lose your temper and make an ass of yourself."

Lambert restrained his anger and made for the pavilion without further protest. He was received with enthusiasm, but his delight was spoilt by the knowledge that if it had not been for "those boys" he would have carried out his bat.

He meant to have his revenge, though he had not any clear idea as to the method by which it might be obtained.

Another man, the last, took his place in a couple of minutes—not, however, before Parker had made a descent on the row of small boys and scattered them, like Hector when he attacked a body of ordinary Greek warriors. Godfrey went over the palings backwards in his hurry to escape, and so came in for more damage than Parker would have inflicted on him.

It is no good for me to put a moral at the end of this story, so I will sermonise here for a few lines. In order, however, that no boy may be induced to skip the paragraph I shall insert an important fact in the centre.

Could anything be in worse taste than the conduct of Godfrey and his friends? One of the best features of cricket is the bringing together of different classes on an equal footing. What should we think of a man who began laughing and jeering at a porter because he was not well born, or well educated, or well off? Yet some boys seem to think it a fine joke to hurt the feelings of others by laughing

at them for what they cannot help. Here was Godfrey, a lazy young cub, who shirked his lessons and generally was a nuisance to the world, presuming to consider himself the superior of Lambert, who had raised himself from poverty to a respectable position where he earned enough to keep himself and lay by a trifle besides.

It was a pity that Lambert could not treat Godfrey's chaff with the indifference which it deserved. But unfortunately he was very sensitive on the subject of his social inferiority; it was his weakest point, and he suffered accordingly. So, instead of forgetting his injury, he nursed it, and determined one day to catch one of the young rascals and make him pay for the rest.

The match ended soon after in favour of the town by one wicket. It was aggravating, but the small boys seemed to resent that it was through Lambert's agency. "That was what happened when the town allowed cads like Lambert to play in the town eleven!"

However, in a couple of days the recollection of the defeat was rendered faint by the approach of the day for breaking-up. Exciting examinations were succeeded by the more exciting adjudication of prizes; old debts were paid up (as far as possible), and old scores paid off. Then came the inevitable "show-day," when essays were read and the boys made exhibitions of themselves. After that a couple of days of dulness intervened before the actual departure.

"Had your travelling money sent you yet?" inquired Smith of Godfrey, the day before the general exodus.

"Yes; but pater has only sent me thirteen bob; he might just as well have made it a sov."

"Why, your fare isn't more than five shillings, is it?"

"No," replied Godfrey; "not if I go third class and half ticket. I think I shall try it on once more."

"I can't, worse luck," said Smith; "I've grown three inches this half, and look pretty well sixteen. My guardian's only sent me the exact fare, and I owe Pender five bob, and haven't a copper. I'm in a hole. I s'pose you couldn't lend me some money till next half?"

"No, I couldn't," replied Godfrey; "but if you want five bob, I don't mind giving it you for your bat."

"Why, it cost eight-and-six, and it's just about new!"

"Well, I can't afford to give you more; I must have a shilling or two over for a tuck-out I've promised some fellows this afternoon."

Smith was forced to accept the offer, and the five shillings changed hands. He made one of Godfrey's party, however, and disposed of a shilling's-worth of pastry at the tuck-shop, so that on the whole he did not do so badly.

There were only three besides Smith who joined in the festivities, but at the close Godfrey found himself with exactly six-and-two pence left. However, it would be enough to carry him home, so he did not regret his generosity.

The next day some of the boys were up early; these had to travel long distances. Godfrey was to go by the ten-fifteen, in company with several of his choicest friends. He anticipated an uproarious time.

There was some delay in getting to the station, and the boys when they reached

the platform found they had not many minutes to spare. Godfrey was the first at the pigeon-hole to take his ticket.

"A single 'third' to Manchester; half ticket, please," he said, putting down his five shillings and twopence.

"Half ticket?" asked the clerk, with a slight emphasis.

"Yes," replied Godfrey, looking up. To his dismay he saw Lambert's face peering through the aperture, with an unpleasant smile on it.

"Aren't you over age?" was his demand.

"I've always gone half price," said Godfrey, rather uneasily.

"Yes, but you can't be under twelve all your life," retorted Lambert. "Ten-and-fourpence, please."

"But I haven't got it!" expostulated Godfrey.

"Then you can't go," replied Lambert, coolly. "Pass on, please; you're stopping every one else."

This was true enough: the other boys were crowding behind him, and his final protestations were made out of earshot of Lambert. Godfrey had a moment's despair.

Then a thought struck him. He hastily scribbled a figure 12 on a scrap of paper and put it in his hat. Then he shoved his way unceremoniously to the window again.

"Isay, you Lambert, I'm under twelve," he cried. "Give me my ticket."

"Ten-and-fourpence," demanded the inexorable clerk.

"Give me my ticket, you cad, you!" shouted the desperate boy.

"Go and see the stationmaster if you like," returned Lambert.

The rush of passengers bore the unhappy youngster on again, in a worse plight than ever.

He was almost crying with rage and vexation. He had never had any trouble before in getting his ticket, and had not anticipated any now. How he regretted his ill-advised chaff of his enemy on the cricket-field!

He rushed about to try and find a master, anybody, who would lend him the requisite money, but there was no one to be seen. Then the bell sounded the approach of the train, and he knew that he had but three minutes before it would have gone again.

He tried to get on the platform without a ticket, but the collector stopped him, and turned a deaf ear to his protestations. What could he do?

Ha! he had it. He rushed to the ticket-window again. Fox was the only boy left at it. He caught him by the arm.

"Get two half-tickets, Fox," he whispered. "They won't give me one."

"I can't," replied Fox, "I'm only going to Derby."

"Never mind, ask for one for Manchester, too."

Fox obeyed, but Lambert was too sharp for him.

"Where are you going?" he demanded.

"To Derby."

"Then here's your half-ticket. Everybody must take his own ticket."

Godfrey heard the words and his heart failed him. Lambert could not resist pushing his head out of the window to enjoy his discomfiture.

"I'll teach you to keep a civil tongue in your head in future, my young cock-a-lorum," he said.

Hope was dead in Godfrey's breast, but revenge was not. He dashed at his tormentor and seized his hair.

"Let me go!" shouted Lambert, who was in a most constrained and painful position. He could not get his arms out to free himself. Godfrey held on in a passion. The train was in, but what of that? He could not go by it, and so he held on grimly.

"Hullo! what's the matter here?" cried a loud voice. It was the station-master, who had suddenly appeared on the scene.

Godfrey loosed his hold.

"What is it, young man?" demanded the station-master.

"He won't give me my ticket."

"He says he's under twelve," said Lambert, "and wants to defraud the company."

"How old are you?" asked the station-master.

"Fourteen," was the truthful reply.

"Then you must take a whole ticket; look sharp."

"I haven't enough money."

"Then you must go by the next train."

"But they're to meet me with a trap," pleaded Godfrey.

"Are you from the school?"

"Yes."

"All right, give him his ticket, Lambert. I'll settle it with the doctor. Now look alive, you are keeping the train waiting."

The sense of relief was too great to allow of any thought but that of deliverance. Godfrey seized his ticket and flew to the train, jumping into a compartment that only contained two women and a baby.

He had been fairly punished, and his journey was a decidedly uncomfortable one.

LIFE AMONG THE SHANS;

OR, THE PREDECESSORS OF THE CHINESE.

A FEW years ago when an orator sought for an example of a changeless race he invariably pitched upon the Chinese. It was then supposed that the Celestials were "indigenous," and that they had occupied their present home since the beginning of Babel, slowly developing from savagery to civilisation. But now even the Chinese have gone the way of the Ancient Britons and all the other indigens, and we know that instead of being the first comers on the land they were almost the last.

China, as we hinted in our article on the "River of Golden Sand," derived its language and the elements of its knowledge and institutions from the Bak families, who moved towards the Pacific from Western Asia twenty-three centuries before the Christian era. Instead of a sudden and complete conquest, they replaced the people they found in possession very slowly and partially, and even in these days we find the representatives of the older races still surviving.

One of these races is the Shans, now independent on the Burmese border, whose eighty thousand square miles of the richest land in Asia were recently explored by the expedition under Colonel Street, concerning which Mr. Colquhoun, the colonel's personal assistant, has written so interesting a book. "Among the Shans" is as good in its way as "Across Chryse," and not only is valuable for the information it contains concerning the peculiar people that give it its title, but is of high importance as directing attention to the aim and scope of the French proceedings in Annam and Tonkin, which are destined to provide at China's expense a counterweight to our Indian Empire.

Starting from Maulmain (or, as it used to be spelt, Moulmein) up the Salween—which is one of the great rivers of the world, extending through upwards of sixteen degrees of latitude and fourteen of longitude, rising in the table-land of Thibet and receiving a branch within a hundred and fifty miles of the headwaters of the Indus, Ganges, and Bramaputra—Mr. Colquhoun entered the Yunzaleen and proceeded up it for ninety-five miles to Palpoo, where the expedition was welcomed by Mr. J. C. Davis, the officer in charge of the Salween hill tracts, who is quite a famous man in those parts.

"Some years ago when certain portions of the country were infested by dacoits, he employed his time for weeks in hunting them out of the precipitous country lying to the east of Thatone. So popular had he become amongst the quiet-loving people of the district that he had no trouble in inducing them to join and aid him in freeing the country from these marauders. His many daring feats are household words throughout the country; and he at length became such a terror to the numerous bad characters that many plots were laid by them for his assassination. Timely warning received from friendly villagers enabled him to elude these attempts, and generally to punish the plotters severely, until the chief of the Toung-thoos—a hill tribe of his district whom he had been compelled to have removed from his post—concocted a well-laid plot for taking Mr. Davis's life, which nearly succeeded. One evening when sitting after dinner in his bungalow, with the police officer and a friend who was paying him a visit, his quick ear recognised the sound of stealthy steps steal-

ing along underneath the house, which is raised on posts some eight feet from the ground. Cautiously peeping over the verandah, he saw a gang of armed men surrounding the house. Quickly re-entering his sitting-room, he told the police officer and his friend to guard the front entrance, and, looking for his arms, he found that they had all been removed. Stepping to his bedroom door in order to secure the arms which he always kept at the head of his bed, he found it shut. Retreating a few steps to gain impetus, he rushed forward, and, forcing the door open, scattered the dacoits who were in the room pell-mell. Seeing a dha, or Burmese sword, which had not been removed, he at once secured it, but in so doing received a wound on his face which would have destroyed his sight but for the rim of his spectacles. Quickly drawing his dha, he cut down two men, while the rest escaped, but were shortly after captured and transported for life."

The next halting-place of importance was Hmine Long-Gyee, where some fifty police reside in order to maintain order in the district. "Their main occupations appeared to be betel-chewing, smoking, and sleeping. A less disciplined squad I have seldom seen. A gong is used in place of a bugle for their martial exercise. The chief official is appointed from Bangkok. He wore an official costume, a strange olio, composed of a new German pickelhaube, a second-hand military jacket, a Siamese sarong, and French-polished shoes. His gentility was further evidenced by the length of his fingernails, which showed the impossibility of his having performed manual labour for at least a year. In the bazaar we noticed, as is usual

A Dangerous Foe.

in the East, arsenic, vitriol, and other poisonous drugs, lying in close proximity to more innocent medicines. One specific we found, though not in common use by the natives, was highly prized. It was locally known as bangilla. No specimen of it could be procured in the bazaar, and our worthy medico was much puzzled as to what this famous panacea could be. After much search an empty bottle was found, when it turned out to be the far-famed American 'Painkiller.'"

But it is when we get farther on that we come across the curious people. Take the Lawas, for instance. "The independent Lawas, who are said to number about eighty thousand, are chiefly cultivators of cotton, and are found in the high mountainous country to the northward and westward of Muang Lem; they wear their hair short and uncombed, and their sole garment is a small waist-cloth. They hold little communication with their neighbours, and never willingly permit a stranger to penetrate into their mountains. The Chinese caravans are often robbed by this tribe. The Lawa villages consist of from four hundred to five hundred houses, and are ruled by independent chiefs, who are frequently at war with each other. The heads of the conquered are very much prized, and serve to decorate the warriors' houses. Heads are in requisition for the purpose of propitiating the nats of the woods and hills and insuring good crops. The men obtain the heads by inveigling unsuspecting travellers into an ambush; when secured the heads are passed from house to house, with much ceremony and rejoicing. From this habit they are termed the 'goung-pyat,' or 'head-cutting-off Lawas.'" A truly pleasant people!

Here is another kidnapping story, in which the victims were kept as slaves. "The people of Mokmai, a Shan State lately tributary to Upper Burmah, make no secret of their fear and weakness, and tell many tales of the Red Karens' skill in kidnapping; amongst others of three Karens who came on a party of six of their people, and, seeing they were weaker than their intended prey, waited till night, when, making a large bundle of bamboos interwoven with thorns, they threw them over the Shans as they slept, and, standing on them, with their spears pricked them out one by one, tied their hands, and marched them off."

Slavery is still flourishing in all these countries. In Siam there are seven classes of slaves—those bought with money, those born slaves, those left as slaves by legacy, those made slaves by gift, those who become slaves from gratitude, those who voluntarily enslave themselves in times of famine, and those taken prisoners in war. The value of a man is from £10 to £20, of a woman from £7 to £12, and children from twelve to sixteen years of age are worth from £5 to £7 10s. Those who are born slaves can claim freedom on reaching manhood by paying £6. Husbands may sell their wives, parents their children, and masters their servants, and, in fact, slavery is an institution of fundamental importance in south-eastern Asia, and the sparsity of many of the hill tribes is due to their having in the olden time been systematically hunted like wild cattle to supply the market.

In the hills and forests there is a great quantity of big game, and some of the hunting incidents are fairly exciting. "In North Siam the natives generally say that the chattering of monkeys indicates the likelihood of a tiger being in the vicinity; their fright is not unnatural, as tigers are as fond of them as the carpenter was of the oysters. The plan followed by these tigers is curious. When they see monkeys sporting on the branches they crawl through the grass to the tree, give it a sudden blow with the shoulder, as children do to get apples or nuts, and the poor creatures, which the blow shakes down, are devoured forthwith."

Crocodiles are also good at monkey-catch-

ing. "It is amusing to see the manner in which these creatures catch the apes, which sometimes take a fancy to play with them.

misadventure does not, however, prevent their recommencing the game a few days afterwards."

A Race for Life.

Close to the bank lies the crocodile, his body in the water, and only his capacious mouth above the surface, ready to seize anything that may come within reach. A troop of apes catch sight of him, seem to consult together, approach little by little, and commence their frolics, by turns actors and spectators. One of the most active or most imprudent jumps from branch to branch till within a respectful distance of the crocodile, when, hanging by the paw, and with the dexterity peculiar to these animals, he advances and retires, now giving his enemy a blow with his paw, at another time only pretending to do so. The other apes, enjoying the fun, evidently wish to take part in it, but the other branches being too high, they form a sort of chain by laying hold of each other's paws, and thus swing backwards and forwards, while any one of them who comes within reach of the crocodile torments him to the best of his ability. Sometimes the terrible jaws suddenly close, but not upon the audacious ape, who just escapes; then there are cries of exultation from the tormentors, who gambol about joyfully. Occasionally, however, the paw is entrapped and the victim dragged with the rapidity of lightning beneath the water, when the whole troop disperse groaning and shrieking. The

Rhinoceros hunting in the native fashion is thus described by Mounot, to whom we are through Mr. Colquhoun indebted for the above. "Our party consisted of eight, including myself. I and my servants were armed with guns, and at the end of mine was a sharp bayonet. The Laos Shans had bamboos with iron blades, something between a bayonet and a poignard. The chief's weapon was the horn of a swordfish, long, sharp, strong, and supple, and not likely to break. Thus armed we set off into the thickest part of the forest, with all the windings of which our leader was well acquainted, and he could tell with tolerable certainty where we should find our expected prey. After penetrating nearly two miles into the forest we suddenly heard the crackling of branches and rustling of the dry leaves. The chief went on in advance, signing to us to keep a little way behind, but to have our arms in readiness. Soon our leader uttered a shrill cry as a token that the animal was near; he then began striking two bamboo canes against each other, and the men set up wild yells to provoke the animal to quit his retreat. A few minutes only elapsed before he rushed towards us, furious at being disturbed. Without any sign of fear, but, on the contrary, showing great exultation, as

though sure of his prey, the intrepid hunter advanced lance in hand and then stood still waiting for the creature's assault. I must say I trembled for him, and loaded my gun with two bullets; but when the rhinoceros came within reach and opened his immense jaws to seize his enemy the hunter thrust his lance into him to a depth of some feet, and calmly retired to where we were posted. The animal uttered fearful cries, and rolled over on his back in dreadful convulsions, while all the men shouted with delight. In a few minutes more we drew nearer to him; he was vomiting pools of blood. I shook the chief's hand in testimony of my satisfaction at his courage and skill. He told me that to myself was reserved the honour of finishing the animal, which I did by piercing his throat with my bayonet, and he almost immediately yielded up his last sigh."

As a contrast to this sanguinary scene we may quote what Mr. Colquhoun says about Zimmé.

"The people struck us as fair for Easterns, and some of the women even had rosy cheeks. It was quite pleasant to see a people who

could blush, or, rather, whose blushes could be discerned. Their countenances, on which good-natured frankness was stamped, were of an even more Tartar cast than those of the Burmese—at least, so it seemed to us. The nearly dead silence which reigned in the bazaar was only broken by an occasional half-suppressed but genial laugh. This was a great surprise to us who had so lately left Burmah, where the haggling, chatting, and vociferation in the markets are nearly deafening. Here the people were as quiet as Quakers; business was carried on without people being importuned to buy, and even the necessary chaffering was done in undertones, which only made more noticeable the strange quietude of the scene.

"The principal meat sold in the market is pork, which is plentiful and good; no pig is allowed to be killed until it is brought before a *dine*, the Burmese name for a superintendent, who is appointed by the chief. Pork being a monopoly, a tax of about three shillings is levied from the Chinese butchers on each animal before it is allowed to be slaughtered. Pig's fat, when properly reduced, is

the cosmetic generally in use at Zimmé, and, being unscented, gives anything but an agreeable aroma to the hair of the people. Very little gingelly, castor, or cocoa-nut oil is found in the town. Owing to the frequent cattle thefts which used to occur, special inquiries are made before cattle are allowed to be killed; this accounts for the scarcity of beef in the market. Fish, although plentiful in all the streams, particularly to the north, is rather scarce in the town, most likely because the principal part of the people being Buddhist are therefore adverse to taking life. All fishermen are looked upon here, as at Burmah, as outcasts. Vegetables, such as Karen-potatoes, onions, and chillies, were abundant, as well as cocoa-nuts, plantains, mangoes, and other fruit in considerable variety. A great number of frogs are seen tied up on strings in the food bazaar, and are esteemed a great delicacy by the Shans. Most cases of snake bite which occur here and in Burmah happen during the torchlight hunts after the frogs. The snakes naturally object to men poaching upon their preserves, frogs forming the chief article of their food."

OUR CHRISTIAN NAMES.

NAMES come from so many roots, and have so many branches, that we are really never sure of their meaning. Take John, for instance, which is said to mean "the Lord's grace." There seems to be no doubt but what John comes from Chananach, and with it from the same original we get all the various stages of clipping and contortion that give us Hannah, Anna, Annie, Anne, Annette, Annabella, Joanna, Joannes, Joannot, Johann, Jhone, John, Jack, Hans, Hannibal, and—Honeyball! But although Ivan, Ian, Evans, Ivens, and even Jones, are said to come from the same root, it is possible to derive them from Celtic words without having recourse to the Hebrew or the Greek.

Spelling gives but little clue, as in the case of a pagan name being somewhat similar in sound to one known to the church, the priest at the baptism would naturally pronounce and spell it in the same way as he did the name for which he mistook it. Kathleen may be the diminutive of Kate, and come from Katherine, or it may be the far older Cathlinn, "the pole star," "the beam of the wave."

And then we meet with another difficulty, and that is simply, What is the name? Is it the name as given and spelt at the time, or the name as we now translate it? Are names translatable? Modern custom would seem to say no, and so we are getting back to the Alianores instead of the Eleanors, the Eadgyths instead of the Ediths, and the Eadgars instead of the Edgars. But if that fashion is to hold, we never had a monarch called John. The king who signed Magna Charta never knew the name. It may be all the same thing, but why should we interfere and translate in one case and not in the other? Lackland's name was Jehan; so he was called, and so he signed himself. And as we never had a king called John, so we only had one queen called Mary—and she was the wife of the third William. The Tudor queen was Marie; the Stuart queen too was Marie. It may be said that this is mere quibbling, but it is these slight differences in spelling that cause the difficulties in derivation.

Take this Mary, for instance. Some tell us it comes from Marah, meaning "bitterness," and others tell us it is the same as Miriam, and means "the Star of the Sea." Ellen and Helen seem much alike, but the first may come from the Gaelic, while the other may come from the Greek. It may be Ellen by way of Elaine, or Helen by way of Helena and Helios, "the sun." Names take strange twists sometimes. Mary suggests Elizabeth, and Elizabeth comes from Aaron's wife, Eli

Scheba, "God hath sworn," which has developed also into Isabel and—Jezebel.

Aaron means "high mountain," and is the same as Haroun; Moses means "drawn out of the water." Mosaic pavements, by the way, have nothing to do with Moses; they get their name from the Museum, the temple of the Muses, which they originally decorated. Eleazar, "God will help," has another form in Lazarus, through whom we get the lazaret-house for lepers. Adam means "red earth," Eve "life," Abel "breath," Cain "obtained," Seth "appointed," and Enos "mortal man."

Esau means "hairy," and Jacob "caught by the heel," a name of the same class as Agrippa, which means "born feet foremost." Jacob has had many startling changes. It is the same, of course, as Yakoub—and as James. Nearly all the Jameses are named after the son of Zebedee—not after his lesser namesake the first Bishop of Jerusalem. It was his body that we are told went sailing across the Mediterranean in a marble ship without oar or sail, and drifted to Aria Flava, where Sanctus Jacobus Apostolus changed into Sancto Jacobo Apostolo, which was clipped in time into Sancto Jaco de Compostella, and further clipped into Santiago de Compostella of the pilgrimages.

The pilgrimages gave us the scallop-shell *Pecten jacobæus*; and the saint's former name, Giacompo Apostolo, not only gave us Giacomo, Iachimo, and Iago, but Iacapoostolo, Jacquot, otherwise Jacko, and Jacques, otherwise one of the Jacks—the other Jack coming through the John line from Chananach. "You are a Jacobin and I am a Jacobite," said Walter Scott to Tom Moore, "so we coincide in politics to a T!"

Many of these strange changes are due to individual peculiarities. The New Zealanders, for instance, are unable to pronounce an L, and consequently in Maori Lot becomes Rota, and William becomes Wiremo; and the Kaffirs cannot pronounce the R,

hence Harry in South Africa becomes Hali, and Mary becomes Mali. In this way many of the names have been formed by our children—Mary becoming Mally and Molly, Dorothy becoming Dolly. Dorothy is the same as Theodore, and means "the gift of God;" and Theodore mispronounced becomes none other than the Welsh Tewdwr—otherwise Tudor! Another Welsh contortion comes from David, "the man after God's own heart," which in other forms appears as Daood, Dako, Daveed, Daffydd, and finally Taffy.

Theodore is the Greek representation of Matthew, which is the same as Matthias, the "gift of Jehovah;" Mark means "shining;" Luke is the "light," and is akin to Lucy, Lucinda, Lucius, and Lucifer, so that the hisping mother was not so far out when, in reply to the question as to her child's name, she answered "Luthy, thir!" and the horrified clergyman, mistaking the sound, remarked, "Lucifer! I shall have no such name. I christen this child John!" And as such the girl went through life, though she had only to alter the John into Jhone to get the old spelling of Joan, and so have a name of the right gender.

Many of the old names were distinctive of peculiarities. We have Ovid, with his Naso, on account of his nose; Tully, with his Cicero, on account of the chick-pea on his face; and there are Balbus, the "stammerer;" Scaevola, the "left-handed;" Seneca, the "white-haired;" Plato, "the broad-shouldered;" Plautus, "the splay-footed;" Galba, "the stumpy;" and the Great Dictator "Fabius," from "growing beans," whence perhaps the origin of the modern colloquial of "giving them beans." Cecil means "a blind man;" Blaise means "a lisper;" and Algernon means "wore his whiskers"—three very fashionable names, with sound much superior to sense.

(To be continued.)

OUR NOTE BOOK.

MY FATHER'S WILL.

A good old man was one day walking to the sanctuary with his Bible in his hand, when a friend met him, and said, "Good morning, Mr. Price, what are you reading there?" "Ah! good morning," replied he;

"I am reading my Father's will as I walk along." "Well, and what has He left you?" said his friend. "Why, He has bequeathed to me a hundredfold more in this life, and in the world to come life everlasting." The reply was the means of comforting his Christian friend, who was at the time in sorrowful circumstances.

BOY LIFE AFLOAT.

BY CAPTIAN H., LATE R.N.

VI.—SWIMMING ON THE LINE.

MOST boys are fond of bathing, but the luxury of a bath on or near the equator is almost impossible to describe.

In the first place there is the excessive heat of the atmosphere, and sometimes it is so warm that on rising after having sat down upon the deck for a few minutes you leave a damp patch on the plank where you have sat! Then again, in the neighbourhood of the line, the water is saltier than in any other part of the ocean; and as it is saltier so it is heavier and denser, and being heavier, it supports the body more easily than fresh water or water less salt.

Most of you have no doubt heard of the old practical joke which we have seen played ourselves—*i.e.*, letting a greenhorn have a look at the line. One of the morning watch on the day of the vessel's approach to the equator obtains a long hair and fastens it inside the object lens of the telescope, stretching it from side to side. Then, when the "green hands" come on deck, and have a look round the horizon to see if a strange sail is in sight, there comes a cry, "Oh! oh! There is the line! I can see the equator."

With regard to bathing on the line, a great deal depends upon the nature and disposition of the captain. One will allow all hands who can swim to bathe; another will only permit the officers; while there are a few who are so cautious with respect to sharks that they will only allow bathing with a sail. This is generally a spare studdingsail, which is fastened by the two inner corners to the ship's side, and by the two outer clews or corners to the fore and main yardarm respectively, the belly of the sail being in about five or six feet of water. But this, although frequently written about, is very seldom seen.

There are captains, again, who will never grant permission to bathe for fear of an accident. The captain who is the hero of the following anecdote had some reason for his refusal, and, although we thought it very hard at the time, there is no doubt that he was justified in acting as he did.

It was about twenty years ago, when we were going out to China on board an auxiliary screw. Unfortunately the gunroom steward, who should have provided the extras for the midshipmen's berth, had taken it into his head to leave us at Plymouth, carrying with him the money that ought to have purchased us our sea-stores. Consequently we were upon very short allowance, and some of us youngsters had very frequently to go without.

Now, it so happened that Captain B— adopted a habit as soon as we got into hot weather of towing a net bag overboard, con-

taining sometimes his allowance of salt beef and pork, and at others a bottle or two of wine. The *raison d'être* of which was, that, although it seems strange, yet soaking salt junk in sea-water will make it less salt, while sinking wine or beer two or three fathoms beneath the surface makes it as cool as though it had been iced. All went well for a week or two, and then one morning the line to which the captain's beef was attached was found divided and the beef gone.

"It must have been one of those confounded sharks," observed the captain. "The grab-alls! they'll eat anything."

Strange to say, the meat disappeared the next day and the day following that! Then the sharks left it alone for one night, and then they had it every night for a week.

Then one evening, after quarters, Captain B— observed, "I don't wish to make any insinuations, gentlemen, but I have my suspicions that the sharks that have taken my beef have been taking it from in board, and consequently I am going to put a special sentry over the tow-line. A marine was put on guard accordingly, and the sharks no longer ran away with the meat."

A few weeks passed away, and we were becalmed within twenty miles of the line. It was as hot as a furnace, and there was not air enough to lift a bit of down. The water looked so cool and tempting as we gazed down into its pellucid depths that the temptation to have a plunge became almost irresistible.

At length we decided that Thornton, one of the sub-lieutenants, and a great favourite on account of his obliging manners, should apply to the skipper on the part of the berth for permission to bathe.

Presently Captain B— came on deck almost gasping with the great heat down below. Thornton approached him, and we formed a semicircle a little way behind.

"If you please, sir," commenced the sub-lieutenant, "I have taken the liberty, on the part of the midshipmen's berth, to ask for permission to have a bathe overboard."

The captain looked at us and seemed to hesitate as he took stock of our anxious and perspiring countenances. Finally he replied,

"Well, really, Mr. Thornton, I should be very pleased to give ye all permission, but under the circumstances I daren't! I really daren't!"

"What circumstances, sir?" asked Thornton, seriously.

Then from the twinkle in the skipper's eyes we knew he was going to have a joke at somebody's expense.

"What, don't you know, Mr. Thornton?" he exclaimed, with pretended surprise; "why,

we have been so—infested I may say—with sharks, that for the last few weeks I have been obliged to place a special sentry over my meat and wine when I have allowed it to tow overboard. And fancy the awful responsibility of allowing all you young gentlemen to run such a risk!"

"Really, sir—" began Thornton.

"It's of no use saying a word, Mr. Thornton," interrupted Captain B—, somewhat sharply; "I have refused you, and *I am sure I have given you a most excellent reason.*"

Of course we knew what the real reason was, and as we dragged ourselves away not loud but deep were the blessings lavished upon the heads of the hungry midships whose peculations had deprived their messmates of their swim.

And now, as a finale, for a slight description of a bathe near the line, for, in spite of our title, we have never had the honour of bathing *exactly* on the line, although we have within ten miles.

The vessel was a corvette, becalmed about ten miles from the equator. The sea was without a ripple, although long even rolls ever and anon passed over the face of the deeply-blue water. The blue was of that marvellous tint that you cannot even imagine, much less witness, in or around England.

The captain had given us permission and we had undressed in the starboard chains, the majority of us jumping in or taking headers, but a few descending by the side ladder. For a few minutes we plunged about, enjoying the peculiar feeling of—to coin a word—insinkability, when suddenly some one called out "Let's have a game of leapfrog!"

It was agreed to *nem. con.*, and by degrees we placed ourselves in a long line. Then the one at the farther end commenced, and swimming up to the fellow in front of him, pressed him down with his hands until he could get his feet upon his shoulders, and then pushing him down as far as was possible in that buoyant water. So he passed over every one, finally taking up his position at the other end.

At last, by the time we had all been over everybody else, the first lieutenant came to the ship's side and, informing us that we had been long enough in the water, ordered us on board.

In five minutes, with great reluctance, we were all on board once more, and one thing that we have noticed since several times we observed then for the first occasion, viz., the sticky feeling left by the water about the equator, which has more the effect of syrup than ordinary sea-water.

OUR OPEN COLUMN.

MR. STUDD'S ADVICE TO CRICKETERS.

Mr. E. Arncliffe writes to us from Chelsea under date of June 17:—"Will you kindly insert the enclosed, a copy of a letter from Mr. J. E. K. Studd, in your next issue of the BOY'S OWN PAPER? Mr. Studd has consented to its insertion in any paper likely to reach those to whom its contents may be useful. As your paper reaches a large number of boys, we should be glad for them to have an opportunity of reading Mr. Studd's letter."

"Polytechnic, June 15th, 1885.

"You ask me what I have found the most refreshing drink during the cricket season, and how thirst caused by a long innings in the sun, or a long day's

fielding, can best be subdued, and whether stimulants are necessary. Personally I have never touched stimulants when playing cricket. At Eton, before I was an abstainer, I used always to avoid taking either beer or wine at luncheon during a cricket match, and my last year in the Eton Eleven I never touched stimulants at all. I think one can do more work, and feel it less, if one does not drink any stimulants (by which I mean beer, wine, or spirits, etc.).

"With regard to quenching thirst, I have always found it best to drink as LITTLE as possible of anything; by this means one's thirst does not get so overpowering as it otherwise would. This applies to all sorts of days, and all the year round. It needs a little self-denial, but one is amply repaid by finding oneself almost entirely free from that insatiable thirst which is so trying and so common.

"The best drink I have ever found for a strong thirst is hot tea; but as this cannot often be had, ginger-beer and a lemon used to be the usual beverage. This is generally termed 'lemon squash,' only a bottle of ginger-beer is substituted for a bottle of soda-water. I know of no nicer drink. The ginger-beer sold in stone bottles is far the best. Many other drinks are used, such as gingerade and soda-water half-and-half, but none of them are nearly so good as the lemon and ginger-beer.

"Summary.—1. Drink as little as possible. 2. Hot tea with a little milk. 3. Bottle of ginger-beer with a lemon.

"Yours sincerely,

"J. E. K. STUDD."

OUR PRIZE COMPETITIONS.

(SEVENTH SERIES.)

III. — Fretwork and Carving Competition.

SENIOR DIVISION (ages 18 to 24).

In this Division, which greatly excels both in its fretwork and carving, we largely increase the prize value, and thus apportion it:—

Prizes—One Guinea each.

CHARLES E. GILL (aged 21), Albert Terrace, Oxford Road, High Wycombe, Bucks.

ARTHUR MINTY (aged 21), 6, Robin's Lane, Frome.

LOUIS H. HIGHAM (aged 20), School House, Marston Biggott, Frome.

Prizes—7s. 6d. each.

JOHN HERBERT SMITH (aged 20), Wolverley, Kidderminster.

WILLIAM SCOTT (aged 24), Hermiston, Lilliesleaf, N.B.

HARRY E. WHITE (aged 18), Mount Pleasant, Castle Donington, *via* Derby.

R. A. STEEL (aged 21), Gold Tops, Newport, Mon.

Certificates.

HENRY COOPER, Lime Trees Cottage, Bengoe, Hertford.

G. H. SHAW, Arnold House, Anlaby Road, Hull.

THOS. E. SHILLINGLAW, 59, Hamilton Square, Birkenhead.

W. HARTLEY MIDDLETON, 17, Newton Street, Hyde, near Manchester.

JOHN W. JENNISON, 16, Stowe Street, Greenheys, Manchester.

CHARLES J. ELSE, Bullbridge, Crich, Derbyshire.

GEORGE P. ADAMS, Lower Road, Shoreham.

G. W. FROST, 1, The Park, Newland, Lincoln.

JOHN S. BUCKLAND, Quelfurlong, near Malmesbury, Wilts.

E. H. KITLEY, Witley Park, Haslemere, Surrey.

We have been much gratified with the skill and perseverance evidenced in this subject. Many of the competitors in all the divisions were entirely self-taught, and their work does them great credit. We very heartily congratulate them on their success.

** The products of this Competition we have sent out by the missionary ship *Harmony*, which sailed on July 4th, to the missionaries labouring along the many hundred miles of dreary Labrador coast. We also sent in the same way the greater portion of the Illuminations received in the previous Competition. The remainder we forwarded to King's College Hospital, which is situated in the centre of one of the neediest districts of London; and Mr. T. R. Macdonald, B.A., secretary, in acknowledging the receipt of the parcel, wrote, under date of June 30: "The beautiful present you have sent has safely arrived, and I must ask you to accept my grateful thanks for your kindness. The Illuminations are all charming, but two or three of them are quite lovely works of art. They will, I need hardly tell you, be greatly appreciated in the wards."

Correspondence.

TELE.—There was a telegraph constructed at Geneva by Lesage in 1774, but it was worked with frictional

electricity, and the signals were given by pith balls. The first working telegraph on the modern principle was that along the Great Western Railway in 1835, which at first extended from Paddington to Drayton. The wires were laid in a pipe along the ground. The first overhead telegraph on wires and posts was constructed in India in 1839.

A. D.—Never balance and rule off a cash-book oftener than once a quarter, as the totals are useful for checking purposes. It may be true that in the text-books the cash-book is closed every week or every month, but you need not assume from that that such is the usual practice. It would take up too much room in the manuals to give a twelvemonth's run as an example, and hence the balancing and short periods in order to show the working of the system. You can balance daily if you like—and should do so—but a red-ink entry in the margin is all that you require. The single-column cash-book, in which you debit yourself with an amount when received, credit yourself with it when you pay it to the bank, debit yourself with it when you draw the cheque on the bank, and credit yourself with it when you send the cheque away, was invented when bookkeeping was in its infancy.

W. BUCKLAND.—You can try "Prairie Experiences in Handling Sheep and Cattle," by Major Shepherd, published by Chapman and Co.; or "Ranch Notes," by Reginald Aldridge, published by Longmans. There is a good deal of information in Mulhall's "Handbook of the River Plate," published by Trübner and Co.; and Rose-Innes' "Condition of Chili," published by Stanford. The Argentine Republic have a pamphlet of their own for emigrants, and you can obtain a copy from their Consul-General in London.

NOM DE PLUME (Bristol).—1. The part was not out of print at the time, but for the future we intend keeping the first volumes only in book form. We have a depot in Park Street, Bristol. 2. The Indian clubs at eight pounds apiece would not be too heavy in ordinary cases.

UNION JACK.—Try Dixon Kemp's "Yacht Designing," price three guineas; or his "Yacht and Boat Sailing," price twenty-five shillings, both published at the "Field" office, Strand. Or try Neison's "Boat-building for Amateurs," price five shillings, published by Gill at 170, Strand.

A. J. S.—The income-tax was first imposed by Mr. Pitt in 1798, and it ceased in 1816, after the close of the long Continental war. It was revived by Sir Robert Peel in 1842 for the purpose of meeting a deficit and carrying out his fiscal reforms. Mr. Gladstone issued his manifesto proposing to abolish it in 1874, but his appeal to the country was unsuccessful.

C. C. W.—The stag beetles are the *Lucanidae*, and the stag beetle is *Lucanus cervus*. They are distinguished by the clubbed antennae, the sturdy legs, and the horns on the head and thorax. The larva is curved towards the breast, so that it cannot creep on a flat surface, but has to lie on its side.

VICH IAN VOHR.—The Circassians are now subject to Russia. They inhabit the Caucasus. There is a "Life of Schamyl," and Spencer wrote two or three books about the district, which has now sunk very much out of mind.

PLAGIUS ORBILICUS.—To prepare canvas for oil painting, stretch it on a frame, and wet it with clean water; when it is quite dry give it another stretching. Grind up equal quantities of whitelead and whiting with five parts of linseed-oil, and add to the mixture one part of boiled oil. Plaster this on the canvas with a brush, knife, or trowel: and when it is dry scrape off all colour that has made its way to the back of the canvas, and give the front a second coat. When that is hard and dry rub it smooth with pumice-stone and water. Then grind up two parts of whitelead, two parts of whiting, and one part of burnt ochre, with just a little pumice dust, in raw linseed oil; add to the mixture some gold-size, and thin it with half and half of raw oil and turpentine, and with it give coat after coat, pumicing down each, until the surface suits you to paint on. Finally, buy your canvas ready prepared whenever possible.

THANA DAGEA.—We are much obliged to you for sending us the newsagent's name, and we have taken the necessary steps.

H. VAUGHAN.—1. The capital of British Guiana is Georgetown. You will find a book by C. B. Brown on "Canoe and Camp Life in British Guiana." It was issued in 1870. 2. Esquimaux is on the other side altogether. It is in British Columbia, and is one of our naval stations in the Pacific.

T. DRESDEN.—You dissolve amber in linseed oil. Powder it, and mix it well in the oil, and then carefully simmer it for some time over the fire. Do not let the temperature fall, and do not let the oil boil over. Such things should not be done carelessly: they require much exactness and deliberation as a chemical experiment.

H. S.—The story of the man-eating tree is a romance. It is an exaggeration based on the truth of the existence of insect-eating plants, to which we have frequently referred in these columns.

T. MURRAY.—In show pansies the outline must be a perfect circle, free from any notch or unevenness, and having the petals lying close and evenly on each other. They should be at least an inch and a half in diameter.

REGINALD CRUDEN:

A TALE OF CITY LIFE.

BY

TALBOT BAINES REED,

Author of "My Friend Smith," etc., etc.

"Could you break it to him?"

CHAPTER XX.—SAMUEL SHUCKLEFORD FINDS VIRTUE ITS OWN REWARD.

IT was just as well for Horace's peace of mind, during his time of anxious watching, that two short paragraphs in the morning papers of the following day escaped his observation.

"At — police-court yesterday, two men named Medlock and Shanklin were brought before the magistrate on various charges of fraud connected with sham companies in different parts of the country. After some formal evidence they were remanded for a week, bail being refused."

"A youth named Reginald was yesterday charged at Liverpool with conspiracy to defraud by means of fictitious circulars addressed in the name of a trading company. He was remanded for three days without bail, pending inquiries."

It so happened that it fell to Booms's lot to cut the latter paragraph out. And as he was barely aware of the existence of Cruden's brother, and in no case would have recognised him by his assumed name, the news, even if he read it, could have conveyed no intelligence to his mind.

Horace certainly did not read it. Even when he had nothing better to do he always regarded newspapers as a discipline not to be meddled with out of office hours. And just now, with his mother lying in a critical condition, and with no news day after day of Reginald, he had more serious food for reflection than the idle gossip of a newspaper.

The only other person in London whom the news could have interested was Samuel Shuckleford. But as he was that very morning riding blithely in the train to Liverpool, reading the "Law Times" and flattering himself he would soon make the public "sit up" to a recognition of his astuteness, he saw nothing of them.

He found himself on the Liverpool platform just where, scarcely three months ago, Reginald had found himself that dreary afternoon of his arrival. But, unlike Reginald, it cost the young ornament of the law not a moment's hesitation as to whether he should take a cab or not to his destination. If only the cabman knew whom he had the honour to carry, how he would touch up his horse!

"Shy Street. Put me down at the corner," said Samuel, swinging himself into the hansom.

So this was Liverpool. He had never been there before, and consequently it was not to be wondered at that the crowds jostling by on the pavement without so much as a glance in his direction, neither knew him nor had heard of him. He could forgive them, and smiled to think how different it would be in a few days, when all the world would point at him as he drove back to the station, and say,

"There goes Shuckleford, the clever lawyer, who first exposed the Select Agency Corporation, don't you know?"

Don't you know? What a question to ask respecting S. S.!

At the corner of Shy Street he alighted and sauntered gently down the street, keeping a sharp look-out on both sides of him without appearing to regard anything but the pavement.

Humph! The odd numbers were on the left side, so S. S. would walk on the right and get a good survey of No. 13 from a modest distance.

What, thought he, would the precious Cruden Reginald (ha! ha!) think if he knew who was walking down the other side of the road?

Ah! he was getting near it now. Here was 17 a baker's, 15 a greengrocer's, and 13—eh? a chemist's! Ah, yes, he noticed

that the first floors of all the shops were let for offices, and the first floor of the chemist's shop was the place he wanted.

He could see through the grimy window the top rail of a chair-back and the corner of a table, on which stood an ink-pot and a tattered directory. No occupant of the room was visible; doubtless he found it prudent to keep away from the window; or he might possibly have seen the figure of S. S. advancing down the street.

Samuel crossed over. No name was on the chemist's side-door, but it stood ajar, and he pushed it open and peered up the gloomy staircase. There was a name on the door at the top, so he crept stealthily up the stairs to decipher the word "Medlock" in dim characters on the plate.

"Medlock!" Ho! ho! He was getting warm now. Not only was his man going about with his own name turned inside out, but he had the effrontery to stick up the name of one of his own directors on his door!

Samuel knew Mr. Medlock—whom didn't he know? He had been introduced to him by Durfy, and had supped with him once at the "Shades." A nice pleasant-spoken gentleman, who had made some very complimentary little speeches about Samuel in Samuel's own hearing. This was the man whose name Cruden had borrowed for his door-plate in the hope of further mystifying the public as to his own personality!

Ah! ah! He might mystify the public, but there was one whose initials were S. S. whom it would need a cleverer cheat than Cruden Reginald, Esquire, to mystify!

He listened for a moment at the door, and, hearing no sound, made bold to enter. Had Reginald been in he was prepared to represent that, being on a chance visit to Liverpool, he had been unable to pass the door of an old neighbour without giving him a friendly call.

But he was not put to this shift, for the room was empty. "Gone out to his dinner, I suppose," said Sam to himself. "Well, I'll take a good look round while I am here."

Which he proceeded to do, much to his own satisfaction, but very little to his information, for scarcely a torn-up envelope was to be found to reward the spy for his trouble. The only thing that did attract his attention as likely to be remotely useful was a fragment of a pink paper with the letters "gerskin" on it—a relic Love would have recognised as part of the cover of an old favourite, but which to the inquiring mind of the lawyer appeared to be a document worth impounding in the interests of justice.

As nobody appeared after the lapse of half an hour Samuel considered his time was being wasted, and therefore withdrew. He looked into the chemist's shop as he went down, but the chemist was not at home; so he strolled into the greengrocer's next door and bought an orange, which he proceeded to consume, making himself meanwhile cunningly agreeable to the lady who presided over the establishment.

"Fine Christmas weather," said he, looking up in the middle of a prolonged suck.

"Yes," said the lady.

"Plenty of customers?"

She shrugged her shoulders. Sam might interpret that as he liked.

"I suppose you supply the Corporation next door?" said Sam, digging his countenance once more into the orange.

"Eh?" said the lady.

"The—what's-his-name?—Mr. Reginald—I suppose he deals with you?"

"He did; if you want to know."

"I thought so—a friend of mine, you know."

"Oh, is he?" said the lady, finding words at last, and bridling up in a way that astonished her cross-examiner; "then the sooner you go and walk off after him the better!"

"Oh, very well," said Sam. "He's not at home just now, though."

"Oh, ain't he?" said the woman; "that's funny!"

"Why, what do you mean?"

"Oh, nothing—what should I? If you're a friend of his you'd better take yourself off! That's what I mean!"

"All right; no offence, old lady. Perhaps he's come in by this time."

The lady laughed disagreeably. The Corporation had bought coals of her three months ago.

Samuel returned to the office, but it was as deserted as ever. He therefore resolved to try what his blandishments could do with the chemist's boy downstairs in the way of obtaining information.

That young gentleman, as the reader will remember, had been a bosom friend of Love in his day, and was animated to some extent by the spirit of his comrade.

"Hullo, my man!" said Sam, walking into the shop. "Governor's out, then?"

"Yus."

"Got any lollipops in those bottles?"

"Yus."

"Any brandy-balls?"

"No."

"Any acid-drops?"

"Yus."

"I'll take a penn'orth, then. I suppose you don't know when the gentleman upstairs will be back?"

The boy stopped short in his occupation and stared at Sam.

"What gentleman?" he asked.

"Mr. Medlock, is it? or Reginald. or some name like that?"

"Oh yus, I do!" said the boy, with a grin.

"When?"

"Six months all but a day. That's what I reckon."

"Six months! has he gone away, then?"

"Oh, no—he was took off."

"Took off—you don't mean to say he's dead?"

"Oh, ain't you a rum un? As if you didn't know he's been beaked."

"Beaked? what's that?"

The boy looked disgusted at the fellow's obtuseness.

"Ad up in the p'lice-court, of course. What else could I mean?"

Samuel jumped off his stool as if he had been electrified.

"What do you say?" said he, gaping wildly at the boy.

"Go on; if you're deaf, it's no use talkin' to you. He's been up in the p'lice-court," said he, raising his voice to a shout. "Yesterday—there you are—and there's your drops, and you ain't give me the penny for them."

Samuel threw down the penny, and, too excited to take up the drops, dashed out into the street.

What! yesterday — while he was lounging about town fancying he had the game all to himself. Was ever luck like his!

He rushed to a shop and bought a morning paper. There sure enough was a short notice of yesterday's proceedings, and you might have knocked S. S. down with a feather as he read it.

"Anyhow," said he to himself, crumpling up the paper in sheer vexation, "they won't be able to do without me, I'll take care of that. I can tell them all about it—but catch me doing it now, the snobs, unless they're civil."

With which valiant determination he swung himself into another cab and ordered the man to drive to the head police-station.

The inspector was not in, but his second in command was, and to him, much against his will, Samuel had to explain his business.

"Well, what do you know about the prisoner?" asked the official.

"Oh, plenty. You'd better subpoena me for the next examination," said Sam.

The sub-inspector smiled.

"You're like all the rest of them," he said, "think you know all about it. Come, let's hear what you've got to say, young fellow; there's plenty of work to be done here, I can tell you, without dawdling our time."

"Thank you," said Sam, "I'd sooner tell the magistrate."

"Go and tell the magistrate then!" shouted the official, "and don't stay blocking up the room here."

This was not what Samuel expected. There was little chance of the magistrate being more impressed with his importance than a sub-inspector. So he felt the only thing for it was to bring himself to the unpleasant task of showing his cards after all.

"The fact is—" he began.

"If you're going to say what you know about the case, I'll listen to you," said the sub-inspector, interrupting him, "if not, go and talk in the street."

"I am going to say what I know," said the crestfallen Sam.

"Very well. It's a pity you couldn't do it at first," said the official, getting up and standing with his back turned, warming his hands at the fire.

Under these depressing circumstances Samuel began his story, showing his weakest cards first and saving up his trumps as long as he could. The sub-inspector listened to him impassively, rubbing his hands, and warming first one toe and then the other in the fender.

At length it was all finished and he turned round.

"That's all you know?"

"Yes—at present—I expect to discover more, though, in a day or two."

"Just write your name and address on one of those envelopes," said the sub-inspector, pointing to a stationery case on his table.

Sam obeyed, and handed the address to the official.

"Very well," said the latter, folding the paper up without looking at it, and putting it into his waistcoat pocket, "if we want you we'll fetch you."

"I suppose I had better put my statement down in writing?" said Samuel, making a last effort at pomposity.

"Can if you like," said the sub-inspector, yawning, "when you've nothing else to do."

And he ended the conference by calling to a constable outside to tell 190 C he might come in.

Grievously crestfallen, Samuel withdrew, bemoaning the hour when he first heard the name of Cruden and was fool enough to dirty his hands with a "big job." What else was he to expect when once these official snobs took a thing up? Of course they would put every obstacle and humiliation in the way of an outsider that jealousy could suggest. He had very little doubt that this sub-inspector the moment his back was turned would sit down and make notes of his information, and then take all the credit of it to himself. Never mind, they were bound to want him when the trial came on, and wouldn't he just show up their tricks! Oh, no! S. S. wasn't going to be flouted and snubbed for nothing, he could tell them, and so they'd discover.

It was no use staying in Liverpool, that was clear. The Liverpool police should have the pleasure of fetching him all the way from London when they wanted him, and possibly with Durfy's aid he might succeed in getting hold of another trump-card meanwhile to turn up when they least expected it.

The journey south next day was less blithe and less occupied with the "Law Times" than the journey north had been. But as he got farther away from inhospitable Liverpool his spirits revived, and before London was reached he was once more in imagination "the clever lawyer, Shuckleford, don't you know, who gave the Liverpool police a slap in the face over that Agency Corporation business, don't you know?"

Two "don't you knows" this time!

On reaching home, any natural joy he might be expected to feel on being restored to the bosom of his family was damped by the discovery that his mother was that very moment in next door relieving guard with Miss Crisp at the bedside of Mrs. Cruden.

"What business has she to do it when I told her not?" demanded Sam, wrathfully, of his sister.

"She's not bound to obey you," said Jemima; "she's your mother."

"She is. And a nice respectable mother, too, to go mixing with a lot of low, swindling jail-birds! It's sickening!"

"You've no right to talk like that, Sam," said Jemima, flushing up; "they're as honest as you are—more so, perhaps. There!"

"Go it; say on," said Samuel. "All I can tell you is, if you don't both of you turn the Cruden lot up I'll go and live in lodgings by myself."

"Why should we turn them or anybody up for you, I should like to know?" said Jemima, with a toss of her head.

"What have they done to you?"

"You're an idiot," said Sam, "or you wouldn't talk bosh. Your dear Reginald—"

"Well, what about him?" said Jemima, her trembling lip betraying the inward flutter with which she heard the name.

"How would you like to know your precious Reginald was this moment in prison?"

"What!" shrieked Jemima, with a clutch at her brother's arm.

He was glad to see there was some one he could make "sit up," and replied, with brutal directness,

"Yes—in prison, I tell you; charged

with swindling and theft ever since he set foot in Liverpool. There, if that's not reason enough for turning them up I give you up. You can tell mother so, and say I'm down at the club, and she'd better leave supper up for me; do you hear?"

Jemima did not hear. She sat rocking herself in her chair, and sobbing as if her heart would break. Vulgar young person as she was, she had a heart, and, quite apart from everything else, the thought of the calamity which had befallen the fatherless family was in itself enough to move her deep pity; but when to that was added her own strange but constant affection for Reginald himself, despite all his aversion to her, it was a blow that fell heavily upon her.

She would not believe Reginald was guilty of the odious crimes Sam had so glibly catalogued; but guilty or not guilty he was in prison, and it is only due to the honest, warm-hearted Jemima to say that she wished a hundred times that wretched evening that she could be in his place.

But could nothing be done? She knew it was no use trying to extract any more particulars from Samuel. As it was, she guessed only too truly that he would be raging with himself for telling her so much. Her mother could do nothing. She would probably fly with the news to Mrs. Cruden's bedside, and possibly kill her outright.

Horace! She might tell him, but she was afraid. The news would fall on him like a thunderbolt, and she dreaded being the person to inflict the blow. Yet he ought to know, even if it doubled his misery and ended in no good to Reginald. Suppose she wrote to him?

At that moment a knock came at the door, followed by the entrance of Booms in all the gorgeousness of his evening costume. He frequently dropped in like this, especially since Mrs. Cruden's illness, to hear how she was, and to inquire after Miss Crisp; and this was his errand this evening.

"No better, I suppose?" said he, dolefully, sitting down very slowly by reason of the tightness of his garments.

"Yes, the doctor says she's better; a little, a very little," said Jemima.

"And she, of course she's quite knocked up?" said he, with a groan.

"No. Miss Crisp's taking a nap, that's all; and mother's keeping watch next door."

Booms sat very uncomfortably, not knowing what fresh topic to discourse on. But an inspiration seized him presently.

"Oh, I see you're crying," he said. "You're in trouble too."

"So I am," said Jemima.

"Something I've done, I suppose?" said Booms.

"No, it isn't. It's about—about the Crudens."

"Oh, of course. What about them?"

"Well, isn't it bad enough they have this dreadful trouble?" said Jemima; "but it isn't half the trouble they really are in."

"You know, I can't understand what you mean when you talk like that," said Booms.

"Will you promise, if I tell you, to keep it a secret?"

"Oh, of course. I hate secrets, but go on."

"Oh, Mr. Booms, Mr. Reginald is in

prison at Liverpool, on a charge—a false charge, I'm certain—of fraud. Isn't it dreadful? And Mr. Horace ought to know of it. Could you break it to him?"

"How can I keep it a secret and break it to him?" said Mr. Booms, in a pained tone. "Oh yes, I'll try, if you like."

"Oh, thank you. Do it very gently, and be sure not to let my mother, or his, or anybody else hear of it, won't you?"

"I'll try. Of course every one will

put all the blame on me if it does spread."

"No, I won't. Do it first thing tomorrow, won't you, Mr. Booms?"

"Oh, yes," and then, as if determined to be in time for the interview, he added, "I'd better go now."

And he departed very like a man walking to the gallows.

Shuckelford returned at midnight, and found the supper waiting for him, but, to his relief, neither of the ladies.

He wrote the following short note before he partook of his evening meal:

"Dear D.—Come round first thing in the morning. The police have dished us for once, but we'll be quits with them if we put our heads together. Be sure and come. Yours, S. S."

After having posted this eloquent epistle with his own hand at the pillar-box he returned to his supper, and then went, somewhat dejected, to bed.

(To be continued.)

ON SPECIAL SERVICE: A NAVAL STORY.

By GORDON STABLES, M.D., R.N.,

Author of "The Cruise of the Snowbird," "Stanley O'Grathame," etc.

CHAPTER XIX.—NIGH UNTO DEATH—COLIN FINDS A FRIEND ON BOARD—LIFE IN LIMA—SAUVA ROSA.

FOR days on days the storm continued to rage with unabated fury. The little vessel had already been blown far south of her course, and must have been in lower latitudes than even the Cape of Good Hope itself. More than once the lieutenant had suggested to Commander Channing the propriety of getting up steam.

The commander pooh-poohed the idea at first. Finally he turned upon the lieutenant with lowered brow and flashing eye. "I'm the responsible party on board the Whitterit, Mr. Clarke!" he snapped. "Leave me to know what is best!"

"I beg your pardon, sir," said Mr. Clarke, humbly—he was a very young man—"I thought I'd suggest—"

"Thought you'd suggest, eh? Humph! Thought I'd forgotten we were a steamer, eh? Take me for a born idiot, I suppose? Um?"

This conversation was being carried on on the little quarterdeck, both the captain and his first officer hanging on by the eyebrows, as sailors say, to the mizen rigging, and swaying and rolling about with every lurch, the while the waves were washing over their sea-boots, and the white spray flying high over the funnel.

She was lying-to, but making plenty of leeway nevertheless, though on the whole the little Whitterit was doing just as well and behaving herself as prettily as could be expected of her under such adverse circumstances.

"Tell you what it is, Mr. Clarke," continued the commander, "you have your duty to perform, and I have mine. Yours, sir, is to obey; mine to command. Pardon me, sir, for reminding you of these facts."

"Excuse me, Captain Channing, I didn't—"

"Then *don't!*" cried the commander. "Last time I was out away round the Australian coast I steamed almost every day, because I was on particular service, and what was the consequence, Mr. Clarke—what was the consequence? Got snubbed when I went home; they'd hardly pass my accounts. I'd been wasting her Majesty's coals! Bah! they won't snub me again for the same reason if I—"

The end of the sentence never got out, for a sea cut the captain right in the teeth. He spat and spluttered, shook himself, made a bolt for the companion,

missed it, brought up on the starboard tack, and finally disappeared below.

Commander Channing had not gone below because he wanted to avoid the seas. No, he was a good sailor and a bold, fearless man, though a bit of a tyrant to all under him. He knew everything—or thought he did. Assuredly he knew his own duties, but he ever took it upon him to advise both the engineer and doctor in the discharge of theirs. These officers used to listen to him, say nothing, smile conciliatorily for peace' sake, and go away and do exactly what was right, and nothing more or less.

The little wardroom of the Whitterit was so small that there was just room enough and no more to sit around the table that occupied its centre. But this want of space was rather an advantage than otherwise in a gale of wind like the present, because you could wedge yourself into a corner somehow, with your back against the bulkhead and your feet against something else, and so defy the weather. The water was rushing about inches deep on the wardroom floor, but with one's legs up one did not mind it; it was rather pleasant to listen to than otherwise. Swallowing a cup of tea under such trying circumstances is almost an impossibility. Probably the first lot goes down between your neck and your collar, the second lot into your eye, the third flies over your shoulder; but the fourth will perhaps go the right way. There is nothing like perseverance, and "try again" is a capital motto.

When the seas struck the Whitterit she trembled all over; the coals rattled in the bunkers, the plates jumped out of the pantry, while the biscuits flew out of the tin and got softened in the sea-water on the floor.

The cockroaches had a bad time of it; they are not good sailors, though they try to be. For example, when they go to get a drink in a basin they do not follow the water when it rolls away with the ship's motion. They know that if they did, in the backrush they would be caught and drowned; so they wait till it approaches, then take a sip, and wait another opportunity, and so on.

The engineer—a Scotchman, as most Navy engineers are—was a very idle man now. But he did not mind that; he was a philosopher, so he read books and sung songs to himself and laughed at the weather and at things in general.

Poor Colin, though! It was a sad time

for him, and yet I do not think he suffered so much after all, because he was not quite sensible.

He was down with coast fever, or jungle fever—call it what you will. For several days after the surgeon got him back to his hammock he was delirious, raving about his former messmates and his life in the old Theodora, raving about his far-away home in the bonnie Highlands, about his mother, about Uncle Peter—ay, and even about Dominic Clayton and his schoolmates of the days of yore.

But Colin's own experiences of this illness were those of one long confused and painful dream. There he lay in his hammock, at times asleep, at times awake—if awake it could be called—but never wholly, never clearly, conscious. He cared nothing about what was happening around him, or about those who passed and re-passed him, sometimes stopping though they did to look for a moment into his face or address a few words to him of kindly-meant inquiry. He knew the doctor in rather a strange way; it was not his face, but his arm he knew. He felt this periodically passing in under his head to raise it in order to administer medicine or nutriment, felt the rough sleeve of the pilot-cloth jacket that rubbed against his scalp, and the broad gold lace that always felt so cold against his neck.

This, then, was all he knew of the doctor for many and many a day. The doctor did his duty—faithfully and well, no doubt—but he seldom if ever waited to do any more.

But through all this terrible time Colin was cognisant, somehow or other, that he was not often alone. Some one was near him; a hand was frequently pressed on his aching brow, a folded wet handkerchief would be laid across his burning eyes; when he moaned a voice spoke soothingly into his ear and caused him to drop off to sleep again, and if he murmured "Water," a spoonful of something acid and cool was placed between his lips. Sometimes he even heard snatches of songs, dear old Scottish melodies, trilled low and sweet, that he knew were meant to soothe him like lullabies.

Then there were other sounds that frequently fell on his ear. At first these were the ceaseless roar of the wind through rigging and shrouds, and the eternal flap of the jerking, swaying canvas, or shouts and words of command,

or, high over all, the shrill notes of a boatswain's pipe. At times there would be a more fearful noise than usual, accompanied by smashing of crockery, and ejaculations of surprise followed almost immediately by stillness broken only by the rushing sound of water. On such occasions the little Whitterit would be for a time quite engulfed beneath some mountain wave.

the way. It is altogether an unsatisfactory way of getting on shore, and albeit the day may be bright and the sea smooth and bonnie and blue, the discomfort in landing banishes both pleasure and romance.

Yes, but there is worse perhaps to follow. I mentioned dinner. Well, I for one—and there are thousands who would say the same—like, after a nice walk on

The weather got colder and colder, and Colin began to revive.

Then he saw one morning a broad, laughing, whiskered, not over-clean face close to his pillow.

"You're better," said the face. "They told me you would die, Scottie, but I stuck to you, man, night and day—either me or my mate. And there you are."

"Bless you!" said Colin, faintly, and

"The little Padre jumped out of his chair."

But these sounds became gradually less frequent, and *presently*—as it seemed to Colin—ceased entirely. The "*presently*" really meant after the lapse of a week or more.

Almost *immediately* after this lull—and the "*immediately*" meant another week—Colin "*dreamed*" he heard strange voices on board—or thought he dreamed it—and the ship was strangely still and quiet, with occasionally the rattle of oars in rowlocks alongside, or the rasp of boats against ship's timbers.

No, it was not a dream. The Whitterit was lying now at anchor in the roadstead off Buenos Ayres. Pity that Colin was not out of hammock and well, he so enjoyed seeing new places.

And Buenos Ayres is well worth a visit, though I have heard many sailor-officers run it down, for the most part, I think, for this reason: the ships have to anchor miles from the shore, and a sailor loves his ship and does not like to have so long a row as this when coming off to dinner.

Nor is the long row the worst of it, for the pier is rotten when you get there. Perhaps you may have to wade part of

terra firma, and a deal of sight-seeing, etc., to jump into my boat and spend my evening on my own ship. But at Buenos Ayres, unless you pay for a special boat, you find, if it has come on to blow, you will have to remain on shore all night, and perhaps the next day and night as well, which is not pleasant.

Nevertheless, there is a charm about the town, especially if one has never been there before. It is a great place, built, like Philadelphia, in blocks, and well spread out with a spacious square and noble public buildings, and streets filled with

"Faces and footsteps and all things strange."

Strange animals, strange natives in strange dresses, strange sights, and strange sounds everywhere.

The next thing that Colin became conscious of was cold. The Whitterit was at sea again, and making the most of her passage south—steaming and sailing by turns, for Commander Channing really did not mind steaming if no one advised him to do so.

held out a thin white hand, which the engineer took. "Bless you! I remember; I'll never forget."

"Well," continued the engineer, "I'm at work down here in the engine-room, close by you. If you want me sing out."

So all round the stormy Cape, and for long after, this rough right and honest engineer continued to nurse and tend his countryman as if he had been a child, and, indeed, at the present time Colin felt but very little better.

Round the Cape went the Whitterit; I do not know why, for she might have gone through the Magellan Straits. But I know that when talking one day with his commander, Mr. Clarke, the lieutenant, happened to mention the Straits while asking a question.

"No lubber's holes for me," was the somewhat curt reply.

Round the Horn, then, and north and north went the little Whitterit. Then at long last the weather grew warmer again, and one day Colin was allowed to sit up a little, and next day a grass hammock filled with wraps and rugs was hung for him on deck, and he was taken up.

It seemed new life to him, this. The warm sunshine, the pure ozonic breath of the sea! He felt happier than he had done since he came on board the gunboat. And being happy, he grew dreamy, drowsy, and slept.

He was soon conscious that some one stood near him, and he awoke almost with a start.

There stood the commander with a smile on his face that aimed at being friendly, though it missed the mark.

"There you are," he said; "as snug as you please. Um? Nearly well, aren't you? Um? Thought we'd have to expend a hammock over you, though, and a couple of shot. Ha! ha!"

Colin smiled faintly, and closed his eyes again.

Next day he was taken up as before, the Whitterit being still under steam, and the sea all round glassy, smooth, and blue.

They were not so very far off the land. Shoals were common here, so men were in the chains heaving the lead, and a man aloft to look out ahead for a change in the colour of the water or even breakers.

Gulls and Cape pigeons—so called—were wheeling and screaming around the vessel, and far off Colin could perceive a solitary whale, rising solemnly out of the water every moment, and moving in a direct line southwards.

He had almost fallen asleep, when the sharp "ping" of a rifle fell on his ears, and he heard a voice behind him say,

"That's got him!"

"He's not dead, nor even shy," was the answer.

"He's been following the ship a week."

"Well, he'll be disappointed"—it was the surgeon who now spoke—"for McLeod is going to live."

It was a shark that had been swimming in the wake of the Whitterit. I know from experience that they do so when a man on board is ill and likely to die, but I also know that it is bits of pork fat, and not the man's body, they are after. Sailors have strange superstitions.

But when the ship entered into tropical waters and the sun burned fiercely down on the deck, even with an awning spread, Colin was so weak he could not be taken up. And down below it was stifling, boiling.

Poor Blair, the Scotch engineer, whenever he had a moment to spare, devoted his time and expended his talents in making cooling fruit-drinks for his countryman.

One evening he caught and cooked a flying-fish, and brought it to Colin's hammock. It was delicious. Colin had some, and it would have done your heart good to have seen the joy depicted on Blair's visage as he stood and watched his patient eating. There were tears in his honest blue eyes, and the silly fellow had to turn away his head to hide them.

But Colin was far worse than the engineer had any idea of. Here is the tail end of a conversation that took place between Commander Channing and the surgeon a few days after.

"Well, then," said the doctor, "I wash my hands of the case."

"You'd shift the responsibility of his death on me, eh?"

"Certainly, sir. I advise that Mr. McLeod be sent ashore at Callao and taken up to the high ground at Lima. That will save his life, nothing else will."

"Indeed!" replied Channing. "Um! Very well, doctor, you'll have your own way *this* time. But the responsibility now rests with you."

"Of course—I take it."

"And you'll find him quarters?"

"A friend of mine, sir, a priest, Fedro to name, whose sister I cured when here last, will take him, and gladly."

* * * *

The Whitterit was anchored at Callao, the seaport of Lima, and Colin was taken up the river, the doctor and Blair going with him, and left with Padre Fedro, and during the fortnight that the gunboat lay at anchor, and Channing conducted mysterious diplomatic business at Lima, both Blair and the surgeon made frequent running visits to Colin.

Then away went the Whitterit. She would come back in a month or two—so it was intended.

For more than six weeks Colin hardly ever left his bed. Then he began to revive and take an interest in things around him.

Padre Fedro was a delightful little man, half French, half Spanish, and his sister, a lady of middle age, was a compound of the prim, the quaint, and the curious. In dress she looked so ancient, thus thought Colin. She reminded him of figures he had seen in old pictures by the great masters. But she was kindness personified. Her manner and behaviour towards Colin were that of a nurse and mother combined. She used to glide about the room like a spirit—a good spirit. Yes, she was very gentle. And whenever her brother appeared she would lift one finger and he would come in upon tiptoe.

Well, they were strange people. But, never mind, between them they nursed Colin back to life, and he was soon able to go downstairs and finally out of doors.

What a charming cottage that was! To be sure the walls were so thin that a strong man could have jumped through them, but this is an advantage in a country like this, so subject to earthquakes, for if the houses do fall there is not so much harm done.

Well, the gardens round the cottage were the good padre's especial delight, and such flowers, such climbers, such floral beauty of every kind Colin had never seen before out of a dream. Talking about climbers the verandahs and porches and even the walls of the cottage itself seemed to be held up and supported by them. They even crept in through the ever-open windows and hung in flowery festoons all round the rooms.

Padre Fedro dwelt about a quarter of a mile from the city itself, and high up above it. But glimpses of Lima could be caught from the cottage garden. Lying in the sunlit valley it looks like an enchanted city. I admit it is not quite so enchanting on closer acquaintance. All foreign cities look best at a distance.

The life the padre led was a very quiet one. He was in some way connected with the naval school, but he spoke so little of himself that though Colin stayed with him for five months altogether he never found out what he did every day. He always came back at night. So did Colin from his wanderings in Lima, beyond its walls, and in the country round about.

Now it was one of the most natural things in the world that Colin, being

here in Lima, should tell his friend the padre all about Mildmay's sad history; but he was not prepared for what followed.

The little padre jumped out of his chair, where he was smoking a meerschaum pipe with a bowl nearly as big as his head. He jumped out of his chair, and stuffed the first thing he got hold of into his pipe, by way of putting it out. This happened, by the way, to be his sister's lace handkerchief, but so excited was he that his sister forgave him on the spot.

"I know her, ve know her," he cried. "Ve know your friend Leeftenant Mildmay's leetle daughter. That is Sauva Rosa. Leevies with her old grandma. Pah! it is simple enough—you shall see her to-night."

And Colin did.

Quite a child looked Sauva Rosa. Her blue eyes filled with tears—but she smiled through them—when Colin told her about her father.

"Oh! I know, and I shall see him, shall I not? Grandma has told me all. Tall he is, so handsome, and bold, dressed in blue and gold. Oh! I shall see my father and I shall know him when I see him."

And the young girl clapped her hands with delight. And the padre's sister wiped a tear away with the handkerchief her brother had lately used so unceremoniously and blacked her nose and looked ridiculous.

"You have blacked your nose, my love," said her brother. "But dat is nooding. And my dear Colin," he added, "dis is to me de most delightful of all days in my life. Rosa!"

Rosa ran into the padre's arms and fairly caressed him.

Colin had a little companion now in all his walks and rambles round Lima.

Sauva Rosa's grandmother too came to the cottage almost every night. She did nothing but sit and look admiringly at Colin, and utter an exclamation of surprise now and then. I think the old lady's memory was somewhat gone. Besides she was very deaf, and I'm sure enough of one thing—it took her quite a week fully to comprehend the situation.

How very quickly the time sped now!

Colin could not help fancying himself in a kind of fairy land, so beautiful were all things around him.

Ah! but cases like these come but seldom in the desert of a sailor's life.

(To be continued.)

OUR NOTE BOOK.

A THRILLING ADVENTURE WITH A SHARK.

ALFETTO, the Spanish diver, met with a remarkable adventure and had a very narrow escape while engaged in diving operations on the coast of North Carolina, near the little town of Morehead. The *Atalanta*, one of the best known coasting vessels in those parts, was capsized in a squall on the 22nd of September, 1853, and sank just inside the bar. The owners of the craft contracted with a diving company to have her raised and to recover as much of her cargo as was still serviceable. Alfetto and another diver were engaged to do the work. They made several successful descents, but on the fourth trip the Spaniard met with the adventure of which we speak. His comrade signalled hastily to be drawn up, and when he had been hauled into the boat he related how Alfetto had been seized by a monster white shark and carried off; but scarcely had he done speaking when Alfetto rose from the water about fifty yards from the boat, and was picked up insensible, with several holes punched in the metallic part of his diving suit. Means were successfully adopted to bring him round, and next day he told the following story:—

"As you know, we had made our fourth descent, and, while my companion clambered into the vessel, I waited on the ground till he should attach the cords to draw something out. I was just about to signal to be drawn up for a moment's rest when I noticed a shadowy body moving at some distance above me and toward me. In a moment every fish had disappeared, the very crustaceans lay still upon the sand, and the cuttle-fish scurried away as fast as they could. I was not thinking of danger, and my first thought was that it was the shadow of a passing boat. But suddenly a feeling of terror seized me; I felt impelled to flee from something, I knew not what; a vague horror seemed grasping after me such as a child fancies when leaving a darkened room. By this time the shadow had come nearer and taken shape. It scarcely needed a glance to show me that it was a man-eater, and of the largest size. Had I signalled to be drawn up then it would have been certain death. All I could do was to remain still until it left. It lay off twenty or twenty-five feet, just outside the rigging of the ship, its body motionless, its fins barely stirring the water about its gills. It was a monster as it was, but to add to the horror, the pressure of the water upon my head made it appear as if pouring flames from its eyes and mouth, and every movement of its fins and tail seemed accompanied by a display of fireworks. I was sure the fish was thirty feet long, and so near that I could see its double row of white teeth. Involuntarily I shrunk closer to the side of the vessel. But my first movement betrayed my presence. I saw the shining eyes fixed upon me; its tail quivered, as it darted at me like a streak of light. I shrank closer to the side of the ship. I saw it turn on one side, its mouth open, and heard the teeth snap as it darted by me. It had missed me, but only for a moment. The sweep of its mighty tail had thrown me forward. I saw it turn, balance itself, and its tail quivered as it darted at me again. There was no escape. It turned on its back as it swooped down on me like a hawk on a sparrow. The cavernous jaws opened, and the long shining teeth grated as they closed on my metal harness. It had me. I could feel its teeth grinding upon my copper breastplate as it tried to bite me in two; for fortunately it had caught me just across the middle, where I was best protected. Having seized me, it went tearing through the water. I could feel it bound forward at each stroke of its tail.

Had it not been for my copper helmet my head would have been torn off by the rush through the water. I was perfectly conscious, but somehow I felt no terror at all. There was only a feeling of numbness. I wondered how long it would be before those teeth would crunch through, and whether they would strike first into my back or my breast. Then I thought of Maggie and the baby, and wondered who would take care of them, and if she would ever know what had become of me. All these thoughts passed through my brain in an instant, but in that time the connecting air tube had been snapped, and my head seemed ready to burst with pressure while the monster's teeth kept crunching and grinding away upon my harness. Then I felt the cold water begin to pour in and heard the bubble, bubble, bubble, as the air escaped into the creature's mouth. I began to hear great guns, and to see fireworks and rainbows and sunshine, and all kinds of pretty things; then I thought I was floating away on a rosy summer cloud, dreaming to the sound of sweet music. Then all became blank. The shark might have eaten me then at his leisure, and I never would have been the wiser. Imagine my astonishment, then, when I opened my eyes on board this boat and saw you fellows around me. Yes, sir! I thought I was dead and ate up, sure."

AN ELEPHANT'S REVENGE.

A SHORT time ago, it may be remembered, an "Old Westminster Boy" gave in our columns an account of "A Fatal Elephant Hunt in Ceylon," where, by-the-by, the writer resided for some years. A few weeks after the appearance of the article, a correspondent, signing himself "R. C. D.," wrote to the "Dublin Daily Express," describing the B. O. P. in flattering terms as an "admirable publication," but asking whether the incidents in this particular narrative of the Elephant Hunt could be accepted as facts. The male elephants figuring in the story were said to have had large tusks, and the correspondent in question was puzzled because "he had always understood that in Ceylon male elephants with tusks were very uncommon, and Sir Samuel Baker says that not more than one in 300 is provided with them."

Whereupon Mr. H. Thwaites wrote from Colombo, Ceylon, to give a short history of a tragic occurrence once witnessed there by himself and wife, in company with many others, amongst whom were his Excellency Sir A. Gordon and Lady Gordon, the Right Hon. W. H. Gregory, Major Knollys, A.D.C., the Hon. J. F. Dickson, etc., etc. We give the story in the writer's own words:—

"A high stand had been erected on one side of the kraal to enable those at the scene to view the noosing of the elephants after they had been driven into the enclosure. This stand was handsomely decorated, carpeted, and furnished with seats. All were enjoying the excitement and grand sight of the intelligence displayed by the tame elephants in breaking down the underwood and trees that obstructed the view, and which had been left standing in order to hide the scaffolding from the wild animals until they had been safely kraaled. One huge tusker in particular worked with a will, and seemed determined to do the lion's share of the work. Everything went down before him. Things were in this state, and the tusker was working away steadily about ten yards from the stand when the mahout dropped his spear. He desired his assistant to slip off and bring it round behind the animal from the left to

the right side and hand it up. The man dropped off, picked up the spear, but, instead of doing what he was told, stepped forward to the creature's head on the left side and handed it up. The moment he did so the animal turned sharp half round, and gave the man a butt with the upper part of the trunk, which was rolled up. He gave one cry and went over like a ninepin. In an instant the elephant was on his knees over the man, at whom he made a heavy lunge with both tusks. When he raised his head there was but one tusk, the other had been broken off short, and was left firmly embedded in the ground. Again instantly another lunge, and up came the one tusk covered with blood; again, another heavy lunge, and then he rose proudly, flourished his trunk, and trumpeted a wild paean. It was the old story. On inquiry, it appeared that the dead man had been in the habit of treating the creature with cruelty, and that twice previously during the week had that elephant attempted the man's life, but had been foiled. The third time he saw his opportunity, and seized it on the instant. The victim had said several times that he knew that elephant would kill him some day. His prophecy, owing to his own careless forgetfulness, came true. It is right just at this point to give a word of praise to the mahout, whose conduct probably saved every one in the town from a great danger, certainly from a great scare. The sudden shock when the elephant went down on his knees unseated the mahout, who promptly took a header over the elephant into the brushwood below. With the quickness of a squirrel he was up, skipped round to the animal's stern, and, climbing up by the tail and crupper rope, crawled along the back, and was seated firmly just as the creature rose. The moment the affair was over, before the elephant had time to wink, he was hustled out of the enclosure by the mahout, and securely fastened by four very powerful chains, one to each leg, to separate trees. In half an hour he was perfectly mad and unapproachable even by his keepers, and remained so for a month. Had the driver not regained his seat and control, or given the elephant time to recover his thoughts, he would have become unmanageable, have infected the other tame elephants, one or two of which were already in much the same state, these would all have broken loose, joined the wild ones—twenty-two in number—and the enclosure would certainly not have held them then. The consequences would have been very serious. Infuriated elephants, together with comparatively harmless but terrified wild ones, would have been rushing all over a town made of leaves and twigs, with 5,000 people crowded together, and hundreds of horses and cattle of every description to add to the terror and danger. The coolest elephant-hunter then was in a quiver of anxiety until the dangerous ones were all secured. One word more about the tuskers. Ceylon, as a rule, does not breed tuskers, but there are some, and very fine ones too, and as one who loves the creature in every phase of its life, I am glad to say that tuskers are increasing in numbers. The elephants which were at the kraal just spoken of were collected from all parts of the island, and were nearly all tuskers of the finest quality—old Walliza, ten feet high, marching through the jungle with the stately ponderousness of a Martello Tower, carried his noble tusks and nose so high in the air that a well-grown man could walk under them easily."

FRANK WORTHING'S INCARCERATION.

CHAPTER I.

ELL, old stick-in-the-mud! and when are you going to finish those letters?" inquired Frank Worthing.

"I'll warm your young head if you don't clear out of this!" exclaimed Mr. Budwell, as the first speaker darted out of reach of the ruler which was threateningly presented at him.

The time was 5.15 p.m. The scene was the general office of Messrs. Brown, Millington, and Co., the eminent shipbuilders of Irontown.

Seated at his desk behind a small and seclusive glass partition was Mr. Budwell, the cashier to the firm. Before him lay a half-finished letter, over which he pored and cogitated, evidently in trouble as to its completion. Mr. Budwell was the most regular and faithful servant on the staff; he came down to business five minutes before the time, and went away five minutes after it. His work was always up to date; he stuck at it most laboriously, and though every one in the firm could execute with greater smartness—could run up a cash column say in one-half the time—Budwell was the correct man in the long run. His power of application was immense; he used it studiously, and, in short, was as good a specimen of the proverb "Slow and sure" as one might hope to come across. The first half of his life had been spent at home upon a farm, and after fifteen years of city experience the crust of the farmer still tenaciously clung to him. He was a broad-looking Briton, stolid, brown-faced; and in walking turned one foot inward. He was also, as Frank Worthing more than once asserted, "copious beneath the watch-guard."

Frank Worthing was seventeen years of age, an apprentice to the firm; a bright sparkling youth with a glib tongue and a ready wit, and was every inch of him what Mr. Budwell called "an audacious young blade." One of the scenes which now and then disturbed the business atmosphere of the place was that of Mr. Budwell turning irately down from his stool, and Mr. Worthing flying through the huge swinging door just in time to escape the pursuing ruler.

The first day upon which Worthing started his duties at the firm Mr. Budwell came to initiate him into the routine of his work, and preliminarily inquired, in a patronising, jocular mood,

"Well—my lad! do you know how to—address envelopes?"

"Do you know your alphabet?" was the impudent reply to the sarcasm.

This was three years before the date of our history; but from that very hour a war of words was entered upon between the two which on either part found little cessation. Mr. Budwell was rather inclined to hector, or, as he thought, to command; but as there was little natural authority in his fibre, his efforts in this direction degenerated occasionally into mere bullying.

The lad Worthing's nature was composed of a different metal, which gave

forth sparks whenever struck; the one was, metaphorically speaking, over-refined steel, and the other solid pig-iron.

It was Frank Worthing's special duty before departing for home to collect the letters from their several departments, copy them through the press, address envelopes, and stamp and post them. Sometimes, to his infinite torture, he had to wait until ten minutes past six for the last letter. This resulted in remaining twenty minutes over the orthodox hour, a species of benevolence which he had little mind for. So on this occasion he was indulging in a fret and fume over the tardy operations of Mr. Budwell.

The clock ticked five feverish minutes.

Mr. Budwell toiled painfully. Correspondence was not his forte: the little per night which he had to send away for his department disturbed his equanimity more than the whole flood of communications which the corresponding clerk dismissed in a day. For Mr. Budwell's faculty of language Worthing, with his smart tongue, had a supreme contempt, and this was one of the points of conflict between them.

The creaking pen was placed slowly down. In a persuasive tone Mr. Budwell said,

"I say, Worthing, just run your eye over this. I'm afraid it reads rather queer. Eh?"

"Find out! You should write your letters before this. Here's the third night this week you've made me late over your hieroglyphics. Ask little Smith."

Little Smith was the office-boy, a business man of thirteen, an absent-minded youth, who when hastily called upon was as often as not observed with a sudden start to cram a "penny dreadful" under his waistcoat. Consequently the suggestion was not a pleasing one. Mr. Budwell glared irefully.

"All right, young man; I'll have it out of you!" (A sudden thought.) "Here, you'll have to go for stamps; there's not enough for the letters."

"How can I go for stamps at this time? It's twenty minutes to six now. You should have found out sooner that you had none. Go yourself," replied Worthing, in no small exasperation.

The other chuckled.

"All I know is they'll have to be got. Here, get two pounds'-worth of penny and ten shillings'-worth of ha'penny," and he threw the money from his cash-drawer upon the table.

Worthing took the money. The journey to the post-office and back would slice ten minutes more from his time. But he saw that he was checkmated, and determined to nurse his wrath.

At that moment a head was pushed round the office-door with a

"Hello! Frank; coming home? Oh, I say, late again? Hasn't old Budwell finished his letters yet?"

The voice and the cranium belonged to Jack Bell, an apprentice in the drawing office, a jubilant youth quite after Frank's own heart. He entered, seated himself on the table, and after kicking over a stool, announced,

"Budwell is a rare hand at the letters."

"Right you are, Jack; but he'd be brilliant at raising turnips. Pity he didn't stick to it instead of coming here."

"Will you shut up!" requested the subject of their observations. "How can I get done with all that row?"

A piece of string was lying upon the table. Mr. Bell took it up, tied a noose at each end, and strode lazily behind Mr. Budwell's stool.

"Yes, Mr. Budwell," he said, in the tender tones of consolation, "it's awfully shameful of Worthing to talk to you in that style. Frank, you nigger, go and hang yourself!"

"Clear out of this!" was the response to his condolence.

But before he did "clear out" one noose of the string was deftly slipped on one of the tail buttons of Mr. Budwell's coat and the other on the handle of a half-open drawer beside him. With a nod to Worthing he remounted the table and commenced to sing. Budwell wrote on in angry silence. The gay anthem proceeded, each second becoming louder. Mr. Budwell finally turned half round upon his seat, the ruler in hand.

"I'll never finish these letters to-night. Now clear, while you are safe! Are you going to get out of this office?" he shouted, violently.

"You old cheat!" expostulated Frank. "Letters? what a cram! Tell you what it is, Jack; he's writing another ode to Dinah."

Mr. Budwell jumped down from his stool and made a lunge with his weapon, but the youngsters had bolted, and at his heels lay the drawer with a pile of labels and envelopes scattered right and left. In the centre of the floor he dismally observed the button from the tail of his coat describe two or three wide circles and then settle down at his feet. The final jest had been too much for him. It was a stone which on these occasions Frank Worthing kept in his sling till the very last. It was always powerful to rouse, as he well knew. Its potency came about in this wise. But let us reserve the incident for another chapter.

CHAPTER II.

UPON one occasion, among the "Letters to post," Frank Worthing discovered a missive addressed to a lady—Miss Dinah Willibod, of Melton. The handwriting was Mr. Budwell's; the lady was his maiden aunt, with whom he domiciled at Melton, a rural suburb of the town. The communication was an announcement that the writer intended to pass the night out of town, and was therefore not to be expected home.

But Worthing, with profound sagacity, put another colour on the matter. Instead of posting the letter without remark, as was his duty, he bore it privately round to "the other fellows," hinting loudly at the suspicious fact that the bachelor Budwell was in correspondence with—well, there was the lady's name and address in full; what could be plainer?

The rumour gathered as it rolled. It

culminated! Mr. Budwell was shortly to depart—and at an earlier date than usual—on his summer holidays. What fellow would be such a superlative duffer as to assert that he would return a single man?

The next day Mr. Budwell received advice gratis from Mr. Jack Bell to

"What *do* you mean?" said Budwell, a light suddenly dawning upon him that he was the victim of a conspiracy.

"Mean? That you're too mean to own your—lives out at Melton, does she? What was her name, Worthing? Dinah, Dinah, Dinah—"

"Confound that fellow!" said Bud-

and when Mr. Budwell came downstairs he was seated in the office, looking for all the world as if nothing had happened, but quite ready to mount the stairs again if need be.

The next day Worthing and Jack Bell were in close communion—a circumstance which might safely be counted

"All right, young man; I'll have it out of you!"

"keep copies of all his letters; breach of promise case is awkward, you know." The allusion was not understood; the impertinence was received in silence. Mr. Bright, the bookkeeper, mildly wished him every happiness. Mr. Hunter, one of the yard overlookers—a big, burly man, who had been a boatswain, with a big red face, a big chest voice, and a big stomach-laugh—dropped in to deliver his felicitations. He actually *believed* the report which had been floated so carefully.

"Is it true you're going to get spliced, Budwell? Wish you joy."

"Now, you are too funny to-day, Hunter! Go away!"

"Really! Came to drink your health on the strength of it."

well, and away he flew after the youth, who had been seated all the time at the desk, drinking in the conversation.

Intent on capture, Mr. Budwell rushed right up the staircase. He heard the culprit burst through the "storeroom" door—it was a compartment containing a medley of galvanised tanks, windlasses, and sundry ironware. Mr. Budwell chuckled that he had caught the victim here, and would once for all make his bones pay for his insolence. He took up a tinsmith's mallet which lay on the floor, hammered at each of the large tanks, pounded in every corner of the place, but no Worthing. The fact was that youth had opened the warehouse door at the end of the stores and slipped down the long rope of the goods hoist,

upon as a storm forecast in the office of Brown, Millington, and Co. In the afternoon Worthing was observed to knit his brows furiously in the throes of composition over a paper which contained a multitude of smears and erasures, but which he studiously covered with a piece of blotting-paper at the approach of curious footsteps. Presently he was satisfied, re-wrote the document upon a piece of fancy-tinted paper, and adjourned to the storeroom, where he was joined by John Bell.

"Have you got it ready? Oh, I say, let's read it!" cried that vociferous youth.

Worthing handed him the document, and he read with great glee the following:—

ODE TO MISS DINAH WILLIBOD.

To Melton! to Melton! my dearest, I'll fly,
And there will repose 'neath the shade of
thine eye,
And oh! dearest Dinah, I'll utter sweet
vows
Under those happy Meltonian boughs.

Oh! who could not love thee? my dearest,
I ask;
To hide from thy charms were a burdensome
task;
And though the world chide me for being so
true,
I'll stick to thee still like—Imperial Glue.

It was signed "Samuel Budwell," and written with a thick pen in a round heavy hand, as much like that gentleman's as possible.

Mr. Bell slapped his knee a dozen times. He nearly turned a summersault for sheer joy. This precious effusion seemed to have the power of an intoxicant. By way of business Frank inquired "had he brought the packet?" This Bell produced, and attached the letter to it with a piece of blue silk. But what were the contents of that mysterious packet? If it did not belie its label it contained "Superior Rose Lozenges."

"Has the governor gone, Jack?"

"Yes, half an hour ago. It's five o'clock."

"I'll get down to the office now. Have all the fellows ready, will you, Jack? You'll hear me whistle when all's square;" and he walked down quietly to the office.

"Where have you been all this time?" thundered Mr. Budwell, when he made his appearance.

"On an exciting search after perpetual motion, sir," Frank replied, in a subdued tone.

"I'll search after your head if you don't get on with your work."

For a few minutes he wrote away in terrible earnest. Such was Worthing's desultory method. He idled for nearly a week, and then almost killed himself for a day in getting straight the arrears. Presently he looked up.

"Mr. Budwell, will you kindly give me the red ink?"

"It strikes me you'd better come for it."

This was precisely the answer he wanted, and precisely the one he expected. It suited him perfectly. He went to Mr. Budwell's stool, and while crushing over his shoulder for the ink, quietly fixed the festive packet half in and half out of the pocket in the tail of that gentleman's coat.

He took his seat and began to whistle, quite spontaneously as it were.

Bell came sauntering in the office to Mr. Budwell with a "Good day, squire! How are you? Oh, I say! what's that sticking out of your pocket?" and he gave the packet a sudden fillip which propelled it and the confectioneries over the floor in every direction.

Two of the "drawing office" fellows appeared, strange to say, almost at the same moment on the scene with the big Hunter. There was a scramble for the lozenges.

"Oh, I say, you fellows," cried Bell, "look here, what's dropped out of Mr. Budwell's pocket!"

With a beautiful emphasis he read the lines which we have already perused. He then flew for his life, and was not seen again that evening at the establishment of Brown, Millington, and Co.

"Ho! ho! ho!" laughed the ponderous Hunter, 'who'd have thought it? THE POTE BUDWELL! Ho! ho! ho! that's the best thing I've heerd for a long time."

"You're at the bottom of that, I know," cried Budwell, seizing Frank with a grip which nearly made him shout.

"Dear Mr. Budwell, how could you say such a thing?" replied that youth, looking cool and innocent.

"Leave him alone, Budwell!" said Hunter, which was done after the administration of a cuff to his ears—a penalty which, under the circumstances, he was glad to escape with. Jack Bell kept to the drawing office for the next two days.

After this episode nothing was so effectual in opening the vials of Mr. Budwell's wrath as an allusion to his respected kinswoman, otherwise his fiancée-in-view, Miss Willibod.

From which lively incident in Mr. Samuel Budwell's career we may easily gather that, when plodding through the evening's correspondence, it was not with much amiability he received the information that he was writing another "Ode to Dinah."

(To be continued.)

HEROES OF THE BACKWOODS.

DANIEL BOONE.

(Continued from page 712.)

ONE afternoon three of the girls went out in a canoe on the river at Boonesborough. Playing and splashing with their paddles, they let the canoe drift near the shrubs on the opposite shore. Five Indians were there in hiding, and one of them crept into the water, seized the canoe, and guided it up stream away out of sight of the fort. Next morning at daylight Boone and Calloway were off in pursuit of their daughters, and after a forty miles following of the trail they came upon the Redskins as they were lighting a fire to cook. There was a fight, and the Indians were driven off and the three girls rescued unharmed.

The Indians hung round Boonesborough by night and day. A brave would hide himself behind a tree-stump in the night and deliberately wait for the first man to come out of the fort in the morning for him to shoot at. On the 23rd of May a grand Indian attack took place, lasting till eleven o'clock at night and renewed next day till midnight. During the fight there were many attempts to burn the fort, and three of the defenders were wounded. When the Redskins retreated, Boone and his companions sallied out in pursuit; and his brother was wounded.

Soon afterwards two men were shot at by the Indians, and rushing to the fort for shelter were pursued up to the gate; and one was tomahawked and scalped just as he entered it. Boone, with ten men, rushed at his murderer, and as soon as they had passed into the open a mob of Redskins leapt out of ambush and cut off their retreat. Six of them fell wounded, and Boone's leg was shattered. As he staggered to the ground a savage jumped at him, tomahawk in hand, but before he could strike the blow Simon

Kenton shot him in the heart, and he rolled lifeless on to Boone.

The garrison at Boonesborough were in sore straits for want of salt, and Boone with a party of thirty men went on an expedition nearly a hundred miles to the north, to procure a supply. The water from the springs had to be evaporated, and for four weeks the work went on, the backwoodsmen boiling the salt water in kettles, and never moving out of reach of the guns. One morning when Boone was alone in the woods in pursuit of something for breakfast, he found himself face to face with a couple of Indians. It is this encounter that the artist has chosen for his incident in the life of Boone which now adorns the south door of the Rotunda in the Capitol at Washington. As the first rifle flashed Boone dodged down and the bullet whizzed past him, as the other flash came he sprang aside; and then firing his own piece he shot one of the Redskins through the brain, and leapt out against the other. The Indian raised his tomahawk, but Boone guarded with his gun, and with his hunting-knife stabbed the Indian to the heart.

The expedition was, however, to end in disaster. Another morning when Boone was away hunting for dinner he was surrounded by a band of a hundred and two Indians and taken prisoner. His captors took him back to Salt Licks, where his comrades, at his suggestion, surrendered themselves. The prisoners were taken to Chillicothe, on the Little Miami, and the next month they were marched off to Detroit, where all were ransomed except Boone, whom the Indians would not part with. He returned to Chillicothe and there was formally adopted into the family of Blackfish, one of the Shawnee chiefs.

The ceremony of initiation was not a pleasant one. All the hair was plucked out of his head except a small tuft on his crown which was allowed to grow long and was ornamented with ribbons and feathers. Having fitted him with a proper scalp lock the Redskins took him to the river and gave him a good hard scrubbing to get the white blood out of him. And then having been duly painted to pattern, he was led to the chief to be greeted and clothed. The Indians, knowing that he would be helpless in the woods without ammunition, were very careful in allowing him, so that he might not accumulate any powder and ball. He, however, got over the difficulty by halving his bullets and using small charges of powder. Thus he slowly collected a goodly store. As he seemed contented with his fate the watch on him became gradually relaxed. He often went hunting with his captors, taking good care never to awaken their jealousy by excelling them at their sports; and although he knew the language thoroughly he always pretended to be ignorant of it.

For many weeks he remained at Chillicothe, and then he was sent off with a salt-boiling party to the springs on the Scioto. After a fortnight's hard work at the salt-kettles he returned to Chillicothe, and found to his horror that during his absence four hundred and fifty Indians had been mustered to march on Boonesborough. To disarm suspicion he helped them in their preparations, and by this means became acquainted with their intended plans. He was 160 miles from his home, so that an attempt at escape was no light undertaking, particularly as he would have to make straight across country to reach the fort in time to give the alarm.

The attempt was, however, made, and with success. Rising with the dawn on the 16th of June, he took with him his hoard of ammunition and a few strips of dried venison, and getting deep into the woods, made off straight for home. A crowd of the fleetest and keenest of the Indian hunters went in pursuit, and for five days he kept on through swamp and forest and stream. At the Ohio he was stopped for a time, but he fortunately found a canoe and paddled himself over in safety. When he reached Boonesborough he found that his wife and children had given him up for dead and returned to the Yadin.

Instantly the fort was put into a state of defence, and provisions laid in to stand a siege. Having assured himself that all was safe, Boone dashed out across the Ohio to meet the Redskins, and succeeded in surprising and defeating one of their detachments. He then hurried back; the Indians, four hundred and more in number, closed round him, and the siege of Boonesborough began. The Redskins hid themselves behind the rocks and the trees, and watched the fort as cats watch mice. When the siege was over 125 pounds of bullets were picked up off the ground, to say nothing of what had stuck in the walls of the fort. One of the men, a negro, deserted from the fort and joined the assailants, but Boone detected him firing from a tree, and, watching his opportunity, shot him through the brain. The Indians fired burning tow on to the roof and set it on fire, and one of the men went aloft and extinguished it, though the bullets fell like hailstones around him. At last the Indians gave up the siege in despair, and the old blockhouse became the nucleus of the present town.

Returning to North Carolina, he found that all the old terms of settlement in Kentucky had been abrogated, and that he had no legal right to the land he had looked upon as his own. To secure himself one of the plots that were then on sale he scraped together the necessary fees and started for Richmond in Virginia, where the Land Court then sat. With him he took sundry amounts entrusted him for investment by his neighbours. On his way he was robbed of all he had about him. The blow was a terrible one, but Boone set to work to retrieve the loss. He returned to Boonesborough, which in 1779 had been recognised by the Virginians as the capital of Kentucky. He had been named one of its trustees. He refused to serve, however, and resumed an ordinary settler's life.

On the 6th of October, 1780, he and his brother went on an expedition to Blue Licks. They were caught in an ambush, and Squire Boone was shot and scalped. Daniel escaped, pursued by the Indians and tracked by an enormous dog. For three miles the chase continued, and then Boone, taking advantage of the dog being at fault for a moment, stopped, waited for him, and shot him as he leapt at his throat. Soon after he had another escape, which did not end so tragically. As a shelter for drying tobacco he had built a small hut, and in this, on tiers strung on sticks by means of the split stalks, he had hung the tobacco to dry. He had hoisted up the sticks to the second tier and was standing on the poles when four Indians glided through the door.

"Now, Boone, we got you. You no get away more. We carry you off to Chilicothe this time. You no cheat us any more."

Boone looked down upon their upturned faces, and saw their rifles pointed at him. He recognised the Shawnees, and pleasantly greeted them with,

"Ah, old friends, glad to see you!"

The Indians told him to come down, but Boone explained that he would rather stay and finish the tobacco if they did not mind waiting a few minutes, and then launched forth into an amusing description of how he

cured the tobacco, and ended with a promise to supply them with some. All the time the Indians kept guard at the door, and Boone carefully gathered in his arms the long, dry leaves, full of pungent dust, blinding and stifling as the strongest snuff. Having selected as much as he could hold, he suddenly broke off short in the middle of a sentence, jumped with his bundle on to the Indians, darted through the door, and reached his bullet-proof hut before they could recover from the coughing and sneezing, with which the tobacco dust had nearly driven them mad.

It was not long after this adventure that Boone suggested that a treaty should be made with the Indians regarding an exchange of prisoners. He went single-handed to their camp, and persuaded the chiefs to agree to abolish the torturing and maiming and to treat their prisoners in civilised fashion. The interview took place at Maysville, and the matter was satisfactorily arranged. Henceforth, as far as the Shawnees were concerned, prisoners were respected, and with the most scrupulous fidelity the treaty in all its details was kept in force on both sides. Had Boone done nothing else, his memory would deservedly be cherished by his countrymen.

In 1795 Boone moved off into Missouri, where the Spanish Government, to whom the territory then belonged, appointed him commandant of the district. Soon afterwards the Emperor Napoleon obtained from Spain the whole of the region west of the Mississippi and Missouri, which then bore the name of Louisiana, so that Boone gained a new nationality. He had been a subject of George III., of the United States, of Transylvania, of the Shawnees, of Spain, and now he was a subject of France. In a few years Napoleon, with a view to "giving England a rival on the seas," sold the territory to the United States, and thus enabled the Americans to obtain that extension to the west which proved of such advantage to the development of their country.

Boone remained hunting and trapping in Missouri for three years, and during that time accumulated a large stock of furs. With these he returned to Kentucky, and, having sold them, realised enough to pay off all his debts. Having settled with all his creditors in full, he returned to Femme Osage with just one half-dollar in his pocket. To his friends who came to welcome him he said, in a tone of triumph,

"Now I am ready and willing to die. I am relieved from a burden which has long oppressed me. I have paid all my debts, and no one will say when I am gone, 'Boone was a dishonest man.'"

He lived till he was eighty-six, dying on the 26th September, 1820. In 1845 the citizens of Frankfort, the state-capital of Kentucky, brought the remains of their pioneer from Missouri, and interred them in the cemetery, where a beautiful monument now marks his grave.

One of the most curious stories of Boone is told by Audubon, the naturalist. He gives it in Boone's own words, as told to him when out with the pioneer on a hunting excursion. He describes Boone as follows: "The stature and general appearance of this wanderer of the western forests approached the gigantic. His chest was broad and prominent, his muscular powers displayed themselves in every limb, his countenance gave indication of great courage, enterprise, and perseverance, and when he spoke the very motion of his lips brought the impression that whatever he uttered could not be otherwise than strictly true." After telling how he had once escaped from Indians while they were sleeping off a drunken carouse by rolling to the fire and burning off the thongs that bound him, Boone continued,

"I felt determined to mark the spot, and, walking to a thrifty ash sapling, I cut out of it three large chips, and ran off. I soon reached the river, soon crossed it, and threw

myself into the cane-brakes, imitating the tracks of an Indian with my feet, so that no chance might be left for those from whom I had escaped to overtake me. It is now nearly forty years since this happened, and more than five since I left the whites' settlement, which I might never probably have visited again had I not been called upon as a witness in a lawsuit which was pending in Kentucky, and which I really believe would never have been settled had I not come forward and established the beginning of a certain boundary line. The story is this, sir:

"Mr. Black moved from Old Virginia into Kentucky, and, having a large tract granted to him in the new State, laid claim to a certain parcel of land adjoining Green River, and, as chance would have it, took for one of his corners the very ash-tree on which I had made my mark, beginning, as it is expressed in the deed, at an ash-tree marked by three distinct notches of the tomahawk of a white man.

"The tree had grown much, and the bark had covered the marks. But somehow or other Mr. Black had heard from some one all that I have already said to you, and, thinking that I might remember the spot alluded to in the deed, but which was no longer discoverable, wrote for me to come and try at least to find the place or the tree. His letter mentioned that all my expenses should be paid, and, not caring much about once more going back to Kentucky, I started and met Mr. Black. After some conversation, the affair with the Indians came to my recollection. I considered for a while, and began to think that after all I could find the very spot as well as the tree, if it were yet standing.

"Mr. Black and I mounted our horses, and off we went to the Green River bottoms. After some difficulty—for you must be aware, sir, that great changes have taken place in those woods—I found at last the spot where I had crossed the river, and, waiting for the moon to rise, made for the course in which I thought the ash-trees grew. On approaching the place I felt as if the Indians were there still, and as if I were still a prisoner among them. Mr. Black and I camped near what I conceived the spot, and waited until the return of day. At the rising of the sun I was on foot, and, after a good deal of musing, thought that an ash-tree then in sight must be the very one on which I had made my mark. I felt as if there could be no doubt about it, and mentioned my thought to Mr. Black.

"Well, Colonel Boone," said he, "if you think so I hope that it may prove true; but we must have some witnesses. Do you stay hereabouts, and I will go and bring some of the settlers whom I know."

"I agreed. Mr. Black trotted off, and I to pass the time rambled about to see if a deer was still living in the land. But, ah! sir, what a wonderful difference thirty years makes in a country! Why, at the time when I was caught by the Indians you would not have walked out in any direction more than a mile without shooting a buck or a bear. There were then thousands of buffaloes on the hills in Kentucky. The land looked as if it never would become poor, and to hunt in those days was a pleasure indeed. But when I was left to myself on the banks of the Green River, I dare say for the last time in my life, a few signs only of the deer were seen, and as to a deer itself, I saw none.

"Mr. Black returned, accompanied by three gentlemen. They looked upon me as if I had been Washington himself, and walked to the ash-tree, which I now called my own, as if in quest of a long-lost treasure. I took an axe from one of them, and cut a few chips off the bark. Still no signs were to be seen. So I cut again until I thought it time to be cautious, and I scraped and worked away with my butcher-knife until I did come to where my tomahawk had left an impression on the wood. We now went regularly to work, and scraped at the tree

with care until three hacks, as plain as any three notches ever were, could be seen. Mr. Black and the other gentlemen were astonished, and I must allow that I was as much

surprised as pleased myself. I made affidavit of this remarkable occurrence in presence of these gentlemen. Mr. Black gained his cause. I left Green River, and came to

where we are now; and, sir, I wish you a good night."

(THE END.)

PETHERICK'S PERIL.*

By E. W. THOMSON.

The Land's End, Cornwall.

EACH storey of the Shelton Cotton Factory now building is fifteen feet between floors; there are seven such over the base-

* Mr. E. W. Thomson, of Montreal, a talented young Canadian, formerly a member of the editorial staff of the "Toronto Globe," sends us a letter of greeting from the colonies, accompanied by a MS. that he hoped might find a place in our columns, especially as representing our colonial admirers. The story, we are happy to say, is accepted, and will be commenced in our next number. This week, by way of introducing Mr. Thomson to our readers, we reprint a story of his, which he enclosed with his MS., and for which he carried off, it seems, in open competition, the first prize of five hundred dollars offered by an American journal, the "Youth's Companion," this story being one of some seven thousand sent in.

ment, and this rises six feet above the ground. The brick walls narrow to eight inches as they ascend, and form a parapet rising above the roof. One of the time-keepers of the factory, Jack Hardy, a young man about my own age, often runs along the brick-work, the practice giving him a singular delight that seems to increase with his proficiency in it. Having been a clerk in the works from the beginning, I have frequently used the parapet for a footpath, and although there is a sheer fall of one hundred feet to the ground, have done it with ease and without dizziness. Occasionally Hardy and I have run races on the opposite walls, an exer-

cise in which I was invariably beaten, because I became timid with increase of pace.

Hopelessly distanced last Wednesday, while the men were off at noon, I gave up midway, and looking down observed the upturned face of an old man gazing at me with parted lips, wide eyes, and an expression of horror so startling that I involuntarily stepped down to the bricklayers' platform inside. I then saw that the apparently frightened spectator was Mr. Petherick, who has been for some weeks paymaster and factotum for the contractors.

"What's the matter, Petherick?" I called down. He made no answer, but walking off

rapidly disappeared round the mill. Curious about his demeanour, I descended, and, after some little seeking, found him smoking alone.

"You quite frightened me just now, Petherick," said I. "Did you think I was a ghost?"

"Not just that," he replied, sententiously.

"Did you expect me to fall, then?" I inquired.

"Not just that either," said he. The old man was clearly disinclined to talk, and apparently much agitated. I began to joke him about his lugubrious expression, when the one o'clock bell rang, and he shuffled off hastily to another quarter.

Though I was puzzled awhile over the incident, it soon passed so entirely from my mind that I was surprised when, passing Petherick in the afternoon, intending to go aloft, he said, as I went by,

"Don't do it again, Mr. Frazer!"

"What?" I stopped.

"That!" he retorted.

"Oh! You mean running on the wall," said I.

"I mean going on it at all!" he exclaimed. His earnestness was so marked that I conceived a strong interest in its cause.

"I'll make a bargain with you, Mr. Petherick. If you tell me why you advise me I'll give the thing up!"

"Done!" said he. "Come to my cottage this evening, and I'll tell you a strange adventure of my own, though perhaps you'll only laugh that it's the reason that it sickens me to see you fooling up there."

Petherick was ready to talk when Jack and I sat down on his doorsteps that evening, and immediately launched into the following narrative:—

"I was born and grew to manhood near the high cliffs of the coast of Cornwall. Millions of sea-fowls made their nests along the face of those wave-worn precipices. My companions and I used to get much excitement, and sometimes a good deal of pocket-money, by taking their eggs. One of us, placing his feet in a loop at the end of a rope and taking a good grip with his hands, would be lowered by the others to the nest.

"When he had his basket full they'd haul him up, and another would go down. Well, one afternoon I thus went dangling off. They paid out about a hundred feet of rope before I reached the ledge and let go."

"What ledge?" asked Jack.

"Oh!" said Petherick, after a pause. "I see it will be troublesome to make you understand the situation." Then, after reflecting for some moments, "You must know that most of the cliffs along that coast overhang the sea. At many points one could drop six hundred feet into the sea, and then be forty or fifty feet from the base of the rock he left. The coast is scooped under by the waves. But in some places the cliff wall is as though it had been eaten by seas once running in on higher levels. There will be an overhanging coping, then, some hundred feet down, a ledge sticking out farther than that of the top; under that ledge all will be scooped away. In places there are three or four such ledges, each projecting farther than those above. These ledges used to fall away occasionally, as they do yet, I am told, for the ocean is gradually devouring that coast. Where they did not project farther than the upper coping, one would swing like a pendulum on the rope, and get on the rock, if not too far in, then put a rock on the loop to hold it till his return. When a ledge did project so that one could drop straight on it, he hauled down some slack and left the rope hanging."

"Did the wind never blow it off?" asked Jack.

"Seldom, and never out of reach," said the old man. "Well, the ledge I reached was like this," illustrating with his hands. "It was some ten feet wide; it stuck out maybe six feet farther than the cliff top; the rock

wall went up pretty near perpendicular, till near the coping at the ground, but below the ledge the cliff's face was so scooped away that the sea, five hundred feet below, ran in under it nigh fifty feet.

"As I went down, thousands of birds rose from the jagged places of the precipice, circling round me with harsh screams. Soon touching the ledge, I stepped from the loop, and, drawing down a little slack, walked off briskly. For fully a quarter of a mile the ledge ran along the cliff's face almost as level and even in width as that side-walk. I remember fancying that it sloped outward more than usual, but instantly dismissed the notion, though Gaffer Pentreath, the oldest man in that country side, used to tell us that we should not get the use of that ledge always. It had been as steady in our time as in his grandfather's, and we only laughed at his prophecies. Yet the place of an old filled fissure was marked by a line of grass, by tufts of weeds and small bushes, stretching almost as far as the ledge itself, and within a foot or so of the cliff's face.

"Eggs were not so many as usual, and I went a long piece from my rope before turning back. Then I noticed the very strange conduct of the hosts of sea-fowls below. Usually there were hundreds, but now there were millions on the wing, and instead of darting forth with playful motions, they seemed to be wildly excited, screaming shrilly, rushing out as in terror, and returning in masses as though to alight, only to wheel in dread, and keep the air in vast clouds.

"The weather was beautiful, the sea like glass. At no great distance two large brigs, and nearer, a small yacht lay becalmed, heaving on the long billows. I could look down her cabin stairway almost, and it seemed scarcely more than a long leap to her deck.

"Puzzled by the singular conduct of the sea-birds, I soon stopped and set my back against the cliff, to rest while watching them. The day was deadly still and very warm.

"I remember taking off my cap and wiping the sweat from my face and forehead with my sleeve. While doing this I looked down involuntarily to the fissure at my feet. Instantly my blood almost froze with horror. There was a distinct crack between the inner edge of the fissure and the hard-packed, root-threaded soil with which it was filled! Forcefully I pressed back, and in a flash looked along the ledge. The fissure was widening under my eyes, the rock before me seemed sinking outward, and with a shudder and a groan and roar, the whole long platform fell crashing to the sea below! I stood on a margin of rock scarce a foot wide, at my back a perpendicular cliff, and five hundred feet below the ocean, now almost hidden by the vast concourse of wheeling and affrighted birds.

"Can you believe that my first sensation was one of relief? I stood safe! Even a feeling of interest held me for some moments. Almost coolly I observed a long and mighty wave roll out from beneath. It went forth with a high, curling crest—a solid wall of water! It struck the yacht stern on, plunged down on her deck, smashed through her swell of sail, and swept her out of sight for ever.

"Not till then did my thoughts dwell entirely on my own position; not till then did I comprehend its hopelessness! Now my eyes closed convulsively, to shut out the abyss down which my glance had fallen; shuddering, I pressed hard against the solid wall at my back; an appalling cold slowly crept through me! My reason struggled against a wild desire to leap; all the demons of despair whispered me to make an instant end. In imagination I had leaped! I felt the swooning helplessness of falling, and the cold, upward rush of air!

"Still I pressed hard back against the wall of rock, and though nearly faint from terror, never forgot for an instant the death at my

feet, nor the utter danger of the slightest motion. How long this weakness lasted I know not: I only know that the unspeakable horror of that first period has come back in waking dreams many and many a day since; that I have long nights of that deadly fear; that to think of the past is to stand again on that narrow foothold, and to look around on the earth is often to cry out with joy that it widens away from my feet!"

The old man paused long. Glancing sideways at Jack, I saw that his face was pallid. I myself had shuddered and grown cold—so strongly had my imagination realised the awful experience that Petherick described.

"Suddenly," said the old man, "these words flashed to my brain: 'Are not two sparrows sold for a farthing? And one of them shall not fall on the ground without your Father. Fear not, therefore; ye are of more value than many sparrows.' My faculties so strained, I seemed to hear the words. Indeed often yet I think that I did truly hear a voice utter them very near me.

"Instantly hope arose, consciously desperate indeed, but I became calm, resourceful, capable, and feeling unaccountably aided. Careful not to look down, I opened my eyes and gazed far away over the bright sea. The rippled billows told that a light outward breeze had sprung up. Slowly, and somewhat more distant, the two brigs moved towards the horizon. Turning my head, I could trace the narrow stone of my footing to where my rope dangled, perhaps three hundred yards distant.

"It seemed to hang within easy reach of the cliff's face, and instantly I resolved and as instantly proceeded to work towards it. No time remained for hesitation. Night was coming on. I reasoned that my comrades thought me killed. They had probably gone to view the new condition of the precipice from a lower station, and on their return would haul up and carry off the rope. I made a move towards it. Try to think of that journey!"

I nodded to him silently.

"Shuffling sideways very carefully, I had not made five yards before I knew that I could not continue to look out over that abyss without glancing down, and that I could not glance down without losing my senses. You have the brick line to keep eyes on as you walk along the factory wall; do you think you could move sideways along it erect, looking down as you would have to? Yet it is only one hundred feet high. Imagine five more such walls on top of that and you trying to move sideways, incapable of closing your eyes, forced to look down, from end to end, yes, three times farther! Imagine you've got to go on or jump off! Would you not, in an ecstasy of nervous agitation, fall to your knees, get down face first at full length, clutch by your hands, and with shut eyes feel your way? I longed to lie down and hold, but of course that was impossible."

"Still there was a wall at your back," observed Jack.

"That made it worse! The cliff seemed to press outward against me. It did in fact incline very slightly outward. It seemed to be thrusting me off. Oh, the horror of that sensation! Your toes on the edge of a precipice, and the implacable, calm mountain apparently weighing you slowly forward."

Beads of sweat broke out over his white face at the horror he had called before him. Wiping his lips nervously with the back of his hand, and looking askant, as at the narrow pathway, he paused long. I saw its cruel edge and the dark gleams of its abysmal water.

"I knew," he resumed, "that with my back to the wall I could never reach the rope. I could not face towards it and step forward, so narrow was the ledge. Motion was perhaps barely possible that way, but the breadth of my shoulders would have forced me to lean somewhat more outward, and this I dared not and could not do. Also to see a

solid surface before me became an irresistible desire. I resolved to try to turn round before resuming the desperate journey. To do this I had to nerve myself for one steady look at my footing.

"In the depth below the myriad sea-fowl then rested on the black water, which, though swelling more with the rising wind, had yet an unbroken surface at some little distance from the precipice, while farther out it had begun to jump to whitecaps, and in beneath me, where I could not see, it dashed and churned with a faint, pervading roar that I could barely distinguish. Before the descending sun a heavy bank of cloud had risen. The ocean's surface bore that appearance of intense and angry gloom that often heralds a storm, but save the deep murmur going out from far below my perch, all to my hearing was deadly still.

"Cautiously I swung my right foot before the other, and carefully edged around. For an instant, as my shoulder rubbed against the rock, I felt that I must fall. I did stagger, in fact, but the next moment stood firm, face to the beetling cliff, my heels on the very edge, and the new sensation of the abyss behind me no less horrible than that from which I had with such difficulty escaped. I stood quaking. A delicious horror thrilled every nerve. The skin about my ears and neck, suddenly cold, shrank convulsively.

"Wild with fear, I thrust forward my head against the rock, and rested in agony. A whirl and wind of sudden wings made me conscious of outward things again. Then a mad eagerness to climb swept away other feeling, and my hands attempted in vain to clutch the rock. Not daring to cast my head backward, I drew it tortoise-like between my raised shoulders and—chin against the precipice—gazed upward with straining of vision from under my eyebrows.

"Far above the dead wall stretched. Side-wise glances gave me glimpses of the projecting summit coping. There was no hope in that direction. But the distraction of scanning the cliff-side had given my strained nerves some relief; to my memory again returned the promise of the Almighty and the consciousness of His regard. Once more my muscles became firm-strung.

"A cautious step sidewise made me know how much I had gained in ease and security of motion by the change of front. I made progress that seemed almost too rapid for some rods, and even had exultation in my quick approach to the rope. Hence came freedom to think how I should act on reaching it, and speculation as to how soon my comrades would hunt me up.

"Then the idea rushed through me that they might even yet draw it away too soon, that while almost in my clutch it might rise from my hands. Instantly all the terrors of my position returned with tenfold force; an outward thrust of the precipice seemed to grow distinct, my trembling hands told me that it moved bodily towards me, the descent behind me took an unspeakable remoteness, and from the utmost depth of that sheer air seemed to ascend steadily a deadly and chilling wind. But I think I did not stop for an instant. Instead a delirium to move faster possessed me, and with quick, sidelong steps—my following foot striking hard against that before—sometimes on the point of stumbling, stretched out like one crucified, I pressed in mortal terror along.

"Every possible accident and delay was presented to my excited brain. What if the ledge should narrow suddenly to nothing? Now I believed that my heels were unsupported in air, and I moved along on tiptoe. Now I was convinced that the narrow pathway sloped outward, that this slope had be-

come so distinct, so increasingly distinct, that I might at any moment slip off into the void. But dominating every consideration of possible disaster, was still that of the need for speed, and distinct amid all other terrors was that sensation of the dead wall ever silently and inexorably pressing me outward.

"My mouth and throat were choked with dryness, my convulsive lips parched and arid; much I longed to press them against the cold, moist stone. But I never stopped. Faster, faster—more wildly I stepped—in a delirium I pushed along. Then suddenly before my staring eyes was a well-remembered edge of a mossy stone, and I knew that the rope should be directly behind me. Was it?

"I glanced over my left shoulder. The rope was not to be seen! Wildly I looked over the other—no rope!

"But what! Yes, it moves! it sways in sight! it disappears—to return again to view! There was the rope directly at my back, swinging in the now strong breeze with a motion that had carried it away from my first hurried glances. With the relief tears pressed to my eyes and—face bowed to the precipice, almost forgetful for a little time of the hungry air beneath—I offered deep thanks to God for the delivery that seemed so near."

The old man's lips continued to move, but no sound came from them. We waited silent while with closed eyes and bent head he remained absorbed in the recollection of that strange minute of devoutness.

"I stood there," he said at last, "for what now seems a space of hours, perhaps half a minute in reality. Then all the chances still to be run crowded upon me. To turn around had been an attempt almost desperate before, and certainly, most certainly, the ledge was no wider where I now stood. Was the rope within reach? I feared not. Would it sway towards me? I could hope for that.

"But could I grasp it should I be saved? Would it not yield to my hand—coming slowly down as I pulled, unrolling from a coil above, trailing over the ground at the top, running fast as its end approached the edge, falling suddenly at last? Or was it fastened to the accustomed stake? Was any comrade near who would summon aid at my signal? If not, and if I grasped it, and if it held, how long should I swing in the wind that now bore the freshness and tremors of an imminent gale.

"Now again fear took hold on me, and as a desperate man I prepared to turn my face once more to the vast expanse of water and the nothing beyond that awful cliff. Closing my eyes, I writhed, with I know not what motions, easily around till again my back pressed against the precipice. That was a restful sensation. And now for the decision of my fate! I looked at the rope. Not for a moment could I fancy it within my reach! Its swayings were not, as I had expected, even slightly inward, but when falling back against the wind it swung outward as though the air were eddying from the wall.

"Now at last I gazed down steadily. Would a leap be certain death? The water was of immense depth below. But what chance of striking it feet or head first? What chance of preserving consciousness in the descent? No, the leap would be death; that at least was clear.

"Again I turned to the rope. I was now perfectly desperate, but steady, nerved beyond the best moments of my life, good for an effort surpassing the human. Still the rope swayed as before, and its motion was very regular. I saw that I could touch it at any point of its gyration by a strong leap.

"But could I grasp it? What use if it were not firmly secured above? But all time for hesitation had gone by. I knew too well that strength was mine but for a moment, and that in the next reaction of weakness I should drop from the wall like a dead fly. Bracing myself, I watched the rope steadily for one round, and as it returned against the wind, jumped straight out over the heaving Atlantic.

"By God's aid I reached, touched, clutched, held the strong line! And it held! Not absolutely. Once, twice, and again it gave with jerks that tried my arms. I knew these indicated but tightening. Then it held firm and I swung turning in the air, secure above the waves that beat below.

"To slide down and place my feet in the loop was the instinctive work of a moment. Fortunately it was of dimensions to admit my body barely. I slipped it over my thighs up to my armpits just as the dreaded reaction of weakness came. Then I lost consciousness.

"When I awakened my dear mother's face was beside my pillow, and she told me that I had been tossing for a fortnight in brain fever. Many weeks I lay there, and when I got strong found that I had left my nerve on that awful cliff-side. Never since have I been able to look from a height or see any human being on one without shuddering.

"So now you know the story, Mr. Frazer, and have had your last walk on the factory wall."

He spoke truer than he knew. His story has given me such horrible nightmares ever since that I could no more walk on the high brickwork than along that narrow ledge in distant Cornwall.

[The author, it is only right to say, greatly exaggerates the height of the Cornwall cliffs, grandly impressive as they are.—Ed. B.O.P.]

OUR CHRISTIAN NAMES.

(Continued from page 718.)

THOMAS is the same as Didymus, and means "a twin;" it owes its popularity in this country not to the apostle but to the great saint of Canterbury—A'Becket. Stephen is one of the finest and oldest of names; it means the "crown" of parsley which the athletes of old won in their games. Another of the Greek names is Nicholas, the "victory of the people," derived from the Nike "victory," which appears also at the end of Berenice, a name almost unrecognisable under its change into Veronica. At one time Nicholas and Marie were the commonest of names. Hence, say some, the answer to the "What is your name?" of the Church Catechism, "N or M, as the case may be"—an answer that could be most truthfully given by Osman of Suakin, who seems to be Digna or Digma as we please.

Peter, if from Petros, means "a stone," if from Petra it means a "rock." The diminutive is Petronilla, which becomes Petronel or Pernell or Parnell. Before we leave the political frontier we may mention that Henry may mean a "home ruler"! It is a fine old name, coming from Heimdall, the porter of Valhalla, who is to rouse the gods to their last fight by his trumpet, and is to slay and be slain by Loki. Heim is the "home"—and the "ham," too, of the Buckingham, Nottingham, the big "ham" of the smaller "hamlet"—and dall is the equivalent for strong or powerful. Heimdall, by way of Heimrich, Heinrich, Hendriks, and Henry, gives us Henrietta and Hetty.

George comes from two Greek words, Ge, "the earth," and— But this sounds too strangely familiar, and with the note that George means an "earthworker" or "agriculturist," we hurry on to Ambrose, "the true life-giving elixir." Laurence comes from Lares, "the household gods;" Leonard is of course "a lion;" Philip is "a lover of

horses;" Eber, "the boar," gives us Everard, Eberhard, and Evremond; and Beorn, "the bear," gives Bernard and Bernicia.

Hilda gives Ildefonso, whence Alphonso and Alonzo; and Ataulphus, "helping father," becomes misspelt as Adolphus. Aeneas becomes Angus or Angus becomes Aeneas, whichever we please; Archibald is Erchenbald, "bold in work;" Andrew is "brave," and in Andrew's Son gives us Anderson. Christopher splits up into Kitts, Christal, Kitson, and Stopher; it is one of the earliest of the names from the root, the first being the Christina given to the martyr who is fabled to have been thrown into Lake Bolsena with a millstone over her neck, and yet to have floated till she was pierced with arrows.

Alexander is a "helper of men;" Alfred "a helper in counsel;" and all the Ead names mean rich—Eadgar, "rich spear;" Eadmund, "rich protector;" Eadwine, "rich friend;" "Eadward, "rich guard." Francis is an excellent name; it is the same as Frank, and has the dictionary meaning. With Free and Frederick and others it comes from the old Scandinavian deities Freya and Freyr. William is another fine name, traceable right away back to the old Voluspa. It is generally translated as "defending many," but the "Willhelm" is what it says—it is the "helmet of resolution." The Will is common in the old mythologies; we have Billing, the son of Willi; and Vilkin—whence Wilkins of Dinah and Peter. Vilkin was the father of Volundr the Smith—whence Wayland Smith. Willi or Billi is the father of all the Wills and Wielands down even to Willer and Villiers, which is almost hopelessly hidden in Weller.*

* Those who are interested in the subject, and require further instances, could not do better than refer to Miss C. M. Yonge's "Christian Names," published by Macmillan and Co.

We have only dealt with ordinary names; some of them are inappropriate enough, but we may as well give a few curiosities as a solace for those that bear them. We trust none of our readers have been named "Eli-bris" from the "name having been found on an ancestor's book plate;" nor "Alas" from their parents having misunderstood "Alas! my brother;" nor "Rightaboutface" and "Leftshoulderforward," like the twins of the Negro who had served in the Cape Corps; nor "Finis," "Appendix," "Addendum," or "Index," from the unrealised hope that the family had ceased to increase; nor "Valuable" and "Serviceable" from "the maker's names discovered in a watch." Nor do we anticipate that many of them suffer from punning like "Henry Born Noble," "Mahogany Wood," "Arch Bishop," "Lord Smith," "Hoar Frost," or "John Bottleof Beer;" and they are not likely to get into difficulties like the Miss Rose who was christened Wild and began life as the sweet Wild Rose, to end her maiden days by becoming a Wild Bull.

Our title is "Christian Names," and it may be objected that many of them are decidedly pagan. That is true, but it is none the less true that most of them even in their earliest days were conferred by christening—if by christening is merely meant the sprinkling of water. For, to disregard the Romans sprinkling the boys on their ninth day and the girls on their tenth, and the Buddhists washing the child while they name it, we have our own northern ancestors dipping the child in the water before they showed it to the father, for him to give it its name and mark its forehead with that sign of the hammer of Thor which afterwards gave place to the sign of the cross.

(THE END.)

CHESS.

(Continued from page 703.)

A GAME

Played at Koenigsberg, between A. R.
(White) and D. M. (Black).

Opening: Scotch Gambit.

- | WHITE. | BLACK. |
|----------------|--------------|
| 1. P—K 4 | P—K 4 |
| 2. Kt—KB 3 | Kt—QB 3 |
| 3. P—Q 4 | P×P |
| 4. B—QB 4 | B—B 4 |
| 5. Kt—Kt 5 | Kt—R 3 |
| 6. B×P (ch.) | Kt×B |
| 7. Kt×Kt | K×Kt |
| 8. Q—R 5 (ch.) | P—K Kt 3 |
| 9. Q×B | P—Q 4 (a) |

| 22. Q—R 3 | Q—B 3 |
| 23. Q R—Kt sq. | Q—Kt 4 |
| 24. R—Kt sq. (e) | |

NOTES.

(a) Many players prefer P—Q 3, but P—Q 4 leads to at least an even game.

(b) If P×P, then R—K sq. (ch.); K—Q sq., R—K 4; R—K sq., R×P; Q—B 4, B—K 3, etc.

(c) If Q—B 4 (ch.), K—Kt sq. 15, P×B, P—Q 5, followed by moves with the P, Q, and Kt.

(d) If Q—R 3, P—Q 5. 20, B×P, R×B. 21, R—Kt sq., R—K 7, etc.

(e) Black now announced mate in four moves, which is our

Problem No. 111.

Black to play, and mate in four (4) moves.

To Chess Correspondents.

E. W. D.—Your three-mover can be solved in one move by 1, Kt—B 5 or P—Kt 8 B mate.

Correspondence.

A SUBSCRIBER TO THE B. O. P.—"wishes to know whether the Thames, flowing as it does from the sea, should be termed going down." This is news indeed from Fulham. Perhaps the subscriber saw the flood tide! If he will look at the Thames above Teddington Lock, where tidal influence ends, he will see the river flowing always to the sea, and his difficulty will vanish.

N. D. O.—Buy "Hints on Training," by Dr. H. L. Cortis, price one shilling, obtainable from, or through, any cricket outfitter.

W. J. GEARY.—We know nothing of the arrangement. The headquarters of the Young Men's Christian Association are at Exeter Hall, Strand. Apply there for a prospectus.

VIOLINIST (Barbados).—A gut string is the best, generally speaking; but persons with hot hands often find the silk strings last longer. Try Farmer's Tutor, or Spohr's Violin School. See our articles on violin playing.

EXCELSIOR (Congleton).—1. We have nothing to add to the information given by the Admiralty. Boys entering before the mast can rise to be warrant officers. For the ranks refer to our article on "Rank Marks of the British Navy." In times of emergency volunteers are called for and entered as ordinary and able seamen. Your description of a man-o'-war's man as a "naval servitor" is delightful. 2. To be an explorer you should have a thorough knowledge of navigation and surveying, and a practical acquaintance with three or four branches of natural science. The leading expeditions are dispatched by the Royal Geographical Society.

T. WARD.—The National College of Music, Kensington Gore, might suit you. But most instrumental music is taught by private tutors.

W. E. P.—The "Young Guard of the King's Army," by the Rev. A. N. Malan, is published by the Society for Promoting Christian Knowledge. It can be obtained through any bookseller.

ledge in "Burlesque Poems" in Henry Morley's series.

CHIP.—1. You might use glacialine for the window, and give it the appearance of being made of stained glass. The glacialine is sold in sheets of convenient size by Perry and Co., of Holborn Viaduct. 2. It seems to have been a printer's error on the wrapper.

F. DAVIS.—St. Nicholas can be obtained in London of Messrs. F. Warne and Co., Bedford Street, Strand.

A. J. W. (Nottingham.)—The cases we supply for binding at two shillings each are the same in every way as those used for the annual sold complete. The cover for each year varies. The annuals contain all the numbers, parts, and presentation plates issued during the year.

C. P. S.—1. A wideawake hat is a hat that never sleeps—in fact, one that never has, or had, a nap. All felts are napless. Jim Crow hats were so called from being worn by that famous nigger minstrel. Beaver hats were made of beaver skins. The Billycock hat was invented by a Mr. Wilcock, facetiously familiarised into Mr. Billycock. 2. The snail remedy for eczema is one of the commonest we have, and has been practised by the country folks for centuries. The only wonderful thing about the cure is the ignorance which calls it new. It is as well known as a cobweb for a cut finger. Any cool slimy substance would probably have the same effect.

W. ROBERTS.—A coloured plate of the different breeds of dogs was given with the August part for 1883; and you will find articles on the subject in the second and fourth volumes.

STANDARD.—Your best plan would be to go to a free library, or newsroom such as Deacon's or Street's, and see all the papers for yourself. There are so many of them. Try the "Colliery Guardian," "Mining Journal," "Mining Record," etc.; or for the other side of the question the "Statist," "Financier," "Money," etc., etc.

D. H. H.—If we all bought our own books, gave away those for which we did not care, and kept and re-read those we really liked, then our library might be an index to our character. But in these days, when libraries are ordered complete, with the furniture, we very much doubt the truth of the saying. Books come with property, too, and are thrust upon men. Could you tell the Duke of Hamilton's character from the magnificent library he recently took such pains to distribute?

F. W. C.—Every pint of port, sherry, or madeira has four ounces of alcohol; every pint of champagne has three ounces; every pint of burgundy has two and a half ounces; every pint of hock has two and a quarter ounces; every pint of claret has two ounces; and every pint of moselle has an ounce and three-quarters. These are approximations, it is true, but they are very nearly correct. The moselle has thus the least alcohol and the most water.

J. R. W.—1. Keep the sweets in tins and they will not get sticky. 2. Sherbet is easily made. Get half a pound of ground white sugar, and pour on it forty drops of essence of lemon. Mix it thoroughly, and add a quarter of a pound each of tartaric acid and carbonate of soda, and mix it up thoroughly again. In fact, "the better the mix the better the fizzic."

W. J. HORRELL.—Refer to the "Boy's Own Museum" articles in the third volume.

FORE HATCH.—In "Engineering" and the "English Mechanic" there are being advertised photographs at half-a-crown apiece of the principal engines on the main lines out of London. **AFTER HATCH** tells us that a note to the editors would obtain for you the advertiser's address.

W. GOODALL.—You will find the parodies in "Rejected Addresses," by James and Horace Smith, published by John Murray and others. It is a small book, costing about a shilling, and has been recently republished by Messrs. Rout-

G. FINDLAY (Montreal).—Pharaoh's serpents are made of sulpho-cyanide of potassium and sulpho-cyanide of mercury. We gave an article on the subject in the third volume, in the part for May, 1881.

H. DANE.—Send to Mr. Burgess-Brown, printer, Maidstone, for a copy of his Kentish Cricketers' Guide. It is a handy little book, giving much information regarding current Kent cricket. It includes a diary ruled for runs and bowling, and has forms for sides, etc., etc.

E. M. LAW (Launceston, Tasmania).—1. Shells are pierced in a lathe or with an ordinary drill. They are sawn with a fine circular saw. 2. The market is, we suppose, overstocked. 3. We are quite unable to "explain the real cause of the war in the Soudan;" and our inability to do so is shared by millions of our countrymen.

P. R. T.—You never know. He may retain his ability through life, or he may not; he is, however, not sufficiently precocious to make a fuss about. When Sir William Rowan Hamilton, the Astronomer-Royal for Ireland, was three years old, he could read well and do the first four rules of arithmetic; by the time he was four he had gained a good knowledge of geography; at five he was able to read and translate Latin, Greek, and Hebrew; at eight he had mastered French and Italian; at nine he had studied Arabic and Sanscrit; at eleven he compiled a Syriac grammar; and at thirteen he could write letters in Persian! The late Professor H. J. S. Smith could read when he was two years old, and before he was twelve had read all Thucydides, Sophocles, Juvenal, Persius, and Sallust, twelve books of Tacitus, several plays of Æschylus and Euripides, and a considerable amount of Hebrew. He had also learnt all the odes of Horace by heart, and of course had been through the six books of Euclid and algebra to simple equations!

F. GARDNER.—1. But there are 110-ton guns! Those of the Benbow are 42ft. in length and 2ft. in diameter. With its carriage and mountings such a gun weighs 300 tons. The powder chamber is 21in. in diameter and 7ft. long, and the charge weighs 900lb., sufficient to drive a 2,000lb. shell at the rate of 2,000ft. per second. 2. In 1863 Sir Joseph Whitworth produced a gun which sent a two-and-a-quarter-hundredweight shot more than six and a-half miles!

A. H.—There are many such machines in the market. Either the Burdoss or the Arrow will climb a hill by changing the gearing, so as to drive more slowly; and the omnicycle can have its driving-gear altered to almost any pitch.

POWDER MONKEY.—The only way is to write to headquarters, or go to the nearest barracks and ask for yourself.

E. A. H.—1. You must not dramatise the book without consent, but the plot can be almost the same. Under any circumstances you should ask permission; it would only be honest to do so.—2. You must not sell the copies you make from published drawings. That is the only restriction.

MEDICAL.—There is no other guide to the profession at present except that published at 170, Strand. Your best plan would be to procure a copy of the Students' Number of the "Lancet" or "British Medical Journal."

UN JEUNE HOMME.—You can have an index to the third volume sent to you direct for three-halpence. All the indexes—that is of third, fourth, fifth, and sixth volumes—can be had on the same terms. Through a newsagent they cost a penny each.

A CARPENTER.—First wash the gloss off the photograph, and then proceed to colour it as if it were a drawing.

No. 345.—Vol. VII.

SATURDAY, AUGUST 22, 1885.

Price One Penny.
[ALL RIGHTS RESERVED.]

REGINALD CRUDEN: A TALE OF CITY LIFE.

BY
TALBOT BAINES REED,
Author of
"My Friend Smith," etc.

CHAPTER XXI.
REGINALD FINDS HIM-
SELF "DISMISSED
WITH A CAUTION."

THERE is a famous
saying of a famous
modern poet which
runs—

"Sudden the worst turns
the best to the brave."

And so it was with

Reginald Cruden
when finally the
whole bitter truth of
his position broke in
upon his mind. If
the first sudden shock
drove him into the
dungeon of Giant
Despair, a night's
quiet reflection, and
the consciousness of
innocence within,
helped him to shake
off the fetters and
emerge bravely and
serenely from the
crisis.

"Between his two custodians he walked, sick at heart."

He knew he had nothing to be proud of—nothing to excuse his own folly and shortsightedness—nothing to flatter his self-esteem; but no one could accuse him of dishonour or point a finger of shame his way. So he rose next morning armed for the worst.

What that would be he could not say, but whatever it was he would face it, confident in his own integrity and the might of right to clear him.

He endeavoured in a few words to explain the position of affairs to Love, who was characteristically quick at grasping it and suggesting a remedy.

"That there Medlock's got to be served, and no error!" he said. "I'll murder 'im!"

"Nonsense!" said Reginald; "you can't make things right by doing wrong yourself. And you know you wouldn't do such a thing."

"Do I know? Tell you I would, gov'nor! I'd serve him just like that there 'Pollyon in the book! Or else I'd put rat poison in his beer, and—my! wouldn't it be a game to see the tet'nus a-comin' on 'im, and—"

"Be quiet," said Reginald; "I won't allow you to talk like that. It's as bad as the 'Tim Tigerskin' days, Love, and we've both done with them."

"You're right there!" said the boy, pulling his "Pilgrim's Progress" from his pocket. "My! don't I wish I 'ad the feller to myself in the Slough o' Despond! Wouldn't I 'old 'is 'ead under! Oh no, not me! None o' yer Mr. 'Elpses to give 'im a leg out, if I knows it!"

"Perhaps he'll get punished enough without us," said Reginald. "It wouldn't do us any good to see him suffering."

"Wouldn't it, though? Would me, I can tell yer!" said the uncompromising Love.

It was evidently hopeless to attempt to divert his young champion's mind into channels of mercy. Reginald therefore, for lack of anything else to do, suggested to him to go on with the reading aloud, a command the boy obeyed with alacrity, starting of his own accord at the beginning of the book. So the two sat there, and followed their pilgrim through the perils and triumphs of his way, each acknowledging in his heart the spell of the wonderful story, and feeling himself a braver man for every step he took along with the valiant Christian.

The morning went by and noon had come, and still the boy read on, until heavy footsteps on the stairs below startled them both and sent a quick flush into Reginald's cheeks.

It needed no divination to guess what it meant, and it was almost with a sigh of relief that he saw the door open and a policeman enter.

He rose to his feet and drew himself up as the man approached.

"Is your name Cruden Reginald?" said the officer.

"No; it's Reginald Cruden."

"You call yourself Cruden Reginald?"

"I have done so; yes."

"Then I must trouble you to come along with me, young gentleman."

"Very well," said Reginald, quietly.

"What am I charged with?"

"Conspiracy to defraud, that's what's on the warrant. Are you ready now?"

"Yes, quite ready. Where are you going to take me?"

"Well, we shall have to look in at the station on our way, and then go on to

the police-court. Won't take long. Bound to remand you, you know, for a week or something like that, and then you'll get committed, and the assizes are on directly after the new year, so three weeks from now will see it all over."

The man talked in a pleasant, civil way, in a tone as if he quite supposed Reginald might be pleased to hear the programme arranged on his behalf.

"We'd better go," said Reginald, moving towards the door.

His face was very white and determined. But there was a tell-tale quiver in his tightly-pressed lips which told that he needed all his courage to help him through the ordeal before him. Till this moment the thought of having to walk through Liverpool in custody had not entered into his calculations, and he recoiled from it with a shiver.

"I needn't trouble you with these," said the policeman, taking a pair of handcuffs from his pocket; "not yet, anyhow."

"Oh, no. I'll come quite quietly."

"All right. I've my mate below. You can walk between. Hullo!"

This last exclamation was addressed to Master Love, who, having witnessed thus much of the interview in a state of stupefied bewilderment, now recovered his presence of mind sufficiently to make a furious dash at the burly policeman.

"Do you hear? Let him be; let my governor go. He ain't done nothink to you or nobody. It's me, I tell yer. I've murdered dozens, do you 'ear? and robbed the till, and set the Manshing 'Ouse o' fire, do you 'ear? You let 'im go. It's me done it!"

And he accompanied the protest with such a furious kick at the policeman's leg that that functionary grew very red in the face, and making a grab at the offender, seized him by the collar.

"Don't hurt him, please," said Reginald. "He doesn't mean any harm."

"Tell you it's me," cried the boy, trembling in the grasp of the law, "me and that there Medlock. My gov'nor ain't done it."

"Hush; be quiet, Love," said Reginald. "It'll do no good to make a noise. It can't be helped. Good-bye."

The boy fairly broke down and began to blubber piteously.

Reginald, unmanned enough as it was, had not the heart to wait longer, and walked hurriedly to the door, followed by the policeman. This movement once more roused the faithful Love to a final effort.

"Let 'im go, do you 'ear," shouted he, rushing down the stairs after them. "I'll do for yer if you don't. Oh, gov'nor, take me too, can't yer?"

But Reginald could only steel his heart for once and feign not to hear the appeal.

The other policeman was waiting outside, and between his two custodians he walked, sick at heart and faltering in courage, longing only to get out of the reach of the curious critical eyes that turned on him from every side, and beyond the sound of that pitiful whimper of the faithful little friend as it followed him step by step to the very door of the police-station.

At the station Mr. Sniff awaited the party with a pleasant smile of welcome.

"That's right," said he to Reginald, encouragingly; "much better to come quietly, looks better. Look here, young

fellow," he added, rather more confidentially, "the first question you'll be asked is whether you're guilty or not. Take my advice and make a clean breast of it."

"I shall say not guilty, which will be the truth."

Mr. Sniff, as the reader has been told, had already come to the same conclusion. Still, it being the rule of his profession always to assume a man to be guilty till he can prove himself innocent, he felt it was no business of his to assist the magistrate in coming to a decision by stating what he *thought*. All he had to do was to state what he *knew*, and meanwhile, if the prisoner chose to simplify matters by pleading guilty—well, why shouldn't he?

"Please yourself about that. Have you made your entries, Jones? The van will be here directly. See you later on," added he, nodding to Reginald.

Reginald waited there for the van like a man in a dream. People came in and out, spoke, laughed, looked about them, even mentioned his name. But they all seemed part of some curious pageant, of which he himself formed not the least unreal portion. His mind wandered off on a hundred little insignificant topics. Snatches of the "Pilgrim's Progress" came into his mind, half-forgotten airs of music crossed his memory, the vision of young Gedge as he last saw him fleeted before his eyes. He tried in vain to collect his thoughts, but they were hopelessly astray, leaving him for the time barely conscious and wholly uninterested in what was taking place around him.

The van came at last, a vehicle he had often eyed curiously as it rumbled past him in the streets. Little had he ever dreamed of riding one day inside it.

The usual knot of loungers waited at the door of the police-court to see the van disgorge its freight. Sometimes they had been rewarded for their patience by a glimpse of a real murderer, or wife-kicker, or burglar, and sometimes they had had their bit of fun over a "tough customer," who, if he must travel at her Majesty's expense, was determined to travel all the way, and insisted on being carried by the arms and legs across the pavement into the tribunal of justice. There was no such fun to be got out of Reginald as he stepped hurriedly from the van and with downcast eyes entered by the prisoners' door into the court-house.

A case was already in progress, and he had to wait in a dimly-lit underground lobby for his summons. The constable who had arrested him was still beside him, and other groups mostly of police filled up the place. But he heeded none, longing—oh! how intensely—to hear his name called and to know the worst.

Presently there was a bustle near the door, and he knew the case upstairs was at an end.

"Six months," some one said.

Some one else whistled softly.

"Whew—old Fogey's in one of his tantrums, then. I wager a dollar he'd have only got three at Dark Street."

Then some one called the name "Reginald," and the policeman near him said, "Coming." Then turning to the prisoner and producing the handcuffs from his pocket, he said, half apologetically,

"Mustn't mind the bracelets on, my man. Fogey's on the bench to-day, and he's particular. Look alive."

And before Reginald could recover from his horror he felt the cold iron on his wrist, and found himself being hurried to the door through a lane of officials and others towards the stairs.

"Your turn next, Grinder," he heard some one say as he passed. "Ten minutes will do this case."

With that vile iron on his wrists he could scarcely mount the steep flight of steps without help. The friendly policeman saw it—he was used to that sort of thing—and took the boy's arm.

Not even the consciousness of innocence could endure this. With a mute gesture of appeal Reginald shook himself free and walked unaided. The stairs seemed interminable. There was a hum of voices above, and a shuffling of feet as of people taking a momentary relaxation in the interval of some performance. Then a loud voice cried, "Silence—order in the court—sit down, gentlemen," and there fell an unearthly stillness on the place.

"To the right," said the policeman, coming beside him, and taking his arm as if to direct him.

He was conscious of a score of curious faces turned on him, of some one on the bench folding up a newspaper and adjusting his glasses, of a man at a table throwing aside a quill pen and taking another, of a click of a latch closing behind him, of a row of spikes in front of him. Then he found himself alone.

What followed he scarcely could tell. He was vaguely aware of some one with Mr. Sniff's voice making a statement in which his (Reginald's) own name occurred, another voice from the bench breaking in every now and then, and yet another voice from the table talking too, accompanied by the squeaking of a pen across paper. Then the constable who had arrested him said something, and after the constable some one else.

Then followed a dialogue in undertone between the bench and the table, and once more Mr. Sniff's voice, and at last the voice from the bench, a gruff, unsympathetic voice, said,

"Now, sir, what have you got to say for yourself?"

The question roused him. It was intended for him, and he awoke to the consciousness that after all he had some interest in what was going on.

He raised his head, and said,

"I'm not guilty."

"You reserve your defence, then?"

"Tell him yes," said the policeman.

"Yes, sir."

"Very well, then. I shall remand him for three days. Bring him up again on Friday."

And the magistrate took up his newspaper, the clerk at the table laying down his pen; the bustle and shuffling of feet filled the room, and in another moment Reginald was down the staircase, and the voice he had heard before called,

"Remand three days. Now then, Grinder, up you go."

In all his conjectures as to what might befall him the possibility of being actually sent to prison had never entered Reginald's head. That he would be suspected, arrested, taken to the police-station, and finally brought before a magistrate, he had foreseen. That was bad enough, but he had steeled his resolution to the pitch of going through with it, sure that the clearing of his character would follow any inquiry into the case.

But to be lodged for three days as a common felon in a police cell was a fate he had not once realised, and which, when its full meaning broke upon him, crushed the spirit out of him.

He made no resistance, no protest, no complaint as they hustled him back into the van, and from the van to the cell which was to be his dreary lodging for those three days. He felt degraded, dishonoured, disgraced, and as he sat hour after hour brooding over his lot, his mind, already overwrought, lost its courage and let go its hope.

Suppose he really had done something to be ashamed of? Suppose he had all along had his vague suspicions of the honesty of the Corporation and yet had continued to serve them? Suppose with the best of intentions he had shut his eyes wilfully to what he might and must have seen? Suppose, in fact, his negligence had been criminal? How was he ever to hold up his head again and face the world like an honest man and say he had defrauded no man?

And then there came up in terrible array that long list of customers to the Corporation whom he had lured and enticed by promises he had never taken the trouble to inquire into to part with their money. And the burden of their loss lay like an incubus on his spirit till he actually persuaded himself he was guilty.

I need not sadden the reader with dwelling on the misery of those three days. Any one almost could have endured them better than Reginald. He began a letter to Horace, but he tore it up when half-written. He drew up a statement of his own defence, but when fact after fact appeared in array on the paper it seemed more like an indictment than a defence, and he tore it up too.

At length the weary suspense was over, and once more he found himself in the outer air, stepping with almost familiar tread across the pavement into the van, and taking his place among the waiters in the dim lobby at the foot of the police-court stairs.

When at last he stood once more in the dock none of his former bewilderment remained to befriend him. It was all too real this time. When some one spoke of the "prisoner" he knew it meant himself, and when they spoke of fraud he knew they referred to something he had done. Oh, that he could see it all in a dream once more, and wake up to find himself on the other side!

"Now, Mr. Sniff, you've got something to say?" said the magistrate.

"Yes, your worship," replied Mr. Sniff, not moving to the witness-box, but speaking from his seat. "We don't propose to continue this case."

"What? It's a clear case, isn't it?" said the magistrate, with the air of a man who is being trifled with.

"No, your worship. There's not evidence enough to ask you to send the prisoner to trial."

"Then I'd better sentence him myself."

"I think not, your worship. Our evidence only went to show that the prisoner was in the employment of the men who started the company. But we have no evidence that he was aware the concern was fraudulent, and as he does not appear to have appropriated any of the money we advise dismissing the case. The real offenders are in custody, and have practically admitted their guilt."

The magistrate looked very ill-tem-

pered and offended. He did not like being told what he was told, especially by the police, and he had a righteous horror of cases being withdrawn from his authority.

He held a snappish consultation with his clerk, which by no means tended to pacify him, for that functionary whispered his opinion that as the case had been withdrawn there was nothing for it but for his worship to dismiss the summons.

Somebody, at any rate, should smart for his injured feelings, and as he did not know law enough to abuse Mr. Sniff, and had not pretext sufficient to abuse his clerk, he gathered himself for a castigation of the prisoner, which should not only serve as a caution to that youth for his future guidance, but should also relieve his own magisterial mind.

"Now, prisoner," began he, setting his spectacles and leaning forward in his seat, "you've heard what the officer has said. You may consider yourself fortunate—very fortunate—there is not enough evidence to convict you. Don't flatter yourself that a breakdown in the prosecution clears your character. In the eyes of the law you may be clear, but morally, let me tell you, you are far from being so. It's affectation to tell me you could live for three months the centre of a system of fraud and yet have your hands clean. You must make good your account between your own conscience and the hundreds of helpless, unfortunate poor men and women you have been the means of depriving of their hard-earned money. You have already been kept in prison for three days. Let me hope that will be a warning to you not to meddle in future with fraud if you wish to pass as an honest man. If you touch pitch, sir, you must expect to be defiled. Return to paths of honesty, young man, and seek to recover the character you have forfeited, and bear in mind the warning you have had if you wish to avoid a more serious stain in the future. The case is dismissed."

With which elegant peroration the magistrate, much relieved in his own mind, took up his newspaper, and Reginald was hurried once more down those steep stairs a free man.

"Slice of luck for you, young shaver!" said the friendly policeman, slipping off the handcuffs.

"Regular one of Sniff's little games!" said another standing near; "he always lets his little fish go when he's landed his big ones! To my mind, it's a risky business. Never mind."

"You can go when you like now," said the policeman to Reginald; "and whenever we come across a shilling for a drink we'll drink your health, my lad."

Reginald saw the hint, and handed the policeman one of his last shillings. Then, buttoning his coat against the cold winter wind, he walked out, a free man, into the street.

(To be continued.)

ON SPECIAL SERVICE: A NAVAL STORY.

BY GORDON STABLES, M.D., R.N.,

Author of "The Cruise of the Snowbird," "Stanley O'Grahame," etc.

CHAPTER XX.—AN EMBRYO MUTINY AND HOW IT WAS QUELLED—A PLEASANT VOYAGE—ISLES OF BEAUTY—SHIPWRECK.

PADRE FEDRO came rushing in through the verandah one afternoon, holding both his hands high up in front of him.

Sauva Rosa was there playing the guitar and singing, while with books in hand the padre's sister and Colin sat listening in a half-dreamy kind of a way, for the day was very hot.

"Ah! my good young friend," cried the padre. "I have tears in mine eyes, I have sorrow in my heart. Your ship has come."

Sauva Rosa turned suddenly pale.

"What!" she cried. "The Theodora? Papa's ship?"

"Nay, my leetle señerita, nay," answered the padre, "but de small goon-boat the Vitterit."

For a moment, but a moment only, Colin's heart sank. He had been living in a kind of fool's paradise. He had been allowing himself too much of the *dolce far niente*. It was all over now. He must go afloat again. How much he loved Lima now he was going to lose it! Its fountains, its squares, and beautiful buildings, its strange people, its bright skies, its gardens and terraces, all would soon fade from his gaze.

We shall pass over his parting with the kind padre and his sister. The latter was in tears. And so was Sauva Rosa.

"I shall count every day an age," said the latter, "till I see my dear father. I wish I were going to him as you are."

The train from Lima to Callao is by no manner of means a fast one, but Colin nevertheless soon found himself on the Pacific shore.

There *she* was, the saucy Whitterit, at anchor on the bright blue water, trying apparently to look as if she were not the wettest little craft in a seaway that ever floated.

Colin did not look long at her. Truth is he neither liked her nor cared to be on her. He had suffered so much in her 'tween decks that there really was nothing pleasant to look back to. Only his duty lay on board her, if his heart did not.

He turned away from the Whitterit and was gazing at the fort and thinking what a gallant thing it was of Lord Cochrane to have cut out the great Spanish Esmeralda from under its very guns, when a hand was laid on his shoulder, and, looking up, there was Blair's big honest face beaming on him.

"Man Scottie," he said, "I'm glad to see you."

They shook hands, and as the boat would not be starting for some time they retired together to a little shop out of the sun, and ordered sherbet, and sat down to talk.

"Man Scottie, you're lookin' fine," said Blair; "but nobody ever thought you'd live."

"And how is Captain Channing?" asked Colin.

"Oh, he's just fine," was the reply; "ramping and raging every day, though. We've been all up and down the coast protecting British interests, and right

round as far as Monte Video. Yes, man, our skipper has an awful temper. Yes, everybody else is well on board. The doctor's on shore somewhere buyin' sweet taties and a goat, and I've got to look out for some hens."

It was dinner-time—that is, half-past one—when Colin and the doctor and the engineer went on board. Colin went at once and reported himself.

"Um!" was the reply. "Well, go to your duty. Hope we'll get some good out of you now. Fine spell you've had of it! Um! When I was a youngster there was no such chance of fun, I can tell you! Um! Go to your duty, sir."

Colin's heart sank to zero now.

The sight of the dinner-table was not calculated to raise any one's spirits. The tablecloth was not clean to begin with, the boy who waited looked slovenly, the sweet potatoes were waxy, the fowls roasted to ribbons. Above all, there was everywhere a suspicion of cockroaches.

Colin was not happy; there was a gloom on his spirits that he could not account for. After dinner he commenced to write letters home; that passed the time away till tea came. Then there was the long, dreary evening with nothing to do but read—for in these latitudes it gets dark at or shortly after six o'clock. He was glad when bedtime came and he found himself once more in his hammock. But that hammock—what dreary nights and days of suffering had he not spent in it!

The Whitterit got up anchor and sailed away on a Saturday morning, in fine weather, wind about E.S.E. She was bound for the distant Sandwich Islands, so it blew fair, but near the land the wind was light, and steam had been got up to make a good offing.

Commander Channing expressed a wish to go round the ship as soon as she was well clear. He had a reason.

His eagle eyes took everything in at a glance as he walked quickly along. Here he paused to point to a rope that was not coiled. The lieutenant and doctor were with him.

"Let us have things tidy," he growled. "Look, now, at that beef-kid kicking about the deck! Why, on a Newcastle coal-ship you wouldn't see the like!"

"Doctor," he said, stopping before the ship's coppers, "it's *your* duty, sir, to see to the cleanliness of everything."

"Yes, sir."

"Well, then, why don't you? Look at those coppers! Look at that greasy swab where it lies! Look at the cook himself, for that matter! But why, what on earth have we here? Fowl-coops and live fowls!"

"Please, sir," said a smart-looking carpenter's mate, marching boldly up and saluting, "we thought as how, bein' so long at sea on ship's provisions, a bit of fresh prog—"

"Why," cried the commander, "I never heard of the like before! and without asking my leave either! Bring live pigs on board next! Mr. Clarke, see to it!"

The seeing to it meant sudden death to the fowls.

Now everybody knows that mutiny in the service is a thing that happily is, nowadays, unknown, and this fact I attribute not so much to the better education of our bluejackets and the strictness of the discipline on board ship and at the naval barracks, but to the kindness of the officers and their thoughtful consideration of the men under their charge. What occurred on board the Whitterit during the darkness of this same Saturday night might not have amounted to mutiny, but it really was one of the first steps in that direction.

Commander Channing was not a bad-hearted man in the main, but he allowed feelings and bad-temper to govern too many of his actions. Ordering the men's fowls to be killed was a proof of this. Strange to say, every one of the captain's store of live fowls was made to walk the plank that night; there were over three dozen of them. In the morning the coops were empty.

Commander Channing did a wise thing—he said nothing about it.

"As soon," said Blair, in confidence, to Colin, "as we are fairly at sea the skipper will let out!"

Blair was right. The commander came on deck and took to the bridge one morning, in the forenoon watch, which was Colin's. His face looked dark, his eyes red, as though he had slept but little.

Colin lifted his hat and saluted him, wishing him "Good morning, sir," at the same time.

Commander Channing raised his hand quickly by way of returning the salute, and as speedily let it fall. It was as though he but brushed a fly from his brow. Then he said "Um!" and looked at Colin up and down, as if trying to find a fault in his dress.

Colin did not like the scrutiny, but bore it quietly.

"Um!" he repeated. "Send for the engineer."

Blair came up.

Walking the deck beneath the little bridge, Colin could hear high words, and could distinguish such terms as "foul smoke," "heated bearings," "revolutions," etc., and presently down came Blair, looking flushed and angry.

"He's in a fine tear this morning!" he said, as he passed Colin.

"Thank you, Mr. Blair," said Commander Channing; "I have good ears!"

Not a doubt of it, he had good ears. And he had also good eyes, for in a few moments he looked aloft, and shouted, "Foretop there!"

"Ay, ay, sah!" replied the Krooman.

"Anything in sight?"

"Nuffin', sah; on'y a whale, sah, on de lee bow."

"Can't you see that sail there—right away on the weather quarter?"

"No sail dere, sah. I 'ssure you, sah."

"Come down from aloft, sir. Mr. McLeod, run up and report."

Colin was aloft in a moment.

"Yes, sir," he cried; "there is a barque there."

"What nationality?"

"No flag, sir."

"Can't you guess by her rig?"

"No, sir."

"Come down, then. Mr. Clarke, would you oblige me by having a look?"

Mr. Clarke had just come up, though it was not his watch. He obeyed orders, but could make nothing of the ship.

Then without a word the commander himself went up. He called her "an American, sure enough," and asked Mr. Clarke if he had ever been to sea before.

"Sir," cried the commander, "the tone of voice in which you now address me is not in accordance with the respect due to a captain of a ship from his officers."

The doctor saluted and retired.

Next the assistant-paymaster came in for a share of the storm. Then Colin again. Then Mr. Clarke was sent for to hold a private interview conversation in the commander's cabin, and every one passing could hear high words.

Towards afternoon matters waxed worse. Krooman after Krooman was taken down from aloft, and punished because he had not seen something or

It really was very mischievous of the doctor to speak like this. But all the commission till now the commander had been making his officers miserable, and a crisis had come.

The commander took half a dozen turns up and down the deck. Then he burst out laughing.

"Thank you, doctor," he said. And the surgeon went below.

Colin had double duty to perform that day. But he did not mind it. The captain kept nearly all the time in his cabin, only towards the afternoon his steward handed a note to the doctor. Would he,

"He clung to a bit of exposed rock."

Mr. Clarke said nothing, but walked below.

Then the doctor came up and reported the sick.

"Never heard of such a thing before in my life!" roared the commander. "Fifteen men sick out of a crew of seventy all told. Why, sir, I've been in a line-of-battle ship with only half the number sick!"

Blair was waiting on deck to report something about the stokehole, and he whispered to Colin, "The doctor is the only one of us who can manage to walk to windward of the skipper."

"Indeed, sir," said the surgeon to the commander, "I don't see how your former experience bears upon the case in hand."

"But *I* do," cried Commander Channing.

"Do you mean to reflect on my treatment of the sick?"

done something which he ought to have done.

Next morning Mr. Clarke was ill—so he said. Mr. Blair, the engineer, was ill—so he said. The assistant-paymaster was ill—so he said.

The doctor smiled to himself, and put their names on the sick-book and prescribed for them.

By-and-by he went on the quarter-deck. The commander was much cooler to-day. He even returned the doctor's salute with a smile, and said good morning.

"Eighteen on the list, sir. Among them are three officers."

"Um?"

"Three officers, sir."

The commander bit his lip.

"Mr. McLeod looks rather pale, sir," continued the doctor; "I believe he is taking it too. And I don't feel over well myself."

it asked, kindly permit his three patients, Messrs. Clarke, Reeve (the assistant paymaster), and Blair, to dine with him to-night, and would he himself come along with them? This was at tea-time. The doctor laughed as he handed the note round the table. Mr. Clarke laughed too.

"By the little old man of the sea," said Clarke, "the commander has conquered after all. It would show malevolence to refuse. Let us go."

So they all went, and a very nice dinner they had. But Commander Channing never once mentioned the word "sick-list."

Next day the officers all went to duty again, and so the mutiny ended, and things were more pleasant after this. But somehow the commander and Colin did not get on well, though the latter tried to do his very best, often with a faint and weary heart, only he always

remembered the good advice his dear old sea-daddy gave him, and stuck to his duty.

* * * *

The Whitterit and her commander were very much alike, in a manner of speaking. They each liked a considerable deal of their own way. When they had this, everything went right, they could do the work given them to do, and do it well.

The commander had finished his business with the Peruvians in a very creditable manner, and, as he told Clarke one day in a burst of confidence, never lost his temper once, and never wrote a letter which he would like to recall.

The Whitterit had fine weather for a whole week, with a pleasant sea and light winds. There was no very great hurry now on the voyage, so fires were banked, and the little ship behaved herself in a way no one could find fault with. Her decks were white and dry, the canvas she carried, low and aloft, looked like the white wings of some beautiful sea-bird; the ocean all around sparkled by day under the sun's bright light, and at night reflected the twinkling rays of a thousand stars.

The sunrises and the sunsets were magnificent. No pen or pencil, no artist's brush, could convey more than a faint, faint notion of their surpassing gorgeousness.

But when a strong breeze sprang up, then the Whitterit got angry, passionate, furious. The decks were constantly all awash. She jerked and tugged and dipped and plunged like a mad thing. In very truth she preferred going under the water rather than over the waves. Only she made good knots. Still, any very strong breezes in this voyage to the Sandwich Islands were rather the exception.

Colin would have been happy enough now had not his commander been such a hard taskmaster. Instead of feeling himself to be filling the station of a gentleman, willing and able to do so well, and needing nothing but the bare perception of his duty to make him perform it, he was made to consider himself but little better than a schoolboy, and bad at that. He was watched, snarled at, his every action criticised, and he got no credit for honest performance of duty. He tried hard to please, and even his zeal was misconstrued. His heart was as it were thrown, nay, rather dashed

back upon itself, until he began to feel almost reckless and full of despair.

Otherwise what a bright and happy voyage might this not have been! Everything was new, strange, charming. The very birds looked as if they belonged to some other planet; the sky, the sea, by day or by night, were different from any skies or seas Colin's eyes had ever rested on before. The sharks were the same, coming up from the profundity of dark blue, and appearing close under the quarter—so close that you could see their terrible eyes, in which ferocity was blended with a languid shyness that made you shudder; dark grey were they in the sunshine, fishes of fire were they by night, for the slightest movement of fin or quiver of body brought out the play of phosphorescence all around them. But other fishes were so grotesque in shape and so wildly fantastic in colour that Colin could not help wondering for what reason Nature had painted them thus.

After what might have been called a long voyage, if time had been of much object to these mariners, the Whitterit made the Sandwich group of islands. Here she cruised for one long delightful month.

The month passed by far too soon, and once more the Whitterit was at sea, making her way southwards, the commander meaning to visit the Society Islands, then make his way homewards round the Horn.

They were about twenty days out from Honolulu, and had already visited one or two of those lovely little islands that dot the Pacific Ocean in these latitudes, and which some consider the remains of a submerged continent, while others look upon them as but the foundations of immense islands that will gradually be built upwards out of the sea and at some distant day support great and mighty nations.

Hitherto the weather had been fine, with variable winds, but one night the sun sank into the ocean surrounded by extraordinary-looking clouds. Between these clouds and the horizon there was a semi-clear space, and just before he finally set the god of day glowed athwart the water from this, not red as usual, but of a strange sulphurous colour as if shining through smoke. And the waves had all the same portentous tint.

As far as the charts could tell there was plenty of sea room, but charts of these seas are seldom right.

Shortly after sundown a storm came on, with the loudest thunder and brightest forked lightning that ever Colin had heard or seen. Squall after squall struck the little vessel, and, though she was almost sailless, heeled her several times over on her beam ends. But steam was up now, and for a time there was apparently little danger.

Near midnight, the commander being still on deck, and the seas making a clean breach over the Whitterit, Blair, the engineer, staggered aft to report an accident to the machinery, and nearly at the same moment the engines stopped.

The gunboat was now for a time at the mercy of winds and waves, but more sail was with great difficulty got up and she was laid-to.

About one bell the storm seemed at its very worst; half an hour after it slightly moderated, though the spray and even seas dashed constantly over the vessel, and it was so dark nothing could be seen either ahead or astern. It was a fearful night.

Colin was below but could not turn in. He sat on his sea-chest, to which he had to cling, the motion was so quick and constant.

In after life he often looked back to that terrible storm and wondered why he had not turned in. He would have been far more comfortable in his hammock.

It was Providence that prevented him from doing so. He was thinking of home, and sometimes breathing a prayer for the dear ones there, and for the safety of himself and all on board. Suddenly there was a fearful rasping crash, a sound that once heard is never never to be forgotten. Colin was thrown far forward off the sea-chest, and when he picked himself up the masts were going by the board, any one could have told that, and the seas were tumbling down the hatchway, which had been smashed off.

Next moment, so it seemed, he was in the surf, the water surging in his ears, and so, blinded and deaf, he found himself shortly cast up—he never knew how—on a sandy beach. He clung to a bit of exposed rock, while the wave receded and left. Before it returned he managed to crawl inland.

There were bushes about, there were stars overhead, there was the roaring, boiling sea behind him. That was all he knew. It was an island of some kind.

(To be continued.)

BOY LIFE AFLOAT.

By CAPTAIN H., LATE R.N.

VII.—SAIL HO!

IT is scarcely possible for any one who has never been a voyage to imagine for a moment the excitement that is created all through a ship by the sound of the cry "Sail ho!" though it is not felt so much now as it used to be in consequence of the quick passages that are made in the present day.

Men-of-war always have a man on the look-out, one during the day up aloft, and two at night, one on either bow. With vessels belonging to the mercantile marine it is different. Some carry a look-out, some do not, and the man is, to say the least, not always as vigilant as he should be.

But take an ordinary case of a man-of-war meeting a strange sail. The man up

aloft sings out as loud as he can, "Sail ho!"

The officer of the watch ceases his monotonous pacing to and fro of the quarter-deck and calls out, "Where away?"

"On the starboard bow, sir," replies the look-out man.

"What is she? Can you make her out?" inquires the lieutenant.

"She is almost hull down, sir," answers the seaman, "but she looks like a big'un by her spars."

The officer of the watch goes below to the captain to make his report, and by the time the skipper is on deck pretty nearly every one else is also. Possibly they have been

some weeks out of port, and this is the first sail they have sighted during the cruise.

The hours pass away, the helm is shifted a little, until the two vessels rapidly approach. Then the man-of-war hoists the interrogative signal, and the merchant ship will reply with her national ensign and her number according to the mercantile code.

The man-of-war will then signal, or if the two ships come close enough inquire by hailing, "Do you want anything?" The other will reply generally in the negative (though not unfrequently they are assisted, the correct longitude, fresh water, and the doctor's aid being the things that are generally required), and then they will politely bow by a dip of

the ensign and part, possibly not to meet with anything else to remind them of the civilised world until the end of the voyage.

But the grandest excitement ever caused by the cry of "Sail ho!" is when a man-of-war is on the slave coast of Africa. This vile trade in human beings is still being carried on, but, as we have remarked elsewhere, there is not a tithe of what there used to be even between twenty and thirty years ago.

We will try and picture a scene from life, one that we really assisted at, and can therefore vouch for as true.

We were on board a small corvette, and though young upon the station, we had already made our mark by capturing a couple of native dhows, and consequently wanted to—no, wanted is not the word! We burned, from the captain down to the youngest second-class boy, to add to our laurels.

We weighed anchor and left Zanzibar with a gentle breeze, and as soon as we dropped the land we began to keep a sharp look-out for strange sails. Day after day "we looked and we looked in vain," until "hope deferred made the heart sick."

One forenoon we were trying to have a "caulk," i.e., forty winks on the lockers down in the midshipmen's berth, while the other fellows were at drill or navigation or some other abomination (as we thought it then), from which we were freed owing to our having kept the morning watch (from four until eight a.m.) Twice had we dropped off, the first time to be awakened by the advent of a huge cockroach of such an enormous size that we are afraid to attempt to describe it, for we are almost certain the editor would think it an exaggeration and cut it out in consequence.

But this gigantic insect (who was not much smaller than the bowl of a tablespoon) happened to be of an inquiring turn of mind, and for the benefit of his species or some other reason he dropped off the beams directly into my open mouth!

He did not remain there long, you may depend, and we had settled down once more with the fragrant flavour still hanging around,

when crash! and we were again aroused by a young nigger who acted as assistant-steward, and who had just succeeded in smashing a basketful of glass and crockery. Having relieved our feelings by throwing a heavy book of logarithms at the aforesaid nigger's head, we again settled down to our snooze. It scarcely seemed five minutes, when suddenly the cry of "Sail ho!" rang through the ship.

I seized my glass, and was on deck in two minutes, and there were not many behind me.

The majority of us youngsters who had any eyes, i.e., good sight, were aloft in a jiffy, and we quickly made out the stranger as a somewhat heavily rigged schooner. She had been standing towards us, but apparently catching sight of us at the same time as we sighted her, she immediately wore, and making sail showed us her heels in fine style.

But our dear old barksy could go along a bit, and up to sunset we continued to gain upon her.

Shortly after sunset, as there was no moon, it became very dark, and the captain ordered all sail to be taken in except close-reefed topsails and jib. The following morning showed the wisdom of this expedient, for the schooner, thinking that we should carry on, had laid-to all night, so that we were much closer than we were the previous evening.

But in a minute she made sail again and we were after her. About noon we made the land, and two hours later we discovered that the chase was making for Mozambique, a Portuguese settlement, that government being a great protector and assister of the slavers.

It was just about eight bells (four o'clock) that we fired a shot from one of the bow guns as a signal to heave-to, and three minutes later she anchored underneath Mozambique fort and furled all sail.

She was undoubtedly right too, for it was as black as crape all round and a nasty puffy wind began blowing in from sea. Nevertheless we had our duty to do, and the first cutter was called away, the men armed, and with a lieutenant in command, sent away

to ascertain what this suspicious stranger was.

They had a long and weary pull of it against the tide, and all the time the storm was rising in the offing. At length the captain gave a long glance all around the horizon, and, evidently much put out, ordered the recall to be hoisted.

This was taken no notice of, and then he ordered a blank cartridge to be fired. This was done, and slowly and with evident reluctance the cutter pulled about and made for the ship.

By the time they were once more on board it was blowing so hard that we were under close-reefed topsails, and had all our work to get out to sea. But I have not mentioned that boat's crew!

I never saw a lot of men so angry in all my life! It appeared that they had got near enough to the schooner to perceive that her crew were armed and she carried two guns, which they were making ready for their reception. "Another ten minutes and we should have had her," exclaimed the disappointed lieutenant; but it was of no use grumbling, and three days later, when we were enabled to get back, the schooner had disappeared and was no doubt some distance on her way to Cuba.

One more "Sail ho!" and we have done. Who can realise the delight of the emigrant, eight or ten weeks away from home, when he hears the sound?

He is not a reading man, unfortunately "he don't see nothin' in bukes," there is no work for him to do, and he has little to employ himself with except to lounge about, talk of the old country, or anticipate the new.

Suddenly the sound of "Sail ho!" brings all hands on deck, and then as the two liners pass one another they exchange reckonings, names, etc., and possibly the latest news respecting the death of a great man, a declaration of war, or the marriage of a monarch.

And even now we have not described one-half the meaning that "Sail ho!" has to the seaman.

(To be continued.)

YOUR MOTHER, BOYS.

A gentle woman, slow of speech,
Not willing to command,
Yet holds, by some unconscious power,
Men's hearts within her hand.

The lights of household love illumine
Her soft confiding eyes;
The peace of God, with folded wings,
Upon her forehead lies.

And from her tender mobile lips
Maternal pleadings flow,
They fall upon the stubborn will
Like sunbeams upon snow.

She shuns the crowded worldly ways,
Their triumphs and their strife,
And moves contentedly along
The peaceful lanes of life.

Enough for her to cull betimes
The wild and wayside flower;
To rest within the grateful shade
Of home's sequestered bower.

Enough for her the fond belief
That men she reared will keep
The old and true "noblesse oblige"
When she has gone to sleep.

Each holy hope that mothers hold
Her trusting spirit sways;
The giving God who is her guide
She worships and obeys.

Amid the noisy restless tide
Of mingling sordid aims,
That quiet influence of hers
Each better impulse claims.
The wayward and ignoble wish
Her memory rules and shames.

And long as time and men exist
That mother's quiet soul
By sacred and mysterious ways
Shall human minds control.

JESSIE M. E. SANDY.

COLONEL PELLINORE'S GOLD.

By E. W. THOMSON,

Author of "Petherick's Peril," etc.

CHAPTER I.

Travellers on the Ottawa River in early May or late October may have noticed on the right bank of the brown stream a low, wide, grey stone house

which crowns a lawny hill that slopes swiftly up from the boulders of the shore.

From the boat during the leafy months the building can scarcely be seen, because then ancient grape-vines and luxuriant creepers more than half conceal the venerable mansion. That walking guide-book to the history and beauty of the great river, the captain of the steamer, will, however, call the attention of every tourist to the old Pellinore Manor House. Those wise travellers who press the captain for more information will learn who the Pellinores were and are. How "old Colonel Persant Pellinore," heart-broken for his wife, came to bury himself in the wilderness more than a hundred years ago; how his only son, Captain Agravaine, went back to England to riot and ruin, with many other particulars of a strangely chequered family history.

In that old house, while Mr. Washington, of the colony of Virginia, was still King George's valorous subject, long before the Marquis de Lafayette had purveyed him a frigate for America, a tall, fair-haired youth of about fifteen, whose bright, dark-blue eyes looked black in the firelight, sat straight-backed, elbows on knees and chin on hands, watching the blazing maple logs in an immense fireplace.

The room, like the whole ground floor, was then flagged with that thin blue limestone which crops out in a gully behind the old house; across its ceiling, under whip-sawed boards, ran square-hewn smoke-browned rafters; its walls were roughly plastered, and through the mica panes of two windows, like wide slips in the wall, scarcely enough daylight struggled to relieve the blackness of the shadows cast by the leaping flame.

From pegs in the rafters hung cuts of dried venison, bear hams, and tongues in plenty, some stretched pelts of beaver, marten and mink, and a few strings of onions, considered more precious than

all the rest. Many pairs of snowshoes and several fringed suits of dressed deer-skin hung on the walls. Over the huge fireplace rested four flint-lock muskets of the clumsy army pattern of that day, and beneath these a clean dull-white curving steel sheath gave earnest that the long cavalry sword within was bright.

Against the jamb of the fireplace leaned a grizzled, gaunt, straight, soldierly man, across whose brown right cheek a long white scar extended. With his left hand he shielded his face from the scorching blaze, when now and again he stirred with a huge iron spoon some preparation in the bottom of the great pot that hung by chain and hook before the fire. This was a fireplace and this a kitchen wherein an ox might have been barbecued easily, but Corporal Cram, cook and body servant and *factotum* to Colonel Persant Pellinore, was then preparing a meal for none but the colonel, his nephew Bryan, and the gallant corporal himself. They were the sole occupants of the mansion.

"And if you did find three thousand guineas to-morrow, Mr. Bryan," said the corporal, waving his spoon, "you'd never know what to do with ten of them."

"Oh! there you are entirely mistaken, corporal," answered the fair-haired boy. "I should buy my ensign's commission with three hundred, and my charger and sword and needments with three hundred more."

"Three and three is six," said the corporal, slowly but triumphantly, having counted all the digits of one hand and the thumb of the other. "Six hundred, Mr. Bryan. You'd have money left."

"I should give you those twenty guineas that you always say would be a fortune to you."

"And that would be kindly done of you too, Mr. Bryan," said the corporal, gratefully, as he saluted. "There never was a close-fisted one of your blood, sir, and that's a true fact, so it is. But still there'd be only six hundred and twenty guineas gone," he continued, looking into the fire with an air as though the coins had to be disposed of somehow, but were too many for him.

"My passage money back to England would be a hundred more, maybe," went on the boy.

"So it would, and dirt cheap," responded the corporal, gladly. "Indeed I was greatly troubled what you'd do with the money till now;" and the corporal once more lifted off the pot-lid, whence a savoury odour of stewing venison floated through the room.

"But there's more than that in three thousand guineas," observed Bryan, instructively. "'Tis not half gone yet. I have more than twenty-five hundred left still."

"Sure, it's always a terrible business to know what to do with money," said the corporal, gravely. "Ah, if Mr. Agravaine was only here! Faith! no one could say that Mr. Agravaine Pellinore ever misdoubted what to do with money."

"Do you think that's a good plan, cor-

poral? to spend all your money! Why couldn't I put some in a bank?"

"So you could now! To think of that!" answered Corporal Cram, admiringly. "Or you could give it to the colonel. Ah! the colonel is in sore need for money now!"

"I will give him the whole of it!" cried Bryan, impulsively, as though the three thousand guineas were not in wish-land.

"It'll be ten years' life to him," said the corporal, joyfully. "There's nothing hardly he wouldn't do for the money just now. Mr. Agravaine is in desperate trouble again, and the colonel hasn't ten pounds instead of more than two thousand that's asked for. It's not the nature of a father to let his only son be locked up in a debtors' prison for life if he can get money for him, fair or unfair."

"Corporal Cram," said the boy, with severe dignity, rising to his feet, "you have forgotten the respect due to your superior officer. My uncle could never do anything unfair, let alone get money unfairly. Why, that would be stealing!"

"I humbly beg your honour's pardon," said the corporal, evasively, standing at attention with the long spoon held like a sword upright against his shoulder. "Would I mean to speak disrespectful of the colonel? Didn't I follow him to this wilderness, and wouldn't I die for him? But he's in sore need for money, so he is."

"Ah! if I could but get the three thousand guineas," sighed Bryan, forgetting his haughtiness, "how soon would I deliver my uncle out of his troubles."

"May be one of the worst of them troubles is that you want to be off to the wars, Mr. Bryan," said the corporal. "What's the reason now there isn't sport in plenty for you here?"

"Sport! My father carried the king's colours when he was a year younger than I," cried the boy, excitedly, "and my grandfather before him! Yes, and every Pellinore, I make no doubt. Sport! To shoot stupid grouse, and waterfowl little wiser!"

"There's the October geese," observed the corporal, defensively, "and the deer."

"Geese! Squaws game! And deer—well, I don't deny that there's sport stalking a big buck that suspects his danger. To cut across the hills planning to head him; to find your reckoning right; to crawl quietly, quietly within range, while, with his proud head at gaze, he sniffs and stamps his fore feet, threatening every moment to be off! To beat him! Yes, that is sport, corporal!"

"Then the bear you killed so clever like in November! The wolves you trapped! And would you leave all that, Mr. Bryan?"

"All that!" said the boy, with a changed manner, taking his seat and sighing once more. "All that can be done by a savage better than by me. For me there is greater game afoot, and duty to be done and dangers to be dared. I must go away, corporal," said Bryan, rising. "In

the dark I hear voices calling me to fight for England and his Majesty. Europe is in arms, France moves once

our squares; musketry rattling, swords clashing and flashing; I see fields of dead English faces, they smile horribly

"Charge! charge!" he cried now, as if possessed, and furiously delivered the right cut against infantry. "I'll go with

The Manor House.

more, the king will want every man. This skulking in the backwoods, killing bucks and bears, is no work for Bryan Pellinore. I tell you," he cried, excitedly, "I hear French cannon roaring in my dreams, and French cavalry galloping on

at me and seem to taunt me! Corporal, I must go!"

Carried away by the rising excitement of the boy, Corporal Cram had reached for his old sword, and taking it down, drew the blade from its sheath.

you, Mr. Bryan!" he shouted, and came back to guard. "We'll fight them in their thousands," he roared, striking a wide-sweeping blow fit to cut down a squadron, while Bryan, catching up the poker, followed his example. "That's

through you, Johnny Crapaud!" stormed the corporal, and lunged fiercely at the door opening.

At that instant a tall, white-haired, fiery-looking old gentleman coming into the room from the hallway found the corporal's point about three inches from his breast.

"What antics are these?" he asked, sternly. "Ah, I see!" and could not but smile at the corporal's horror as he threw his weapon clanging to the floor and fell on his knees. "You old rascal! is it thus that you obey my orders? Thus that you restrain Mr. Bryan's warlike longings? A pretty illustration of the joys of peace you are, surely!" and he gazed down at the corporal with humorous severity.

"Forgive me, colonel dear, but I forgot myself. Sure, I thought it was the day of Minden, and me riding slap into them after your honour again."

"It was my fault, Uncle Persant," said Bryan, coming forward. "The corporal did his best to keep talking about bears and other wild beasts, but I would speak about wars and Frenchmen till he became wild. Indeed, 'twas all my fault, uncle."

The old colonel laid his hand on the boy's shoulder and looked kindly into his steady eyes.

"Tristram's boy!" said he, fondly; "Brother Tristram's boy! And thy spirit, Bryan, calls thee too to foughten fields!"

The boy's eyes filled at the tenderness of the old man's tone, but he did not speak.

"True Pellinore art thou!" went on the colonel, still looking into Bryan's eyes steadily. "So Tristram was when we were lads together. And his bones bleach at Plassey! Poor Tristram! Well, well,

boy, 'twere better to fall on the field of honour than rot in idleness here. Thou shalt go, Bryan; thou shalt go!"

"Oh, uncle, I will not leave you!" exclaimed the boy, overcome by the old man's manner.

"Thou shalt go to the wars!" he answered, and paused in a reverie. "Ay, Bryan shall have the gold that Marhaus brings," muttered he, absent-mindedly. "I will take it for *him*, 'twill be no robbery! Tristram's boy must have a career, come what will. Ay, the guineas I will keep for him."

Bryan stared in amazement at the colonel, finding his references to Marhaus and the gold utterly inexplicable.

"Corporal," continued the colonel, turning to that faithful servitor, who had got back to his pot meantime, "see that store of food is kept in readiness. Lieutenant Marhaus, with the usual escort of six men, is due to-morrow. Let them want for nothing our woods afford."

"There's fat venison fit for the king's own table," said the corporal, opening the larder door and gazing fondly in, "forty brace or so of grouse, and as many of them small hares, ducks in great plenty, and geese, your honour, and bear-meat, and some of the moose beef the Indians brought down the river, and pikes and trouts, and beaver—the tails is fine!—and musk-rats—"

"Spare the musk-rats, I pray you, corporal!" said the colonel, laughing.

"But they're the best of good eating," protested the corporal, as his master slowly retired. "Parboiled till the queer flavour goes off in smell, Mr. Bryan, and then fried. It's a dish fit for the commander-in-chief!"

"I'm off to the wars at last, corporal!" cried the boy, disregarding the culinary remarks; "off at last!"

"Where the money's to come from I don't know," objected the old soldier.

"Did you hear what my uncle said about that?" asked Bryan, anxiously; the words "robbery" and "keep" stuck disagreeably in his memory.

"I did not. My hearing is getting no better fast. What was it, sir?"

"No matter. But whence could my uncle take money for me?"

"I can't think. But if his honour's heart is set on getting it, he will get it somehow. Many's the desperate push he's been put to to save Mr. Agravaine."

"I shouldn't like him to be so troubled with me," answered the boy, as he went out of the corporal's laboratory. "I might go as a volunteer."

From one great bare apartment to another Bryan went, restlessly pondering his uncle's words. When he dwelt on the promise that he should go to the wars his heart grew big and light; but when the colonel's strange mutterings about money and robbery and Marhaus recurred to his memory, his soul was shaken with dread. He remembered uneasily how the absent-mindedness of the colonel had increased. And now another aberration! He did not plainly say to himself that the colonel's mind was unhinged, but had his fears taken clear shape such would have been their form. In the great dining-room, cheerless save for a huge log fire, he at last came to a halt, and sat down, much troubled by the mystery.

(To be continued.)

TOM'S PUP.

TOM JONES had always worshipped dogs from early childhood up,

His one desire for years had been to own a terrier pup;

He did not care for Sissy's birds, he had no love for cats;

What Tommy wanted was a dog that would be "down on" rats.

But masters are not given to encourage, as a rule,

The maintenance of pets by boys who patronise their school;

But Tommy found that Melliship, his chum, had two white mice,

So he resolved to keep a dog by some astute device.

As if to meet his wishes, when he next went "down to town,"

He met a loafing vagabond who wanted half-a-crown

To sell the sweetest little pup that ever yet was seen,

Though just at present, to be sure, he wasn't over clean.

The half-a-crown changed owners, and Tom pocketed his pet,

He hadn't quite determined where to put him up as yet;

But he settled as he reached the gates the coach-house p'raps might do,

For only boxes lay there, with a cricket bag or two.

Tom pocketed some bread at tea and slipped out after dark

To feed his pet, who welcomed him with many a joyous bark;

Tom tried to hush him till his bark subsided to a growl,

Which changed, when Tom was going, to a melancholy howl.

Tom fled away in terror, fearing greatly lest the boys,

Or, even worse, the masters, might observe the puppy's noise;

His fears had grounds; the animal was not to be suppressed,

But set himself to howling with an unremitting zest.

The Doctor passed a sleepless night, and sent next door to say

He hoped they would be kind enough to send their dog away;

A message came back quickly that the Doctor's new-bought pup

Had so disturbed the family they gave all sleeping up.

A fresh howl struck the Doctor's ears, and, guided by the sound,

The cause of all the trouble in an empty box was found;

A wretched little object, cold and shaking every limb,

And Tommy had to own the fact the pup belonged to him.

The Doctor frowned severely as the little beast he conned,

Then ordered John the gardener to drown it in the pond;

But John was kinder than he looked, and when the coast was clear

He gave it to a butcher for a glass of bitter beer.

PAUL BLAKE.

FRANK WORTHING'S INCARCERATION.

CHAPTER III.

WHEN Worthing returned from the post-office it was with sundry misgivings as to his reception. He no sooner entered the door than he was seized, and transfixed by a broad shoulder against the wall, which nearly drove the breath out of his body.

"Now, then; you'll try your pranks on me, will you?"

"I didn't do it, really, Mr. Budwell. Here! that hurts. Are you going to stop? There now, look what you've done!" dropping the stamps out of his hand and putting his foot on them. "You're making me spoil the stamps! Fifty shillings' worth! You'll have to pay for—" He gained his release. The drawerful of envelopes and labels was still on the floor.

"Pick every one of those up," said Mr. Budwell.

"I didn't knock them down," was the response, and with a supreme disregard for the untidy floor he seated himself at his desk for five minutes, in a desperate effort of enclosing and stamping the letters. Presently he went to the door of the outer office and shouted,

"Here, boy! come and pick these envelopes up. Smith, d'ye hear?"

That small boy was startled in the midst of a congenial occupation, viz., putting a halfpenny down the back of his neck and waiting its arrival at the heel of his trousers.

Ten minutes' earnest work ensued. Frank Worthing put forth efforts which, if it had been the time for starting business instead of the hour for leaving off, would have been commendable. The screw of the letterpress whirled and shrieked, envelopes were addressed at a perfect railway-clerk speed, odd papers stuck upon their respective files, until the office assumed an appearance of order. Meanwhile Mr. Budwell's pen was working at its copyhead rate. Presently he looked at the clock, closed the books, and wheeled right-about-face upon his stool.

"Worthing! take what stamps you want and let me have the rest—sharp!" and so saying he walked to the table.

"Used thirty-seven penny and ten halfpenny," said Worthing, handing him the remainder of what he had purchased.

"Be sure you put all the books in the safe, and see you come down in time in the morning," was the admonition of Mr. Budwell, as he strode to the corner where the hat and coat rack lay.

But the injunction was drowned in a shriek of the copying-press. Frank had washed the oil off the screw, a process which he defined as "tuning it," for a sharp turn of the handle would produce a prolonged excruciating cart-wheel sort of a harmony, which made the teeth turn acid and the back run chill.

Mr. Budwell flung his office coat upon the nail. A sudden thought struck him; he took it off again, came to the light, and surveyed it critically.

"Well, I've been thinking it looks seedy, and when you fixed that drawer to the button you finished it, you young beggar! Slip up to the storeroom and

get a sheet of brown paper; there's a laddie! No! I mean gentleman."

"I will, since you ask respectfully," said Frank. He cleared up the stairs, and presently reappeared with paper and twine, and a quantity sufficient to enclose an army of jackets.

Mr. Budwell carefully fastened up the coat, placed the parcel under his arm, and with a "Good night, young un," made his way to the omnibus, which left him at his aunt's door.

Did Frank Worthing then make his way home? One would have thought from his burning ardour at dismissing business that such would have been the case. But Mr. Worthing's methods of procedure were generally more original than commendable. He produced a bright-looking instrument from his desk, examined it carefully, pointed it at the knob of a distant drawer, struck a brigandish attitude in the centre of the office, and then—click! It was a pistol.

This then was the secret joy which made him so anxious to dispatch both business and Budwell from the scene.

"It's a real beauty," he soliloquised.

Next he adjourned to the shipyard with a tin pannikin in his hand. This he fastened up in a joiner's shed, and proceeded to "die villain!" it with ball-shot at a distance of six yards.

After half an hour of these seductive heroics he returned to the office, pocketed the letters, locked the doors, and left the keys at a small house by the yard gate, where resided the porter and watchman, "Old Smithers."

He had scarcely passed out two minutes when he returned.

"I say, Smithers, you know my little pistol?"

"Yes."

"Well, I've been peppering a pannikin with it in Robinson's shed. Just slip and take the can down, will you? I forgot. Pitch it over the wall; there's a good fellow!"

"All right. Good night, sir."

"Good night, Smithers."

CHAPTER IV.

THE next morning on his way to business, when Frank arrived at the Dock Gate Bridge, over which the path lay to the office, he suddenly ceased his headlong course, and stepped behind the wall of the unloading shed. He was already ten minutes after time, a pretty regular occurrence with him, and the sight of Mr. Millington, the managing partner of the firm, standing at the other end of the bridge in conversation with some person, had brought him to an abrupt standstill. Were he to see him that gentleman would not be likely to allow his appearance ten minutes after time at business to pass unnoticed.

Five minutes elapsed. Frank became feverish, and in his impatience impetuously kicked the wall.

Mr. Millington gave no token of moving. Whatever did he want there? Why couldn't he go into the office and talk? Bother it! There's another five minutes. Ah! happy thought! Frank

took a piece of notepaper from his pocket, folded it up to the size of an envelope, and, holding it prominently in his hand, as though returning with a message, sauntered slowly and coolly past Mr. Millington, and entered. The questionable morality of the ruse never occurred to him.

There was no one in the office, so he seated himself at the books, and in two minutes was hard at work, looking as much as possible as if he had been consuming his energies there a good half-hour.

A voice came from the other side of the door.

"Really! it looks bad."

It was Mr. Budwell's, and that gentleman entered, evincing no small excitement. He was followed by Smithers, the watchman, whose mental equilibrium seemed also to be shaken.

"Sure you locked up all right, Worthing?"

"Sure—yes, certain."

"Well, somebody's been in. The stamps you bought last night have gone—clean! The queer thing is that when I came down this morning the drawer was locked just as I left it last night, and so were the doors; the windows were fastened. The fellow knows the place well, whoever he is; he knows the shape of the keys too."

The face of old Smithers displayed anxiety. His reputation as a watchman was at stake. He broke out,

"Askin' your pardon, Mr. Budwell, sir, there's never been no one through these doors since Mr. Worthing locked 'em at seven o'clock and gev' in the keys to me."

Up to this Worthing had looked on carelessly. Now the red blood glowed painfully in his cheeks, and then left him deadly white. As by a flash he divined the suspicion conveyed in the old man's words.

Budwell eyed him curiously, and proceeded, in a sarcastic tone,

"And now, young man, I thought you were in a hurry to get away last night. What were you doing here till seven o'clock, eh?"

Worthing stared hard for a second.

"Find out!" was the angry response. A hot red spot burned on each of his cheeks; he scowled and seemed as if passion and indignation shook him to the very finger-tips. He turned to his seat.

A sharp step was heard.

"Here! here! what's this?" To Worthing, "Don't forget where you are."

It was Mr. Millington, who had opened the door in time to witness the young man's rage and to catch the last heated sentence of the dialogue. He stood impatiently jingling the keys in his pocket, awaiting an explanation.

None was forthcoming from Worthing. An oppressive silence followed; the keys still jingled.

Mr. Budwell ended the suspense.

"The stamps were taken from the drawer last night, sir; I locked them up, two pounds five worth!—and took the key home, as I always do. When I came

down this morning they were gone. The drawer was locked, and nothing else seemed touched. I was just inquiring into it when—when—when—

He hesitated, and looked as if something very unpleasant were coming and he would rather not relate it.

"Come, out with it!" Mr. Millington demanded, sharply.

"Well, sir, I'm sorry to say it, but I find Worthing did not leave till seven o'clock. I went at a quarter-past six. I

"Yes, sir."

"Why, fellow, you must be mad! You know perfectly well that I have ordered men to be fined for smoking there before this, and you have the temerity to use it for a shooting-range—a place where a spark is sufficient for a conflagration! You're mad! mad!"

Frank held down his head in utter contrition.

Uttering "Mad! mad! mad!" in extreme exasperation, Mr. Millington

means to sift this matter to the bottom!"

"You can do what you like!" replied Frank, stung by the implied accusation into utterly forgetting himself.

"Budwell, Smithers, follow me to the private office," and Mr. Millington, with sharp, irritable step, passed out.

In the last two minutes little Smith had made a communication to Mr. Budwell.

"Please, sir, as I was going out I met

"Made his way to the omnibus, which left him at his aunt's."

was asking what kept him, and—I think you heard what he said."

Mr. Budwell's suspicions were evidently too premature and too blunt to be acceptable.

"Not so fast! Perhaps he was working late. Are your books up to date, Worthing?"

"Yes, sir," replied Frank.

"Then for what reason were you on the premises until seven o'clock?"

Frank cast down his eyes and hesitated. "I was firing—" he began.

"Shootin' pistols in the jyners' shed, sir, he was," blurted out old Smithers, officiously, in haste to put a word in.

"Is that true, Worthing?"

banged out of the office. Suddenly he returned and stepped up to Worthing.

"What do you know about those stamps?"

Frank raised his head, and the reply was short and heated.

"What do you mean, sir?"

"Have you touched or seen the missing stamps since you gave them to Budwell last night?"

"No, I have not!"

"I don't want impertinence! I will ask you once more. It may be well for you to say all you know about them at once! Speak, sir!"

A dead silence.

"Listen, my lad! I shall now employ

Mr. Worthing comin' along the passage—and I told him summun had stolen your stamps—and he sez, 'Don't let on, young un, I took 'em,' and he pushed my straw hat over my eyes, and it's all bagged, sir."

"Here, come along with me, boy," said Mr. Budwell, and that sprightly germ of a business man went trotting off at his heels.

In two minutes big Hunter entered the office.

"What's in the wind now, Frankie boy? The governor's just told me to keep charge of you, and vows all sorts of things if I let you slip before he comes."

Frank looked up as if to speak. He

threw his head upon his arm and burst into passionate tears.

Mr. Millington was seated at his desk in his private office in evident perplexity.

"Close the door, Budwell. Sit down. What does that boy want?"

"He says Worthing told him this morning that—" Turning to Smith, "Tell Mr. Millington what you told me."

The small and unwholesome-looking youth, whose speech and appearance would certainly not commend the literary fare upon which, as we have seen, he was wont to feed, began, after some vacillation,

"Please, sir, I was going on a herrand—and I seen Mr. Worthing—and he gave me a hit on the 'ead, sir, in the front passage."

"What was that for?"

The reply came in gasps.

"I didn't do anythink, sir. I told him the stamps was stolen—he said he'd got 'em—and said I wasn't to let on."

"That fellow is most unaccountable!

Are you sure he told you he had taken the stamps? Mind, you may have to repeat your words to a magistrate."

"Yiz-zir," he stuttered beginning to look frightened.

"You may go."

A considerable pause.

"I shall lock that young man up," Mr. Millington at last broke forth, "or his impertinence will do it for him. Had he made a clean breast of the matter I'd have been disposed to give him another chance. I liked the lad; he is bright and warm-hearted, and it appeared only a matter of time for him to forget his schoolboy tricks and steady down. I thought he was just high-spirited; it is only too plain that he is much worse. I won't be defied to my face. Smithers! are you sure that Worthing passed out at seven o'clock? Be careful what you say."

"I'm dead certain, sir. I'd say it before the mayor, sir. I'd just bin to wind the front clock up. It was seven then, sir—at least, barrin' five minutes, sir."

"Are you sure you locked the stamps up, Budwell?"

"Yes, sir, I've turned out all the other drawers and no trace of them. I'd locked all but the stamp drawer when he handed over the stamps, and I distinctly remember locking that too."

Then followed a discussion of the pros and cons of the robbery, in which not a gleam of hope was evolved on behalf of Frank Worthing. Such collateral evidence to his general recklessness was afforded by Budwell that the seal was set and Mr. Millington decided to prosecute. In business matters he was a stern disciplinarian.

"Smithers, bring Worthing."

In two minutes he entered with the youth.

"Now, once more tell me what you know about the missing stamps."

"I've told you once, sir," was the wild, foolish reply.

In half an hour a cab drove up to the gate. Frank Worthing was hurried away in it, and beside him sat a constable.

OUR NOTE BOOK.

THE ANCHOR WATCH.

"I often recall," says an old sailor, "my first night at sea. A storm had come up, and we had put back under a point of land which broke the wind a little, but still the sea had a rake on us, and we were in danger of drifting. I was on the anchor watch, and it was my duty to give warning in case the ship should drag her anchor. It was a long night to me. I was very anxious whether I should know if the ship really did drift. How could I tell? I found that, going forward and placing my hand on the chain, I could tell by feeling it whether the anchor was dragging or not, and how often that night I went forward and placed my hand on that chain! And very often since then I have wondered whether I am drifting away from God, and then I go away and pray. Sometimes during that long stormy night I would be startled by a rumbling sound, and I would put my hand on the chain and find it was not the anchor dragging, but only the chain grating against the rocks on the bottom. The anchor was still firm. And sometimes now, in temptation and trial, I become afraid, and upon praying I find that away down deep in my heart I do love God, and my hope is in His salvation. And I want just to say a word to you boys: Boys, keep an anchor watch, lest before you are aware you may be upon the rocks."

HEROES OF THE BACKWOODS.

KIT CARSON.

PART I.

A Pioneer Cabin.

HAVING sketched the adventurous career of Daniel Boone, the Pioneer of Kentucky, we can appropriately follow on with a few notes on another Kentuckian, the most famous backwoodsman of modern times—Kit Carson, the "Monarch of the Prairies," the "Nestor of the Rocky Mountains."

Kit was born in Madison county, Kentucky, on Christmas Eve, 1809. When he

was a year old his father moved west to Boone's Lick, in Missouri, and when he was eighteen he walked off on his own account to Santa Fé, and thenceforth wandered about among the Rockies and their east and west slopes, southwards to New Mexico and northwards to the Canadian border, till every peak and pass and stream and plain were known to him.

His early boyhood was spent amid the same surroundings as that of Daniel Boone, the only difference being in the superior mechanism of the firearms that even the women and children were taught to use. There was the same log-cabin, half hut, half fortress, loopholed and roughly fortified and girt with a glacis from which every bush and tree and point of cover within rifle range had been cleared. And as he grew up the settlement increased until it became a cluster of roughly-built farmhouses with a stronger blockhouse in the centre, to which at each Indian alarm the settlers could flee for mutual safety. Round this fort was a loopholed palisade made of trimmed trees six or eight inches in diameter and rising ten feet from the ground, so that the place was of ample strength against any ordinary attack.

At fifteen Kit was apprenticed to the village saddler. He was then a famous shot and an adept in all matters of woodcraft. Slightly built and small in stature, he had gained a reputation for decision and quiet daring inferior to none, and, unlike most of his class, he was no boisterous scapegrace or sower of wild oats. He was, however, a very unpromising saddler, and the awl and the leather had little charm for a king of the wilderness longing for the freedom of the woods, and looking beyond the bench to the hunting of the buffalo, the trapping of the beaver, and the guiding of the frail canoe down the dangerous rapids of the West.

When he was eighteen a party of traders passed through the village on their road to Santa Fé, the capital of New Mexico, which then belonged to Spain. The journey, one of a thousand miles, promised to be adventurous, and young Carson begged to be released from his apprenticeship in order to share its perils. The permission was obtained, and Kit set forth.

His first experience was a surgical operation. One of the men had an accident with his gun and blew the bone of his arm to splinters. The arm became inflamed, and to save the man's life it was necessary to amputate the limb. Kit was requested to act as surgeon, and the others promised to assist; the instruments were a razor, a hand-saw, and a bar of iron. The lad of eighteen bound a ligature round the arm so as to check the flow of blood, and then, with the patient held firmly down by his friends, proceeded to slash through the flesh with the razor. Then with the hand-saw he cut through the bone. And then with the iron bar heated almost to white heat he seared and cauterised the wound. The rough operation proved successful, and by the time Santa Fé was reached the patient had recovered.

Later on in life Kit was to meet with a certain Pegleg Smith, of whom a still more marvellous operation is recorded. Smith, while out trapping, was shot by an Indian, and managed during the fight to creep into a thicket, unobserved by the enemy or his own men. There he lay exhausted, with his leg-bone shattered below the knee. When he came to himself again he cut his hunting-shirt into strips and tied his leg up tightly with the buckskin thongs. Then he coolly and deliberately set to work with his knife and hacked off his own leg! This is vouched for as being true, and Pegleg Smith was a noted character in the West. As a burlesque

In the Yosemite Valley.

on his experiences, perhaps, we have another frontier story of a man, on whom a tree had fallen and smashed both his legs, coolly taking out his knife, cutting off the shattered stumps, and then walking home—which, considering that his legs were wooden ones, he had no difficulty in doing.

Kit did not return with his Mexican traders, but went away eighty miles north-eastwards, and took up his quarters for the winter with the celebrated Kin Cade. Cade was a master trapper and humble explorer, who knew the prairies and mountains like a book, and was glad to come across so promising a pupil. With his ramrod he would draw on the hut floor rough maps of the country, showing the positions of the rivers, the lakes, and the hunting-grounds, and telling long yarns of his varied adventures and successes. A thorough Spanish scholar, he set to work to teach Kit the language which in that border country was almost indispensable for those who wished to trade. All the mysteries of hunting and trapping that had come within his ken did he reveal to him, and in many ways we may regard Kin Cade's hut as Kit's academy.

In the spring Kit started on his return journey to Missouri, but at the ford on the Arkansas, which served as the half-way mark, he met another party bound west, with whom he returned to Santa Fé as interpreter—the offer coming to him thanks to his recently acquired knowledge of Spanish. From Santa Fé he went with another party a hundred and fifty miles south to Chihuahua, and then returning, went off a hundred and fifty miles north to Taos, where years afterwards he was to settle.

Here he entered the service of Colonel Young, and became a trapper. In that capacity he spent the winter of 1827. His life when thus engaged is thus eloquently described by one of his biographers, Mr. Abbott:—

“Young Carson, alone with his horse and mule, would journey from fifty to a hundred miles, examining every creek and stream, keeping a sharp look-out for signs of beaver. Having selected his location—generally in

some valley eight or ten miles in extent, with a winding stream circling through the centre, which he had reason to believe was well stocked with beaver—he would choose a position for his camp. This would be more or less elaborate in its construction, according to the time he intended to spend there. But he would always find some sunny nook, with a southern exposure and a pleasing prospect, near the brook or some spring of sweet water, and, if possible, with forest or rock sheltering from the north winds.

“In a few hours young Carson would construct his half-faced cabin, as the hunting-camp was called. A large log generally furnished the foundation of the back part of the hut. Four stout stakes were then planted in the ground so as to enclose a space about eight feet square. These stakes were crotched at the ends, so as to support others for the roof. The front was about five feet high, the back not more than four. The whole slope of the roof was from the front to the back. The covering was made of bark or slabs, and sometimes of skins. The sides were covered in a similar way. The whole of the front was open. The smooth ground floor was strewn with fragrant hemlock branches, over which were spread blankets or buffalo robes. In front of the opening the camp fire could be built, or on the one side or the other, in accordance with the wind.

“Thus in a few hours young Carson would erect himself a home, so cosy and cheerful in its aspect as to be attractive to every eye. Reclining upon mattresses really luxurious in their softness, he could bask in the beams of the sun, circling low in its winter revolutions, or gaze at night upon the brilliant stars, and not unfrequently have spread out before him an extended prospect of as rich natural scenery as ever cheered the eye. He had no anxiety about food; his hook or his rifle supplied him abundantly with what he deemed the richest viands. He knew where were the tender cuts. He knew how to cook them deliciously. And he had an appetite to relish them.

“Having thus provided himself with a habitation, he took his traps and, either on foot or on horseback, as the character of the

region or the distance to be traversed might render best, followed along the windings of the stream till he came to a beaver-dam. He would examine the water carefully to find some shallow which the beavers must pass in crossing from shoal to deep water. Here he would plant his trap, always under water, and carefully adjust the bait. He would then follow on to another dam, and thus proceed till six traps were set, which was the usual number taken on such an expedition.

“Early every morning he would mount his horse or mule and take the round of his traps, which generally required a journey of several miles. The captured animals were skinned on the spot, and the skins only, with the tails, which the hunters deemed a great luxury as an article of food, were taken to the camp. There the skin was stretched over a framework to dry. When dry it was folded into a square sheet, the fur turned inward and a bundle made containing from ten to twenty skins tightly pressed and corded, which was ready for transportation.”

In the spring a party of eighteen trappers fell into an Indian ambush, and the survivors retreated to Taos with the news of the disaster. To punish the redskins Colonel Young called together his trappers, and, forty strong, marched off to battle. With him went Carson as his right-hand man.

(To be continued.)

Our Portrait Gallery.

(See page 749.)

THE portraits in this week's number of the Heads of our Great Schools are engraved from photographs, as follows: Rev. G. C. Bell, M.A., of Marlborough, from a photograph by Messrs. Elliott and Fry, Baker Street, London, W.; Rev. Edmond Warre, M.A., of Eton, from a photograph by Hill and Saunders, Eton; Rev. D. L. Scott, M.A., LL.D., from a photograph by Boning and Small, Baker Street, W.

Correspondence.

X. Y. Z.—1. You can only obtain the first volume in volume form. All its parts and numbers are now out of print. 2. In these preserving days you may find pheasant eggs and partridge eggs in very curious places—thanks to the gamekeepers.

A. CHAPMAN.—Indexes are in print to Volumes III., IV., V., and VI. They cost three-halfpence post-free. There was no Summer Number in 1883; the first was issued in 1884. The first special Christmas Number was in 1888.

AFRICANDER (Ondtshoorn).—The value of the Bible is what it is worth to you. Because the Mazarin copy fetched £3,900, it by no means follows that all old Bibles are of that value—or even that that one would fetch the same price again. The copy you have is worth more for the family information written on its fly-leaves than the printed matter. If it is properly bound a second-hand bookseller might give you a couple of guineas for it. Your letter was wrecked on the voyage home, and reached us in another cover—a relic from the deep, all stained with sea-water.

L. E. BOXILL (Barbados).—You will find the names of several leading stamp merchants on the cover of the monthly part. We are glad to hear that the B.O.P. is very much appreciated in Barbados, and that there are so few Barbadian boys that are not its constant readers.

D. E. F.—You can get almost any book on application to one of the wholesale houses, such as that of Simpkin, Marshall, and Co., Stationers' Hall Court. It matters not who the publisher or author may be. “Workshop Receipts” is published by Spon and Co., three volumes, five shillings each. We do not know the other work.

W. WHYTE.—The metals that burst into flame on contact with water are sodium and potassium. See “Mirror Magic” in our last Christmas part.

I. S. L. E.—There is no danger in blowing out a paraffin lamp if you will only do it properly. The proper way is to turn down the wick until only a flicker is visible, and then with your mouth at the level of the top of the chimney blow across the opening very sharply. Never blow down the chimney; by puffing across it you cause an upward draught, and thus avoid the danger of the flame reaching the oil.

S. A. F.—Coprah is the sun-dried flesh of the cocoanut; it comes from the West Coast of Africa. Eoony comes from most tropical countries; it is worth from £6 to £14 per ton, according to the size of the pieces. Most of it comes from Old Calabar and North Borneo.

LORD BOB.—The idea of a centre keel to the catamaran has already been tried and found to work admirably. Your rudder notion with the bar across for the pintle to fix in would cripple your craft. You could steer very well with a rudder hung higher, with a pair of rudders from the ends, with a rudder fixed to your central keel, or with an oar—any way, in fact, but the way you suggest.

X. Y. Z.—The naval recruiting office is opposite St. Martin's Church in Trafalgar Square. Apply there. It is at the corner of Hemming's Row.

AN APPRENTICE.—Write for list of books to Crosby Lockwood and Co., Stationers' Hall Court. They publish several on timber measurement. You will find many useful tables in “Hoppus's Measurer” and the “Bijou Calculator.”

DOCE UT DISCAM.—1. Pictures are cleaned by rubbing them over with Scotch whisky until the varnish comes off in a froth. They are then well washed with cold water, and re-varnished. 2. If you take out the front of the piano you will find something touching the wires—perhaps the covering of a hammer, perhaps a piece of fluff.

HELVETIA.—The national debt of Switzerland is about a million and a half, or nearly two pounds per head of its population. Our national debt is £4 6s per head of our population. Switzerland has an army of over two hundred thousand men, the services of all its male inhabitants from twenty to forty-four being compulsory.

A CLYDE LUG-SAILOR.—It would depend so much on the boat, but we should think a few cloths taken out of the sail would be better. A very good plan is to draw a sketch to scale of the hull and sail plan, and if experienced in boats you can almost tell at once when you are over-canvased.

W. DANIELS.—The mainmast should be in the centre of the water-line, the foremast should be half-way between it and the stem head, and the greatest beam should be half-way between the masts.

STRABISMUS.—University College Hospital, Gower Street, W.C.; Central London Ophthalmic Hospital, 238, Gray's Inn Road, W.C.; Royal London Ophthalmic Hospital, Blomfield Street, Moorfields, E.C.; Royal South London Ophthalmic Hospital, St. George's Circus, Obelisk, S.E.; Royal Westminster Ophthalmic Hospital, 19, King William Street, W.C.; Westminster Ophthalmic Hospital, 153, Marylebone Road, N.W. An inquiry addressed to the secretary will procure you full particulars as to times and terms.

B. R.—Dissolve a quarter of a pound each of alum and sugar-of-lead in half a pailful of water, and after three hours dip in your cloth leggings or coat. Let them soak for twenty-four hours, and hang them up to drip dry. This is the simplest and best water-proofing solution you can have.

PURR.—Back numbers can be sent direct, if in print, on receipt of cost and postage, by Mr. Tarn, 56, Paternoster Row, E.C.

B. WHITE.—1. From the end of the ninth century there was no gold coinage either in England or in any of the neighbouring countries till the reign of Henry III. 2. Oak warps and twists very much in drying, and shrinks a thirty-second of its width in seasoning. It is a very durable wood, and has been known to last a thousand years in its dry state. 3. Olive-oil is made from the ripe fruit of the olive crushed in a mill.

COLUMBIA.—1. Weld is one of the mignonettes, *Reseda luteola*. It is cultivated in some parts of Essex. It gives the lively green lemon colour on silks and paperhangings. Its place in calico printing has been taken by quercitron bark. 2. Philctas was a poet and critic of the Alexandrian school, who lived in the early part of the fourth century, and was so sickly and thin that he wore lead in his shoes to keep himself from being blown away. This may account for the heaviness of foot and earthiness of soul displayed by this poet of small displacement. 3. The "dalag" is a fish found in the Philippines. Perhaps you will find it under *Ophiocephalus vagus*.

INCOG.—There are two tablets, one in the Exchange and the other on the "Times" office. The surplus of the money was used to found the "Times" Scholarships at Christ's Hospital and City of London School. The testimonial was subscribed in 1842 to mark the appreciation of the commercial people for the "Times" having, at considerable expense, succeeded in bringing to light a gigantic fraud, by which the bankers of Europe were to be robbed of a million of money by forged letters of credit. Some of the Continental bankers were defrauded and lost £10,700; but in this country the information given by the "Times" was acted upon. The trial is Bogle v. Lawson, at Croydon, on August 16, 1841; report edited by W. Hughes Hughes.

F. M. C. (The Hague.)—1. Should a batsman hit a no-ball and run a two, the two would be scored to the no-ball; otherwise the score would be increased by three—one for the no-ball and two for the runs. In the event of a no-ball being bowled, the over consists of five instead of four balls, a ball having to be bowled to replace the one disallowed. 2. Score the runs as byes. 3. A batsman must not hit at a wide, inasmuch as the ball is called "wide" on the supposition that it will be out of his reach. Wides are like no-balls. See the new laws: "neither a no-ball nor a wide ball shall be reckoned as one of the over."

J. F. K.—The article on hammock-making was in the second volume, and is only to be had in volume form.

W. H. S.—1. You can buy varnish for violins from George Withers, of St. Martin's Lane. 2. Grind up some pumice-stone, and powder some chalk; mix together equal quantities of each, and then add just as much soda as you have of the mixture. Give the marble a coat of this, and wash it off with soap and water. 3. Inscribed stocks are those for which no certificate is issued. The list is too long for us to insert, but there are about forty varieties, including Consols, Bank Stock, Board of Works Stock, etc. There are other stocks for which a certificate is issued, and which are transferred by deed; but they are all colonial.

J. R. EAST.—The telegraph line to Adelaide is 14,216 miles in length. It goes from London to Porthcurno, 323 miles overland, thence to Lisbon 826 miles under water, thence to Gibraltar 363 miles under water, thence to Malta 1,118 miles under water, thence to Alexandria 925 miles under water, thence to Suez 226 miles overland, thence down the Red Sea to Aden 1,445 miles, thence to Bombay across the Indian Ocean 1,829 miles, thence to Madras 720 miles overland, thence to Penang 1,429 miles under water, thence to Singapore 414 miles under water, thence to Banjoewangie 920 miles under water, thence to Port Darwin 1,130 miles under water, and thence overland to Adelaide 2,543 miles—or 3,812 miles of land line, and 10,404 miles of cable. To Sydney the line is 14,670 miles, to New Zealand—the cable crossing from Botany to Wakapuaka—the length is 14,820 miles, to Wellington 14,949 miles; and thus you get the about 15,000 miles which you find so difficult to understand.

H. B. H.—All runs scored in a match count towards the average, and in the event of a second innings being commenced and no wickets falling, the runs gained by the two batsmen are added to the runs they obtained in the first innings; or, what is the same thing, the runs gained through the season are divided by the number of times out during the season.

EXCHANGE COLUMN.—Under no circumstances could we adopt your suggestion. Those who are behind the scenes are, to their sorrow, aware how an "exchange column" has opened the door to almost every branch of dishonesty and sharp practice. If you want to barter with strangers there is a recognised channel for your doing so; buy the "Exchange and Mart," and, from the rules and regulations that it has been found necessary to draw up to save the patrons of that paper from fraud, you will probably gather why it is that "exchange columns" so often degenerate into traps for the unwary.

T. Y. V. G.—The North Cape is not the most northerly point of Europe, but it is near enough for all practical purposes. It is not, however, as near to the Pole as the cape at the other end of the bay on which it is situated. This cape, "the Knife-skerry-Point"—Knivskjerodde—is a thousand yards farther to the north than the North Cape. Both of these capes are on an island. The most northerly cape on the mainland is North Kyn. The most northerly town is Hammerfest; the most northerly fortress is Vardöhus.

P. H. and T. H.—Such a lugsail boat complete would cost you £20. You can average the cost of a boat at a sovereign per foot run, and the sails at the square of a quarter of her length.

TOBY.—Unless you keep the hutchies very clean, rabbits always have a peculiar odour about them, and in hot weather it becomes very disagreeable. The remedy is scrupulous cleanliness.

SILKWORM.—We know of no place where amateurs can dispose of their silk. Can any of our readers inform us where and at what price they find purchasers for it?

ARKLOW.—The average depth of the Pacific is greater than that of the Atlantic, and areas of deeper water occur in it than in any other part of the globe. The seas branching off from it are, however, shallow. The Sea of Japan is, however, a very deep one, averaging 2,500 fathoms.

GOLDMAN.—1. Safety matches are tipped with a mixture of one part of chlorate of potash, two of glue, one of sulphide of antimony, and twelve of water. The mixture on the box consists of two parts of amorphous phosphorus, one part of powdered glass, and a solution of glue. 2. Silent matches are made of sixteen parts of gum-arabic dissolved in the least possible amount of water, with nine parts of powdered phosphorus triturated into it; and then having fourteen parts of nitre and sixteen parts of vermilion, or binocide of manganese, added to form a paste. 3. The heads of vesuvians are made of powdered charcoal and saltpetre to which has been added a little satinwood, cascarilla bark, or gumbenzoin.

PICTOR.—There is no book with everything in it about anything. How is it possible for there to be? The best of the present classical dictionaries is Dr. W. Smith's, published by John Murray, Albemarle Street. For the chief subjects why not consult the Encyclopedia Britannica, and look up the references at the foot of the articles?

A

TALE OF CITY LIFE.

BY TALBOT BAINES REED,
*Author of "My Friend Smith,"
etc., etc.*

CHAPTER XXII.—THE DARKEST
HOUR BEFORE THE DAWN.

IF the worshipful magistrate flattered himself that the reprimand he had addressed to Reginald that afternoon would move his hearer to self-abasement or penitence he had sadly miscalculated the power of his own language.

Every word of that "caution" had entered like iron into the boy's soul, and had

roused in him every evil passion of which his nature was capable. A single word of sympathy or kindly advice might have won him heart and soul. But those stinging brutal sentences goaded him almost to madness, and left him desperate.

What was the use of honesty, of principle, of conscientiousness, if they were all with one accord to rise against him and degrade him?

What was the use of trying to be better than others when the result was an infamy which, had he been a little more greedy or a little less upright, he might have avoided?

What was the use of conscious innocence and unstained honour when they could not save him from a sense of shame of which no convicted felon could know the bitterness?

It would go out to all the world that Reginald Cruden, the suspected swindler, had been "let off" for lack of evidence after three days' imprisonment. The victims of the Corporation would read it, and regret the failure of justice to overtake the man who had robbed them. His father's old county friends would read it, and shake their heads over poor Cruden's prodigal. The Wilderham fellows would read it and set him down as one more who had gone to the bad. Young Gedge would read it, and scorn him for a hypocrite and a humbug. Durfy would read it and chuckle. His mother and Horace would read it. Yes, and what would they think? Nothing he could say would convince them or anybody. They might forgive him, but—

The thought made his blood boil within him! He would take forgiveness from no man or woman. If they chose to believe him guilty, let them; but let them keep their forgiveness to themselves. Rather let them give the dog a bad name and hang him. He did not care! Would that they could!

Such was the rush of thought that passed through his mind as he stood that bleak winter afternoon in the street, a free man.

Free! he laughed at the word, and envied the burglar with his six months. What spirit of malignity had hindered Mr. Sniff from letting him lose himself in a felon's cell rather than turn him out "free" into a world every creature of which was an enemy?

Are you disgusted with him, reader? With his poor spirit, his weak purpose, his blind folly? Do you say that you, in his shoes, would have done better? that you would never have lost courage? that you would have held up your head still and braved the storm? Alas, alas, that the Reginalds are so many and the heroes of your sort so few!

Alas for the sensitive natures whom injustice can crush and make cowards of! You are not sensitive, thank God, and you do not know what crushing is. Pray that you never may, but till you have felt it, deal leniently with poor Reginald, as he goes recklessly out into the winter gloom without a friend—not even himself.

It mattered little to him where he went or what became of him. It made no odds how and when he should spend his last shilling. He was hungry now. Since early that morning nothing had passed his lips. Why not spend it now and have done with it?

So he turned into a coffee-shop, and ordered coffee and a plate of beef.

"My last meal," said he to himself, with a bitter smile.

His appetite failed him when the food appeared, but he ate and drank out of sheer bravado. His enemies—Durfy, and the magistrate, and the victims of the Corporation, would rejoice to see him turn with a shudder from his food. He would devour it to spite them!

"How much?" said he, when it was done.

"Ninepence, please," said the rosy-cheeked girl who waited.

Reginald tossed her the shilling.

"Keep the change for yourself," said he, and walked out of the shop.

He was free now with a vengeance! He might do what he liked, go where he liked, starve where he liked.

He wandered up and down the streets that winter evening recklessly indifferent to what became of him. The shops were gaily lighted and adorned with Christmas decorations. Boys and girls, men and women, thronged them, eager in their purchases and radiant in the prospect of the coming festival. There went a grave father, parading the pavement with a football under his arm for the boy at home; and here a lad, with his mother's arm in his, stood halted before an array of fur cloaks, and bade her choose the best among them. Bright-eyed school-girls brushed past him with their brothers, smiling and talking in holiday glee; and here a trio of school-chums, arm-in-arm, bore down upon him, laughing over some last-term joke. He watched them all.

Times were when his heart would warm and soften within him at the memories sights like these inspired; but they were nothing to him now; or if they were anything they were part of a universal conspiracy to mock him. Let them mock him; what cared he!

The night drew on. One by one the gay lights in the shops went out, and the shutters hid the crowded windows. One by one the passengers dispersed, some to besiege the railway-stations, some to invade the trams, others to walk in cheery parties by the frosty roads; all to go home.

Even the weary shopmen and shop-girls, released from the day's labours, hurried past him homeward, and the sleepy cabman whipped up his horse for his last fare before going home, and the tramps and beggars vanished down their alleys, and sought every man his home.

Home! The word had no meaning to-night for Reginald as he watched the streets empty, and found himself a solitary wayfarer in the deserted thoroughfares.

The hum of traffic ceased. One by one the bedroom lights went out, the clocks chimed midnight clearly in the frosty air, and still he wandered on.

He passed a newspaper-office, where the thunder of machinery and the glare of the case-room reminded him of his own bitter apprenticeship at the "Rocket." They might find him a job here if he applied. Faugh! who would take a gaol bird, a "let-off" swindler, into their employ?

He strolled down to the docks. The great river lay asleep. The docks were deserted; the dockyards silent. Only here and there a darting light, or the distant throb of an engine, broke the slumber of the scene.

A man came up to him as he stood on the jetty.

"Now, then, sheer off; do you hear?" he said. "What do you want here?"

"Mayn't I watch the river?" said Reginald.

"Not here. We've had enough of your sort watching the river. Off you go," and he laid his hand on the boy's collar and marched him off the pier.

Of course! Who had not had enough of his sort? Who would not suspect him wherever he went? Cain went about with a mark on his forehead for every one to know him by. In what respect was he better off, when men seemed to know by instinct and in the dark that he was a character to mistrust and suspect?

The hours wore on. Even the printing-office when he passed it again was going to rest. The compositors one by one were flitting home, and the engine was dropping asleep. He stood and watched the men come out, and wondered if any of them were like himself—whether among them was a young Gedge, or a Durfy?

Then he wandered off back into the heart of the town. A wretched outcast woman, with a child in her arms, stood at the street corner and accosted him.

"Do, kind gentleman, give me a penny. The child's starving, and we're so cold and hungry."

"I'd give you one if I had one," said Reginald, "but I'm as poor as you are."

The woman sighed, and drew her rags round the infant.

Reginald watched her for a moment, and then, taking off his overcoat, said,

"You'd better put this round you."

And he dropped it at her feet, and hurried away before she could pick up the gift or bless the giver.

He gave himself no credit for the deed, and he wanted none. What did he care about a coat? he who had been frozen to the heart already. Would a coat revive his good name, or cover the disgrace of that magisterial caution?

The clocks struck four, and the long winter night grew bleaker and darker. It was eleven hours since he had taken that last defiant meal, and Nature began slowly to assert her own with the poor outcast. He was faint and tired out, and the breeze cut him through. Still the rebel spirit within him denied that he was in distress. No food or rest or shelter for him! All he craved was leave to lose himself and forget his own name.

Is it any use bidding him, as we bade him once before, turn round and face the evil genius that is pursuing him? or is there nothing for him now but to run? He has run all night, but he is no farther ahead than when he stood at the police-court door. On the contrary. It is running him down fast, and as he staggers forward into the darkest hour of that cruel night it treads on his heels and begins to drag him back.

Is there no hope? no voice of a friend? no helping hand to save him from that worst of all enemies—his evil self?

It was nearly five o'clock when, without knowing how he got there, he found himself on the familiar ground of Shy Street. In the dim lamplight he scarcely recognised it at first, but when he did it seemed like a final stroke of irony to bring him there, at such a time, in such a mood. What else could it be meant for but to remind him there was no escape, no hope of losing himself, no chance of forgetting?

That gaunt, empty window of No. 13, with the reflected glare of the lamp opposite upon it, seemed to leer down on him like a mocking ghost, claiming him as its own. What was the use of keeping up the struggle any longer? After all was there not one way of escape?

What was it crouching at the door of No. 13, half hidden in the shade? A dog? a woman? a child?

He stood still a moment, with beating heart, straining his eyes through the gloom. Then he crossed. As he did so the figure sprang to its feet and rushed to meet him.

"I knowed it, gov'nor; I know'd you was a-comin'," cried a familiar boy's voice. "It's all right now. It's all right, gov'nor!"

Never did sweeter music fall on mortal ears than these broken, breathless words on the spirit of Reginald. It was the voice he had been waiting for to save him in his extremity—the voice of love to remind him he was not forsaken, the voice of trust to remind him some one believed in him still, the voice of hope to remind him all was not lost yet. It called him back to himself; it thawed the chill at his heart, and sent new life into his soul. It was like a key to liberate him from the dungeon of Giant Despair.

"Why, Love, is that you, my boy?" he cried, seizing the lad's hand.

"It is so, gov'nor," whimpered the boy, trembling with excitement, and clinging to his protector's hand. "I knowed you was a-comin', but I was a'most feared I wouldn't see you too."

"What made you think I would come?" said Reginald, looking down with tears in his eyes on the poor wizened upturned face.

"I knowed you was a-comin'," repeated the boy, as if he could not say it too often; "and I are waited and waited, and there you are. It's all right, gov'nor."

"It is all right, old fellow," said Reginald. "You don't know what you've saved me from."

"Go on," said the boy, recovering his composure in the great content of his discovery. "I ain't saved you from nothink. Leastways unless you was agoin' to commit soosanside. If you was you was a flat to come this way. That there railway-cutting's where I'd go, and then at the inkwidge they don't know if you did it a purpose or was topped over by the train, and they gives you the benefit of the doubt and says, 'Found dead.'"

"We won't talk about it," said Reginald, smiling, the first smile that had crossed his lips for a week. "Do you know, young un, I'm hungry; are you?"

"Got any browns?" said Love.

"Not a farthing."

"More ain't I, but I'll—" He paused, and a shade of doubt crossed his face as he went on. "Say, gov'nor, think they'd give us a brown for this 'ere 'Robinson'?"

And he pulled out his "Robinson Crusoe" bravely and held it up.

"I'm afraid not. It only cost three-pence."

Another inward debate took place; then drawing out his beloved "Pilgrim's Progress" he put the two books together and said,

"Suppose they'd give us one for them two?"

"Don't let's part with them if we can help," said Reginald. "Suppose we try to earn something?"

The boy said nothing, but trudged on beside his protector till they emerged from Sly Street and stood in one of the broad empty main streets of the city.

Here Reginald, worn out with hunger and fatigue, and borne up no longer by the energy of desperation, sank half fainting into a doorstep.

"I'm—so tired," he said; "let's rest a bit. I'll be all right—in a minute."

Love looked at him anxiously for a moment, and then saying, "Stay you there, gov'nor, till I come back," started off to run.

How long Reginald remained half-unconscious where the boy left him he could not exactly tell, but when he came to himself an early streak of dawn was lighting the sky, and Love was kneeling beside him.

"It's all right, gov'nor," said he, holding up a can of hot coffee and a slice of bread in his hands. "Chuck these here inside yer; do you 'ear?"

Reginald put his lips eagerly to the can. It was nearly sixteen hours since he had touched food. He drained it half empty, then stopping suddenly, he said,

"Have you had any yourself?"

"Me? In corse! Do you suppose I ain't 'ad a pull at it?"

"You haven't," said Reginald, eyeing him sharply, and detecting the well-meant fraud in his looks. "Unless you take what's left there I'll throw it all into the road."

In vain Love protested, vowed he loathed coffee, that it made him sick, that he preferred prussic acid; Reginald was inexorable, and the boy was obliged to submit. In like manner, no wile or device could save him from having to share the slice of bread; nor, when he did put it to his lips, could any grimace or protest hide the almost ravenous eagerness with which at last he devoured it.

"Now you wait till I take back the can," said Love. "I'll not be a minute," and he darted off, leaving Reginald strengthened in mind and body by the frugal repast.

It was not till the boy returned that he noticed he wore no coat.

"What have you done with it?" he demanded, sternly.

"Me? What are you talking about?" said the boy, looking guiltily uneasy.

"Don't deceive me!" said Reginald. "Where's your coat?"

"What do I want with coats? Do you—"

"Have you sold it for our breakfast?"

"Ga on! Do you think—"

"Have you?" repeated Reginald, this time almost angrily.

"Maybe I ave," said the boy; "ain't I got a right to?"

"No, you haven't; and you'll have to wear mine now."

And he proceeded to take it off, when the boy said,

"All right. If you take that off, gov'nor, I slides—I mean it—so I do."

There was a look of such wild determination in his pinched face, that Reginald gave up the struggle for the present.

"We'll share it between us, at any rate," said he. "Whatever induced you to do such a foolish thing, Love?"

"Bless you, I ain't got no sense," replied the boy, cheerily.

Day broke at last, and Liverpool once

more became alive with bustle and traffic. No one noticed the two shivering boys as they wended their way through the streets, trying here and there, but in vain, for work, and wondering where and when they should find their next meal. But for Reginald that walk, faint and footsore as he was, was a pleasure-trip compared with the night's wanderings.

Towards afternoon Love had the rare good fortune to see a gentleman drop a purse on the pavement. There was no chance of appropriating it, had he been so minded, which, to do him justice, he was not, for the purse fell in a most public manner in the sight of several on-lookers. But Love was the first to reach it and hand it back to its owner.

Now Love's old story-books had told him that honesty of this sort is a very paying sort of business; and though he hardly expected the wonderful consequences to follow his own act which always befall the superfluously honest boys in the "penny dreadfuls," he was yet low-souled enough to linger sufficiently long in the neighbourhood of the owner of the purse to give him an opportunity of proving the truth of the story-book moral.

Nor was he disappointed; for the good gentleman, happening to have no less than fifty pounds in gold and notes stored up in this particular purse, was magnanimous enough to award Love a shilling for his lucky piece of honesty, a result which made that young gentleman's countenance glow with a grin of the profoundest satisfaction.

"My eye, gov'nor," said he, returning radiant with his treasure to Reginald, and thrusting it into his hand, "ere, lay 'old. 'Ere's a slice o' luck. Somethink like that there daily bread you was a tellin' me of t'other day. No fear, I ain't forgot it. Now, I say sassagees. What do you say?"

Reginald said "sausages" too; and the two friends, armed with their magic shilling, marched boldly into a cosy coffee-shop where there was a blazing fire and a snug corner, and called for sausages for two. And they never enjoyed such a meal in all their lives. How they did make those sausages last! And what life and comfort they got out of that fire, and what rest out of those cane-bottomed chairs.

At the end of it all they had fourpence left, which, after serious consultation, it was decided to expend in a bed for the night.

"If we can get a good sleep," said Reginald, "and pull ourselves together, we're bound to get a job of some sort to-morrow. Do you know any lodging-house?"

"Me? don't I. That there time you jacked me up I was a night in a place down by the river. Tain't a dainty place, gov'nor, but it's on'y twopence a piece or threepence a couple on us, and that'll leave a brown for the morning."

"All right. Let's go there soon and get a long night."

Love led the way through several low streets beside the wharves until he came to a court in which stood a tumble-down tenement with the legend "Lodgings" scrawled on a board above the door. Here they entered, and Love in a few words bargained with the sour landlady for a night's lodging. She protested at first at their coming so early, but finally yielded on condition they would make

the threepence into fourpence. They had nothing for it but to yield.

"Up you go, then," said the woman, pointing to a rickety ladder which served the house for a staircase. "There's one there already. Never mind him, you take the next."

Reginald turned almost sick as he entered the big, stifling, filthy loft which was to serve him for a night's lodging. About a dozen beds were ranged along the walls on either side, one of which, that in the far corner of the room, was, as the woman had said, occupied. The atmosphere of the place was awful already. What would it be when a dozen or possibly two dozen persons slept there?

Reginald's first impulse was to retreat

and rather spend another night in the streets than in such a place. But his weary limbs and aching bones forbade it. He must stay where he was now.

Already Love was curled up and asleep on the bed next to that where the other lodger lay; and Reginald, stifling every feeling but his weariness, flung himself by his side and soon forgot both place and surroundings in a heavy sleep.

Heavy but fitful. He had scarcely lain an hour when he found himself suddenly wide awake. Love still lay breathing heavily beside him. The other lodger turned restlessly from side to side muttering to himself, and sometimes moaning like a person in pain. It must have been these latter sounds which awoke Reginald. He lay for some minutes listening

and watching in the dim candle-light the restless tossing of the bed-clothes.

Presently the sick man—for it was evident sickness was the cause of his uneasiness—lifted himself on his elbow with a groan, and said,

"For God's sake—help me!"

In a moment Reginald had sprung to his feet and was beside the sufferer.

"Are you ill?" he said. "What is the matter?"

But the man, instead of replying, groaned and fell heavily back on the bed. And as the dim light of the candle fell upon his upturned face, Reginald, with a cry of horror, recognised the features of Mr. Durfy, already released by death from the agonies of smallpox.

(To be continued.)

ON SPECIAL SERVICE: A NAVAL STORY.

By GORDON STABLES, M.D., R.N.,

Author of "The Cruise of the Snowbird," "Stanley O'Grahame," etc.

CHAPTER XXI.—THE BURIED TREASURE—THE EARTHQUAKE—ALONE ON AN UNKNOWN ISLAND.

THE story that Colin had told Padre Fedro about the early career of Lieutenant Mildmay had made a deep impression upon the mind of the kind-hearted little priest, especially that portion of it which related to the sunken treasure—the gold buried in the sand.

"I do not know," Colin had said to him, "whether I may be doing right or not in telling you this. The secret is not mine. But I believe I am acting for the very best. Here then," he had added, putting papers in the padre's hand, "are the plans of the coast where the gold lies buried. Whatever you do—if indeed you think fit to do anything at all in the matter—something tells me will be for the best. And, sir, I think myself happy in having found you, and thankful, oh! so thankful, that I shall be the means of restoring my dear friend's daughter to him."

For nights and nights after Colin's departure the padre lay awake thinking what he should do.

Poor little Sauva Rosa and her grandmother were very poor. Indeed the former was the bread-winner. She taught music, especially among the Europeans. And to think—that within a measurable distance of them wealth was lying on the coast, and that that wealth was theirs by right!

Then the padre determined to act. He took his sister into his confidence. She advised a consultation in the first place with the old grandmother.

"Surely," said the priest's sister, "she can remember something."

She did remember something when questioned, just as you or I would, reader, of a dream long gone by. But it was enough to decide the padre in his course of action. He was by no means a wealthy man, but he would spend a portion of his money in an attempt to find this buried treasure.

He bade his sister good-bye, and started for Callao. He told his sister to pray for him, that was all, and if he were successful it would be owing to the goodness of the kind Father in heaven, if he failed it would be because He—the

Father—willed it so. The padre's faith was a very simple and beautiful one.

At Callao he was more fortunate than he could have expected to be. English, or rather British divers had been at work near the mole on a sunken vessel. Their labour was finished, and they were not sorry to have a promise of more work.

Padre Fedro's next move was to charter a small schooner. On board this was conveyed not only all the divers' craft and apparatus, but provisions for half a year, and timber and implements to build huts on shore.

Then the schooner sailed away to the coast where the treasure lay. Somehow the nearer to the place the vessel came the higher rose the padre's hopes. But when he arrived at last and cast anchor at the very spot from which Loreana's sketches had been taken, and found every landmark and rock and boulder on the coast to coincide with the draughts, then indeed his heart beat high, and he felt sure of success.

About half a mile distant from this place a long reef extended with deep water between it and the shore, and into this natural harbour the Spera—as the padre called his little craft—was sailed and moored permanently. Opposite to her on shore huts were built and entrenched, the accommodation on board the schooner being small. Entrenchment was necessary, for the country around here is wild and lawless, and before a week was over and work had fairly commenced the wisdom of it was apparent enough. A band of horsemen arrived and encamped near. A more lawless-looking, cut-throat crew was seldom seen; partly brigands, partly gipsies, but with mouths filled with butter and honey, you would have said, so sweet and soft was their speech.

They were wondering what the white foreigners were about. They stayed there for days and wondered. The padre had boat-loads of beautiful coral taken on shore, and made a pile of, and placed an armed man to watch it. The ruse was successful. The gipsy-brigands drew

near to the pile and wondered, and wondered again. Then one morning they came to the conclusion that the white men were nearly all mad or fools, and so wondering still they broke up camp and rode off.

And band after band of these wanderers arrived from time to time, but seeing nothing to steal, or anything worth fighting about, they smiled to themselves in their oily deceitful way, and went away.

At the end of three months Padre Fedro seemed no nearer success than ever.

The divers found the boxes of the sunken ship, but not many of these. The keel was there, however, deeply embedded in sand and mud. Padre Fedro would not give up hopes, however. He was there every day on which a boat could float watching the work progressing.

There were days of storm, though, when no work could be done. And if the wind was from the west, as it frequently was, and the waves beat mountains high on the beach, the divers when the tempest ended always found they had to begin their labours nearly all over again, all their excavations having been covered over with sand and mud.

It was heartless, thankless work. But they toiled away, for the padre was of the sanguine temperament and never lost hope.

But he almost did at last. Five months had come and gone, and they seemed no nearer success than at the commencement; and now the head diver announced to Padre Fedro that he must in a week or two more give up the "job," as he called it. His family expected him at home.

Poor Padre, he felt a ruined man! Yet he merely bowed his head, meekly sighed, and breathed a prayer.

But the end had yet to come. One day, although the sun was quite obscured by immense piles of inky-black clouds, it was so hot and oppressive that the men gave up work and came on shore. There was not a breath of wind, and yet high over head those clouds moved and

mixed together in a most mysterious way. At half-past six there was a sharp thunderstorm, the lightning being singularly vivid. It was pitchy dark before the storm came on, but now hills and rocks and the sea itself seemed all on fire.

The little schooner in which the padre slept never ceased to quiver and shake with the rattling, vibrating bursts of thunder.

The storm passed away over the distant mountains, and darkness resumed its sway. But lo! hardly had midnight come ere a low, ominous, rumbling noise

before she was off again, sucked backwards with the after-rush.

All that night the men had to pump for their lives. Morning broke at last, and the sun gleamed red and fierce over the ocean, which was calm with a heaving swell, while save a few leaflets of gold and crimson high up towards the zenith, there was not a cloud in the sky.

The good padre gazed in surprise to notice that, though it was high tide, far more of the beach than had ever been exposed, even at ebb, was visible now.

He hurried on shore in his dinghy. His people were seated at breakfast.

chest of great weight was found. It was more like a piece of rock at first than anything else, so encrusted with lime was it, but a few blows of the hammer revealed what it was. Padre Fedro had found the sunken treasure. None too soon, though, for hardly had it been conveyed on board the schooner ere the beach swarmed with gipsy brigands.

The padre would fain have stayed to make good repairs, for the vessel was far from seaworthy; but better trust themselves to the stormiest ocean than fall into the harpy hands of that lawless band, whose very profession was rapine, and

"A metal-bound chest of great weight was found."

was heard coming onwards from the direction of the hills. Every one was awake in a moment. All knew what it meant. Those in the schooner rushed on deck. Those in the little fort fled out into the open and threw themselves face downwards on the earth.

The noise of the subterranean thunder was appalling, and the earth moved and heaved as if it had been the sea itself, and a strange giddiness and sickness stole over every one.

In thirty seconds the earthquake had passed. But now a great wave came rushing inland. The Spera broke her moorings and was carried shorewards with it. Luckily the fort stood on high rocky ground, or not a soul would have been left alive in it. As it was, the spray dashed high over all, and the sound of the breaking water was deafening.

Hardly had the Spera touched bottom

They could talk about nothing else, think about nothing save the recent earthquake. As for the appearance presented by the foreshore they could make nothing of it.

They were not so used to earthquakes as was Padre Fedro.

"It is nothing unusual in this climate," he quietly remarked, "for upheavals of the sea bottom to occur on parts of the coast and depressions on others. But stay till low water," he added, smiling, "and the scene of your recent labours will be high and dry."

And so it was! There was but little need even for divers now. The keel of the sunken ship, and her ribs, and the remains of her beams, could be walked round at low tide. Then the work proceeded merrily.

In under the very keel, after another week of hard work, a long metal-bound

violence and murder mere accessories thereto.

In ten days more Padre Fedro had the treasure safe in bank, and was at home in his own quiet cottage, relating to his sister and Sauva Rosa, and in a louder key to the old grandmamma, all his adventures, and how mercifully Providence had protected him.

* * * * *

We must now return to the island on which the Whitterit was wrecked.

It is sad to think of, but out of all that crew of over seventy good and gallant men, only seven stood alive on the beach on the morning after their little vessel had been driven on shore. How they had got there seemed a mystery, for even yet the sea was mountains high, and the breakers were tumbling in on the sands like mighty cataracts.

Colin and Blair were the only surviv-

ing officers; the cook, a Krooman, two able seamen, and a boy, were the others.

Colin himself had got ashore intact, though half drowned; but several of the others had been severely lacerated among the sharp coral rocks.

The ship was going rapidly to pieces. They were on a small uninhabited island, with merely a jungle behind them and two or three cocoa-nut trees, so they at once set about saving all the wreckage they could. Spars, ropes, pieces of timber, sea-chests, everything was picked out of the surf they could lay hands on. A cask of biscuit was a great find. The contents were soaked with sea-water, but they could be dried in the sun.

They worked hard all that day, and as soon as night fell retired to rest into a cave they found in a wall of black, burned-looking rocks close to the beach. The floor of this cave was the silver sand, but it was warm and dry, and the shipwrecked mariners were soon fast asleep. They were awakened about midnight in a strange way. A regiment of monster crabs invaded the cave. These were finally driven out, and scuttled away in the moonlight towards the sea.

Colin could not go to sleep again, however. He lay for an hour on the warm sand, then got up and walked forth into the night. The wind had gone down; there was above him a dark-blue sky, with a round pale moon, and bright twinkling stars; on one side was the black cliff, on the other the snow-white wall of tumbling breakers.

He did not feel alone, though, nor did he feel hopeless, sad though his heart was. He sat down on a rock and gazed outwards to sea. Not a vestige of the vessel remained. No wonder a tremor passed through his frame as he thought of his poor commander and messmates all gone to their last account.

Why, he asked himself, should he have been spared? He did not pause to answer his own question, but dropped there on his knees and breathed out his soul in thanksgiving to the merciful Providence that had protected him.

He did not sit up again, but lay there in the sand, with his back against the rock, and his hand supporting his elbow.

Memories of home once more stole over him; he thought of the dear old glen, and his mother, father, and brother, till they seemed actually to rise up before him, and their voices to mingle with the roar of the surf. But the sound of the breakers grew less and less distinct, and—Colin slept.

It was Blair who awoke him. "Found you at last, have I?" he said. "Man! what a thud my heart gave against my ribs when I awoke this morning and missed you. You have fairly frightened my wits away. Come to breakfast."

Breakfast consisted of biscuit and raw salt pork, washed down with cocoa-nut milk.

They set about exploring the island after this meal, but found no water at first. They finally came upon a large pool in a rock. It was evidently rain-water, but they laid pieces of wood across it, and covered it carefully with sailcloth, lest the sun might steal their priceless treasure.

No more wreckage came on shore, but some bodies did. And these they buried deep in the sands close to the cliff, and raised rude crosses over their graves.

They spent the day in wandering about

the shore and gathering some seaweed of an edible kind, and some species of small shell-fish, which they found most palatable and luscious. They often gazed seaward.

They gazed in vain. No ship nor even boat was in view. They were Crusoes to all intents and purposes. They were marooned.

When they retired to their cave on the second night they drew after them branches and brushwood as a protection against those horrible crabs.

About midnight Colin awoke suddenly. He thought he could distinctly hear voices mingling with the monotonous roar of the surf on the sand.

He grasped Blair's arm and bade him listen.

In addition to the sound of voices there was ever and anon a clashing noise as of men fencing with sword-sticks.

"Listen," cried Colin. "There are people outside."

"Never a people," was Blair's answer. "Go to sleep, man. It's only the partans (*Scottice*, crabs). They're no ower well pleased at bein' kept out o' their cave. Go to sleep."

Day after day went by in dreary monotony. The boy who had been saved died. They buried him near the others.

In another week they had to bear one of the seamen to his long home. Both these died from the effects of their wounds, but their loss was severely felt by those left behind.

Water now began to get scarce, and no more rain fell.

They put themselves on short allowance of water, but while they did so they confessed it would probably be as well to drink it. For it was the heat that was causing its absorption. "Why," one or two reasoned, "should we suffer for thirst? why not use it instead of letting the sun get it? It can make but small difference in the long run."

But Colin and Blair ruled otherwise, and it was surprising that the surviving men still looked up to their two officers as their superiors, and gave them as much respect and obedience as if they had all been on board ship.

Great comfort was found from bathing in the sea. For the skin absorbs the water, though not the salt. Cocoa-nuts still held out, but there was a limit to even these.

The pork had gone bad. It was thrown upon the beach and the crabs devoured it.

Their main stay in a fortnight's time came to be the biscuits.

Lower and lower fell the water in the rocky tank, and lower and lower sank their spirits in consequence. One evening they found they could barely scoop up a cupful. Next morning the water was gone, the tank was dry.

Their sufferings now began in earnest. They spent the days they hardly knew how, wandering over the island in a meaningless kind of a way, or gazing seawards for help, or skywards for a shower of rain.

But the sky was like steel; the sea showed nothing except when the wind blew higher than usual, then it was dotted over with little white flakes that their eyes often and often caused them to believe were vessels' sails. Three days went past thus without water. Neither Colin nor Blair ceased to move about, but the other three lay motionless or delirious in the cave.

When Colin had nearly given up and wanted to lie down in the shade and die, Blair, to his joy, found three green cocoa-nuts, each of which contained about a pint and a half of delicious water.

The water of one nut was carefully divided, and the drooping men began to revive, and slept soundly that night and were able to assist next day in the search for more fallen cocoa-nuts. They found some succulent herbs but no more nuts.

It was the morning of a broiling hot day. The very ocean seemed to steam. The last cocoa-nut had been finished the day before. The men had relapsed into a kind of drowsy stupor.

Colin sat on the cliff-top under the shade of a stunted breadfruit-tree. Near him lay Blair, sometimes quite still, then falling off into a momentary dose, from which he would start up talking nonsense, recollect himself, gaze wildly about him for a few seconds, then sink wearily down again.

"Then passed a weary time. Each throat
Was parched, and glazed each eye.
A weary time! A weary time!
How glazed each weary eye!
When looking forward, he beheld
A something in the sky."

"At first it seemed a little speck,
And then it seemed a mist;
It moved and moved, and took at last
A certain shape I wist."

Colin started up, his eyeballs seemed starting from their sockets. Was it a cloud, a bird, or but the fin of a monster shark? No, it was—a ship far away on the horizon.

"A ship!" he shouted.

Blair started up. Blair was very weak now. He laughed and wept by turns, as he pointed seawards.

The men staggered out of the cave; they had heard the shout. And they pointed away towards the sea with both hands held aloft, but they could not speak, their "tongues through utter drought seemed withered at the roots," and when they opened their mouths only sounds like those the dumb make issued therefrom.

Nearer and nearer came the vessel. Colin took off his jacket and waved it in the air.

Nearer still, tack and half-tack, a three-masted schooner, and evidently English. What a gladsome sight for the weary eyes of those shipwrecked sailors!

COLONEL PELLINORE'S GOLD.

By E. W. THOMSON,

Author of "Petherick's Peril," etc.

CHAPTER II.

trear for the two kegs of coin against which his back rested.

There was perhaps little need for an escort, as the road at that time traversed a wilderness, where vast dark forests of white pine alternated with grand woods of huge maples, beeches, oaks, elms, and butternuts. The few Indians then remaining in the district above the Lake of Two Mountains were all well-disposed, and, like the French *habitants* and trappers scattered here and there through the forest, were singularly honest people. But as an escort for treasure was laid down in the rules and regulations, Lieutenant Marhaus, on his quarterly trips to the *Chaudière*, was always accompanied by a squad.

Now they trudged silently along, and complete stillness would have prevailed but for the objurgations of the *habitant* driver, who urged on his stolid pony with frequent cries of "Blue death!" and "Pig there!"

As the dark was about descending, the driver, pointing for an instant with his hickory-handled whip, burst into a more cheerful torrent of exclamations.

"Why does his clatter increase now, Sergeant Bors?" asked the officer, in the rich, soft, brogue-suggesting voice of an Irish gentleman.

"He thinks he had a glimpse of Colonel Pellinore's lights," answered the sergeant, proud to show that he had acquired some smattering of French.

"Faith! I can sympathise with his shouts, then, though I don't remember this bit of wood as near the house. It would be a welcome sight indeed. As I get nearer the mansion I always think better of the judgment that placed it in the wilderness. It's the best of halfway-houses for me."

"Twas General Scarlett that built it, I'm told," said the sergeant.

"Yes, 'Dungeon' Scarlett, as he is

always called, by reason of his mania for building secret rooms. He had his private dungeon in Boston and Quebec and Montreal before being in either place three months."

"There's one here, then, your honour?"

"No, sergeant. On my last visit the colonel and his nephew, young Bryan, and I searched high and low without finding the sign of a secret room, nor, indeed, any place where one could be. Though what the general could want of a dungeon in this wilderness I know not. The darkest place in a city gaol is less retired than the mansion itself. Ah! there it is indeed."

Having now reached the edge of the clearing, they beheld the lights of the house. At the welcome sight the men broke into a cheer, which was answered by a loud, fierce barking of dogs from the hill. With a storm of words the *habitant* urged his horse to a gallop up the slope, and the soldiers followed as they might.

"It's Marhaus already!" cried Colonel Pellinore, flinging open the wide door and stepping out with Bryan by his side. "Stop at the magazine, Marhaus, I beg of you!" he shouted. "I will be with you in a moment. Bryan"—turning to his nephew—"hasten to the corporal's aid. Tell him to prepare plentiful food quickly for our guests. And do thou make ready a welcome cup, a mighty jorum let it be. Thou hast seen the proportions. Let it be served out to the men when they enter. I shall detain the lieutenant only while I house the treasure and turn loose the dogs."

"If such be your commands, sir," answered Bryan, in wonder, and returned into the house, while his uncle hurried out to greet the arrivals.

"Have you my gold too, Marhaus?" whispered the colonel as he shook hands.

"Yes, faith! The two kegs are exactly alike," answered the lieutenant. "One for you and one for the troops at the *Chaudière*. Three thousand bright guineas in each. By my life, colonel, if the yellowboys were mine they should soon shine in a less lonesome locality."

"Perhaps their fate may be as merry as you would give them," said the colonel. "But let me ask you to order your men in. 'Tis not my desire that they should witness the disposal of this coin. Order them in, pray, that I may give you an understanding of the mystery."

"The guineas," proceeded he, when the men had disappeared, "are for Bryan, a fact I do not wish him to know. I must hasten to conceal them."

Saying this, he lifted one of the kegs from the *traineau*, and, carrying it to the steps of the verandah, placed it beneath.

"This must be my bank for the present," he observed.

"Well, it's an illigant one for all the purposes of a burglar," exclaimed Marhaus.

"Happily we are free in these woods from such adjuncts of the civilisation to which you long to return," retorted the old gentleman. "Your gold might be

left on the sled all night as safely as in the magazine. Nevertheless, let us house it."

He opened with one of a rattling bunch of heavy keys the iron-studded oak door before which the *traineau* rested, while the lieutenant, lifting the remaining keg, rolled it to the threshold. The interior of the magazine was wainscoted very roughly to a height of about four feet, its floor was of wood also, apparently that the danger of exploding powder, if placed therein, might be reduced to a minimum. Giving the keg such a thrust with his foot as could not fail to drive it hard against the opposite wall, which was built into the side of the rocky hill, the colonel hastily closed the door, and drawing his arm through that of the younger officer proceeded toward the house.

"Ah, I had forgotten to unchain the dogs," said the colonel, turning back for the purpose. "This money," he resumed, on rejoining the lieutenant, "shall go to Bryan to buy his commission. Here has the lad been eating his heart out for many a month in longing to be with the king's colours. He shall go back to Quebec with you, lieutenant, thence to London and to life."

"Faith! it's Agravaire can show him life there," said the lieutenant.

The old colonel stopped the young man and looked sternly, almost threateningly, into his face.

"Never more mention that name to me," then said he. "In thus enjoining you I should explain, and—"

"Do not, colonel dear," said Marhaus, taking his senior's arm again affectionately. "Twill but distress you. But I would that you might forgive Agravaire once more."

"While my son was a spendthrift I had hopes of him still," said the colonel, in a tone of suppressed agony. "Now he has become a coward and a liar. I cast him off! I will never see his face again!"

There was a pause.

"But I will spare you my private griefs," went on the colonel. "Only this—those guineas represent the last penny of my fortune, the last acre of the Northumbrian estate held immemorially by a Pellinore. Agravaire has wasted the whole. I had intended these last guineas for his debts too till this last news came; but no, they shall go to Tristram's son."

"He will do credit to the fine old name, colonel," struck in Marhaus.

"That's as may be," answered the colonel, sadly, who remembered sorely how gallantly Agravaire had gone forth for the first time. "He shall have the chance, at any rate. But not a word of this, Marhaus, not a hint to Bryan. He little imagines I have the means to buy his commission, nor shall I explain to him before the day of his departure. The suspense of waiting your return, the dreams of life near, would cost him all sleep during your absence did he know of this money."

(To be continued.)

FRANK WORTHING'S INCARCERATION.

CHAPTER V.

WHEN Frank Worthing passed out of the gate in such questionable company, several of the men in the yard threw down their hammers for sheer astonishment. He was a favourite with them, and, to confess the truth, spent a considerable portion of his time about the forge, the lathes, and the carpenter's shed, curiously watching the processes of manipulation, using the tools, and upon all possible occasions initiating himself into the "knack" of handling them.

One of the men said he would "rather a' had a day's pay stopped than that should have happened." The report took wing that Budwell had charged him with abstracting stamps from the drawers, and when that gentleman passed out at dinner-time he was surprised to confront the salutation of a prolonged hoot.

"And what if he did tell little Smith he'd slipped your stamps off, are you muf enough to believe it?" was Mr. Hunter's retort when Budwell, at his eager solicitation, gave him an account of the matter. "Look here, Buddy, if he thought it'd fool you five minutes, he'd vow he pocketed the safe. The lad's honest to the core, though he is a sprightly young spirit. Left three quarters of an hour after you? D'ye think he'd have stayed that time if he'd intended such a job? Five minutes'd have been enough; then he'd have hooked it. He flushed up so, did he? I'd be a mighty lot surprised if he hadn't flushed up when you threw such dirty water in his face. Tween you, me, and the wall, I wouldn't like to say old Smithers doesn't know something about it. There, the lad's spoiled for life! It's real cruel! It strikes me you and the governor will find out, soon or late, the blunder you've made."

So the kind-hearted Hunter passed out, feeling bitterly the uselessness of championing the cause of the unfortunate youth any longer; and that afternoon in the shipyard woe betided the unfortunate "hand" who occasioned his displeasure, for he growled at nothings and thundered at the merest mistakes.

In the office the general opinion was that had the culprit replied respectfully to the interrogations of Mr. Millington

he would simply have suffered quiet dismissal, and not the public disgrace which was now inevitable. The news of his foolish boldness, his mad replies, and general defiance was received in astonishment. The character of Mr. Millington was well known, and it was possible to compute to a nicety the course he would take in such a matter. Any remissness coming under his notice met with prompt scrutiny, which either mended the shortcoming or resulted in some punishment well calculated to prevent its recurrence. That much was certain. It was also well known that a spark of true contrition and an absence of that swaggering self-assertiveness with which some men attempt to brave out their blunders, had often released offending employes from a merited penalty. But insolence, evasion, lying, these he met with impatience, with withering contempt, and dealt out smart and summary treatment.

It was further well guessed that he had a quiet liking for Frank; and it was held by some that a prompt statement of his delinquency would have resulted in the matter being at once hushed up and a chance of self-redemption permitted to him. But his ill-timed audacity, his effrontery, becoming generally known, every particle of sympathy, except that in the breast of the impulsive Hunter, became weaned from him. Old Smithers recalled the fact that at sundry times tools had been missed from the sheds; to ascribe it to the now common culprit was a plausible solution of the mystery.

Two o'clock in the afternoon! Mr. Budwell had been in the town and was at that hour making up his money for the bank.

A pile of cheques, a heap of notes, a bowl of gold, and a spread of silver lay on the desk before him, while he entered the amounts on a bank-slip.

"How much cash to-day, Budwell?"

Mr. Millington had entered.

"About £1,920, sir. Lawson's paid, the Bell Shipping Company, and a few small accounts."

"Very well, put it up. We'll have to prepare now for the business with that miserable lad. I shall instruct Riley, the solicitor, to prosecute. Smithers and the boy will be wanted. We'd better hear them repeat their tale, and send them over to Riley's office. You will follow after you've been to the bank."

Smithers and the boy were accordingly examined, warned not to alter their evidence, and dispatched to the office with instructions to await Mr. Budwell.

Mr. Millington was seated at the desk. A clerk entered from the outer office, a young woman like a servant-girl came in at his heels.

"You're wanted, Mr. Budwell. This person requires to see you at once."

The girl handed Mr. Budwell a large envelope.

"Missis says will you please open that, and I'm to bring word whether it's all right."

Mr. Budwell turned hastily aside from his principal and ripped open the envelope. *Out upon the desk fell a bundle of postage-stamps, and with them an epistle,*

which the recipient found to his horror and amazement to contain the following:—

"Melton, Tuesday, 11.30 a.m.

"Dear Samuel,—In looking through the old coat which you brought home last night (before giving it away, as you said) I found these stamps. They were in the breast-pocket. Thinking you might have some anxiety in case they have any connection with your business, I send Mary at once with them. In haste,

"Your affectionate aunt,

"DINAH WILLIBOD."

Oh, maddest of blunders! He could have whipped himself, or done anything else equally foolish, at that moment. And there were the hard eyes of his principal surveying him from head to foot with a gaze sarcastic, sharp, and inquisitorial. Mr. Budwell turned hot from his temples to his toes, and, what he never could avoid when exceptionally bothered, burst into a violent perspiration.

"Those are stamps, sir," he stammered out, quite unaware of what he said.

"Yes, presumably so. Your messenger waits a-repy, I think."

"All right, Mary, all right, all right—go on!"

And the girl went, looking as if she would have liked to know more about the matter.

Mr. Budwell then explained that he "quite remembered now." "I went over," he said, "to the table, sir, last night when the letters were all put up, and Worthing handed me the stamps. As I was just reminding him to be sure and put everything in the safe and to come down in time in the morning"—this information he calculated to have a mollifying tendency—"why I must have pushed the stamps in my pocket. And it was last night I took my office coat home. My aunt, it seems, found the stamps when she looked through the coat, and sent the servant with them."

And this much he stammered through, praying fervently that his auditor would rave, or stamp, or blame, or anything but fix that wide gaze, so cool, attentive, pitiless!

A contemptuous "T-t-t!" escaped Mr. Millington's lips, and without a word to the bewildered Mr. Budwell he turned on his heel and passed out. In half an hour he had hastily dispatched his immediate business, and was rattling away from the gates in a cab in order to effect the release of the unfortunate Worthing.

The dying advice of an old British admiral to his son was upon no occasion to *trouble overmuch*, but when he did make a blunder only to trouble so far as would prevent its recurrence. Perhaps Mr. Budwell had some idea of this nature; we do not know. But during that humiliating confession he had been driving his nails into his palms in out-and-out self-disgust, and now, smarting under the "T-t-t!" and that turn of the heel with which Mr. Millington had replied to his explanation, almost beside himself with wrathful chagrin, he suddenly jambed one foot against the

stationery cupboard, and with the other dealt his leg three violent kicks.

"I say there, what's to do, old lunny?"

It was John Bell who appeared, opening his eyes and mouth rather wide at the strange spectacle. He also looked very uncertain whether to stand or to run, especially after his impertinent salute. He eventually decided it would be safer to run.

It was Smithers who spoke. After waiting two hours he had thought fit to return, and the boy with him, as Mr. Budwell had not put in his promised appearance. These worthies looked most weary and doleful.

"By the—why, it's half-past four!" exclaimed Mr. Budwell, with a start. "Whatever made you stay all this time?"

evening, but Smithers told his tale of the journey to the solicitor's, Jack Bell told his tale of the strange scene which he had witnessed in the office, and in office and yard there was much wondering conjecture. But who could solve the riddle? After all sorts of theories were started, not one could elucidate the matter further than old Smithers, who proclaimed,

"In office and yard there was much wondering conjecture."

The interruption was salutary, for it recalled Mr. Budwell's scattered wits—really acted as a wet sheet upon his fever—and without more ado he opened his books and proceeded to work. Work was his good point. Whether chagrin, disappointment, or even a cantankerous toothache beset him, he had this specific. "There's nothing so good for the dumps as honest work" he was once heard to explain, and with that one force had he made his way to the trust of cashiership, the prior claims of a keener but less steady man being disregarded. So he sank all his bitter thoughts, as many greater men had done before him, in the healthy oblivion of his immediate duty. "Please, sir, you never come, sir."

"And didn't you say we was to stay at Mester Riley's till you come, sir?"

That was true. He ought to have recalled them by a messenger, but their very existence had slipped his memory.

"Done again!" Mr. Budwell muttered to himself, with another gulp of rising displeasure.

Further, at five o'clock he remembered that the bank closed at three, and there was the undeposited money in his drawer, which distracting events had conspired to cast from his memory. "One day's interest," he reckoned, with a groan, "at three and a half per cent. on £1,920, three and—three and—dear me! Ah, yes! nearly four shillings! That's gone!"

Mr. Millington did not return that

"There's summut up, gen'elmen; there's summut up."

* * * * *
Next morning, at nine o'clock, to the surprise of all and the pleasure of many, in walked Frank Worthing, just as usual. Nay, not just as usual, for it was not ten minutes after nine, but to the second promptly, nine o'clock.

Mr. Hunter was at that moment not far from the yard gate; he had buttoned one of the clerks, and was writhing in mirth over a history of the succession of blunders which Mr. Budwell had perpetrated in two short days. "Tell you what, false imprisonment's an ugly thing for the governor to do with, eh?" was his partial and crude comment.

As Frank came up he caught the mention of his own name. His throat felt too full to speak, for he *knew* he had been spoken of kindly. He simply received the proffered grip from Hunter's outstretched hand, looked into his eyes with a grateful glance, and passed straight to the private office, where, hat in hand, he stood awaiting Mr. Millington.

"Good morning, Worthing. Sit down," said that gentleman, as he appeared after some quarter of an hour had elapsed.

"And now I think the best thing we can do with you will be to remove you to the drawing office. I have noticed recently that you and Budwell don't work amiably together. Continue your apprenticeship at the terms you started—one hundred pounds you receive, I think, for five years. Well, go on at that. What do you say?"

"Thank you, sir; thank you," said Frank, and a warm blush of surprise and gratitude covered his face at the prospective change.

Mr. Millington proceeded. "You hardly liked your incarceration yesterday, I imagine. I am more than sorry you should ever have had such an experience as that. Be thankful you were behind the strong doors a few hours only. I think you will now see it was the peculiar attitude you took yesterday which put you there at all."

"Oh yes, sir!" he exclaimed, in utter contrition; "I am very sorry for the manner I spoke to you."

"And now you will go downstairs and shake hands with Mr. Budwell," continued Mr. Millington. "You can work out to-day in the general office, and you will start business again on Monday, when I will have made arrangements for the change."

"It was all my fault," said Frank Worthing, holding out his hand to Mr. Budwell. "Don't you remember when I handed you the stamps that night I started the rusty screw of the copying-press shrieking. You must have crammed the stamps in your pocket when you turned to stop the noise."

"All your fault! no it wasn't, young un! I'd like to have gone down in an earthquake when I found out my cruel blunder, and thought of where it'd sent you to. I was a weasel-headed"—Mr. Budwell ground the words between his teeth—"chump-headed, pudding-headed, flab-ber-gas-ted-headed, Aberdeen turnip!"* that's what—but here, give us your hand! And now, I just want to put in a word or so if you don't mind. I wish you well, I do, and I'd like you to reflect over the skylarking which you indulge in here now and then. It may be all very lively for the time, Worthing, but if a fellow wants to get up the tree in business he's got to bring to the push all the spirit and brains he's got in him. You can work like a brick if you're steady, but if a man wants to turn out well he mustn't go about his business in any 'don't care' sort of a way. Look ahead a bit. Reflect over that high-flying style of yours, Worthing, and consider this—Is it worth your while? Is it worth your while?"

And thus Mr. Budwell strained through his remarkably-worded but well-meaning speech. It was a great effort. He felt almost stunned when he reflected how prodigal of advice he had been, and it is reported that he found it necessary to be reticent for a week afterwards, as a protest against his own verbosity.

But Frank, he was touched to the quick by the rough kindness of the words. He was really humbled by the troubles he had caused, and he set to work with a will, and we doubt whether in the whole of his history he had passed a day of such quiet, concentrated effort, as in that last day of his connection with the work of the general office. Certainly, and the fact was quite a discovery to him, every man has a career before him—good, bad, or indifferent, and with this idea one besetting question would per-

* We can vouch for the literal accuracy of this remarkable anathema of Mr. Budwell's. If necessary we could produce a shorthand note of it taken at the moment of utterance. Further, we may remark that in a certain busy corner of Western England that gentleman still indulges in the unique phrase.

sist in coupling itself in Frank's mind throughout that memorable day; it was the query raised by Mr. Budwell, "Is it worth your while? Is it worth your while?"

How did he answer it?

* * * *

After a jump in our history of some ten years we find at the shipyard of Brown, Millington, and Co. a new screw steamer of exceptionally large tonnage upon the stocks. As she approached completion great interest towards her was manifested in certain influential quarters, for she was the subject of improvements and experiments calculated to make her the fastest of ocean liners.

Further, for every day beyond the date upon which she was contracted to be finished a heavy penalty would be incurred by the builders. Time was short, the men worked day and night, when suddenly the yard manager, who had long been ailing, succumbed to increased illness. But his place was filled by a younger man, the work was still urged forward, and her contractors breathed easily when, upon the day she lay ready for the launch, there was yet time to spare.

Her public naming was completed, the "thing of life" had crested her first wave, and at the dinner-party celebrating the launch a gentleman was pointed out to whose energy Mr. Millington thereupon publicly ascribed the prompt completion of the work. This young man, he remarked, had been for some years an arduous and successful student in matters connected with marine engineering. Further, he hoped it was no breach of confidence to disclose that he was the author in a certain technical journal of the articles upon "Naval Construction," which had recently awakened so much interest and debate. He had the pleasure to introduce his young colleague as the future manager of the Irontown Shipbuilding and Engineering Works—Mr. Francis Worthing.

(THE END.)

LAMPS AND LANTERNS.

ONE can easily imagine that man had tenanted the earth for but a very short space when he found it necessary to possess some means of providing himself with artificial light. Indeed his discovery of the wonderful element fire, which doubtless occurred at a very early period of his existence, could not fail to lead up thereto, for it would obviously be then but the easiest and most natural of all things that he should snatch a lighted brand from the flames which he had kindled to furnish him with a substitute, however feeble, for the glorious light of the sun when heaven's great luminary had sunk to rest.

But here he may be said to have stood still, for he does not appear to have gone beyond the torch stage of his history for centuries afterwards, and there are many savage races at the present day who even yet have advanced no further. Indeed the progress made by man in respect of artificial light until the early part of the century in which we live was extraordinarily slow.

Lamps, it is true, were in general use amongst the Jews, Greeks, and Romans, and the other great nations of antiquity, but they were of the rudest description, and consisted for the most part of a simple vessel which

held oil, grease, or wax, from the surface of which projected a wick. The light obtained was of the feeblest description, the flame had no protection whatever from the wind, and the smell which arose could only have been rendered endurable from the fact that "use is second nature."

The Greeks and Romans lavished much artistic excellence upon their lamps, making them with one wick, two wicks, or thirty or forty wicks. But they did not improve their construction one step, and to all practical intents and purposes they were no better than the saucer of tallow with its floating cotton which may yet be found flaring and guttering and smoking in some of the out-of-the-way corners of our own land.

The seven-branched candlestick placed in the sanctuary by Moses, and those afterwards prepared for the Temple by Solomon, were crystal glasses filled with oil and fixed upon the branches of the candlestick, whilst in private houses the lamps were generally placed on high stands which rested upon the ground.

A very common form of light amongst the Jews—and which we are told by antiquaries is more often than not intended by the word "lamp" in our Bibles—consisted of a sort of

advanced torch made of iron or potter's earth, around which was wrapped old linen which required to be moistened from time to time from the vessel of oil carried by the person using it.

This was the light used by Gideon and his three hundred men. It was also the "lamp" of the wise and foolish virgins, and will explain the reference to oil in the parable.

After the lamp came the candle, whose modest ray we are inclined to regard with a considerable amount of kindliness and esteem. But for the candle the dark ages of the world would have been dark in a still more literal sense than they already were, and to this humble servant civilised man kind was indebted for the very best illuminant it possessed—certainly until the latter end of the eighteenth century and probably right up to the time of the invention of gas.

The Romans possessed an inferior sort of candle which was made of strings of papyrus or rush dipped in pitch and surrounded with wax. But candles in perfection were not made until a much later period, and Alfred the Great has the credit of being the inventor of the horn shield for the flame—and consequently of the "lant-horn."

One proof of their value is the fact that

previous to the invention of the Argand burner in 1784 lamps had entirely fallen out of use, a glance at the prints of that period being sufficient to convince one that candles reigned supreme not only in the houses of the people, but in the churches and in all other places of public assembly.

In such places there was an official whose sole duty it was to pass round armed with a pair of snuffers and an extinguisher on the end of a long stick, attending to the requirements of such of his flaring rods of tallow or wax as needed his attention.

Candle-making at that time also formed a part of the education of every housewife, and the candle-box was to be found in every household. In how many is it to be found now?

Were not the tallow-chandlers also in their glory? To wit, is there not a great City Company yecept the Tallow-chandlers? And yet at a recent meeting in the Company's Hall for the benefit of a charity connected with the trade we heard the chairman lament that tallow-chandlery was an industry which was fast dying out.

For in 1784, as we have stated, came M. Argand with his improved lamp. This was the first attack upon the dominion of the candle which could cause that luminary any alarm. Later on appeared an inventor with his coal gas, when the poor candle received a deadly thrust, and in later years paraffin and petroleum put in their appearance and drove it utterly routed from the field.

To refer then to Argand's invention. He had already designed the circular burner, which, compelling the air to rush through the flame on both sides of the wick, intensified its powers of combustion and so consumed the smoke which had hitherto expended itself in the atmosphere, and which had formed perhaps the *bête noir* of all lamps then existing. In addition the brilliancy of the flame was much increased; but he was not yet satisfied.

It is said that he and his brother were sitting together one night, Argand with his head resting on his hand pondering over a sheet of memoranda which lay on the table before him containing the result of experiments connected with the subject which he had always at heart, when suddenly the power of the little oil lamp which was burning on the table increased doubly in intensity. Argand looked up and saw that his brother had in an idle moment placed the neck of a broken bottle over the flame. He saw at once that another great step towards improvement was secured.

Beyond this, however, invention did not go much farther, on account of the difficulty of finding a material light and fluid enough to rise in the wick in sufficient quantities to supply the flame, and until the discovery of paraffin and petroleum we find no end of inventions of all sorts brought into the market, each of which was either very complicated or very inefficient and liable to easy derangement if the lamp was not very carefully handled.

"Punch" in one of Leech's sketches has given us a picture of an old gentleman who has taken his after-dinner nap with a "camphine" lamp burning on the table. He is shown viewing his blackened visage in the chimney glass, whilst everything in the room is alike covered with a thick coating of soot, and the origin of all the mischief is still volleying forth thick clouds of Stygian-like vapour.

If then so much difficulty was experienced in finding a suitable light for domestic, not to speak of other purposes, we can well imagine how great a contrast the streets of the various towns—for instance, of our own metropolis—must have presented to that with which we are accustomed as a matter of course in the present day.

And we find that London seems to have been left in entire darkness with the exception of an occasional cresset (see illustration)

until, at any rate, the middle of the seventeenth century, when several regulations were made for the improvement of the streets, and in 1668 Londoners were reminded that they should hang out lanterns daily at the accustomed time. A few years after every householder was required to hang out a light at dusk, which he was to keep burning until twelve o'clock at night. Many like regulations were made at different periods which apparently did not receive the attention thought desirable by those by whom they were promulgated.

In fact they were but very indifferently carried out; for their enforcement was left to the only police which then existed, the asthmatic and decrepid watchmen who, armed with a staff and a horn lantern containing a glimmering candle, shuffled through the streets uttering their monotonous cry. This varied at different periods in their history from the "Lanthorn and a whole candle light, hang out your lights, hear!" of the time of Queen Anne and previous thereto down to the "Hali-past twelve o'clock and a fine starry night" of the "Charleys" who existed until the new police, as they were then denominated, were called into existence by Sir Robert Peel in the year 1835—not quite fifty years ago.

En passant let us say a word or two with regard to these defunct officials. In the reign of Henry VIII. London was patrolled nightly by the marching watch, one of whom is shown in the illustration. This body, handsomely dressed, some mounted and some on foot, made their way nightly through the streets of the city.

The advantage of their perambulation is somewhat difficult to discover, for the noise which accompanied their progress, to say nothing of the flaming cressets which they bore aloft, was sufficient to give plentiful notice to wrong-doers of their approach, whilst as soon as they had passed the evil-disposed could carry on their operations in safety.

The marching watch was an enormous expense, and brought no corresponding benefit to the citizens beyond gratifying their eyes—once a year on Michaelmas eve, when the watch was set—with the sight of a magnificent procession; and accordingly in 1659 it was abolished, and it was determined "in the room thereof to have a substantial standing watch for the safety and preservation of the city." Therefore, as a good example of how not to do it, the sturdy archers, pikemen, and demi-lancers were got rid of, and the watching of London was placed in the hands of apparently the most decrepid and shaky personages who could be discovered. These, with cracked voices and halting gait, impeded by a heavy stick, and rendered still more useless by the glimmering horn lantern they carried, which served only to give notice to thieves of the approaching cripple, furthered this still more by shouting out the legend set out in the illustration.

Will it be believed that these worthies continued the same cry even down to the reign of Queen Anne, and that long after the glass lantern had come into general use the watchmen continued to carry the dingy horn lanterns in vogue when they were first instituted?

In the reign of Mary, to add to their efficiency, they were provided with a large bell, and the sound of this instrument of torture woke the echoes of the quiet streets until the time of the Commonwealth, when Puritan common sense got rid of that nuisance at any rate.

Nice times those for invalids or persons to whom rest was of consequence!

That London depended upon the efforts of its individual citizens for illumination is evident from the cry of the watchmen, and at the top right-hand corner of the picture we have given a watchman represented in a print of the time of James I., under which appears the following lines:

"A light, here, maids, hang out your light,
And see the horns be clear and bright,
That so your candle clear may shine,
Continuing from six till nine;
That honest men that walk along
May see to pass safe without wrong."

We can perhaps, however, obtain some faint notion of the "darkness visible" which existed till a recent period in the great metropolis when we look at the regulations of the Common Council for street lighting. Every housekeeper whose house fronted the street, and for which he paid a rent of £10, was required from September 29th to March 29th to hang out a lantern, which was to be kept burning "on every dark night" from six till eleven. Under this regulation whole streets were without light, as their inhabitants were not rated at £10, a considerably larger sum in every way in those days than in these. This was in 1716.

At a subsequent period, in the reign of William III., an attempt at improvement was made, and a contract was entered into by a company for lighting the streets. The unwelcome shedding of light into dark places, utterly inefficient though it was, was looked upon with great distaste by certain classes, and the lamps were frequently broken by stones or by bullets. The contract, which was for five years, was not renewed at its expiration.

Shortly after this, however, owing to the terrible state of insecurity of the streets of London after dusk, one thousand oil-lamps were placed in various parts of the city, which were increased in 1736 to five thousand, and in 1786 Beckman, in his "History of Inventions," is astonished at the magnificence of the arrangements for the lighting of London.

He speaks almost with bated breath of the lamps as being all of crystal glass, each furnished with three wicks and affixed to posts placed at a certain number of paces from each other.

But very soon the round glass lamps, with their dismal oil lights, were to give way to the gas, which still forms and appears likely to form, for years to come, at any rate, the principal means of illuminating our thoroughfares.

Like most other useful inventions, gas was at first treated with ridicule, and the early companies for its manufacture were for many years anything but successful in their operations, and, indeed, were carried on at a loss. As our readers know, they are now amongst the most profitable of undertakings.

One side of Pall Mall was the first thoroughfare in London lighted with gas. This was in 1807, when the people thronged in great numbers to view the new lamps, and many might be seen carefully wetting the tips of their fingers and cautiously placing them upon the gaspipes, under the impression that the tubes which contained the gas must of necessity be in a state of intense heat.

The general adoption of gas made no longer necessary the vocation of the flambeau-bearer, without whom, armed with his flaring torch, the sedan-chairs or carriages of the higher classes did not dare to venture forth after nightfall. For, unless attended by a sufficient number of these stalwart retainers to overawe the bands of marauders armed with cudgels, and possibly more formidable weapons, the rout or party-goer could scarcely hope to return to his house in Bedford Square or some other part of the then fashionable quarter of the town without dire mishap to his property, and likely enough to his person into the bargain. The huge extinguisher into which the bearer plunged his flambeau before stumbling in darkness round to the stable or down the stone steps leading to the kitchen, then decorated the front of every great man's house, and many may be seen at the present time in those parts of London tenanted by the upper classes at that time.

Gas also put an end to the services of the

lamplighter of the period, who with ladder on shoulder and scissors in belt, attended by his can-boy, hurried through the streets each morning, here striking some heedless passer with the ladder, and there running against another with his greasy clothes or can—inso-much that “to run like a lamplighter” became an everyday proverb. Even when mounted on high he still favoured the passer by with his attention, or rather want thereof, for it was no uncommon thing for the guileless pedestrian to receive a shower of highly perfumed oil from the overflowing lamp above.

The lamplighter of the gas era has also in time been relieved of the ladder which formed an essential part of his equipment, and now carries a light pole containing a flame in one end. Whether electricity will in time dispense also with his services remains to be seen.

We have left ourselves but little space to speak of the lamps of other nations. Everybody knows that the Chinese and Japanese are the great lantern-makers. In fact, a lantern seems to be an essential adjunct to a Chinaman, and there is a story told of a night

attack on a Chinese fort by the English when every Chinaman took to his heels and mounted the hill behind with all his speed. But every man carried his lighted lantern slung over his shoulder, and so formed the best of targets for the victorious blue-jackets.

Many nations of the East, besides those more closely connected with Scriptural history, and notably the Chinese and Japanese, carry a lantern at the end of a stick, thus giving double point to the words of the Psalmist, “Thy word is as a lamp unto my feet and a light unto my path.”

THE REVERSE OF THE MEDAL.

A RIVER RECOLLECTION.

By PAUL BLAKE,

Author of “A Week on the Thames,” etc., etc.

IT is somewhat on my conscience that I have written hitherto about the river almost entirely from one point of view. Its delights are apt to impress themselves on the imagination so strongly that one forgets all the inconveniences and even positive discomforts that are occasionally involved. But let me be just, and recount the events of one miserable day which will be remembered by our crew as long, perhaps, as any delicious moonlight sail or pleasant afternoon laze.

Some years ago, when the crew of the Swan were more active and enterprising than they are now, they started for their first trip for the season at Easter. It fell early on that particular occasion, but the weather was inviting and a party of friends were staying at Marlow, so it was unanimously decided not to postpone the first trip till more settled

weather. Easter Monday was all that heart could desire: the river was tolerably free from boats, and the sun was pleasantly warm. I formed part of the crew on this occasion, and congratulated myself on my good fortune.

Certainly it grew chilly about dusk, and we landed at Marlow before dark, feeling that it would be risky to stay on the water longer. Budd's cousins were amongst the friends with whom we had spent the day, and Budd had persuaded them to come and breakfast with us next morning. They were returning to London by a nine o'clock train, but Budd conclusively proved that there was plenty of time for them to meet us and have breakfast and then be rowed down to Bourne End, where they could catch their train.

We added our entreaties, which had their desired effect. It was arranged that at eight o'clock sharp they were to meet us by the little bridge which leads from the meadow to the Quarry Woods, on the left bank of the river (facing the source). We had often breakfasted at that particular spot, and knew it to be a very convenient and pleasant one.

In those days we never dreamt of having any meals indoors. We had brought our cooking apparatus to a pitch of perfection

which defied the elements. The young ladies were quite ready to signalise the last day of their holiday by indulging in a somewhat gipsy-like proceeding, and we all took it for granted that the weather would be all that could be desired.

I suppose the effect of the unwonted air and exercise was stronger than usual; at any rate, we woke rather late next morning, and there was a scramble to get down to the boat and start. It seemed very chilly, but that was natural in the early morning. There was a considerable breeze, and Figgis was regretting that we were not going up stream: we could have sailed magnificently.

The lock-keeper was slower in opening the gates than usual, and in the hurry of getting out again Budd dropped a boat-hook. Figgis did not notice the loss, and vigorously pulled a couple of strokes to keep us out of the bank, for the stream is a strong one just outside the lock, as every one knows. It was “no end of a nuisance” to have to turn and pull back: time was getting on apace.

However, in the mood in which we were, it was not a matter of many minutes to reach the woods. We pulled the Swan on to the mud and landed in haste, throwing the contents of the boat on to the grass pellmell.

"I'll boil the water," said Charlton, when we had lifted out our apparatus. In a couple of minutes he had set the kettle on the iron cylinder, which had been dumped down close to the water.

Figgis began spreading the cloth. Whilst he was doing so he became aware of several facts. One was that the wind was a strong one, for it lifted the cloth and bid fair to carry it away bodily. Another was that the wind had a clear passage to the spot we had chosen: the woods were no protection whatever.

What a wind it was! I never felt so cold a one in my life. It nipped our fingers, so that we could not untie the parcels we had brought with us, nor loosen the fastenings of the cushions. It blew the flame from under the kettle, in spite of our apparatus, and we had to build up a pile of stretchers and hampers to protect it. It blew up the tablecloth like a balloon, and upset all the cups placed on it.

There was no denying the fact that it was a terribly cold day: more fit to spend round a big fire than out in the open air. But there was no help for it: we must remain where we were on the chance of Budd's cousins arriving. In our hearts we were all ungallant enough to wish them farther.

"Look here," said Figgis, who was getting desperate with his failures to lay the cloth; "this will never do; we can't breakfast in this Arctic region. We must get shelter; help me fix up the sail on the windward side, and we shall be as snug as you like."

The idea was a good one. We fixed the mast and the long boat-hook in the ground as well as we could and stretched the sail between them; fastening it down with stones and a scull laid lengthwise. Then we tied sculls to the supports to form buttresses, and had a snug and cosy spot to breakfast in, though the view of the river was shut out. But that was an insignificant detail.

We had all mounted our coats and wrappers; Budd had even put on his macintosh. Charlton, who was terribly exposed to the icy wind, had slung the bow cushion round his shoulders and was trying to thaw his hands over the flame of the methylated spirit.

Suddenly there was a cry of dismay from Martin, who was getting the provisions in order.

"No bread!" he cried.

It was true enough: the shops were shut the night before, and no one had thought of buying any in the hurry of departure.

Now came our first piece of good fortune. A small boy emerged from the wood and was going on his way to Marlow when Figgis stopped him.

"Look here, Tommy; here's a shilling for you to get us a couple of loaves, and if you're back here in twenty minutes you shall have another for yourself."

The boy took the money and was off at a trot.

"We shall just get it in time," said Martin. "Has any fellow got a spare pair of gloves?" he continued.

The fact that his question did not meet with shouts of derision and scorn shows the state to which the crew were reduced. *Gloves in the Swan!*

The breakfast was now fairly well laid. The butter was on our only china plate; there were three or four pots of jam open, a box of sardines, and some tinned salmon; when the eggs were boiled and the steak fried we should have a breakfast which the Swan need not be ashamed of. Figgis stood up and stretched his back, which was getting cramped with continual stooping.

Swish! swash! A specially severe gust of wind was too much for the fastenings of the sail. Figgis darted forward to hold the mast up, stepping on the sardine box on his way. He was too late: he saved the mast, but the boat-hook gave way, and in a moment the sculls and sail and everything were lying in a confused mass on the breakfast.

We rushed to Figgis's aid and extricated him from the ruins. The English language was not equal to the occasion, so we made no attempt to use it. In silence we took away the useless sail, which bore the marks of jam and eggs on its snowy whiteness, and set ourselves to collect the *débris*.

"What shall we do?" asked Martin.

"Do?" retorted Figgis. "There's nothing to do but make the best of it and be wiser next time. Isn't it almost eight o'clock?"

It was; but though we eagerly scanned the footpath neither the ladies nor the boy could be seen.

"I should think they won't come," said Martin.

"Probably not," said Charlton, "but we've got to be ready for them all the same."

"Then it's quite time we saw something of them," said Budd. "Look here, you fellows, if I don't get something to eat soon I shall collapse; those cousins of mine are due at eight, if they don't turn up by five minutes past let us begin, and I'll do the apologising if they come late."

We were ready enough to agree; the idea of a good cup of cocoa was enough to make us risk any seeming want of consideration towards our visitors.

"Then it's time I started the steak," said Charlton. "We must keep the kettle hot over the small spirit-pad."

We had a second apparatus for boiling water, a small one without proper means of protecting it from the wind. The only way to manage was to light it in the boat, where it would be sheltered by the gunwale.

I was commissioned to see to it, and had the pleasant job of climbing into the wobbling boat with a kettle full of boiling water. I soon had the spirit alight and kept the kettle boiling. At all events, we should have a warm cup of cocoa soon. The very thought was delightful.

Charlton meanwhile was cooking the steaks. In five minutes more we should begin. There was still no sign of the ladies, but in the distance we could see the boy returning.

We beckoned wildly to him, for we were now only waiting for him in order to begin. The steaks were nearly done, and the eggs had just been popped into the saucepan, when we heard a shout from the opposite bank.

There stood the two ladies. They had come down the wrong bank.

Budd scrambled into the boat and pushed off.

"We must fetch them," he said, as he seized a scull. Then we found that all the other sculls were on land, and had to wait till Martin brought us one.

"Our breakfast will be spoilt," I heard Charlton growl.

We reached the opposite bank in safety: I kept my eye on my precious kettle. But when we arrived the next step was not easy. The bank is high, four feet out of the water, and quite perpendicular: how were the ladies to get into the boat?

However, it was no time for ceremony. Budd scrambled out and I held the boat against the bank whilst Budd lowered his cousins gently from the most convenient spot we could find.

One of them managed the descent very neatly, but the second slipped on the uncushioned thwart, and in saving herself gave the Swan a lurch. I held on tightly, so that the danger was of the slightest degree, but—the kettle slipped.

You would have thought the Swan a launch from the steam that rose from the boat. I had to skip pretty nimbly to save myself from being scalded.

Budd dropped in with a savage thump and

began pulling back to the others. He jumped recklessly into the mud; he seemed to take a delight in making himself as miserable as possible.

Figgis met us with a woeful face. The boy had returned without bread; he said there was none to be obtained till nine o'clock. (Subsequently we had reason to believe he had never returned to Marlow at all.)

The steaks were burnt to a cinder; the eggs which had survived the catastrophe were hard. We could offer our visitors absolutely nothing but biscuits with jam on them until we could boil some more water.

Fortunately they had had a cup of tea and a roll before they started. Indeed they had only come to tell us that they thought it would be wise to postpone the affair as the day was so bitterly cold; but when the boat came over for them they thought they

ought to shake hands and say good-bye properly instead of shouting adieu across the river.

It would have been mockery to try and persuade them to stay when by returning at once to Marlow they might have time for a short breakfast before the train started. We bade them an apologetic good-bye, hoping we might meet them again before long under pleasanter circumstances.

We made a melancholy meal off biscuits and jam, drawing lots for the eggs that were done. Then we packed the boat and shoved off, shaking the mud of that miserable field from off our shoes. Two of us caught cold (I was one), and for the first time in the history of the Swan we left all our utensils uncleaned. We disembarked at Maidenhead, made for the train and home, after the most miserable experience we ever enjoyed (!)

DOINGS FOR THE MONTH.

SEPTEMBER.

OR instructions this month commence with

THE POULTRY

RUN.—You will not have very old birds in your run, for this would be against all principles of success in breeding, so you will find some of the younger moulting this month. Next month, and the month after that, your earlier-hatched chickens will be in full feather. Some of them may look a

little ragged now, but they will not fully moult until about next August, and later than that the year after. We have already given various hints about moulting which you will do well to refer back to.

Continue weeding out, and taking extra care of all birds that have properties which give them a chance of winning at a show or make them worth while keeping to breed from.

We may expect a change of weather now that will make us say summer is indeed gone. Days and nights may, and likely will be, wet and cold. We keep an eye to the fowl-house, therefore, and all its surroundings; and if any bird seems suffering from cold we remove it immediately and have it seen to. We should not forget, however, that it is when huddling in a corner, "waiting till the clouds roll by" that fowls catch cold and many other diseases. It is in a great measure owing to the want of exercise therefore; and this only proves how necessary for health it is to possess a good run, grass and otherwise. On cold days give more stimulating food, and scatter grain here and there that they may run for it and keep up the animal heat. See now that your houses are perfectly clean, dry, and comfortable, and well ventilated without a direct draught.

Colds, if not at once attended to, may produce inflammation of the lungs and death. Birds at first sneeze and run at the nose. Place such as are thus attacked immediately in a warm, quiet corner. If it be running much at the nose, simply bathing the head frequently with hot water will give much relief. Give a dose of castor-oil, five drops of paregoric in a little water, three or four times a day, and plenty of good food—given warm. A valuable fowl should never be left in a run when ill. The others invariably badly use it.

Prepare your hampers for exhibition if you intend showing. You will see all shows of the year advertised in the "Exchange and Mart." Write for schedules in time, so that you may send your entries in before the day on which they close. Write

the addresses distinctly on indestructible labels, and tie them on so that you will have nothing to do on the morning the birds start but place them in the hampers, fasten them up, and send them off. Do not show unless you really have something good enough to stand a chance. To act otherwise is but to throw money to the winds. Pen up your intended exhibits for some time before, so as to have them used to it and perfectly tame. There is a great deal in how a bird shows itself.

We promised this month to address a few remarks about turkeys to our ambitious boys. These birds are by some writers recommended to be kept as chicken-hatchers—mere animated incubators. Well, there is no doubt they are wonderful sitters. But it is a really profitable speculation to rear them. A great many are afraid to venture on doing so because they are difficult to rear. We say this: the young need more attention than fowls, and if you can get them to a certain age they will do well so long as they are kept on a dry soil and well roosted at night. However, we will give you hints about setting them in good time. Meanwhile Christmas is only a few months ahead, and what is better than a nice roast turkey for dinner? Well, what we advise is this: if you have any funds to spare by all means buy your turkeys now, young and cheap, and feed them against the festive season.

THE PIGEON LOFT.—The breeding season is over. You can now count up your profits and losses after you have weeded out your loft, retaining therein nothing but the *crème de la crème*. Sell surplus either for the table or to boys like yourself who like pigeons to keep. We have already advised you to breed only from the best stock and strains that could be procured anywhere. If you have now good healthy birds well up in properties, there will not be much difficulty in finding a market for them. But if you cannot sell, it is better to feed them up a little and make pies of them than to keep them to eat their own heads off.

Count now, then, your profits and losses—do not leave out of reckoning the amount of pleasure and healthful occupation your birds have been to you. Remember that innocent, healthful pleasure is worth a good deal. Well, if you find that you are tired of the pigeon fancy, that it is more trouble to you than it is all worth, now is the time to break up your establishment, and go in for something else.

But if you do not mean to sell off, then, having well weeded your stock, begin at once and do your weeding, disinfecting, lime-washing, repairs, and cleaning out. Do not hurry matters. Work slowly and leisurely, and you will do everything perfectly. Some of your most valuable birds may be suffering from colds or even canker. In colds the nostrils run with water and the eyes are also affected, and this may go on to a mattery or cankerous condition. Take the bird in time. Put the bird in the hospital-pen, in a warm but well-lighted corner. This hospital-pen, we forgot to say, should be big. Indeed, the more roomy it is the better, and it should be always kept clean, and invariably washed well out when a patient leaves it. Give a capsule of castor-oil to a bird suffering from cold. Bathe the head and nostrils frequently with warm milk-and-water, warm water with a few drops of carbolic acid well mixed with it, or with warm weak tea. Give nourishing food, and little else will be required, although two or three drops of paregoric in a little water may do good twice a day during the earlier stages.

Canker is a terrible disease, and in many cases incurable. It is preventable, however, by attending to the perfect cleanliness of the loft, the water, and the food. It comes in the throat like masses of ulcers, and about the head. The best application we know of for throat canker is equal parts of glycerine and tincture of iron, with a few drops of carbolic acid mixed with it. Nitrate of silver may be applied well to the growths in head canker, and afterwards a wash of alum, ten grains to the ounce. Quarantine the diseased bird, and thoroughly clean out the loft.

THE AVIARY.—Attend canary shows whenever you have a chance. Get a book on canaries, when you have saved money enough. Carefully note all points, and compare them with the birds you see at the shows you visit. Take a note also of the kinds of cages you see at exhibitions. You may make others of

the same pattern. Look at mules. Talk to breeders and get their ideas.

Breeding being now well over, care of the moulting birds will be the chief work of the month. See that all birds are now kept clean and well-fed, and that even their cages are in the pink of perfection. If you once get into a routine of feeding and seeing to your birds regularly, it is difficult to get out of it.

THE RABBITRY.—Now you should lay up a good store of dry stuff for bedding during the winter months, and if you have space you may store roots carefully. It is often an advantage to get these nice and dry in frosty weather. They may be kept among chaff.

We are often asked how rabbits should be prepared for show. Our reply invariably is that rabbits should be kept in so healthy a condition that they are ready for show all the year round. But the only legitimate preparation for shows is feeding and keeping the coat nice. Long-hair rabbits require grooming very frequently, else they will get matted. A rabbit for show should be in good condition, but not too fat. You must get the schedule from the secretary in good time, and obedience to all the rules of the show is imperative. The rabbits should be sent in well-ventilated boxes, each in a compartment by itself, and on the label—a conspicuous part of it—the words "Live Stock" must be written. If, after that, the company permit your rabbits to be killed they will have to pay for them.

THE KENNEL.—If you have a dog you keep out of doors, and you care at all, as you ought to, for his comfort, you will have a proper kennel made for him. Now is a good time to make it. It should be roomy, it should open to clean out, and it should be sheltered from the wind. Spruce-trees make a capital shelter, and they may be planted now. The chain should be long and strong, and have two swivels on it, and the water-dish should be one that cannot be easily spilled.

THE KITCHEN GARDEN.—Wet days are plentiful enough now. Weeds grow apace—a second growth from summer weeds. Destroy them before they flower. Take up potatoes. Gather and store fruit before they ripen on the trees. Plant cabbage. Plant out endive. Plant out your August-sown lettuces.

THE FLOWER AND WINDOW GARDENS.—Keep everything neat. Remove dead blooms and decaying leaves, which keep the moisture and banish sunlight. Begin to think about future bedding of spring flowers, but do not plant yet. Sow annuals if you have plenty of seed. Gather and store seeds. Let the beauty of your window-boxes be enriched with flowers from the garden. Put extra mould in the window-boxes, and take away all dead leaves and flowers.

The Red Tint indicates BRICK; the Stone-colour, STONE; the Pink, GRANITE; the Purple, BRONZE, COPPER, or LEAD; and the Yellow, GOLD.

Correspondence.

BOW OAR.—1. The hire of a four-oar is generally ten shillings per day, but the rate varies. 2. It costs five shillings, but the same information is given in Dickens's "Dictionary of the Thames," published by Macmillan and Co., price one shilling.

P. O. KEITH.—"Under the Red Ensign" costs a shilling, and is obtainable by any bookseller of Kent and Co., Paternoster Row. You can average cruising yachts at £10 per ton.

C. T. GAUNTLETT.—Our mazes were the ground-plans of special plantations, and not fancy sketches.

GYMNAST.—All gymnastic apparatus can be supplied ready-made. Apply to Goy, Leadenhall Street, or any of the cricket outfitters.

A. JONES.—Get your vicar to apply for you to the Secretary, Church Missionary Society, Salisbury Square, E.C.

A CHEMIST'S APPRENTICE.—You should pass your examinations here, and then there would be no difficulty. The fact of your holding an English certificate would prove a great help.

FUNNYBONE.—1. The price of the parts as published by us is sixpence. For those that are out of print you will have to advertise, and you must pay whatever you can get them at. Some of them have been sold at a shilling each; but we have nothing to do with such business, and cannot advise you. 2. We mentioned painting lantern-slides on ground glass in our last Christmas part.

G. D. BROWSE.—You can obtain copies of the Latin authors from the Clarendon Press, through any bookseller.

VICTOR.—We do not wonder at the local paper refusing to answer you. Any one with the slightest knowledge of a printing-office would see at once how such an error occurred. It is too obvious to be worth making a fuss about, and the discovery does you no credit whatever.

W. T. BILLER.—Read the swimming articles in our first volume.

BOATSWAIN.—The boats are varnished, not painted. Ordinary oak varnish is the sort used.

DADA.—Apply to the Canadian Government Agency, Victoria Street, S.W., or get the penny handbook to Canada that they publish. The book can be obtained through Messrs. W. H. Smith and Son.

No. 347.—Vol. VII.

SATURDAY, SEPTEMBER 5, 1885.

Price One Penny.

REGINALD CRUDEN:

A TALE OF CITY LIFE.

BY TALBOT BAINES REED,

Author of "My Friend Smith," etc., etc.

"Horace was kneeling at the bedside."

CHAPTER XXIII.—LOST AND FOUND.

BOOMS was not exactly the sort of man to be elated by the mission which Miss Shuckleford had thrust upon him. He passed a restless night in turning the matter over in his mind and wondering how he could break the news gently to his friend.

For he was fond of Horace, and in his saturnine way felt deeply for him in his trouble. And on this account he wished Jemima had chosen any other confidant to discharge the unpleasant task.

He hung about outside Mrs. Cruden's house for an hour early that morning in the hope of being able to entrap Miss Crisp and get her to take the duty off his hands. But Miss Crisp had been sitting up all night with the patient and did not appear.

He knocked at the door and asked the servant-girl how Mrs. Cruden was. She was a little better, but very weak and not able to speak to anybody.

"Any news from Liverpool?" inquired Booms. This had become a daily question among those who inquired at No. 6, Dull Street.

"No, no news," said the girl, with a guilty blush. She knew the reason why. Reginald's last letter, written just before his arrest, was at that moment in her pocket.

"Has Mr. Horace started to the office?"

"No, he's a-going to wait and see the doctor, and he says I was to ask you to tell the gentleman so."

"Can I see him?"

"No, he's asleep just now," said the girl.

So Booms had to go down alone to the 'Rocket,' as far as ever from getting the burden of Jemima's secret off his mind.

He had a good mind to pass it on to Waterford, and might have done so had not that young gentleman been engaged all the morning on special duty, which kept him in Mr. Granville's room.

Booms grew more and more dispirited and nervous. Every footstep that came to the door made him tremble for fear it should be the signal for the unhappy disclosure. He tried hard to persuade himself it would be kinder after all to say nothing about it. What good could it do now?

Booms, as the reader knows, had not a very large mind. But what there was of it was honest, and it told him, try how he would, there was no getting out of a promise. So he busied himself with concocting imaginary phrases and letters by way of experiment as to the neatest way of breaking his bad news.

Still he dreaded his friend's arrival more and more; and when at last a brisk footstep halted at the door, he started and turned pale like a guilty thing, and wished Jemima at the bottom of the sea!

But the footstep was not Horace's. Whoever the arrival was, he tapped at the door before entering, and then, without waiting for a reply, walked in.

It was a youth of about seventeen or eighteen, with a bright honest face and cheery smile.

"Is Horace Cruden here?" he inquired, eagerly.

"Oh no," said Booms, in his most doleful accents.

"Isn't this where he works?"

"It is indeed."

"Well, then, is anything wrong? Is he ill?"

"No. He is not ill," said Booms, emphasising the pronoun.

"Is Reginald ill, then, or their mother?"

A ray of hope crossed Booms's mind. This stranger was evidently a friend of the family. He called the boys by their Christian names, and knew their mother. Would he take charge of the dismal secret?

"His mother is ill," said he. "Do you know them?"

"Rather. I was Horace's chum at Wilderham, you know, and used to spend

my holidays regularly at Garden Vale. Is she very ill?"

"Very," said Booms; "and the worst of it is, Reginald is not at home."

"Where is he? Horrors told me he had gone to the country."

Booms would tell him. For the visitor called his friend Horrors, a pet name none but his own family were ever known to use.

"They don't know where he is. But I do," said Booms, with a tragic gesture.

"Where? where? What's wrong, I say? Tell me, there's a good fellow."

"He's in prison," said Booms, throwing himself back in his chair, and panting with the effort the disclosure had cost him.

"In prison! and Horace doesn't know it! What do you mean? Tell me all you know."

Booms did tell him, and very little it was. All he knew was from Jemima's secondhand report, and the magnitude of the news had quite prevented him from inquiring as to particulars.

"When did you hear this?" said Harker; for the reader will have guessed by this time that the visitor was no other than Horace's old Wilderham ally.

"Yesterday."

"And he doesn't know yet?"

"How could I tell him? Of course I'm to get all the blame. I expected it."

"Who's blaming you?" said Harker, whom the news had suddenly brought on terms of familiarity with his friend's friend. "When will he be here?"

"Very soon, I suppose."

"And then you'll tell him?"

"You will, please," said Booms, quite eagerly for him.

"Somebody must, poor fellow!" said Harker. "We don't know what we may be losing by the delay."

"Of course it's my fault for not waking him up in the middle of the night and telling him," said Booms, dismally.

"Is there anything about it in the papers?" said Harker, taking up a "Times."

"I've seen nothing."

"You say it was a day or two ago. Have you got the 'Times' for the last few days?"

"Yes; it's there."

Harker hastily turned over the file, and eagerly searched the police and country intelligence. In a minute or two he looked up and said,

"Had Cruden senior changed his name?"

"How do I know?" said Booms, with a bewildered look.

"I mean, had he dropped his surname? Look here."

And he showed Booms the paragraph which appeared in the London papers the morning after Reginald's arrest.

"That looks very much as if it was meant for Cruden," said Harker—"all except the name. If it is, that was Tuesday he was remanded, and to-day is the day he is to be brought up again. Oh, why didn't we know this before?"

"Yes. I knew I was to blame. I knew it all along," said Booms, taking every expression of regret as a personal castigation.

"It will be all over before any one can do a thing," said Harker, getting up and pacing the room in his agitation. "Why doesn't Horace come?"

As if in answer to the appeal, Horace at that moment opened the door.

"Why, Harker, old man!" he exclaimed, with delight in his face and voice as he sprang towards his friend.

"Horrors, my poor dear boy," said Harker, "don't be glad to see me. I've had news, and there's no time to break it gently. It's about Reginald. He's in trouble—in prison. I'll come with you to Liverpool this morning; there is a train in twenty minutes."

Horace said nothing. He turned deadly pale and gazed for a moment half scared, half appealing, at his friend. Booms remembered something he had to do in another room, and went to the door.

"Do you mind getting a hansom?" said Harker.

The words roused Horace from his stupor.

"Mother," he gasped, "she's ill."

"We shall be home again to-night most likely," said Harker.

"I must tell Granville," said Horace.

"Your chief? Well, be quick, the cab will be here directly."

Horace went to the inner room and in a minute returned, his face still white but with a burning spot on either cheek.

"All right?" inquired Harker.

Horace nodded and followed him to the door.

In a quarter of an hour they were at Euston in the booking office.

"I have no money," said Horace.

"I have, plenty for us both. Go and get some papers, especially Liverpool ones, at the bookstall while I get the tickets."

It was a long memorable journey. The papers were soon exhausted. They contained little or no additional news respecting the obscure suspect in Liverpool, and beyond that they had no interest for either traveller.

"We shall get down at three," said Harker; "there's a chance of being in time."

"In time for what? what can we do?"

"Try and get another remand, if only for a couple of days. I can't believe it of Reg. There must be some mistake."

"Of course there must," said Horace, with a touch of scorn in his voice, "but how are we to prove it?"

"It's no use trying just now. All we can do is to get a remand."

The train seemed to drag forward with cruel slowness, and the precious moments sped by with no less cruel haste. It was five minutes past three when they found themselves on the platform of Liverpool station.

"It's touch and go if we're in time, old boy," said Harker, as they took their seats in a hansom and ordered the man to drive hard for the police-court; "but you mustn't give up hope even if we're late. We'll pull poor old Reg through somehow."

His cheery words and the brotherly grip on his arm were like life and hope to Horace.

"Oh yes," he replied. "What would I have done if you hadn't turned up like an angel of help, Harker, old man?"

As they neared the police-court the cabman pulled up to allow a police van to turn in the road. The two friends shuddered. It was like an evil omen to daunt them.

Was he in that van—so near them, yet so hopelessly beyond their reach?

"For goodness' sake drive on!" shouted Harker to the cabman.

It seemed ages before the lumbering

obstruction had completed its revolution and drawn to one side sufficiently to allow them to pass.

In another minute the cab dashed to the door of the court.

It was open, and the knot of idlers on the pavement showed them that some case of interest was at that moment going on.

They made their way to the policeman who stood on duty.

"Court's full—stand back, please. Can't go in," said that official.

"What case is it?"

"Stand back, please—can't go in," repeated the stolid functionary.

"Please tell us—"

"Stand back, there," once more shouted the sentinel, growing rather more peremptory.

It was clearly no use mincing matters. At this very moment Reginald might be standing defenceless within, with his last chance of liberty slipping from under his feet.

Harker drew a shilling from his pocket and slipped it into the hand of the law.

"Tell us the name of the case, there's a good fellow," said he, coaxingly.

"Bilcher—wife murder. Stand back, please—court's full."

Bilcher! Wife murder! It was for this the crowd had gathered, it was for the result of this that that knot of idlers were waiting so patiently outside.

Bilcher was the hero of this day's gathering. Who was likely to care a rush about such a lesser light as a secretary charged with a commonplace fraud?

"Has the case of Cruden come on yet?" asked Horace, anxiously.

The policeman answered him with a vacant stare.

"No," said Harker, "the name would be Reginald, you know. I say," added he to the policeman, "when does Reginald's case come on?"

"Stand back there—Reginald—he was last but one before this—don't crowd, please."

"We're too late, then. What was—what did he get?"

Now the policeman considered he had answered quite enough for his shilling. If he went on people would think he was an easy fish to catch. So he affected deafness, and looking straight past his eager questioners again repeated his stentorian request to the public generally.

"Oh, pray tell us what he got," said Harker, in tones of genuine entreaty; "this is his brother, and we've only just heard of it."

The policeman for a moment turned a curious eye on Horace, as if to convince himself of the truth of the story. Then, apparently satisfied, and weary of the whole business, he said,

"Let off. Will you keep back, please? Stand back. Court's full."

Let off! Horace's heart gave a bound of triumph as he heard the words. Of course he was! Who could even suspect him of such a thing as fraud? Unjustly accused he might be, but Reg's character was proof against that any day.

Harker shared his friend's feelings of relief and thankfulness at the good news, but his face was still not without anxiety.

"We had better try to find him," said he.

"Oh, of course. He'll probably be back at Shy Street."

But no one was at Shy Street. The

dingy office was deserted and locked, and a little street urchin on the doorstep glowered at them as they peered up the staircase and read the name on the plate.

"Had we better ask in the shop? they may know," said Horace.

But the chemist looked black when Reginald's name was mentioned, and hoped he should never see him again. He'd got into trouble and loss enough with him as it was—a hypocritical young—

"Look here," said Horace; "you're speaking of my brother, and you'd better be careful. He's no more a hypocrite than you. He's an honest man, and he's been acquitted of the charge brought against him."

"I didn't know you were his brother," said the chemist, rather sheepishly, "but for all that I don't want to see him again, and I don't expect I shall either. He won't come near here in a hurry, unless I'm mistaken."

"The fellow's right, I'm afraid," said Harker, as they left the shop. "He's had enough of this place, from what you tell me. It strikes me the best thing is to go and inquire at the police-station. They may know something there."

To the police-station accordingly they went, and chanced to light on one no less important than Mr. Sniff himself.

"We are interested in Reginald Cruden, who was before the magistrate to-day," said Harker. "In fact this is his brother, and I am an old schoolfellow. We hear the charge against him was dismissed, and we should be much obliged if you could tell us where to find him."

Mr. Sniff regarded the two boys with interest, and not without a slight trace of uneasiness. He had never really suspected Reginald, but it had appeared necessary to arrest him on suspicion, not only to satisfy the victims of the Corporation, but on the off chance of his knowing rather more than he seemed to know about the doings of that virtuous association. It had been a relief to Mr. Sniff to find his first impressions as to the lad's innocence confirmed, and to be able to withdraw the charge against him. But the manner in which the magistrate had dismissed the case had roused even his phlegmatic mind to indignation, and had set his conscience troubling him a little as to his own conduct of the affair. This was why he now felt and looked not quite happy in the presence of Reginald's brother and friend.

"Afraid I can't tell you," said he. "He left the court as soon as the case was over, and of course we've no more to do with him."

"He is not back at his old office," said Horace, "and I don't know of any other place in Liverpool he would be likely to go to."

"It struck me from the looks of him," said Mr. Sniff, quite despising himself for being so unprofessionally communicative—"it struck me he didn't very much care where he went. Very down in the mouth he was."

"Why, but he was acquitted; his character was cleared. Whatever should he be down in the mouth about?" said Horace.

Mr. Sniff smiled pityingly.

"He was let off with a caution," he said; "that's rather a different thing from having your character cleared, especially when our friend Fogey's on

the bench. I was sorry for the lad, so I was."

This was a great deal to come from the lips of a cast-iron individual like Mr. Sniff, and it explained the state of the case forcibly enough to his two hearers. Horace knew his brother's nature well enough to imagine the effect upon him of such a reprimand, and his spirits sank within him.

"Who can tell us now where we are to look for him?" said he to Harker. "Anything like injustice drives him desperate. He may have gone off, as the detective says, not caring where. And then Liverpool is a fearfully big place."

"We won't give it up till we have found him," said Harker; "and if you can't stay, old man, I will."

"I can't go," said Horace, with a groan. "Poor Reg!"

"Well, let us call round at the post-office and see if Waterford has remembered to telegraph about your mother."

They went to the post-office and found a telegram from Miss Crisp: "Good day. Better, decidedly. Knows you are in Liverpool, but nothing more. Any news? Do not telegraph unless all right."

"It's pretty evident," said Horace, handing the message to his friend, "we can't telegraph to-day. I'll write to Waterford and get him to tell the others. But what is the next thing to be done?"

"We can only be patient," said Harker. "We are bound to come across him or hear of him in time."

"He's not likely to have gone home?" suggested Horace.

"How could he with no money?"

"Or to try to get on an American ship? We might try that."

"Oh yes, we shall have to try all that sort of thing."

"Well, let's begin at once," said Horace, impatiently, "every minute may be of consequence."

But for a week they sought in vain—among the busy streets by day and in the empty courts by night, among the shipping, in the railway stations, in the workhouses, at the printing offices.

Mr. Sniff did them more than one friendly turn, and armed them with the talisman of his name to get them admittance where no other key would pass them. They inquired at public-houses, coffee-houses, lodging-houses, but all in vain. No one had seen a youth answering their description, or if they had it was only for a moment, and he had passed from their sight and memory.

False scents there were in plenty—some which seemed to lead up hopefully to the very last and then end in nothing, others too vague even to attempt to follow.

Once they heard that a body of a youth had been found floating in the Mersey—and with terrible forebodings they rushed to the place and demanded to see it. But he was not there. The dead upturned face they looked on was not his, and they turned away, feeling more than ever discouraged in their quest.

At length at the end of a week a man who kept an early coffee-stall in one of the main streets told them that a week ago a ragged little urchin had come to him with a pitiful tale about a gentleman who was starving, and had begged for a can of coffee and a slice of bread to take to him, offering in proof of his good faith his own coat as payment. It was a

bitterly cold morning, and the man trusted him. He had never seen the gentleman, but the boy brought back the empty can in a few minutes. The coffee man had kept the jacket, as it was about the size of a little chap of his own. But he had noticed the boy before parting with it take two ragged little books out of its pockets and transfer them to the bosom of his shirt. That was all he remembered, and the gentlemen might take it for what it was worth.

It was worth something, for it pointed to the possibility of Reginald not being alone in his wanderings. And putting one thing and another together they somehow connected this little urchin with the boy they saw crouching on the doorstep of No. 13, Shy Street the day of their arrival, and with the office-boy whom Mr. Sniff described as having been

Reginald's companion during his last days at the office.

They would neither of them believe Reginald was not still in Liverpool, and cheered by the very feeble light of this discovery they resumed their search with unabated vigour and even greater thoroughness.

Happily the news from home continued favourable, and, equally important, the officials at the "Rocket" made no demur to Horace's prolonged stay. As for Harker, his hopefulness and pocket-money vied with one another in sustaining the seekers and keeping alive within them the certainty of a reward, sooner or later, for their patience.

Ten days had passed and no fresh clue. Once or twice they had heard of the pale young gentleman and the little boy, but always vaguely, as a fleeting vision

which had been seen about a fortnight ago.

On this day they called in while passing to see Mr. Sniff, and were met by that gentleman with a smile which told them he had some news of consequence to impart.

"I heard to-day," said he, "that a patient—a young man—was removed very ill from a low lodging-house near the river—to the smallpox hospital yesterday. His name is supposed to be Cruden (a common name in this county), but he was too ill to give any account of himself. It may be worth your while following it up."

In less than half an hour they were at the hospital, and Horace was kneeling at the bedside of his long-lost brother.

(To be continued.)

ON SPECIAL SERVICE: A NAVAL STORY.

BY GORDON STABLES, M.D., R.N.,

Author of "The Cruise of the Snowbird," "Stanley O'Grahame," etc.

CHAPTER XXII.—BACK IN THE OLD THEODORA—SAILORS ON SHORE—FIGHTING INLAND—HAND-TO-HAND WITH SAVAGES.

"THERE is going to be some fun." "There is going to be some fighting." "There is going to be a row."

These are not the expressions I myself care to listen to on the eve of what may turn out to be a very severe engagement. They are nevertheless very common ones among our blue-jackets on such occasions, and I am bound to paint the service as I have found it. The British navy sailor or soldier is the least cruel in heart of all warriors on the face of the earth. As a rule he would not wantonly harm a fly; but let him only know that the cause for which he is about to fight is a just and a good one and no one will sharpen cutlass or sword with greater zest than he will.

Yes, there was going to be a row, and it was going to take place on the Gold Coast.

The *casus belli* was simple in the extreme. Things of this kind usually are. Two missionaries from England, accompanied by a French traveller, had conceived the bold design of starting from the coast near Addah and penetrating into the land of Dahomey. It was their intention to visit the king of that dark land and endeavour if possible to persuade him to abolish the awful human sacrifices that usually took place on every one of his high days and holidays, or whenever the king needed a little excitement.

The idea was good, and in theory the plan seemed feasible enough. They were to go as men of peace; they would carry no arms, do nothing to provoke a quarrel, and trust entirely to the justice of the cause they meant to plead. These gentlemen succeeded in getting Commodore O'Connell to lend them a few Kroomen—excellent fellows and faithful—to act as guides and help them through the bush.

So good a scheme ought to have been crowned with success. But, alas! it was not. Dahomey happened to be at war just then with a neighbouring tribe who owned territory that had once been a section of his own country.

By this tribe the travellers were made prisoners, and thrown into a dungeon to await their release if ransomed, their death if not.

Dahomey, when he heard of it, was naturally indignant. He did not love white men any more than the chief of the Poonasees, but these prisoners were to have been guests of his, and if the right of putting them to death or parting with them for a ransom belonged to any one, it belonged to him.

So he increased his forces, gazetted more officers than usual—female officers of course—to his regiments of viragos, consulted his priests, sacrificed a lot of sheep and fowls and ducks, and, sad to say, a few human beings as well, and prepared to demolish the Poonasees.

The Poonasees in their turn resolved to defend themselves. They did more—they even carried war into the camp of their enemy, defeated the viragos in two pitched battles, and threatened Abomey. The King of Dahomey had not been quick enough.

Meanwhile one of the imprisoned Kroomen was executed as a beginning; another escaped, and making his way to the coast, related all, and an expedition for the release of the two Englishmen was determined upon forthwith.

A council of war was held on shore, and no time was lost. Compared to the hordes they would have to encounter our men were a mere handful. But they had skill, they had push, and—and they were British!

It was the evening before the march. All was in readiness, and nothing was talked about either fore or aft in the Theodora or in the Aurora except the coming brush with the savages.

It was about one bell in the first night watch, Quentin and Benbow were walking the quarterdeck, Benbow as merry as ever; nothing ever disconcerted this bold little gentleman. There was nothing doing on board the Theodora. Silence reigned everywhere, when suddenly the signalman reported the lights of a ship

coming in. The lights were very low down and very near each other. She could not be large; nor was she. It was only the Foremast, a tiny despatch vessel, and in half an hour she was snugly at anchor astern of the Theodora.

Wonders will never cease. They never do cease at sea, at all events. And shortly after the Foremast had anchored and gone to sleep to all appearances on the smooth breast of the gently heaving sea, a boat was heard coming rapidly towards the Theodora.

Clunk - click - clunk - click - clunk - click—went the sound of the oars.

Presently the sentry hailed "Boat ahoy!"

"Ay, ay!" was the cheery response. And in a few moments more she was alongside the starboard ladder, and Colin himself was running up.

Quentin and Benbow caught each a hand of our long-lost hero and pulled him towards the light.

As fast as he could talk he told them his adventures. There was no time to dwell on them, for his first duty was to report himself to Lieutenant Mildmay and Captain Blunderbore. But he found time to rattle out a sentence or two.

"Horrid times of it in the Whitterit. Sick—very ill—nearly dead—ashored at Lima for nearly six months—Whitterit wrecked—myself and four more all the saved—nearly dead on an island—taken off at last by a pleasure yacht—landed at the Cape—came up here in the Foremast—going to be tried by court-martial for losing my ship."

"Of course you will," said Benbow, in a bantering tone of voice, "and you'll very likely be shot, and serve you right too. But trot below, old man, and report yourself."

Both Captain Blunderbore and Mildmay were unfeignedly glad to see Colin. And it was fully an hour before he got up on deck again. There was so much to tell.

"I dare say," said the good-natured captain, "I ought to put you under

arrest pending your court of inquiry anent the loss of the Whitterit, but I'm not going to do anything of the kind. You won't desert, I suppose, so you'd better go to duty, and we'll want you to-morrow on shore."

"When you've had a good long gossip with your messmates on deck," said Mildmay, putting his hand on Colin's shoulder and leading him out, "come to my cabin."

'rouse' will sound before we know where we are."

Then Colin found his way to Mildmay's cabin.

"Oh!" he cried, as soon as he got inside the curtain, "I have such good news for you!"

"Sit down, sit down," replied Mildmay; "don't say a word till you are seated. I know what is coming. God has heard my prayer. But begin at the

It was clear starlight above, but the hills and woods were covered with a snow-white mist. The soldiers were drawn up near the shore. They challenged the boats—more for fashion's sake than anything else—and were duly and ceremoniously answered. Long before sunrise the little army was in full march up country.

The few Kroomen they had brought with them, including the man who had

A very Critical Moment.

So up went Colin again, and his messmates, including Brown and D'Austin, gathered round him to hear a more detailed account of his adventures. When he had finished,

"And what has the Theodora been doing all the time?" he asked.

"Been to Australia," said Quentin, "and we also had some fighting with the Maories down south."

"Oh, yes!" cried Benbow, "and you wouldn't believe it, but Stupid-numerary Brown here has made quite a hero of his little self. We all thought that there was nothing in him but 'the bones' till we saw him charge the Maories. But come, boys, I'm going to turn in. The

very-beginning; don't forget anything. Work gradually up to the best part of your story. I'm not going to let you go for an hour yet. As for myself, I shall not turn in to-night. We're going to have a bit of tough fighting, and I always write before I fight. Here is tea. Have some. Don't say a word till you've done."

Then Mildmay threw himself into his rocking-chair and set himself to listen.

I leave the reader to judge whether Colin's story pleased him or not.

The "rouse" sounded about six bells in the middle watch. Then the men breakfasted, and before four of the clock the boats had shoved off.

escaped from the Poonasees and Benbow's blameless Ethiopian Othello—the little rascal had come on shore without leave—were in charge of the interpreter Golava.

Golava's knowledge of bush life had been of the utmost service to our man-of-war ships many and many a time on the coast, and was invaluable now.

He managed his Kroomen and some native guides in a wonderful way. He formed them into a kind of advanced guard, but well spread out. Golava himself was the centre and director of their movements, and everything was reported to him. There was little fear, therefore, of our fellows finding themselves in the

midst of a morass, exposed to the attacks of an unseen enemy, or even in wood or jungle that there was no way out of.

For two days never an enemy was visible. On the morning of the third natives were seen for a moment. They fled; but when natives appear and fly suddenly they have those behind them who mean fighting.

This little expedition was under the command of Mildmay, and carefully and well he handled his men.

He made no extra hurry. He was not going to incur the mistake of fatiguing his men before the right time. They halted regularly for meals and rest and sleep.

He was not too proud to consult with McGee about the most wholesome place for the camp at night, for Death roams through these jungles and glens in the shape of miasmata, and claims more victims than the muskets, pikes, or knives of the natives. And it so happened that the present was the most unhealthy time of the year for campaigning.

It was about noon on the fourth day, and the little army was passing through a forest that stretched upwards on a hill with a deep morass beneath, which it would have been perilous in the extreme, if not impossible, to cross. It was about noon, and terribly hot; in under the trees there was shade enough, but not a breath of wind; the very birds were gasping for air as they crouched open-mouthed in the cotton-trees. The men were panting and tired, and no one was sorry when in a clearing a halt was called and dinner served out.

The trees in this forest jungle were very high, and dark and bushy, while underneath was an intricate mass of creeping and climbing plants. Sometimes it was impossible for a man to see his comrades if twenty feet ahead or to one side of him. It was an ugly spot for a fight to take place in, certainly not the situation Mildmay would have chosen of his own free will. But he was the victim of circumstances, for by making their way through this jungle a distance of fully fifteen miles was saved on the march towards the stronghold where the prisoners were confined.

The men had finished their meagre meal, and were lounging on the ground, when suddenly without the slightest warning, without warlike shout or beat of tom-tom, a perfect shower of bullets was poured into their midst.

For a moment it was startling in the extreme. The pickets had given no warning. Neither Golava nor any of his Kroomen had been driven in.

It was soon discovered that the savages were lodged in the trees. Golava had passed them without noticing their presence.

It was difficult to dislodge them, but it was done at last, and none too soon. Golava had rushed back to report the enemy coming through the jungle in millions—so Golava's figurative language described it.

Mildmay lost no time in extending his forces in battle array and advancing. Luckily the jungle was less dense now, but it was thick enough to impede the progress of our men, while the savages, with whom they soon got to close quarters, seemed perfectly at home in the place.

The fight was a desperate one. The enemy was in clouds, and it appeared

after a time as if annihilation itself to our troops would be the terrible result. There was no time to lose. The foe must be outflanked. Gayly on the right and Benbow on the left were thrown out, each with a brave band of blue-jackets.

In less than twenty minutes rattling volleys were heard in the rear, and the enemy fell back. The forest now ended on a bare plateau, and here taken on all sides, with our men free to act, the Poonasees were in a few minutes utterly routed and demoralised, and our fellows paused to rest.

Mildmay complimented them on the gallant way they had behaved, and well they deserved it, each and all of them.

West had fought to-day with all his customary nonchalance. To him a battle was simply a problem to be solved, and he rather prided himself in being able to solve problems of this kind. Several times within the first quarter of an hour he had managed to win points of vantage, and to bring succour at critical moments to places where men were hand-to-hand and nearly overpowered.

Benbow, who fought rather heedlessly, would have died to-day had it not been for West's timely aid. The former with three daring blue-jackets had "rushed" a rock held by about fifty of the enemy, and been beaten in consequence. Benbow was on the ground with a triangular spear at his neck, when West "went in" with ten marines, among whom was gallant Duncan Robb, and turned the tide of battle. A short time after this West and his chosen handful had put thrice their number to the rout and succoured Mildmay himself.

Hours were spent in attending to the wounded and preparing to continue the advance.

The road led over an open plain now towards more forest, and here there was evidence enough that the enemy was concealed.

When they had arrived within about five hundred yards of the forest our men halted, and an entrenched position was at once thrown up.

Afterwards skirmishers were thrown out, but they could not tempt the enemy from the woods.

A consultation was now held, at which Golava and the Krooman who had escaped from the Poonasees were present, and a little *ruse de guerre* was forthwith determined on.

Ten miles from their present position—the road leading through the forest—was the river, and on it the stronghold of the Poonasees, while here in front of them was the chief portion of our *corps d'armée*, the army itself in full strength being at another of the dominions fighting against Dahomey. Mildmay determined to leave Gayly and Quentin with sufficient men, and no more, to protect the newly-made camp, while he himself—guided by Golava and his Krooman—should make a forced march with the bulk of his troops in a different direction, and if possible capture the fort by *coup de main*.

Accordingly, soon after nightfall, when pickets had been stationed outside the ramparts, Mildmay and his fellows stole silently away and commenced the detour, and long before daylight were concealed in a wood, with the river near them, and beyond it on the top of a stiff hill the stronghold they were about to storm.

It was far stronger than they had had

any idea of. With the axes they carried they could not have forced the gate without great loss of life, and they had no artillery worth the name.

"Blow in the gate," said Colin.

"Bravo!" said Benbow, "you had the word before me."

"Who will volunteer to fire a bomb?" said Mildmay.

There was something akin to a shout in answer to the lieutenant's question.

"Hush! hush!" he cried.

It was now daylight, and the enemy's savage sentinels could be seen consulting together and gazing intently towards the wood where our men were concealed.

Extra precautions were necessary, extra quietness must be maintained, so Mildmay drew off his men from the river; they walked on tiptoe across the turf, careful not to snap even a branch-let or twig.

Having gained a good offing, a bomb was quickly prepared, a good old-fashioned one, it must be confessed, merely a large bag of gunpowder with a piece of fuse so fixed as to be easily fired, but impossible to pull out without tearing the sack.

While this was being done Colin walked boldly up to his commander and touched his hat.

How handsome he looked as he did so! His whole attitude and bearing, the bright sparkle in his eye, and the flush upon his face, gave evidence of manly daring. "I think, sir," he said, "as I was the first to suggest this plan of action, I ought to be allowed to volunteer to carry it out."

Kindly old Lieutenant Mildmay, "gallant and good," gazed at the boy for a moment in undisguised admiration ere he made reply. The thought that was then uppermost in his mind was verbally as follows:

"I promised by letter to this lad's mother to be a father to him. Can I let him lead this forlorn hope? I promised his *uncle* I would help him in every bold enterprise. Can I refuse his present request? No; the boy shall go."

"And so," he said, aloud, "you are to be the David that is to go out against this Goliath?"

"No, sir," replied Colin, laughing, "I'm going to take Goliath with me to carry the powder-bag." He motioned towards the marines and up stepped brawny young Duncan Robb.

"Scotland has it," said Duncan; "I'm ready, sir."

"Strip," cried Colin, "and let us be off."

In a minute more, what Artemus Ward called "extra garments" were thrown on the grass, the great bag was shouldered, and with brave hearts Colin and his foster-brother set out on their perilous task.

"Man! Colin, lad," Duncan found time to say as soon as they had started, "I'm gladder than if I had been made king o' the Comoro Islands. My heart's in my mouth, Colin. It's down stream you're going," he continued, "and not straight up the brae, is it? Straight up the brae would mean certain death, would it? Oh, I see; but, man! how proud your auld uncle would be to see you now! How proud your father will be o' his sailor son!"

"Hush! dear Duncan. We may never return."

They soon reached the part of the

stream where Colin found it would be safest to cross, and happily for them they effected the transit without drawing the fire of the sentinels. The rocks at the other side were terribly steep, with never a bush to hold on by.

"They'll never do it," cried Benbow, excitedly. "They can't climb that rock."

"They are both Highlanders," said Mildmay, quietly.

"And one is a marine," added West.

"Look! they are up!" said Benbow.

They were up. But now they had to creep close by the foot of the wall for fully a hundred yards ere they reached the gate. It was a minute or two of intense excitement for those who watched them from the wood.

But Colin was cool. Both had stopped to breathe when they reached the cliff-top. Then—

"I have the matches ready," said Colin.

"The bag is safe," replied undaunted Duncan Robb.

"Then we'll make a run for the gate. But hold secure; don't let it be a race; a run only. Haste might spoil all. Are you ready?"

"Yes."

"Then here's for off."

"Look! look!" cried Benbow. "The sentinels see them—they fire. Colin's down. He is up again and runs on—"

"Now for us to show," cried Mildmay, drawing his sword. "Rake the top of the wall with your rifles, Mr. West."

Just as Colin and Duncan reached the gate and placed their bomb, West and his men showed out at the river's bank, drawing the fire of those on the wall and themselves firing whenever they saw a chance.

And Colin and Duncan were kneeling close to the gate. Duncan weighted the bag against it with a great stone. Colin lighted a match, or tried to do so.

Did ever any one yet do anything well in a hurry. The first match went out, the second missed fire, the bullets were pattering on the wall near them; but the sentinels were also in a hurry, they took no aim. Poor Colin's fingers felt like great thumbs as he dived them a third time into the box, but he took more time. Hurrah! the fuse is alight. It spits fire.

"Run!" cried Colin. "Down hill we go."

Alas! this was the only mistake made. Had they gone back as they came they would have been safe.

Helter-skelter down the brae they rushed, longer-legged Duncan first.

He soon paused. His foster-brother had fallen, wounded and bleeding. The bomb would explode in a moment or two, but brave Duncan rushed back and seized and bore his comrade off amid a hailstorm of bullets.

Fortuna favet fortibus. Duncan reached the river in safety with his precious burden just as an explosion took place that made the very boulders rattle in the river, and came roaring back in a hundred-tongued echo from the hills and rocks. Not only was the gate blown to pieces, but a large tower on the north side of it had fallen.

"Charge, men, charge," shouted Mildmay.

Duncan met the wild rush of armed determined men in mid-stream. They took no notice now of either him or the burden he bore, but made straight for the foe.

Duncan crossed and laid his foster-brother on the grass at the foot of the tree where Surgeon McGee had placed those terrible instruments of operation that are more dreaded by our bravest soldiers and sailors than bullet or bayonet of a fighting foe.

Colin's shirt was red with blood, his face was pale and his eyes were closed.

Duncan bent over him, and big tears chased each other down his face.

Then he drew his bare brown arm and hand across his eyes, and starting up, seized his rifle and bayonet, and rushed off to join the *mêlée*, but his cheeks weren't dry before he was in the very midst of the battle.

(To be concluded.)

COLONEL PELLINORE'S GOLD.

By E. W. THOMSON,

Author of "*Petherick's Peril*," etc.

CHAPTER III.

windows in a high and rising wind. No sound came from the distant kitchen, where the corporal always slept, and where on this night the soldiers had like him stretched themselves on bear and wolf skins.

Suddenly Bryan sat up in his bed thinking he heard a creaking of the stairs as though some one were stepping downward very cautiously. He listened intently till, as the step reached the flagged hall-floor, he became convinced that the moving person was the colonel. A faint sound of clearing his throat habitual to the old man set the matter at rest.

Bryan heard his uncle enter the room called the "colonel's office," because there he sat once or twice a year in his capacity as magistrate over a vast district, and there too he wrote his occasional letters.

Soon the old man's step shuffled cautiously out along the hall to the front door, which he very slowly opened, yet not slowly enough to obviate a scarcely noticeable creak of hinges. As the door opened Bryan heard plainly the alarmed growl of the mastiffs on guard. Then the door closed, and again no sound save the snoring of Marhaus and the rattling of doors and windows could be heard.

It was very strange, Bryan thought. The colonel had certainly moved as if afraid of waking anybody; he had seemed to skulk downstairs, to sneak through his own door. The young fellow tried in vain to account for it. What could his uncle be about? With the horrible suggestions that came from all the occurrences of the day his heart beat heavily and his brain seemed on fire.

Listening intently, the boy heard a murmur of his uncle's voice outside ordering the dogs down; the tone was suppressed; he reflected that he had never before known the colonel to fear having his voice heard. For some moments after this there was silence. Silence was worse than sounds giving some hints as to what was being done. The more Bryan listened the more his anxiety and curiosity grew. He made up his mind to go down, and then remained for some minutes sitting on his bedside debating whether his purposed descent would not be a mean sneaking and spying after his uncle. Soon he heard the house door softly opened again, there was a rush of cold wind, he heard the colonel place a block against the door to keep it open, then the old man went out and immediately re-entered.

BRYAN PELLINORE could not get to sleep that night. He lay with wide-open eyes, thinking of his Cousin Agravaine's escapades, of his uncle's sorrows and his goodness, of the obstacle which want of money presented to his own career, of the colonel's strange expressions, of the corporal's talk concerning his master's desperate need, of the guineas in the magazine.

In the next room he could hear Marhaus snoring steadily. Throughout the big bare house was otherwise all stillness, except for the rattling of doors and

with a heavy step. He stopped, apparently setting down a great weight, then cautiously moved away the block from the door and closed it.

"This beats all," said Bryan, but still made no move. Then there was a strange slow sound that he could not at all make out the meaning of, a very cautious creaking movement of some weighty thing across the flagged floor. Sometimes a loose stone rattled, then the movement would stop for a little. What could the colonel be doing?

The apparent furtiveness of his uncle's proceedings made Bryan's curiosity intolerable at last, and he determined to clear up the mystery. He thought he would go boldly downstairs and explain that he had been amazed by strange sounds, but he went very silently and fearfully on his bare feet. At the stair-head he stopped aghast. There was his uncle stooping over a keg which he was rolling slowly and cautiously. It was an oaken keg of exactly the shape that Lieutenant Marhaus always brought his coin in.

The boy remembered his uncle's words of the afternoon: "The gold that Marhaus brings!" But still he could not fully believe the horrible tale that seemed revealed to him. He stood still trying to find some possible explanation of the strange scene. The colonel continued to roll the keg around the stair-foot. He crossed the hall with it to his office. Then he closed and slowly double-locked the door. Bryan could hear the stealthy slowness of the closing bolts.

The boy went back on tiptoe to his room to think it all over. What could the colonel be doing with the paymaster's keg? Perhaps moving it to safety? But there was no need for that, no thieves in all the district round except wolves and wild cats! Moreover the mastiffs could perfectly guard the treasure.

"I may, I must be mistaken," then thought Bryan. "Perhaps it was not *that* keg." He perceived that the colonel's conduct would be no less inexplicable, even if this were true. Still the possibility tended to relief from the worst imputations forming in his mind. If it

were not *that* keg, then the mystery might involve no wrong. He determined to go to the magazine and see.

Bryan dressed, crept quietly downstairs, took from a nail the huge bunch of keys, opened the front door, and went out. The mastiffs growled, then came forward squirming with their delighted hind-quarters and wagging their stumpy tails. Bryan went down the steps and stood for a moment patting the dogs' heads.

Brilliant and cold was the night, with stars and moon and whistling icy wind. From the hill he could see the shadows of drifts on the wide river and every log in the clearing stretching to its bank. Close to the farther shore he thought he made out for an instant two moving figures on a path that led to an Indian trapper's wigwam recently established in the woods inland. On that shore the forest stretched interminably away on gradually rising land. To the west a long rapid murmured in its night-shroud of mist. The stillness and the stars seemed to rebuke him as he paused looking on the scene. Turning he saw a light through the cracks of the shutters of the colonel's office, and with that reminder he walked straight to the door of the magazine.

Unlocking the door he looked in. All was dark except near the door, through which the moon threw a square of light. Entering, he struck flint and steel on tinder and blew thereon till the flame seized the "dip" that he carried. Then he looked around. There was nothing whatever on the floor. The keg of gold was gone!

Bryan, standing in the middle of the floor, looked around, and to the walls and to the ceiling again and again, as though expecting the keg to appear. Then, shuddering, he went out, locked the door mechanically, and walked to the house. There was still an explanation—there *must* be one, he thought. Some theory he tried to find which would leave him his faith in his uncle. He told himself that the old man's remark about the gold of Marhaus could not have had *this* dreadful and insane intention in view. But his heart was cold with dread.

Now he had again ascended the verandah. The office window was but a few steps away, and through its shutter the light still streamed. He went over and peered in. There sat the colonel, with the keg before him! Its top hoop was off, and the cover had been prised out. On the table beside him the colonel had a number of pieces of cloth, torn in squares of about a foot each. One by one he filled them with yellow guineas, and, tying each with a thong of shaganippi, placed it in a hole before the fireplace, from which he had removed the widest stone of the hearth. As the colonel replaced the stone, and carefully smoothed over the sand above its joints, the boy softly entered the house, and, hanging the keys on their peg, went up to his room. He was shivering with sorrow and wonder and distress.

Soon he heard his uncle come upstairs and go to bed. In a quarter of an hour the old man's heavy breathing convinced him he was asleep. Marhaus snored as steadily as before. Bryan found inaction unendurable. He dressed himself in his warmest, took down from their pegs his father's holsters and long straight sword, and crept again downstairs. Looking cautiously into the kitchen, where the corporal was sleeping with Sergeant Bors and his men, Bryan whispered, unheard, "Good-bye, dear corporal!" His heart felt like to break as he left the house, there was a big lump in his throat nearly choking him, and he had much ado to keep back his tears. Going to the stable, he harnessed the fast bay mare to a cariole and sped away towards the settlements with his young brain on fire.

He could not accuse his uncle, he could not look into that venerable face and tell what he thought he knew; he could not imagine how the colonel could escape the consequences of his act; a faint belief that if he himself were away his uncle would not want to keep the guineas agitated him. It was all a horrible, maddening tangle; this he felt most deeply. There was nothing for him to do but get away; he could not stay to hear the colonel accused—worse yet, to hear him deny!

(To be continued.)

GREAT SHIPWRECKS OF THE WORLD.

THE RAMMING OF THE NORTHFLEET.

A SQUALLY night off Dungeness; a fleet of outward-bounders waiting for a change of wind; one of them, a large three-master, anchored opposite the coastguard station in the safest berth of all, with her head towards the lighthouse, the red beam from whose lantern shines full upon her as it marks the anchorage. Her own riding light burning brightly, her watch awake on deck, the ship trim aloft and aloft, and every precaution taken to ensure her safety. She is the Northfleet, on her way out to Hobart, with a cargo of railway material, and with it she is taking a number of navvies to lay the new line. Counting navvies, wives, children, and crew, there are three hundred and seventy nine in all on board as she rides to her anchor in Dungeness roads on that squally January night.

She has been here all day waiting in vain for the south-westerly wind to shift a point or two and allow her to get down Channel. In like case with her are many others; the

bay is crowded with wind-bound craft, large and small. Her nearest neighbour is the *Corona*, an Australian clipper, and she is but three hundred yards away.

The Northfleet is a 940-ton ship. At one time she belonged to Mr. Duncan Dunbar, the owner of that ill-fated *Dunbar*—of whose wreck at Sydney Gap we told the story in our last volume—whose place in his fleet he filled with that *Duncan Dunbar* which soon afterwards perished in the flames off the coast of Brazil. The captain of the Northfleet had been stopped as she was leaving the Thames owing to his being required as a witness in the notorious Tichborne trial, and her present commander is her late first mate, who was married but a month ago and has his wife with him. He took his ship out of dock on the 17th January, and owing to the stormy weather has only reached these roads this Wednesday morning, in this year 1873. The Northfleet is a good ship, well found, well commanded, and well manned; and

here she rides at anchor in eleven fathoms, while the waves race by her and the clouds chase each other across the sky, unveiling every now and then a bright patch of stars to make the darkness more visible. The lights of the lighthouse burn with their wonted brilliancy, the lights of all the shipping shine brightly, and her light is conspicuous by its brightness. All promises well; no fault seems to have been committed by which her safety is imperilled—and none was committed.

She is, however, a doomed ship, and in less than an hour she will have gone to her last home by the clumsiest and most dastardly performance that ever took place in the English Channel. A few minutes after half-past ten a large two-masted screw steamer comes down from Dover, bearing straight on to her. In vain the watch hail the steamer, in vain they shout and whistle and ring. On comes the steamer, straight and swift, as if singling out the Northfleet to ram her. She comes

straight at her side, strikes her amidships, crashes on into her, and even cuts into the

ships? No. To hang a tarpaulin over her name so that she shall not be recognised!

founder. In vain the mate of the Northfleet roars out, "Ship ahoy! Stop and save us!

The Northfleet off Margate.

bunks where the men are lying. At the noise the stranger's sleepy crew wake up and

And then she backs, and clumsily sidles round with much jabbering, confusion, and

There are nearly four hundred emigrants on board!" Her only manoeuvre is that best

"Stand back, or I will put a bullet through you!"

come rushing along her deck. To help? No. To do any kind action? No. To clear the

abuse, and, hurriedly clearing herself, shoots off down Channel, leaving her victim to

calculated to keep her anonymous, and away she scuttles as fast as her screw can drive her.

Who is this mysterious stranger that does such ruin and runs off? The legal mind of Spain knows not to this moment. But a few days after the wreck a telegram goes off to Cadiz to watch for the Murillo on her voyage thither from Antwerp. She comes in direct to avoid being questioned by the custom-house officers. She has her cutwater damaged, and has had it fresh painted. Her captain is put on his trial for having run down the Northfleet, and the verdict is that he had been at the place stated, on the night stated, at the time stated, and had run down a ship in the manner stated; but that, although no other ship was run down at the time, there was no proof that the ship that he ran down was the Northfleet!

The scene of horror that the collision gave rise to was terrible. At the crash the captain rushed on deck, and the passengers, following, came streaming up the hatchways. The ship's side was doubled in, and the water poured into the hold like a river. The pumps were manned and a vigorous effort made to keep the torrent down, but all was in vain. The captain sent rocket after rocket up in signal of distress, and burnt his blue lights. And by the ghastly glare of the lights the men of a pilot-cutter hurrying to the rescue saw the pallid faces of the passengers as they swarmed on the deck. The neighbouring ships and the men on shore mistook the rockets and the lights for pilot signals, and

took no steps to help, and such at first was the impression of the pilot men until the unusual quantity alarmed them, and brought them hurrying up, too late to be of much service. Before the boat could get to the rescue the Northfleet had sunk, and the light on her foremast had been quenched in the waves, and all was dark.

On board the navvies lost all self-control and tried to crowd the boats as they were being launched. In vain Captain Knowles ordered them back until the women and children could be saved. One of the passengers handed him a revolver, and he threatened to shoot the men unless they kept back. The officers and sailors did all they could, but the confusion was so great, and the calamity was so sudden, that but little could be done.

The captain tied a lifebelt round his young wife, and, bidding her farewell, helped her into a boat with some of the other women, in charge of the boatswain. Into this boat some of the navvies tried to climb. "Stand back," shouted the captain, "or I will put a bullet through you!" "Might as well be shot as drowned, mister!" quoth the men, still crowding up. One of them jumped into the boat, and the captain fired and shot him in the leg. The man, who was one of the saved, and whose name it would be doing him an injustice to mention, seems to have gloried in his wound, and to have looked

upon himself as quite the hero of the occasion!

And like this wretched man were hundreds of others, thinking only of themselves, and thronging round the boats, ruining their own chance and that of all their fellows. The boatswain threatened to chop off the hands of those that held the boats, but the threat had no effect.

As the ship sank the captain and his officers were still at work trying to reduce the disorderly mob to order, and not an officer of the Northfleet was saved. She settled down in such shallow water that her masts remained above the waves, and to the rigging many of her people clung. The Princess, the pilot cutter, picked up many in her boat; the City of London steam tug fell in with the boatswain's boat and saved all that were therein; and the Mary, a Kingsdown lugger, saved several more; but out of the three hundred and seventy-nine that left the Thames, two hundred and ninety-three were drowned.

Whatever comfort can be gained from this disaster off Dungeness is due entirely to Captain Knowles and his men, who did their best, and died doing their duty. But the less said the better about the performances of the owners and crew of the Murillo, the apathy and stupidity of the look-outs on the neighbouring ships, and the unmanly selfishness of the panic-stricken navvies, whose conduct was quite unworthy of their race.

BOY LIFE AFLOAT.

By CAPTAIN H., LATE R.N.

VIII.—SALE AT THE MAST.

THIS was one of the old-fashioned customs of the navy, and one but seldom seen in the present day.

The regulation in the "Admiralty Instructions" runs as follows:

"SALE OF DEAD OR RUN MEN'S EFFECTS. —Upon the death or desertion of any officer, petty officer, seaman, marine, or other person belonging to any of her Majesty's ships the captain is to cause . . . an inventory . . . such inventory to be approved by the captain and retained by the paymaster. But in the case of the death of an officer the captain may if he think fit . . . direct that his effects or any part of them be preserved . . . instead of having them sold by auction at the mast. In exercising this discretion the captain will be governed by a consideration of the circumstances. . . . Private books and papers . . . to be sealed up in the presence of witnesses and if possible forwarded to relatives or executors."

In the last edition of the "Admiralty Instructions" this regulation has been slightly altered, but the spirit of it remains the same.

When the inventory has been made the goods are handed over to the master-at-arms, who acts as auctioneer, and who takes his stand at the mainmast.

The affair then proceeds in a similar manner to an auction sale ashore.

Sometimes, if the deceased was a popular man, many of the things will be run up to fancy prices, in consequence of his friends desiring to obtain keepsakes in remembrance of him. We have seen a sixpenny tobacco-box fetch as much as five shillings under these circumstances.

It is a strange and touching sight sometimes to witness a sale of this description. The master-at-arms, for instance, will hold out a cap. "The next article is a cap in thorough repair. How much for this?"

"Ah! that were his best cap, that were," one of his messmates will probably remark. "Poor Tom! he were always fond of that 'ere cap. I'll say a shilling."

Or perhaps the article will be a chain or other piece of jewellery, when the remark

will be, "Ay, he only bought that the last time he was ashore; I were with him. He don't want it now, poor bo', though he were pleased with it at the time."

A very remarkable circumstance occurred within our own knowledge, owing to a purchase made at a sale at the mast, which, as it may interest our readers and point a moral as well, we shall take the liberty of relating, merely altering the names in order not to hurt the feelings of any of the parties concerned.

Some years ago we were serving in a small ship named the H—, on the East Indian station. We were only a youngster at the time, and the senior midshipman of our watch was a good-hearted, high-spirited, generous, and foolish young Irishman named Conrad Kingsale. He was a great favourite, for it was impossible to avoid liking him, and many a kindness the present writer still feels grateful to him for. Finally, he was a good seaman, and in a month or two his time would have been up and he would have obtained his sub-lieutenant's commission, for he could have easily passed the examination. But it was not to be. We entered Trincomalee Harbour, in the island of Ceylon, after a lengthy cruise in the Indian Ocean, and there, to our great delight, we found a mail from home awaiting our arrival.

Among Kingsale's letters was one from his father informing him that by the death of a distant relative he had come into a large estate and a considerable fortune, and enclosing a note or order to pay twenty-five pounds.

Wild with delight, he soon changed the money order, and that twenty-five pounds proved his ruin. He obtained leave to go on shore, and on returning on board managed to smuggle three cases of spirits into the ship. He gave one to his boat's crew, another he presented to his messmates, and the third he unfortunately retained for his own use. It is a sad tale, and we will hurry over it. Suffice it to say that he gave way to the degrading and disgusting vice of drunkenness. For

three days and nights he was not sober, his friends carefully concealing the fact from the superior officers. It was during our first watch (between eight o'clock p.m. and midnight) that the climax was arrived at.

Conrad Kingsale was lying in a stupor in the gangway, covered with a rug—we may remark, in passing, that in a very hot climate it is usually the custom for the junior officers to sleep on deck in preference to sweltering in their hammocks in the stifling atmosphere of the cockpit or lower deck—when the captain came on deck and, approaching the lieutenant of the watch, inquired,

"Who is the midshipman of the watch?"

"Mr. Kingsale, sir," was the reply.

"Tell him I want him," said the captain.

"Mr. H—," exclaimed the lieutenant, "where is Mr. Kingsale?"

We were hesitating, when the quartermaster remarked,

"I saw him in the gangway just now, sir."

This was a malicious observation on the quartermaster's part, but it appeared that he had a spite against Kingsale for reprehending him for some dereliction of duty.

"Mr. Kingsale!" exclaimed the lieutenant, walking forward. "Mr. Kingsale! Pass the word for Mr. Kingsale!" And he stopped just opposite the sleeping midshipman.

The captain, becoming impatient, now came forward and called out,

"Where is Mr. Kingsale?" The youth, hearing his name called, rolled over, and answered, half-asleep,

"Here I am. Who wants me?"

"How disgraceful!" cried the captain. "What is the meaning of this?"

In an instant Kingsale's humour seemed to change; he sprang up, wide awake, his eyes starting out of his head, seized an iron belaying-pin (a thick bar of iron about two feet in length), and rushed wildly at the captain.

On the following day, when the effect of the drink had passed away and he was told what he had said and done, his repentance was as sincere as it was useless. He had

broken one of the chief articles of war, and was liable to a long term of imprisonment as well as being dismissed from the service with disgrace.

But Captain P—— was one of the kindest-hearted men that ever lived, and the offender's evident contrition prompted him to be merciful. Still it was necessary that something deterrent should be done, and, while hesitating, Conrad Kingsale settled the matter by deserting. We heard afterwards that he had succeeded in reaching Colombo, on the other side of the island, where he shipped on board a merchant craft.

Two days later his things were sold at the mast, and as a souvenir we purchased his silver watch. It had been dropped from aloft, the face was cracked, the bow broken off, and of course inside it was very much muddled and mixed.

Three years later we returned to England, and took the opportunity of having the watch repaired and done up. One evening shortly after we happened to be at an evening party,

and were introduced to a lady named Nevins, who chanced to inquire the time.

We pulled out the watch, and directly she saw it she turned very pale, exclaiming,

"Would you mind my examining that for a minute?"

Of course we handed her the watch, and, turning it over, she observed the initials C. K. engraved inside a ribbon.

"I thought so," she exclaimed, sadly. "This was poor Conrad's watch. May I inquire how you became its possessor?"

I replied that I had been a shipmate of Conrad's, and had purchased it, refraining for obvious reasons from adding under what circumstances.

"Was his not a sad death?" she continued.

"Is he dead?" we inquired. "When did he die?"

"In November, 1868," she replied. "He fell off a yard in a gale of wind and was drowned."

Now, as Kingsale did not desert from the

H—— until January, 1869, we knew that this information was incorrect, and immediately informed Miss Nevins of the fact.

"Oh, if you are certain," she exclaimed, clasping her hands, "how we shall all bless you! His father is dead, and he is heir to twelve thousand a year and a peerage in prospective."

We thought it would be better under the circumstances to make a clean breast of it, and did so accordingly, much to the joy of the young lady, who forgot the disgrace in the happiness of knowing that her cousin might be still alive.

We heard some months later that inquiries had been started in various parts of the world that had ultimately succeeded in discovering the young man, who was working in a small coasting schooner in Australasia.

We have never met, but we understand that he has taken his lesson to heart, and, abstaining from strong drink, has become the old honourable, good-hearted Conrad Kingsale that he was when we first knew him.

WORTH NOTING.

GUARD well your tongue; how easily there slips

An angry word between ill-guarded lips;
And one sharp word, as surely as a blow,
May alter love to hate, a friend to foe.

How hard it is that friendship to renew
Which one brief word of causeless anger
slew;
And harder still to stifle your regret,
And yet more hard the quarrel to forget.

Remember, then, *he* has the right to boast
Who bears—not he who seeks revenge—the
most;
Remember, words of hate as well as love
Are registered indelibly above.

HEROES OF THE BACKWOODS.

KIT CARSON.

PART II.

THE Indians were ready and waiting, and delighted at the prospect of another trial of strength. But the colonel caught sight of them, and posted his men before they were aware he was so near. Twenty-five of the trappers he hid in ambush, and with the remaining fifteen he advanced a little; and then, seeming to see the Indians for the first time, he halted as if irresolute. The redskins mustered in hundreds; the trees and bushes were alive with them, as, seizing each point of cover, they came swiftly on. They glided into the ambush as the wily trappers retreated, and then the five-and-twenty rifles spoke, and five-and-twenty Indians bit the dust. From the front, from all sides, the redskins found themselves fired upon, and, waiting only for another volley from the united white men, they were seized with a panic and fled.

After the fight the trappers returned to business, and the whole band made their way down an affluent of the Colorado, trapping as they went, until they reached the head-waters of the San Francisco. The colonel then led off eighteen of his men to the valley of the Sacramento. As the road was to lie for several hundred miles through a waterless desert, a few days before the start were devoted to hunting, and the skins of three of the deer that were killed were converted into water-tanks, to be carried by the mules. For four days Young, Carson, and their men passed through a sandy waste, with neither streams nor springs, and the water had to be doled out as if they were on a camel journey through the Sahara. On the fifth day a stream was reached; and then came another four days' desert tramp down into the rich valley of the Colorado. Resting here for a while, they started again for the west, and finally reached the San Joaquin, where they met with another trapping party under Peter Ogden, in the employ of the Hudson Bay Company. Joining their forces, the parties

worked together down the river to the Sacramento, where Ogden's men left for the Columbia.

Close to their camp was the Mission of San Rafael. In the employment of the missionaries were many Indian converts. One night some of these broke into mutiny, and after committing the usual atrocities made off to their tribe to take to their old ways. The missionaries sent out a party to demand that the fugitives should be handed over for trial, but the tribe took up their cause and drove back the messengers with serious loss. In fear lest the success of the Indians should bring them on to San Rafael, the missionaries applied to the trappers for help, and eleven volunteers, under Kit Carson, started off to compel the surrender of the criminals. The village was captured, a third of the warriors were slain, and the men who had committed the outrage were handed over and marched back to the mission.

Soon afterwards the Indians stole the trappers' horses during the night and fled with them to the mountains. Carson went off in pursuit, following the track through the snow. For more than a hundred miles he followed them, and then he caught them encamped. They had killed and eaten six of the horses, and were resting after their meal, when the rifles of Kit and his companions each brought down its victim. The Indians fled, and the horses were recovered.

On his way back to Santa Fé Colonel Young halted on the bank of the Colorado, and here another adventure befell the young trapper. He had been left in charge of the camp with half a dozen men, and had fortified it in the usual way, the bundles of furs being built up around it, while the horses and mules were turned out to graze. Suddenly a band of five hundred Indians were desecrated. They halted a short distance from the camp and sent off a strong body of warriors, who made friendly signs and were ad-

mitted within the ring. They were followed by others, and Kit discovered that each man had a weapon concealed about him. In the quietest and most ordinary tone he suddenly told the six trappers each to mark his man, and raising his own rifle, aimed straight at the head of the leader of the party, who was hardly six feet away from him. Very coolly and decidedly he told him that unless he left the camp immediately he and his men would be shot. The redskins grasped the situation at a glance and leapt off for their lives. They might easily have overpowered the trappers, but Indians will seldom attack when they feel certain that some of their prominent leaders will be killed.

In 1830 Kit was out trapping under Fitzpatrick up the streams and valleys of the Rockies. In the following January the horses were stolen by the Crow Indians, and there was another pursuit for forty miles or so, ending in the usual battle with the usual success. On this occasion the trail had been almost wiped out owing to a herd of several thousand buffaloes having crossed it in the night. Soon afterwards when out with four of his companions Kit came suddenly on four Indians evidently on the war-path, to whom they gave chase. The Indians led them into an ambush, and they had to cut their way through and ride for their lives. Often the yelling crowd was within a few feet of their horses, but the arrows and bullets whistled harmlessly past owing to the speed of the chase. Towards the end, as the camp was reached, two of the men were wounded, but not seriously.

In October, 1832, Kit joined Captain Lee as a fur trader, and with him went over the Old Spanish Trail, the single-file path between New Mexico and California. On the Windy River they were overtaken by the winter, and took up their quarters in the camp of a Mr. Robidoux, in whose employ was a gigantic Indian of much strength and dex-

terity. One night this Indian, in whom much confidence was placed, walked off with six of the best horses and five loads of furs. Kit was asked to go in pursuit, and with an Indian companion he started.

time to stop, as the runaway, with his choice of mounts, could keep on without a pause. Suddenly, as he rounded a small hill in the prairie, Kit caught sight of the thief riding along leisurely not two hundred yards ahead

rifle went up, and the redskin fell with the bullet through his heart while he was in the very act of lifting his cocked rifle at his pursuer.

Kit collected the six horses, and quietly returned to camp, where his reception may be imagined.

Not long afterwards Kit was out trapping on the Laramie. He and his two companions had been toiling for hours through a dreary ravine, and when the camp was pitched, just before sunset, he went off into the woods in search of something for supper. About a mile from the camp he came upon fresh tracks of elk, and, following the trail, soon discovered a herd grazing on the hill-side. Setting down for a stalk, he managed to get round the trees behind them, and, creeping into range, picked out the fattest and dropped him at his first shot. Kit was congratulating himself on his good fortune, and was rising from his place of concealment, when a terrific roar made him turn sharply round, and but a few yards away there were a couple of huge grizzly bears coming down upon him at full speed.

There was no time for him to load, and a grizzly is so tough a customer that a single shot is seldom enough. There was nothing for it but to run, and the speed of a grizzly is terrific for short distances. Dropping his rifle, he made a desperate rush for a tree close by, and, springing to the lower branch, just caught it, and dragged himself up into safety as the bears, growling and gnashing their teeth below, struck at him with their claws.

A grizzly is as good a climber as a man. And after a moment's hesitation one of them began to swarm up the trunk. But in the meanwhile Kit had hacked off a stout cudgel with his knife, and as the bear came within range, showing his white teeth in anger and certainty of his prey, down came such a whack on his nose as drove him nearly mad with pain; for a bear's nose is his tenderest part—and, indeed, the only part in which a blow can hurt him. Drawing back for a moment to consider, he again made for Carson, who again and again struck him down

A Watch-Tower on the Prairies.

For a hundred miles and more they raced together down the valley of the Green River until the Indian's horse gave out, and then

of him. The Indian saw him at the same moment, and, jumping to the ground, rushed for the shelter of a few trees that grew close

The Buffalo at Bay.

Kit went on alone. Thirty miles farther he went, frequently leaping off his horse to rest him and running by his side. There was no

by. Carson was riding at full speed, and saw that if his foe could but reach the cover he could get the first shot. Instantly the

with the cudgel, until he dropped howling to the ground.

The other grizzly, doubtless feeling some

contempt for his friend at his failure, then scrambled up the tree and artfully endeavoured to dodge the blows with which he was assailed.

then they would return to the tree, start to climb it, and give up the attempt in despair as they caught sight of the cudgel above.

been eaten by the wolves, went back to camp, where he had to content himself with a breakfast of beaver meat.

An Indian Graveyard.

His efforts were in vain; the thuds rained down so fiercely on his snout that in drawing back he slipped, and with a tremendous bang he was knocked flying off the bough. Howling with pain and roaring with rage, the

At last they came under the branch, and, gnashing their teeth at Kit, gave him a good-bye roar, and retired slowly and sadly into the woods.

The trapper waited for some time in the

In a fortnight Carson and his companions joined company with Fitzpatrick's men, and with them journeyed off to the Trappers' Fair, which in that year took place on the Green River. Here the furs were disposed

Across the Prairie.

bears filled the forest with their noise for hours. Now and then they would bury their snouts in the ground to ease their pain, and

tree to make sure that they had gone, and at dawn he descended, recovered his rifle, and, finding that the deer he had killed had

of and stores and ammunition laid in for the coming season. A strange scene was one of these fairs in the wilderness! Traders and

trappers of all nationalities here met, and for a month and more joined in a barbarous round of business and amusement. The site was a green meadow on the banks of a mountain stream, which was soon covered with the huge camp of two or three hundred men, with their five or six hundred horses and mules, and as each party came in to the rendezvous they were cheered by the earlier arrivals.

"On one of the gorgeous days of the Indian summer the encampment presented a spectacle of beauty which even to these rude men

was enchanting. There was the distant encircling outline of the Rocky Mountains, many of the snow-capped peaks piercing the clouds. Scattered through the groves, which were free from underbrush, and whose surface was carpeted with the tufted grass, were seen the huts of the mountaineers in every variety of the picturesque, and even of the grotesque. Some were formed of the well-tanned robes of the buffalo; some of boughs, twigs, and bark; some of massive logs. Before all these huts fires were burning at all times of the day, and food was

being cooked and devoured by these ever-hungry men. Haunches of venison, prairie chickens, and trout from the stream were emitting their savoury odours as they were turned on their spits before the glowing embers. The cattle, not even tethered, were grazing over the fertile plain."

When the fair broke up Carson and fifty others went off to the upper branches of the Missouri, and after a two hundred mile tramp encamped on the banks of the Big Snake, where they were attacked by the Blackfeet.

(To be continued.)

OUR NOTE BOOK.

FIRE BRIGADE DOGS.

DOGS have proved themselves useful in rescuing people not only from watery but from fiery graves. An instance was narrated only a short time ago of a noble Newfoundland dog at New York, who rescued several persons from a burning hotel, and at last himself perished in the flames; and more than one case is on record of dogs who have proved themselves good members of the fire brigade.

One of these dogs, named "Chance," first formed his acquaintance with the London Fire Brigade by following a fireman from a conflagration in Shoreditch to the central station at Watling Street. Here, after he had been petted for some little time by the men, his master came for him, and took him home; but he escaped on the first opportunity and returned to the station. After he had been carried back for the third time, his master—like a mother whose son *will* go to sea—allowed him to have his own way, and for years he invariably accompanied the engine, now upon the machine, now under the horses' legs, and always, when going up-hill, running in advance, and announcing the welcome advent of the extinguisher by his bark. At the fire he used to amuse himself with pulling burning logs of wood out of the flames with his mouth. Although he had his legs broken half a dozen times, he remained faithful to his pursuit; till at last, having received a severer hurt than usual, he was being nursed by the fireman beside the hearth, when a "call" came, and at the well-known sound of the engine turning out the poor brute made a last effort to climb upon it, and fell back dead in the attempt.

Another dog, called "Bill," belonged to Samuel Wood, a brave man who had charge of a fire-escape at Whitechapel. Wood saved nearly one hundred men, women, and children from the flames, but much of his success was due to his wonderful dog, of which the following interesting account has been given.

Bill, like his master, had to be very wakeful and at his post of duty all night, and therefore he slept during the day close to his master's bed, and if Wood was at all likely to be late through sleeping too long Bill was sure to wake him. When the fire-escape was wheeled out of the Whitechapel Churchyard at nine o'clock the dog was promptly at his post. When an alarm of fire was heard Bill, who at other times was very quiet, began to bark most furiously. Wood had no occasion to sound his rattle, for the policemen all around knew Bill's bark so well that they at once came up to render their valuable help. If the alarm of fire took place when but few people were in the streets Bill ran round to the coffee-houses near, and, pushing open the doors, gave his well-known bark, which those who heard it knew at once to mean, "Come and help, men! come and help!" In the dark nights the lantern had to be lit, when Bill at once seized it, and, like a "herald," ran on before his master. When the ladder was erected, Bill was at the top before his active

master had reached half way. He jumped into the rooms, and amid thick smoke and the approaching flames, ran from room to room, helping his master to find and bring out the poor inmates. On one occasion the fire burned so rapidly, and the smoke in the room became so dense, that Wood and another man were unable to find their way out. They feared their death was certain. Bill seemed at once to comprehend the danger in which his kind master was placed, and the faithful creature began to bark. Half suffocated, Wood and his companion knew this to be the signal "Follow me," and they at once crawled after Bill, and in a few moments they were providentially led to the window and their lives were saved. On another occasion a poor little kitten was found on the stairs of a house that was on fire. Bill immediately drove the kitten down from stair to stair until it reached the door, where it was picked up and cared for by a kind-hearted policeman. Poor Bill, like human beings, had his trials and sufferings as well as his honours. At one fire he fell through a hole burnt in the floor into a tub of scalding water, from which he suffered dreadfully and narrowly escaped a painful death. On three other occasions he had the misfortune to be run over, but with careful doctoring he was soon able to resume his duty. Whilst on duty at a fire, however, he again received a serious injury, and notwithstanding all his master's care and good nursing he died. In token of his valuable services during the nine years that he filled the important post of "Fire-escape Dog" the parishioners of Whitechapel had, some time before his death, placed round his neck a silver collar, which bore this inscription:

"I am the fire-escape man's dog—my name is Bill;
When 'fire' is called I am never still.
I bark for my master; all danger I brave,
To bring the 'escape,' human life to save."

POISON IN PRINT.

Few persons have any conception of the vast amount of literature of a most unwholesome character which is circulated, or the fearful extent to which it is the source of vice and crime. Sir Thomas Chambers, the Recorder of London, states:

"No country in the world has such rivers of literature flowing in different directions and of every kind; no country has so much that is filling the minds of the population with wrong thoughts and desires, and the results are shown month after month in our criminal courts. There is not a boy or young lad tried at our Courts of Justice whose position there is not more or less due to the effect of this unwholesome literature upon his mind."

The late chaplain of Newgate, the Rev. F. Lloyd Jones, repeatedly referred to the same thing in his prison reports. In one of these he states:—"By repeated interviews and conversations I discovered that all these boys,

without exception, had been in the habit of reading those cheap periodicals which are now published for the alleged instruction and amusement of both sexes, and that they learned from them to commit crimes which brought them to prison."

LAWN TENNIS CHAMPIONSHIP.

On Monday, July 13th, Mr. W. Renshaw once again proved himself *facile princeps* in the lawn tennis world, and carried off the honours of the championship for the fifth year in succession. Mr. Lawford, who defeated Mr. E. Renshaw on the previous Thursday in the final tie of the All Comers' Single, met the champion the same afternoon. Mr. Lawford played with great pluck and perseverance; but from start to finish it was evident that he was overmatched. Eventually Mr. Renshaw won by three sets to one. Each championship meeting seems to mark a new phase in the evolution of the game. At one time all the play was from the back of the courts. Then the volleying game came into fashion, and the brothers Renshaw invented their smash. Now the volleying game has to a great extent been abandoned, the smash is only attempted on rare occasions, and the old-fashioned long rallies seem to be becoming the order of the day. Mr. W. Renshaw, however, appears to be able to adapt himself to any style of play, and there seems every probability of his retaining the championship for some years to come.

VESSELS CRUSHED BY ICE.

Four men belonging to the Norwegian barque Bayard, who were landed at Liverpool the second week in July, gave particulars of the loss of their vessel, which was crushed by ice, and their subsequent severe sufferings during four days and nights. The Bayard, Captain Andersen, was bound to Quebec, and when off the Canadian coast immense icebergs gradually closed round the vessel, so that she could not move in any direction, and at last literally crushed her, and she sank. The crew had nothing left for it but to take to the ice, and for their own safety took with them one of the ship's boats. Day after day they traversed the ice and dragged their boat after them, but saw nothing to give them hope of a rescue. The men suffered very much from the intense cold and from exhaustion. As far as the eye could reach nothing could be seen but vast fields of ice, here and there studded with large icebergs. On the fourth day they sighted an English steamer. She too appeared fast in the ice. She proved to be the Marie Louise. The shipwrecked crew were received on board, but they had only been there about half an hour when they had to leave along with the steamer's crew, as the ice also crushed this vessel and caused her to founder. Fortunately on the same day the Norwegian barque Brillante was fallen in with, and she rescued both crews, landing them at Quebec.

HOW A TRAVELLER WAS ENTERTAINED BY THE BOYS OF BOKHARA.

THERE are very few English travellers who have yet visited Bokhara. Until very recently it was a dangerous place for strangers, as even Vambéry in disguise found. In a book of travels in "Russian Central Asia, including Kuldja, Bokhara, Khiva, and Merv" (published by Sampson Low), Dr. Lansdell tells more than has hitherto been known about Bokhara. In one chapter he tells in how curious a manner the Emir of Bokhara entertained his guest on the first evening of his stay at Kital.

He says: "At dusk the scene was lighted up with twenty-five lamps, and we were to sit under a spreading vine that formed a rustic balcony at the back of the house, and from thence to see the fun. Three men, with tambourines, sat near a charcoal fire in a brazier, over which, from time to time, they held their instruments to tighten the parchment. Presently four boys, or *batchas*, arrived, and were presented to us as the *artistes* of the evening; and whilst they were drinking tea and eating fruit, the tambourines, increased to five, began to sound and the men to sing. The *batchas* were dressed in red flowing robes, with loose wide trousers, but had their feet uncovered, their most striking peculiarity being their long hair, like that of girls. In the first dance the boys walked leisurely round and round, keeping time with clappers. In the next they danced faster, clapped their hands, and sang in unison—love, on the part of the supposed girl, being the burden of their song. In

the third dance the lover answered this ditty, and in the fourth the dance was interspersed with somersaults and other antics.

"Whilst the *batchas* were dancing and putting themselves through various movements intended to be graceful, two men carried candles, dodging about to hold them close to the dancers, that their good looks might be admired, the candle-bearers themselves contorting their faces and disporting themselves like clowns. One of their nonsensical feats, when there was a lull in the dance, was to sit opposite each other and make grimaces, or move the muscles and skin of the face like a rabbit. They brought on next a Persian song and dance with whistles, the *batchas* snapping their fingers in time, and then striking together a pair of wands.

"As the entertainment proceeded, a large crowd, attracted by the sound of the music, pressed into the courtyard and garden, delighted to witness the performance. Their appreciation of the *batchas* was intense. They offered them tea and fruit, and when the boys sat they could hardly have been made more of had they been the first stars of a London season. They seated themselves apart from 'the vulgar crowd,' near to us, whereupon lights were placed before them, that all might gaze and admire. He thinks himself a happy man to whom a *batcha* condescends to offer a bowl of tea, and receives it with expressions of great respect. So, again, if a man offers tea to a *batcha*, it is counted an honour if it is taken and the cup

returned, after tasting, to the owner, but a great indignity if the remainder be handed to another. I gave the boys refreshments, and sent round to the crowd some of our boxes of sugar-candy, which was readily accepted.

"We were next entertained with some acrobatic feats, the men bending backwards till their heads touched the ground, and performing several other fantastic exercises.

"After this a man gave us a Hindu dance, and preparations were made for some rude comic acting, in which were represented various scenes from native life. First a quarrel and lawsuit about a scarf; presently a high priest, or some dignitary, amply covered with cotton wool to represent white hair and beard, was carried in on a sort of sedan-chair. Whether he was intended to represent the Emir or the Grand Lama I am uncertain, but he was waited upon with great obsequiousness, whilst the musicians kept up vociferous singing and loud beating of tambourines. Presently a supposed dead man was brought in, upon whom the mullah sprinkled water in such abundance as to make the corpse wince, and he then proceeded to count the dead man's debts, supplying himself with a substitute for ink with a nastiness that will not allow of description. At length, by accident or by design, one of the candles set fire to the cotton wool of the judge's hair, and he was about to be enveloped in flames, but which fortunately they were able to put out, and this touch of reality brought the proceedings to an unceremonious close."

OUR PRIZE COMPETITION.

(SEVENTH SERIES.)

IV.—Music Competition.

By reference to page 15 of this volume it will be seen that we wrote as follows:—

"Our last Music Competition was very successful, and we see no reason why this one should not be even more so. We offer, then, Prizes of *Two Guineas* and *One Guinea* respectively, for the best musical setting, with organ or pianoforte accompaniment, of any of the verses appearing in our last volume (Vol. VI.). There will be two classes—Junior, all ages up to 18; Senior, from 18 to 24."

We have now much pleasure in publishing our Award. There are not, perhaps, on the whole quite so many really good songs this year as there were last, though the two first compositions, by competitors who ran each other very close for the same places last year, show, we are glad to see, a distinct advance.

Our Award is as follows:—

JUNIOR DIVISION (all ages up to 18).

[This year, as last, the Juniors carry off the laurels for Music; and as the two competitors at the head of the list approach each other very closely in point of merit, we give an additional prize over and above that offered.]

First Prize—Two Guineas.

EDWARD CUTHBERT NUNN (aged 17), Ockbrooke, Lower Edmonton, N.

Extra Prize—One Guinea and a Half.

COLIN MCALPIN (aged 14), 4, Portland Terrace, Leicester.

CERTIFICATES.

[The names are arranged in the order of merit.]

HAROLD H. WYATT, 26, Seymour Road, Cheetham Hill, Manchester.

SYDNEY H. THOMSON, 28, Blantyre Street, King's Road, Chelsea, S.W.

HERBERT GREEN, 8, Alexandra Cottages, Penge, Surrey.

HAROLD B. OSMOND, 33, Cassland Crescent, South Hackney, E.

WM. R. THURNHAM, 13, Fisher Street, Carlisle.

JOHN T. MCALLUM, 18, Emerville Avenue, South Circular Road, Dublin.

ARTHUR WADSWORTH, Hartington Street, Cotton Tree, near Colne, Lancashire.

M. MAYSON, 4, Lidlington Place, Oakley Square, N.W.

JOHN MARTIN, 5, Tennant Street, Leith.

ALFRED B. NUTTER, Caldwell Priory, Bedford.

JOSEPH C. WINNER, 7, Cloudesley Street, Barnsbury, N.

HARRY SHEPLEY, 29, St. James's Road, Halifax.

W. G. CHANDLER, 3, Norfolk Terrace, Arundel, Sussex.

GEORGE HARE, 73, Bousfield Road, Nunhead, S.E.

JOHN W. WESTON, 13, Blackshaw Street, Macclesfield, Cheshire.

FREDK. A. KEENE, 17, Marmion Road, Lavender Hill, Battersea, S.W.

LUCIEN F. L. SAYOURNIN, Grosvenor House, 160, Buckingham Palace Road, S.W.

CLIFFORD CRAWFORD, 21, Windsor Street, Edinburgh.

CHAS. E. JOHNSON, 404, Stockport Road, Longsight.

ARNOLD B. STOCK, Fern Lodge, Millfield Lane, Highgate, N.

JOHN W. BEARDER, 180, Derby Road, Nottingham.

HARRY STANBROOK, Cambria Villa, Adelaide Road, Windsor.

JOHN W. PARKER, Bridge Street, Buckingham.

HARRY T. BROWN, Cambridge Crescent, Edgbaston, near Birmingham.

WM. H. BAKER, 31, Wilson Street, Stoke-on-Trent.

J. F. LOVE, 82, Welbourne Road, High Cross, Tottenham.

B. W. HENDERSON, 34, Highbury Hill, N.

W. H. CURTIS, 35, Faroe Road, Hammersmith.

QUENTIN S. MCPHAIL, F. C. Manse, Kilnmar, Uig, Isle of Skye.

ALLEN HUSSELL, 27, High Street, Uffacombe.

F. B. ANDREWS, Avondale, Selley Park, Birmingham.

F. W. ALLSOP, 46, Birmingham Street, Oldbury.

HERBERT ELDRIDGE, 16, Grove House Road, Mornsey.

H. F. SIMPSON, The Vineyard, Abingdon, Berks.

WALTER ASTON, 63, Wellington Road, Dudley, Worcestershire.

THOMAS KEIGHLEY, 105, High Street, Stalybridge.

A. F. BENNE, Garfield Villa, Ballard's Lane, Finchley.

HERBERT L. HART, The Grammar School, Cartmel, Carnforth.

EDGAR M. CLARKE, 161, Stratford Road, Sparkbrook, Birmingham.

FRANK PARKER, 4, Bedford Place, Southampton.

JOHN KEEN, 31, Abinger Road West, New Cross, S.E.

FREDK. DAVISON, 2, Mill Lane, Canterbury.

THOMAS THRELFALL, 31, Hope Street, Southport, Lancashire.

W. J. GARDNER, 34, Clayton Street, Caledonian Road, N.

Correspondence.

T. S.—The address we gave for silkworms was Slaymaker's, Covent Garden Market. You have only to go to the market and look in the windows.

H. BURNETT.—Write distinctly, in ink, on one side of the paper only. Ask no more than two questions—and let them be on allied subjects. There is no charge for answering, but you have to take your chance amongst hundreds of others, and, owing to the limitation of space, there is a very strong probability that your answer will be long delayed.

J. FARMER.—1. It was the Midland Railway Company that first resolved to run only first and third class to all trains, and there has been no second class on the line for years. The suggestion is said to have come from Sir James Allport, who was then general manager of the company. 2. It is not true that the life of a railway servant is more dangerous than it used to be. In the four years ending 1869 the Mutual Assurance Society on the Great Western show four deaths and three disablements per thousand; while in the four years ending 1884 the deaths have sunk to 1.3 and the disablements to 1.1 per thousand. 3. The North-Western foot-warmers are filled with acetate of soda instead of water. The acetate melts at about the boiling point of water, and it is melted in the sealed case before being used. As it cools it crystallises, and throws out the latent heat.

H. FOSTER.—1. Charles VIII. was the king that died from hitting his head against a doorpost; Frederick Lewis, Prince of Wales, died from a blow of a cricket-ball. 2. Some of the Greeks are reported to have had strange deaths. Anacreon was choked with a grape-stone; Æschylus was knocked on the head by a tortoise dropped from the claws of an eagle; Agathocles swallowed his toothpick; and Zeuxis laughed himself to death at the sight of one of his own pictures. Zeuxis was not a comic artist.

FRED IDLE.—A very full list of colleges and schools is given in Cassell's "Educational Year Book," price six shillings. No list gives the information you require about the cricket and football clubs. In James Lillywhite's "Cricket Annual" you will find a list of the cricket clubs, and in the "Football Annual" you will find a list of the football clubs.

H. T. E.—The articles on killing and setting insects were in the first volume.

E. JAMES.—The parody is by the late C. S. Calverley, who has quite a reputation for excellence in such matters. Miss Jane Ingelow's peculiarities are remarkably well hit off. We may as well quote from it as it is before us. The title is "Lovers and a Reflection":—

In moss-prankt dell, which the sunbeams flatter
(And heaven it knoweth what that may mean;
Meaning, however, is no great matter),
Where woods are a-tremble with rifts atween.

Boats were curtseying, rising, bowing
(Boats in that climate are so polite),
And sands were a ribbon of green endowing,
And oh! the sun-dazzle on bark and bight.

We journeyed in parallels, I and Willie,
In fortunate parallels! Butterflies
Hid in wetting shadows of daffodilly,
Or marjoram, kept making peacocks' eyes.

And Willie 'gan sing (O! his notes were fluty,
Wafts fluttered them out to the white-winged sea)
Something made up of rhymes that have done much
duty,
Rhymes (better to put it) of "ancientry."

O! if billows and pillows and hours and flowers
And all the brave rhymes of an elder day,
Could be furled together this genial weather
And carted or carried on wafts away,
Nor ever trotted out again—Ay, me!
How much fewer volumes of verse there'd be.

A READER OF THE B. O. P.—1. All the small craft that have crossed the Atlantic have been more or less decked. No really open boat has survived to tell the tale. 2. Jibs and staysails are now made with the canvas cloths forming a series of triangles, having the luff as the base, in order that the sail may stand as flat as possible. In the old days the idea was that a sail should belly and hold the wind; but now it is recognised that the flatter and more board-like the sail the greater is its power. Hence old jibs were made with the cloths parallel, while now the cloths are in two series meeting at a sharp angle. 3. The "Cruise of the Snowbird" was in the third volume.

W. F. R.—1. The "Giant Raft" was in the third volume. 2. There were nine parts in the first volume. 3. Kingsley's "Westward Ho!" is published at six shillings by Messrs. Macmillan and Co.

A SUBSCRIBER.—The "Boy's Own Museum" articles ran through the third volume to No. 103, and were contained in the November, December, and January parts—that is, November and December, 1880, and January, 1881.

BOBBY.—Such a book on mechanical toys is published at 170, Strand, by L. U. Gill.

FOSSIL, E. A.—You must serve in the ranks. If you want to be a soldier, be a soldier, and if you are not prepared to take your share of the dangerous work stay away from the army altogether. Surely you can see the absurdity of a man wanting all the distinction of the pretty uniform, all the certainty of the pay, and all the borrowed glory of the fighting men, of whom outsiders mistake him to be one—and at the same time doing merely penwork safely out of reach of annoyance or disturbance.

E. J. L.—1. The cement for joining the brasswork on to the glass in paraffin lamps is made by boiling together three parts of resin, one of caustic soda, and five of water, thus making a soap which is mixed with half its weight of plaster of Paris. 2. Badigeon is a synonym for "filler." It generally consists of sawdust and glue in carpentry, of tallow and chalk in coopers, of plaster and freestone in statuary, and of putty in amateur work.

CANIS.—Try "The Dogs of the British Islands," by J. H. Walsh, price fifteen shillings; published by Horace Cox, 346, Strand.

S. J. T.—The articles unsigned are as strictly copy-right as the others, and you must not republish them without our written permission. Send your real name and address, and we will help you.

W. A. GIFFIN (Ont.).—To make a full-size balloon will cost you a good deal. We know of no place where they can be bought ready-made; your best plan would be to communicate with one of the aeronauts whose ascents are advertised. Send the letter care of the Crystal Palace Company, or the proprietors of the grounds at which the ascent took place. You could obtain full particulars as to the manufacture of balloons in France from M. Tissandier, office of "La Nature," Paris.

C. B. KING.—In Christchurch Bay you get fair mackerel fishing during the summer months; and about Christchurch Ledge there are pollack, known locally as whiting cob. In the harbour you may find sand smelts, eels, flounders, grey mullet, bass, salmon, or peal. The salmon are in the Wiltshire Avon, which flows into the estuary, and are often taken with the fly.

OUR HOLIDAYS.—A Splendid Dip!

No. 348.—Vol. VII.

SATURDAY, SEPTEMBER 12, 1885.

Price One Penny.

REED,

Author of "My Friend
Smith," etc., etc.

CHAPTER XXIV.
LOVE FIGHTS HIS
WAY INTO THE
BEAUTIFUL
PALACE.

REGINALD recol-
lected little of
what happened on that
terrible night when he
found himself suddenly
face to face with his dead
enemy.

"Gov'nor—that palis I—I'm gettin' in—I hear them calling."

AP.

He had a vague impression of calling the landlady and of seeing the body carried from the pestiferous room. But whether he helped to carry it himself or not he could not remember.

When he next was conscious of anything the sun was struggling through the rafters over his head, as he lay in the bed beside Love, who slept still, heavily but uneasily.

The other lodgers had all risen and left the place; and when with a shudder he glanced towards the corner where the sick man last night had died, that bed was empty too.

He rose silently without disturbing his companion and made his way unsteadily down the ladder in search of the woman.

She met him with a scowl. She had found two five-pound notes in the dead man's pocket, and consequently wanted to hear no more about him.

"Took to the mortuary, of course," said she, in answer to Reginald's question. "Where else do you expect?"

"Can you tell me his name, or anything about him? I knew him once."

She looked blacker than ever at this. It seemed to her guilty conscience like a covert claim to the dead man's belongings, and she bridled up accordingly.

"I know nothing about him—no more than I know about you."

"Don't you know his name?" said Reginald.

"No. Do I know *your* name? No! And I don't want to!"

"Don't be angry," he said. "No one means any harm to you. How long has he been here?"

"I don't know. A week. And he was bad when he came. He never caught it here."

"Did any doctor see him?"

"Doctor! no," snarled the woman. "Isn't it bad enough to have a man bring smallpox into a place without calling in doctors to give the place a bad name and take a body's living from them? I suppose you'll go and give me a character now. I wish I'd never took you in. I hated the sight of you from the first."

She spoke so bitterly, and at the same time so anxiously, that Reginald felt half sorry for her.

"I'll do you no harm," said he, gently. "Goodness knows I've done harm enough in my time."

The last words, though muttered to himself, did not escape the quick ear of the woman, and they pleased her. She was used to strange characters in her place, seeking a night's shelter before escaping to America, or while hiding from justice. It was neither her habit, nor her business to answer questions. All she asked was to be let alone and paid for her lodgings. She knew Reginald had her in a sense at his mercy, for he knew the disease the man had died of, and a word from him out of doors would bring her own pestiferous house about her ears and ruin her.

But when he muttered those words to himself she concluded he was a criminal of some sort in hiding, and criminals in hiding, as she knew, were not the people to go and report the sanitary arrangements of their lodgings to the police.

So she mollified towards him somewhat, and told him she would look after her affairs if he looked after his, and as he had not had a good night last night, well, if no one else wanted the bed to-night he could have it at half-price; and after

that she hoped she would have done with him.

Reginald returned to the foul garret and found Love still asleep, but tossing restlessly, and muttering to himself the while.

He sat down beside him and waited till he opened his eyes.

At first the boy looked round in a bewildered way as though he were hardly yet awake, but presently his eyes fell on Reginald and his face lit up.

"Gov'nor," he said, with a smile, sitting up.

"Well, old boy," said Reginald, "what a long sleep you've had. Are you rested?"

"I are 'ad sich dreams, gov'nor, and—my, ain't it cold!" And he shivered.

The room was stifling. Scarcely a breath of fresh air penetrated through its battered roof, still less through the tiny unopened window at the other end.

"We'll get some breakfast to make you warm," said Reginald. "This horrible place is enough to make any one feel sick."

The boy got slowly out of bed.

"We are got to earn some browns," he said, "afore we can get any breakfast."

He shivered still, and sat down on the edge of the bed for a moment. Then he gathered himself together with an effort and walked to the ladder. Reginald's heart sank within him. The boy was not well. His face was flushed, his walk was uncertain, and his teeth chattered incessantly. It might be only the foul atmosphere of the room, or it might be something worse. And as he thought of it he too shivered, but not on account of the cold.

They descended the ladder, and for a little while the boy seemed revived by the fresh morning air. Reginald insisted on his taking their one coat, and the boy seemed to lack the energy to contest the matter. For an hour they wandered about the wharves, till at last Love stopped short and said,

"Gov'nor, I don't want no breakfast. I'll just go back and—"

The sentence ended in a whimper, and but for Reginald's arm round him he would have fallen.

Reginald knew now that his worst fears were realised. Love was ill, and it was only too easy to surmise what his illness was, especially when he called to mind the boy's statement that he had been taking shelter in the infected lodging-house ten days ago during his temporary exile from Shy Street.

He helped him back tenderly to the place—for other shelter they had none—and laid him in his bed. The boy protested that he was only tired, that his back and legs ached, and would soon be well. Reginald, inexperienced as he was, knew better, or rather worse.

He had a battle royal, as he expected, with the landlady on the subject of his little patient. At first she would listen to nothing, and threatened to turn both out by force. But Reginald, with an eloquence which only extremities can inspire, reasoned with her, coaxed her, flattered her, bribed her with promises, and finally got far enough on the right side of her to obtain leave for the boy to occupy Durfy's bed until some other lodger should want it. But she must have a shilling down or off they must go.

It was a desperate alternative,—to

quit his little charge in his distress, or to see him turned out to die in the street. Reginald, however, had little difficulty in making his choice.

"Are you comfortable?" said he to the boy, leaning over him and smoothing the coarse pillow.

"Yes, gov'nor—all right—that there ache will be gone soon, and see if I don't pick up some browns afore evening."

"Do you think you can get on if I leave you a bit? I think I know where I can earn a little, and I'll be back before night, never fear."

"Maybe you'll find me up and about when you comes," said the boy; "mayhap the old gal would give me a job sweeping or somethink."

"You must not think of it," said Reginald, almost sternly. "Mind, I trust you to be quiet till I come. How I wish I had any food!"

With heavy heart he departed, appealing to the woman, for pity's sake, not to let harm come to the boy in his absence.

Where should he go? what should he do? Half-a-crown would make him feel the richest man in Liverpool, and yet how hard, how cruelly hard, it is to find a half-crown when you most want it.

He forgot all his pride, all his sensitiveness, all his own weariness—everything but the sick boy, and left no stone unturned to procure even a copper. He even begged when nothing else succeeded.

Nobody seemed to want anything done. There were scores of hungry applicants at the riverside and dozens outside the printing-office. There were no horses that wanted holding, no boxes or bags that wanted carrying, no messages or errands that wanted running. No shop or factory window that he saw had a notice of "Boys Wanted" posted in it; no junior clerk was advertised for in any paper he caught sight of; not even a scavenger boy was wanted to clean the road.

At last he was giving it up in despair and coming to the conclusion he might just as well hasten back to his little charge and share his fate with him, when he caught sight of a stout elderly lady standing in a state of flurry and trepidation on the kerb of one of the most crowded crossings in the city.

With the instinct of desperation he rushed towards her, and, lifting his hat, said,

"Can I help you across, ma'am?"

The lady started to hear words so polite and in so well-bred a tone, coming from a boy of Reginald's poor appearance, for he was still without his coat.

But she jumped at his offer, and allowed him to pilot her and her parcels over the dangerous crossing.

"It may be worth twopence to me," said Reginald to himself as he landed her safe on the other side.

How circumstances change us! At another time Reginald would have flushed crimson at the bare idea of being paid for an act of politeness. Now his heart beat high with hope as he saw the lady's hand feel for her pocket.

"You're a very civil young man," said she, "and—dear me, how ill you look."

"I'm not ill," said Reginald, with a boldness he himself marvelled at, "but a little boy I love is—very ill—and I have no money to get him either food or lodging. I know you'll think I'm an impostor, ma'am, but could you, for pity's sake,

give me a shilling? I couldn't pay you back, but I'd bless you always."

"Dear, dear!" said the lady, "it's very sad—just at Christmas-time, too. Poor little fellow! Here's something for him. I think you look honest, young man; I hope you are, and trust in God."

And, to Reginald's unbounded delight, she slipped two half-crowns into his hand and walked away.

He could only say "God bless you for it." It seemed like an angel's gift in his hour of direst need, and with a heart full of comfort he hastened back to the lodgings, calling on his way at a cookshop and spending sixpence of his treasure on some bread and meat for his patient.

He was horror-struck to notice the change even a few hours had wrought on the sufferer. There was no mistaking his ailment now. Though not delirious, he was in a high state of fever and apparently of pain, for he tossed incessantly and moaned to himself.

The sight of Reginald revived him.

"I knowed you was comin'," said he; "but I don't want nothing to eat, gov'nor. On'y some water; I do want some water."

Reginald flew to get it, and the boy swallowed it with avidity. Then, somewhat revived, he lay back and said, "I are got 'em, then?"

"Yes, I'm afraid it's smallpox," said Reginald; "but you'll soon be better."

"Maybe I will, maybe I won't. Say, gov'nor, you don't ought to stop here; you'll be catchin' 'em too!"

"No fear of that," said Reginald, "I've been vaccinated. Besides, who'd look after you?"

"My! you're a good un to me!" said the boy. "Think of that there Medlock—"

"Don't let's think of anything so unpleasant," said Reginald, seeing that even this short talk had excited his patient unduly. "Let me see if I can make the bed more comfortable, and then, if you like, I can read to you. How would you like that?"

The boy beamed his gratitude, and Reginald, after doing his best to smooth the wretched bed and make him comfortable, produced the "Pilgrim's Progress" and settled down to read.

"That there Robinson ain't a bad un," said Love, before the reading began; "I read 'im while I was a-waitin' for you. But 'e ain't so good as the Christian. Read about that there pallis ag'in, gov'nor."

And Reginald read it—more than once. The evening closed in, the room grew dark, and he shut the book. The boy was already asleep, tossing and moaning to himself, sometimes seeming to wake for a moment, but dropping off again before he could tell what he wanted or what was wrong with him.

Once or twice Reginald moistened his parched mouth with water, but as the evening wore on the boy became so much worse that he felt, at all hazards, he must seek help.

"I must bring a doctor to see him," said he to the landlady; "he's so ill."

"You'll bring no doctor—unless you want to see the boy chucked out in the road!" said she. "The idea! just when my lodgers will be coming home to bed too!"

"It's only eight o'clock; no one will come till ten. There'll be plenty of time."

"What's the use? You know as well

as I do the child won't last above a day or two in his state. What's the use of making a disturbance for nothing?" said the woman.

"He won't die—he shall not die!" said Reginald, feeling in his heart how foolish the words were. "At any rate, I must fetch a doctor. I might have fetched one without saying a word to you, but I promised I wouldn't, and now I want you to let me off the promise."

The woman fretted and fumed, and wished ill to the day when she had ever seen either Reginald or Love. He bore her vituperation patiently, as it was his only chance of getting his way.

Presently she said, "If you're bent on it, go to Mr. Pilch, round the corner; he's the only doctor I'll let come in my house. You can have him or nobody, that's flat!"

In two minutes Reginald was battering wildly at Mr. Pilch's door. That gentleman—a small dealer in herbs, who eked out his livelihood by occasional unauthorised medical practice—happened to be in, and offered, for two shillings, to come and see the sick boy. Reginald tossed down the coin with eager thankfulness, and almost dragged him to the bedside of his little charge.

Mr. Pilch may have known very little of medicine, but he knew enough to make him shake his head as he saw the boy.

"Regular bad case that. Smallpox and half a dozen things on the top of it. I can't do anything."

"Can you give me no medicine for him, or tell me what food he ought to take or what? Surely there's a chance of his getting better?"

Mr. Pilch laughed quietly.

"About as much chance of his pulling through that as of jumping over the moon. The kindest thing you can do is to let him die as soon as he can. He may last a day or two. If you want to feed him give him anything he will take, and that won't be much you'll find. It's a bad case, young fellow, and it won't do you any good to stop too near him. No use my coming again. Good night."

And the brusque but not unkindly little quack trotted away, leaving Reginald in the dark without a gleam of hope to comfort him.

"Gov'nor," said the weak little voice from the bed, "that there doctor says I are a-goin' to die, don't he?"

"He says you're very ill, old boy, but let's hope you'll soon be better."

"Me—no fear. On'y I wish it would come soon. I'm afeared of gettin' frightened."

And the voice trembled away into a little sob.

They lay there side by side that long restless night. The other lodgers, rough degraded men and women, crowded into the room, but no one heeded the little bed in the dark corner, where the big boy lay with his arm round the little uneasy sufferer. There was little sleep either for patient or nurse. Every few minutes the boy begged for water, which Reginald held to his lips, and when after a time the thirst ceased and only the pain remained, nothing soothed and tranquillised him so much as the repetition time after time of his favourite stories from the wonderful book which, happily, Reginald now knew almost by heart.

So the night passed. Before daylight the lodgers one by one rose and left the place, and when about half-past seven

light struggled once more in between the rafters these two were alone.

The boy seemed a little revived, and sipped some milk which Reginald had darted out to procure.

But the pain and the fever returned twofold as the day wore on, and even to Reginald's unpractised eye it was evident the boy's release was not far distant.

"Gov'nor," said the boy once, with his mind apparently wandering back over old days, "what's the meaning of 'Jesus Christ's sake, Amen,' what comes at the end of that there prayer you taught me at the office—is He the same one that's in the Pilgrim book?"

"Yes, old boy; would you like to hear about Him?"

"I would so," said the boy, eagerly.

And that afternoon, as the shadows darkened and the fleeting ray of the sun crossed the floor of their room, Love lay and heard the old, old story told in simple broken words. He had heard of it before, but till now he had never heeded it. Yet it seemed to him more wonderful even than "Robinson Crusoe" or the "Pilgrim's Progress." Now and then he broke in with some comment or criticism, or even one of his old familiar tirades against the enemies of his new hero. The room grew darker, and still Reginald went on. When at last the light had all gone the boy's hand stole outside the blanket and sought that of his protector, and held it till the story came to an end.

Then he seemed to drop into a fitful sleep, and Reginald, with the hand still on his, sat motionless, listening to the hard breathing, and living over in thought the days since Heaven in mercy joined his life to that of his little friend.

How long he sat thus he knew not. He heard the voices and tread of the other lodgers in the room; he heard the harsh groan of the bolt on the outer door downstairs; and he saw the candle die down in its socket. But he never moved or let go the boy's hand.

Presently—about one or two in the morning, he thought—the hard breathing ceased, and a turn of the head on the pillow told him the sleeper was awake.

"Gov'nor, you there?" whispered the boy.

"Yes, old fellow."

"It's dark; I'm most afeared."

Reginald lay on the bed beside him, and put an arm round him.

The boy became more easy after this, and seemed to settle himself once more to sleep. But the breathing was shorter and more laboured, and the little brow that rested against the watcher's cheek grew cold and damp.

For half an hour more the feeble flame of life flickered on, every breath seeming to Reginald as he lay there motionless, scarcely daring to breathe himself, like the last.

Then the boy seemed suddenly to rouse himself and lifted his head.

"Gov'nor—that pallis!—I'm gettin' in—I hear them calling—come there too, gov'nor!"

And the head sank back on the pillow, and Reginald, as he turned his lips to the forehead, knew that the little valiant soul had fought his way into the Beautiful Palace at last, and was already hearing the music of those voices within as they welcomed him to his hero's reward.

* * * *

(To be continued.)

ON SPECIAL SERVICE: A NAVAL STORY.

BY GORDON STABLES, M.D., R.N.,

Author of "The Cruise of the Snowbird," "Stanley O'Grahame," etc.

CHAPTER XXIII. (AND LAST).—VICTORY—THEODORA AND AURORA ORDERED HOME—THE "FLAG OF BRITANNIA."

AMONG the first to fall in the passage across stream was poor Golava. He fell in the river shot through the brain.

The same volley wounded Benbow's little Othello. The boy crawled back and laid himself down under a tree. He quietly took up one of McGee's bandages—the doctor had gone on with the rest—and bound up his wounded leg.

"Spect I is going to die," he said to himself. "Der is a drefull lot ob blood coming out. Dun know, am shuah, where it all comes from."

Then he fainted. Duncan Robb had found time to glance towards him, but thought the boy was dead.

In less than fifteen minutes the fort was taken, and the prisoners were saved.

Having hastily done his best for the wounded in this brilliant combat, Dr. McGee hastened back to see to Colin—on a day of battle surgeons must be everywhere.

For a considerable time he thought about nothing else save his patient.

He was lucky enough to find the bullet and to extract it, an operation that gave Colin McLeod a much greater chance of life. And when he had done all for his patient that his skill suggested, he had time to look around him, to listen and to think.

He noticed Othello, and went towards him. The boy's face was cold, his arm was pulseless. "He is dead, poor little fellow," said McGee to himself. "Hullo!" he continued, "a flash of lightning, and how black it is getting. And drops of rain begin to fall. The river will be swollen into a roaring torrent in a very short time. I'm not safe here, I don't want to be cut off, I shall cross at once."

For McGee had seen many a Highland stream come down in "spate," and knew well what a sudden storm in a mountainous land can do.

He did not take long to shift his camp and carry Colin over, and it was well he had done so.

The storm came on with awful fury, and in less than a quarter of an hour down came the river, carrying trees and turf and stones and even boulders before it.

For the time being Mildmay was prevented from retracing his steps to the relief of the camp. He had left brave men and true behind him, however, and thought he had little to fear, for doubtless the river would fall as speedily as it had risen.

Gayly was a good sailor, and that means a good soldier also, and no sooner had the main body of the little army left that night, under the guidance of the nigger-boy, than he set about fortifying the camp, and before daylight, by almost superhuman exertions, he had succeeded in throwing up a rampart all round, behind which it was possible for thirty determined British men to defy ten thousand savages.

It was well he did so, for hardly was the morning well advanced ere his picket was driven in, and soon after a determined attack was made on the camp.

The enemy had soon to retire, however, with the loss of many of their number. This taught them a lesson, and they were not slow to profit by it.

They had learned something else as well; they had found out that the men in camp were a mere handful, who might defend themselves for a time, but could not hold out long.

Another and even more energetic attack was made to storm the ramparts about two hours after the first; and this, like the last, failed, though some of the boldest had actually succeeded in scaling the earthwork, but only to be "scuppered," as sailors call it, on the top of it. Sound travels far on a still day in this climate, and the noise of the blowing-up of the gates was distinctly heard by all. It was a welcome sound to Gayly and Quentin, but it caused the enemy to redouble their efforts to subdue the little stronghold before assistance might arrive and the siege be raised.

The tactics pursued in order to accomplish this task were excellent, and showed that the Poonasees, savages though they were, were commanded by a captain who knew a good deal of the art of warfare. From the edge of the wood, which was on a level with the camp, a trench was zigzagged up to within seventy or eighty yards of the rampart.

No sooner was this finished than trees that were being felled in the forest were dragged up, and the construction of a tower commenced, by which the inside of Gayly's fort could be completely commanded.

It is not likely that Gayly and Quentin permitted the work to go on quietly. They did all in their power to harass the builders, but with little success. Higher and higher rose the pile, and by noon it was of such a height that had the men who swarmed upon it been better marksmen Gayly's fort would soon have been quite untenable, and every one within it have been slain or made prisoners. As it was, the only defence possible was effected by the spade rather than the rifle.

By two o'clock many of the sailors and marines lay dead or wounded, and among the dead, much to Quentin's grief, was Gayly himself. He had exposed himself for a moment on the rampart to roll back lifeless the next.

By three in the afternoon things had come to such a pass that Quentin determined to make a sortie. Better die fighting sword in hand than remain a mere target to the enemy's bullets.

"Barclay," he said to the chief gunner, "we must make a rush."

Barclay was "making a reconnaissance," as he called it, through a small loophole that he had formed of a few flat stones.

"One moment, sir," he replied. "Why, sir—"

"What is it, Barclay? What do you see?"

"Why— Hurrah!" shouted Barclay. "Their tower is on fire!"

It was true. The light wind blew off

the camp, smoke was seen rising from the foot of the great pile, and next minute the whole structure was one blazing mass, for the wood of which it was built was dry and hot with exposure to the sun.

"And here comes little Othello," cried the gunner. "Why, it must have been he, and no one else, who fired the stack."

It was true. When Dr. McGee had recrossed the stream, and the rain began to fall and patter on Othello's face, he began slowly to revive, and finally stretching himself, wearily opened his eyes. Then he sat up and looked about.

"Specs nobody cares nuffin now 'bout poor Massa Thello," he said. "De ribber come down plenty big too, and de docta he hab take de buckra officer ober in his arms. 'Nebber mind de niggah chile,' he say to hissef, 'de niggah boy am good for nuffin now.' Well, I see on'y a niggah chile arter all. What for I sit down and blubber? I go back to de camp directly. I get some food den. Dat is bettah dan sit and cry. I is so stiff and sore though. Nebber mind, I see on'y a poor little niggah boy."

It was a long weary march that to Othello. But he found fruit in the forest, and that refreshed him, and so by-and-by he came in sight of the camp.

"Dey am fighting for sure," he said, rubbing his eyes. "And poor Massa Quentin he gettin' de worst ob it. Berry much indeed. Why, right ober against de camp dere dey hab build de Tower ob Babel, all same's de kind ole cluggyman tell me 'bout. Why dis niggah soon put an end to dat prank; dis niggah boy fire de tower. Ah! yah! Fire de tower and frizzle all de niggahs on de top. Ah! yah!"

Othello soon put his scheme into action. Nobody noticed the approach of the tiny black fellow, so he concealed himself at the foot of the pile and in the pile.

It took him quite a quarter of an hour to "make fire," as he called it, with some hard and soft wood. Both the grass and the timber had hours before become dry, and once alight they burned with fury.

The river went down as speedily as it had come up, and the camp was relieved about sundown.

The enemy, now utterly routed in three battles, withdrew entirely, and left our people unmolested. On our side, however, the losses were heavy enough. No less than three of the Aurora's officers were wounded, and several men were killed. Every one was sorry for poor Gayly. A smart, brave officer he had been, and no one remembered his faults or foibles now that he was gone.

All the dead were buried at the edge of the forest. A cairn marks the place of sepulchre—a cairn that the superstitious natives will not go near, either by night or by day.

McGee and the junior surgeon of the Aurora had their work cut out for them in attending to the sick, but by slow degrees and in safety they were conveyed to the coast, and thence on board their own ships.

The Aurora and Theodora then sailed for the Cape, taking with them the prisoners they had released and leaving the Dahomeians and the Poonasees to settle their own never-ending quarrels in their own wild way.

The Theodora had now been over four years and a half in commission, and it had been a stirring one on the whole. No one, I believe, was tired of adventure, but it must be admitted that no one was sorry to learn on their arrival at the

It was summer time, and the number of ladies on deck, and the laughing, talking, joking, ay, and weeping—tears of joy—made the Theodora look as gay as a village green at fair time.

Nearly every one had some one to welcome him home, but for a time Colin looked in vain for a boat coming off to him. But yonder it comes at last, and in a few moments up the starboard ladder stumped old Captain Peter, with his wooden leg evidently newly stained and

Captain Peter was cordial in the extreme, and it rejoiced Colin's heart to notice the respect with which the former treated his uncle.

In a day or two the court of inquiry—a mere service formality—was held on Colin and Blair. They were of course acquitted of all blame, and highly complimented for their watchfulness when on the island.

Colin dined that same night with Captain Blunderbore. His uncle was there,

Welcome Home!

Cape that both the Aurora and Theodora were ordered home.

They sailed away together. They hardly lost sight of each other during the passage home, and they made Plymouth waters within a watch of each other.

And there they lay for hours till the ceremony of *pratique* had been gone through and the medical officer of health had declared them to be clean ships.

Then, and not till then, did the friends of those on board, who swarmed around the ships in boats, but who hitherto had to be content with words spoken from quarter-deck, from side-ladder, from port or bow, rush on board.

polished for the occasion. Behind him, looking somewhat abashed, for he was unused to scenes like these, came Colin's brother Roland.

Then Colin was indeed happy. He had about one hundred and fifty questions to ask his brother, and when they were all answered about three times over, then he led Roland below to his mess.

Roland was very much surprised indeed at what he took to be the smallness of the accommodation. To his eye, used to the great halls and rooms of a Highland castle, even the Theodora looked wondrous small.

The meeting between Mildmay and

and Commodore O'Connell and Quentin Steele and Benbow.

Quentin and Colin said little, they kept quiet, respectfully quiet, and listened. But they enjoyed themselves none the less.

Next morning Mildmay received a letter from his London agents which contained a very pleasant surprise for him indeed. Padre Fedro had arrived in England with Sauva Rosa, and the lieutenant bade Colin good-bye and started off for town the same day.

As he stepped on board the train, dressed in plain clothes, Colin thought to himself he had never seen him looking so handsome, so happy, or so young before.

The *Theodora* was paid off in due time, and the officers bade each other farewell.

"Vowing off to meet again,
They tore themselves asunder."

Benbow was the same funny jolly little fellow to the last.

"McGee," said Colin, "I have to thank you for saving my life."

"Nonsense, man," replied McGee. "Good-bye. Take care of yourself. You're looking rather white yet."

"Good-bye, Scottie," cried Blair. "God bless you."

"God bless you," returned Colin, heartily, "and mind you come and see me. My brother Roland here will give you a week's shooting."

"That I will, gladly," said Roland.

"Good-bye both. I'll come," cried Blair.

One fine morning about a fortnight afterwards Colin McLeod, now sub-lieutenant, found himself back once more in the dear old glen and at his father's house.

"I'm proud of you," his father said. His mother simply wept, as women folks will. But his uncle, with the old wooden leg looking more shiny than ever, was a sight to see and to hear! Colin was "his own boy."

"Bother it all," he said, "if he—Captain Peter—hadn't had his own way of it the lad would still have been pottering

around in some flagship, a fresh-water sailor, a long-shore chap, a mere Jack o' Lantern."

Blunderbore did get his promotion, though he was not made an admiral, and old Commodore O'Connell retired as a Rear.

D'Austin was made an A.P. (Assistant Paymaster), and got a shore billet in an admiral's office, which suited him better than going to sea.

Quentin, Colin's dearest friend, found himself heir to a snug fortune on his return home, and the Lords Commissioners of the Admiralty (capital letters, Mr. Printer, please, or I, the author, will be tried by court-martial and lose my half-pay) graciously permitted him to retire. Benbow at this moment has a command of his own, and is making it hot for the Arabs out on the East Coast. Last, but least only in point of rank, Duncan Robb is a sergeant, and a bolder or smarter never stood in front of a company.

* * * * *

Just three years after these stirring events Colin McLeod—now lieutenant (epaulets at last) led to the altar the beautiful daughter of retired Captain Mildmay. Quentin and Benbow were both there, the latter as brisk as ever.

But of the doings at the castle on the day Colin and his bride—with little Othello up on the dicky beside the

coachman—drove away to spend their honeymoon, I am not going to speak. Something should always be left to the imagination of the reader; but I may say this much: Dear Mildmay, the gallant and good, looked serenely happy, and Benbow remarked of Colin's uncle that he really was a grand old fellow, in grand old form. And to all Captain Peter's yarns that day and evening there was no more delighted listener than old Dominie Clayton.

In the grand hall of the castle—it has a fireplace in it big enough to roast an ox—a select company of blue-jackets not only dined but danced. Barclay the gunner was there. I give just one verse of a song he sung, and a ringing one it is:

"How the heart of each Briton doth beat when on high

The flag of Britannia unfurls to the sky;

And gloriously braveth the battlefield's shock,

As the waves vainly dash on the storm-beaten rock.

There's many a banner hangs drooping its head,

For the strength that sustained it is nerveless and dead,

And the hearts that once followed it on to the field

Left no kindred spirits its honour to shield.

But the flag of Britannia, the flag of the brave,

Triumphant it floateth o'er land and o'er wave;

And proudly it braveth the battle and blast,

And when tattered with shot it is nailed to the mast—

"Chorus—The flag of Britannia," etc.

(THE END.)

BRASS-RUBBING.

BY JOHN E. CLAUSON.

... graves, upon the which I trust
Shall witness live in brass. . . .

HENRY V., *Act iv., Sc. 3.*

WELL remember the interest with which I received initiation at the hands of an antiquarian uncle of mine into the mysteries of brass-rubbing.

The *modus operandi* is as follows. The brass-rubber, accompanied if possible by a friend, sallies forth on his country walks, and having fixed on a church in which he knows brasses to exist, proceeds to make his way into it. For this purpose the keys have to be hunted up from the incumbent or sexton of the church. The rubber has already provided himself with a long roll of paper, technically termed "lining-paper," which can be procured from any paper-hanger at a penny a yard; he has also obtained from a cobbler a few lumps of heelball, a black substance sold at a halfpenny a cake. A few sixpences for sextons complete his outfit, so altogether

brass-rubbing can hardly be called an expensive amusement.

When admittance has been gained the paper is laid over the brass effigy and firmly fixed by means of hassocks, etc., so that it cannot shift. If the brass is vertically placed on a wall wafers are very convenient. In these operations the assistant friend is extremely useful, for with only one person the paper has a constant tendency to roll itself up or otherwise change its position.

The black heelball is then rubbed over the paper, the result being a beautiful reproduction of all the raised parts of the effigy in their minutest details.

In this way a very interesting collection of transcripts of brasses can be made with very little trouble and expense, while brass-rubbing also leads to much pleasant and healthful exercise in wandering over the country in search of the monuments, for in almost all counties numerous brasses of the local magnates are to be found.

Many brasses are extremely quaint and interesting. Those we possess date from the end of the thirteenth century to the middle of the seventeenth, if we except the modern revivals produced within the last few years. On the brasses executed during these four centuries we have a complete and accurate encyclopædia of costume, and it is this which makes them so valuable to the archaeologist.

This accuracy of brasses is due to the fact that they were usually engraved during the lifetimes of the persons represented. There is a curious drawing among the British Museum MSS. which represents two workmen with hammer and chisel working at the effigies of a knight and his lady. Their foreman stands behind them, explaining to the family who have called on him that the work is proceeding according to their directions.

Usually, of course, general directions only were supplied, but sometimes minute instructions were given by personal interview with the engraver if a man did not care to entrust his memorial to the tender mercies of his executors. In the latter case additional accuracy of detail would be ensured—the ecclesiastic would be very careful about the orthodoxy of his vestments, the knight would have his accoutrements exactly reproduced, the lady would cause her favourite gown and head-dress to be accurately portrayed—in fact, very close copies of the clothing of the period would be the result. Of course we thus discover the dress of the richer classes only, and, moreover, not their highest extravagances of fashion, for we find that they with very good taste avoid these on their monuments.

Brasses were often elevated on altar tombs, just as stone effigies would be, but more usually they are found fixed in stone slabs as part of the church pavement; where space was limited, as for instance in the chancel, they would be far more conveniently placed in such a position than on raised monuments. Brasses commend themselves also in preference to stone effigies by reason of their great durability, cases having occurred where brasses have escaped unhurt from the burning of churches when stone effigies have crumbled to dust. The value of brass effigies as old metal, however, much endangers their existence, for it is comparatively easy for a thief to wrench them from the settings, to which they are only secured by rivets.

All brasses were probably at one time ornamented by the filing of the incised lines with enamel of various colours. Of this ornamentation few traces survive, but the metal itself in many cases seems as freshly cut as when it left the engraver's hands.

BOY LIFE AFLOAT.

BY CAPTAIN H., LATE R.N.

IX.—HOMEWARD BOUND.

"HURRAH, Jack, we're homeward bound!" That's the sound to make the blood flow through the veins more swiftly, while the various pictures of far-away homes pass swiftly across the absentee's mental eyes.

For, no matter where he may be, the sound of "Homeward bound!" has a wonderful effect upon a true seaman. He may be sailing amidst the balmy breezes, smiling wavelets, and azure skies of the Adriatic, but it will not compare, to your true Jack Tar, with the green, choppy Channel wave, blowing half a gale, and under close-reefed topsails, "homeward bound."

Of course, we need not explain to our reader the meaning of the term; in the mercantile marine it speaks for itself, and in the Royal Navy the difference is that the "commission," or length of time on duty on that particular station, is over, and they are all going home to be "paid off," and then enjoy six weeks' holiday with their friends and relatives.

A man-of-war is now usually only kept three years in commission, but formerly the period was much longer. There are well-founded yarns of a vessel going out to the West Coast of Africa on a five years' commission, and not one of the original officers returning in her when she was homeward bound. This would be caused by exchanges, and the direful effect of the climate on that coast, which has not inaptly been termed "the white man's grave."

Occasionally a ship is paid off one day and recommissioned the next. This is when the ship is in good condition and is a particularly serviceable one for that part of the world wherein she may happen to be stationed.

There was a twenty-one-gun corvette on the West Coast of Africa named the Rattlesnake that was recommissioned—I should be afraid to say how often—without returning to England.

She was lying at anchor off Sierra Leone when I paid my first visit to that place, under the command of Commodore Wilmot. He was somewhat laughed at for many of the peculiarities in his way of carrying on duty; but as he who laughs last laughs best, he certainly had the advantage, for although his ship was the largest, it was also the healthiest on the West Coast. His idea was that in a malarious country like that men required occupation and amusement, and he carried out his idea to the full.

I had the pleasure of seeing one of his favourite "fads," as they used to be called, the first evening of our meeting. It was during the first watch, and we were down below, when a cry on deck caused us all to scamper up. And well worth our while we found it.

The Rattlesnake had manned her yards and rigging, and the seamen were letting off blue lights, rockets, etc., from all parts, illu-

minating the delicate tracery of the rigging, and outdoing the finest exhibition of fireworks possible.

She had gone through the hands of innumerable first-lieutenants, who had each tried to outdo his predecessor in the way of ornamentation, and I must confess I have never seen any yacht that could compare to her quarter-deck.

Precious woods are cheap out there, and we have plenty of good taste in the Navy; so, what with the ivory-white deck and gratings, and Tonbridge ware mixture of ebony, satin-wood, etc., mingled with the bright brass-work, our readers may imagine that it was a sight worth looking at.

It is usually the custom for the ship that is going to take the old one's position on the station to come out and relieve her predecessor, and then is the time to hear the men hurrah as the new-comer enters the harbour and swings round to her anchor.

There are exceptions, however, to every rule, and we can remember one exceptionally miserable homeward-bound voyage. We were in one of the old-fashioned frigates that had been altered and done up, until nearly as much money had been spent upon her as would have purchased a new one. One of the best men in the ship was Will Emery; every one liked him, and he was a sharp, smart man, that knew his work and always did it.

We were on the North American and West Indian station, and one day he informed the midshipman to whose boat he belonged that he had made arrangements for his wife and two little ones to join him at Halifax.

That being our headquarters, he knew that he should have more opportunity of seeing his better half, and his time being out in another two years, he anticipated being able to settle down out there.

But alas for poor Will! On the following day the mail came in, and with her our orders to return home, as it was considered necessary that our noble craft should be surveyed out of the service.

Will nearly went mad. For he anticipated that his wife would arrive at Halifax about the same day he would anchor at Spithead. At the same time there was nothing to be done but grin and bear it. Everybody except himself was glad enough to be homeward bound, while every thought of it was agony to Will.

At last we were to sail in two days, when one evening Will Emery was reported missing. I doubt there was hardly a man in the ship, from the captain down to the master-at-arms, but felt at heart glad that he had got off all right.

"Of course I must make a report of it," said the captain, but he took twice as long, I know, to do it as was necessary.

The following day passed, and then in the forenoon we weighed anchor, set all plain

sail, and, saluting the admiral, were about to run out of harbour.

Suddenly the signal middy adjusted his glass, muttering, "Hallo! what's the meaning of this? Huzz! hum! hum! Return to your anchorage. *Port sail. Anchor.*"

The answering pennant was hoisted, and in a state of startled amazement we obeyed the admiral's order. The anchor had scarcely disappeared from sight when a launch with half a dozen of marines and poor Will Emery in irons came alongside.

He had been found out and given up ashore, and the admiral (I won't mention his name) said that it was necessary to make an example, and he should try Will by court-martial. There were two or three cockroach-traps, *alias* gunboats, in harbour, so there were plenty of officers, and when the day arrived Will had a full court.

They did not take long over it. Will pleaded guilty, and showed his characters, every one "Very good," and threw himself on the mercy of the court.

He might as well have thrown himself on the mercy of the sharks in Port Royal Harbour. Verdict—Guilty. Sentence—Four dozen.

It had to be done, although I know our captain humbled himself to ask to have it remitted, but it was useless. Poor Will took the whole forty-eight lashes without a sound or a flinch. But he was never the same man afterwards. It killed him as surely as any poison will kill, and when we entered the Channel he had been given up.

That was a funny homeward-bound cruise. No larking or joking. Nobody had the heart to be merry, with that poor fellow dying down below.

We rounded the Wight, and I was mid of the watch when we anchored at Spithead. We were soon surrounded by boats, and the captain gave the order that no one was to come on board.

Presently the corporal of the gangway came and half-whispered to me,

"Poor Will's wife is in a boat at the gangway, sir."

I reported it, and the captain at once gave permission for her to come on board.

I heard her prattling to the old corporal as he took her down below:

"Will will be so pleased that I waited for him, because, don't you see? I happened to hear through a friend that you were a-coming home."

A few minutes elapsed, and then there arose a shriek. It sounded all through the ship, and for months it echoed in my ears.

It was the shriek of death, and two loving, truthful hearts mingled together and flew aloft to the quarter-deck of the Almighty Admiral, who, although He is just, is also merciful.

(THE END.)

HEROES OF THE BACKWOODS.

KIT CARSON.

PART III.

"WITH me, Carson and truth mean the same thing. He is always the same—gallant and disinterested. He is kind-hearted, and averse to all quarrels and turbulent scenes, and has never engaged in any mere personal broils or encounters except

on one single occasion, which he sometimes modestly describes to his friends."

So wrote General Fremont, referring to a hand-to-hand encounter which Kit had with a certain bully named Shunan. It took place on horseback, and Kit luckily shattered his

enemy's forearm with a pistol-shot as the rifle-trigger pulled, and thus, instead of meeting his death, escaped with his face burnt with the powder and the top of his head grazed with the bullet—for the shot was fired not a yard away from him.

Previous to this, however, Kit had been through his battle with the Blackfeet. One the snow. He came upon the Indians after a fifty-miles ride; a parley ensued, and Kit treachery. Carson demanded the horses, and promised if they were given up that he would

A Halt in the Clearing.

night, when on the Big Snake, eighteen of | and his men walked into the camp and sat | return quietly and do no damage. Only five

The Camp of the Blackfeet.

the horses were stolen, and with eleven of his companions he went off in pursuit through round the fire and smoked the pipe of peace with the chiefs, who thus agreed to use no of the horses were offered, and these were the poorest of the lot, and the negotiations were

The Giantess Geyser of the Yellowstone.

broken off. The trappers retired from the camp, the redskins rushed to their guns, and after a few minutes' interval the fight in the forest began.

At first the Indians were driven back, but Carson, catching sight of one of their men taking deliberate aim at Markhead, risked his own safety to save his friend. He shot the Indian dead, but was himself shot in the shoulder by another savage, who had been watching him for some time. With Kit's fall the chance of the trappers went down to zero, and though they kept the foe at bay till nightfall, they had to clear off in the dark and carry their wounded with them. Soon, however, they returned, reinforced, and found that the Blackfeet had disappeared.

Carson's wound did not take long to heal, and then, after the fight with Shunan already alluded to, he joined in a trapping expedition to Fort Hall. Great were the perils of the journey; so pressed at times were the party for food that they only saved themselves from starving by bleeding their mules and drinking the warm blood, it being impossible for them to kill them with any hope of escaping from the wilderness.

They reached Fort Hall, and a few months afterwards the Blackfeet began their old tricks, and in a night foray rode off with all the horses without the loss of a single man killed or wounded. After a season on the Yellowstone, Carson returned to the upper waters of the Missouri to lead the expedition which the trappers had organised against the thieves. The Blackfeet were then a great nation, numbering some thirty thousand in all, so that the undertaking was no light one. At the head of a hundred picked backwoodsmen, Kit marched off to their chief village. After reconnoitring the position with five companions, he divided his party, taking forty-three to do the fighting, and leaving the rest behind as a camp guard and reserve under Fontenelle.

The arms of the Blackfeet were mainly bows and arrows, and there were very few who had guns, so that the odds were not as great as might at first appear. The battle raged fiercely for hours in the woods, and the trappers had nearly exhausted their ammunition, when the Indians, fancying their chance had come, waited till most of the rifles had spoken, and, with one united charge, rushed on their enemies. The trappers were too quick for them, and the deadly rifles cracked out, each claiming its victim; but the Blackfeet, unchecked, came on to conquer, hand-to-hand. Suddenly, to their consternation, the revolvers, until then unknown to them, gave forth their fatal message, and, broken and disheartened, the Indians staggered back.

And then Fontenelle brought up the reserve, and in a long line the hundred dismounted trappers came cheering through the woods, Indian fashion—from tree to tree, from rock to rock, from cover to cover, every moment closing up with their desperate foes. Never was there a more determined battle in the bush. Often a trapper would be on one side of a rock and an Indian on the other, each watching for the other's life, neither leaving the shelter but to die. For an hour or more the long series of man-to-man fights went on; as one Indian was disposed of another would spring into his place, and from tree to rock and rock to tree, with the path bespattered with blood, the victorious backwoodsmen slowly fought their way. At last there came a piece of open ground, and with a cheer the white men charged straight on to the remnant that was left, and with a wild yell of defiance the Blackfeet scattered and fled. Three of the trappers were killed and many were wounded; but of the Indians the corpses were lying about in scores, so tough had been the struggle and so sudden the final collapse.

Even after this desperate affair the Blackfeet could bring five thousand warriors into the field, and other battles had to be fought

before their strength was broken. All, however, were of the same class, all with the same incidents and the same ending. The bows and arrows stood no chance against the deadly rifle and revolver in the hands of men who never threw away a shot or went a handsbreadth from their mark. Terrible as Carson made himself to the Blackfeet, he was the staunch friend of the Crows and Flatheads—and, indeed, with most of the Indian nations, all of whose languages he knew.

With the Blackfeet War his career as a trapper closed. Silk hats came into fashion, beaverskin went out; and the six hundred men then employed in beaver capture among the streams of the Rockies found their occupation almost gone. Kit was shrewd enough to see that trapping was a thing of the past, and on the huntership to Fort Bent being offered to him he gladly accepted it.

Here he stayed from 1834 to 1842, his duties being to provide meat for fifty men by the spoils of his gun. Day after day during those eight years was he out in the woods, and it is said that he never failed in the supply or had a cross word with those that employed him. A delightful duty it would seem to be! Eight long years of constant necessary sport amongst elk and buffalo, deer and antelope, and smaller game, roaming over mountain and prairie from sunrise to sunset, welcome everywhere alike in the hut of the white man and the wigwam of the Arapahoe, the Cheyenne, the Kioway, and the Comanche!

During this period it was that he became so well known and respected throughout the west for having brought about the peace between the Sioux and the Comanches; and it was then that he won the heart of his Indian wife.

And here we may as well give place to Joaquin Miller, "the poet of the sierras," and let him tell in his own perfect way the story of

KIT CARSON'S RIDE.

Run? Now you bet you; I rather guess so.
But he's blind as a badger. Whoa! Paché, boy, whoa!
No, you wouldn't think so to look at his eyes,
But he is badger-blind, and it happened this wise—
We lay in the grasses and the sunburnt clover,
That spread on the ground like a great brown cover,
Northward and southward and west and away
To the Brazos, to where our lodges lay,
One broad and unbroken sea of brown,
Awaiting the curtains of night to come down
To cover us over and conceal our flight
With my brown bride, won from an Indian town
That lay in the rear the full ride of a night.

We lay low in the grass as the broad plain levels,
Old Revels and I, and my stolen brown bride.
"Forty full miles if a foot to ride,
Forty full miles if a foot, and the devils
Of red Comanches are hot on the track
When once they strike it. Let the sun go down
Soon, very soon," muttered bearded old Revels,
As he peered at the sun, lying low on his back,
Holding fast to his lasso; then he jerked at his steed
And sprang to his feet, and glanced swiftly around,
And then dropped, as if shot, with his ear to the ground,
Then again to his feet and to me, to my bride,
While his eyes were like fire, his face like a shroud,
His form like a king, and his beard like a cloud,
And his voice loud and shrill, as if blown from a reed:
"Pull, pull in your lassos, and bridle to steed,
And speed you if ever for life you would speed,
And ride for your lives, for your lives you must ride—
For the plain is aflame, the prairie on fire;
And feet of wild horses hard flying before
I hear like a sea breaking high on the shore,
While the buffalo come like a surge of the sea,
Driven far by the flame, driving fast on us three,
As a hurricane comes, crushing palms in his ire."

We drew in the lassos, seized saddle and rein,
Threw them on, sinched them on, sinched them over again,
And again drew the girth, cast aside the machier,
Cut away tapidas, loosed the sash from its fold,
Cast aside the catenas red and spangled with gold;
And gold-mounted Colt's—true companions for years—
Cast the red silk serapes to the wind in a breath,
And so bared to the skin sprang all haste to the horse,

As bare as when born, as when new from the hand
Of God, without word, or one word of command,
Turned head to the Brazos in a red race with death—
Turned head to the Brazos with a breath in the air
Blowing hot from a king leaving death in his course;
Turned head to the Brazos with a sound in the air
Like the rush of an army, and a flash in the eye
Of a red wall of fire reaching up to the sky,
Stretching fierce in pursuit of a black rolling sea,
Rushing fast upon us as the wind sweeping free,
And afar from the desert, bearing death and despair.

Not a word, not a wail, from a lip was let fall,
Not a kiss from my bride, not a look or low call
Of love-note or courage, but on o'er the plain
So steady and still, leaning low to the mane,
With the heel to the flank and the hand to the rein,
Rode we on, rode we three, rode we gray nose and nose,
Reaching long, breathing loud, like a creviced wind
blows,

Yet we broke not a whisper, we breathed scarce a
prayer!
There was work to be done, there was death in the air,
And the chance was as one to a thousand for all.
Gray nose to gray nose, and each steady mustang
Stretched neck and stretched nerve till the hollow
earth rang,
And the foam from the flank and the croup and the
neck

Flew around like the spray on a storm-driven deck.
Twenty miles! Thirty miles... a dim distant speck...
Then a long-reaching line, and the Brazos in sight,
And I rose in my seat with a shout of delight.
I stood in my stirrup and looked to my right,
But Revels was gone; I glanced by my shoulder
And saw his horse stagger; I saw his head drooping
Hard on his breast, and his naked breast stooping
Low down to the mane as so swifter and bolder
Ran reaching out for us the red-footed fire.
To right and to left the black buffalo came,
In miles and in millions, rolling on in despair,
With their beards to the dust and black tails in the air
As a terrible surf on a red sea of flame
Rushing on in the rear, reaching high, reaching higher.
And he rode neck to neck to a buffalo bull,
The monarch of millions, with shaggy mane full
Of smoke and of dust, and it shook with desire
Of battle, with rage and with bellows loud
And unearthly, and up through its lowering cloud
Came the flash of his eyes like a half-hidden fire,
While his keen crooked horns through the storm of
his mane
Like black lances lifted and lifted again;
And I looked but this once, for the fire licked through
And he fell and was lost, as we rode two and two.

I looked to my left then, and nose, neck, and shoulder
Sank slowly, sank surely, till back to my thighs;
And up through the thick blowing veil of her hair
Did beam full in mine her two marvellous eyes
With a longing and love, yet a look of despair,
And a pity for me, as she felt the smoke fold her,
And flames reaching far, for her glorious hair.
Her sinking steed faltered, his eager ears fell
To and fro and unsteady, and all the neck's swell
Did subside and recede, and the nerves fell as dead.
Then she saw that my own steed still larded his head
With a look of delight, for this Paché, you see,
Was her father's, and once at the South Santafe
Had won a whole herd, sweeping everything down
In a race where the world came to run for the crown;
And so when I won the true heart of my bride—
My neighbour's and deadliest enemy's child,
And child of the kingly war-chief of his tribe—
She brought me this steed to the border the night
She met Revels and me in her perilous flight
From the lodge of the chief to the north Brazos side,
And said, so half guessing of ill as she smiled,
As if jesting, that I, and I only should ride
The fleet-footed Paché, so if kin should pursue
I should surely escape without other ado
Than to ride, without blood, to the north Brazos side,
And await her—and wait till the next hollow moon
Hung her horn in the palms, when surely and soon
And swift she would join me, and all would be well,
Without bloodshed or word. And now, as she fell
From the front, and went down in the ocean of fire,
The last that I saw was a look of delight
That I should escape—a love—a desire—
Yet never a word, not a look of appeal,
Least I should reach hand, should stay hand or stay heel
One instant for her in my terrible flight.

Then the rushing of fire rose around me and under,
And the howling of beasts like the sound of thunder—

Beasts burning and blind and forced onward and over
As the passionate flame reached around them and
wove her

Hands in their hair, and kissed hot till they died—
Till they died with a wild and a desolate moan,
As a sea heart-broken on the hard brown stone.
And into the Brazos . . . I rode all alone—
All alone, save only a horse long-limbed,
And blind and bare and burnt to the skin.
Then just as the terrible sea came in
And tumbled its thousands hot into the tide,
Till the tide blocked up, and the swift stream brimmed
In eddies, we struck on the opposite side.

Sell blind Pachè?—blind Pachè? Now, mister, look here,
You have slept in my tent, and partook of my cheer
Many days, many days, on this rugged frontier,
For the ways they were rough and Comanches were near;
But you'd better pack up! And take care of your skin!
I couldn't have thought you so niggardly small.
Do you men that make books think an old mountaineer
On the rough border born has no tum-tum at all?
Sell Pachè! You buy him! A bag full of gold!
You show him! Tell of him the tale I have told!
Why he bore me through fire, and is blind, and is old!
Now pack up your papers and git up and spin,
And never look back. Now git off with your tin!

Alas! that it should be so! Like the somewhat similar "Good News from Ghent" of Mr. Robert Browning, the incident in this glorious ballad has no foundation in fact. Kit did win an Indian girl for his bride, but she lived to present him with a daughter. And with regard to his horse Pachè or Apache, he lived to be the hero of many a longer run than that of this wild rush from fire and the Comanches.

(To be concluded.)

COLONEL PELLINORE'S GOLD

BY E. W. THOMSON,

Author of "Petherick's Peril," etc.

CHAPTER IV.

"BRYAN is keeping fashionable hours," said Lieutenant Marhaus at breakfast next morning. "Such trout as these, such venison-steak—how fat it is, colonel!—by the powers! the corporal's cooking might have tempted him up to breakfast."

Colonel Pellinore rose, stepped to the door of the room, and cried,
"Bryan!"

His voice rolled along the unplastered rafters and shattered through the house.

"Bryan, you sluggard!" roared the colonel again.

"Faith, he's one of the seven sleepers," said Marhaus, laughing. "Yet I'd like to shake hands with him before I go."

The colonel went out of the room and upstairs.

Outside, the squad of soldiers in huge grey overcoats had stacked arms, and with full-fed enjoyment were drawing at their short cutty pipes while stamping round on the snow in the sparkling morning. Baptiste Larocque, the *habitant* driver, had left his pony harnessed to the *traineau* before the magazine, and returned to the kitchen determined to eat to the last. Corporal Cram stood ministering to the Frenchman, hospitably bent on subduing his unexampled appetite.

"Merci, merci, monsieur!" said Baptiste, pretending a negative as the corporal placed on his plate another fat steak of a couple of pounds.

"Mercy, ye heathen, is it!" answered the corporal. "Mercy! never till ye surrender! The likes of ye shall never g'out of Colonel Pellinore's house saying that he couldn't get his fill of victuals. What's a steak or so? Eat, Johnny Crapaud, eat, I say!" an admonition which Baptiste did not seem to need.

"Bryan is not in his room," said the colonel, on his return, looking much puzzled. "There is something singular, too, about his absence. His father's sword and pistols have likewise disappeared. Where can the boy have gone? Corporal Cram!" he shouted.

"Here!" answered the corporal, running in and drawing himself up as if on parade.

"Have you seen anything of Mr. Bryan this morning?"

"Not a hair, your honour!"

"See, then, if he is about the stables. Tell him Mr. Marhaus is about to march."

"Nor is there much time to spare

either," said the lieutenant, bustling into his overcoat. "I must make the Rouge River before noon, colonel. If Bryan don't turn up before I get away, tell him he owes me an apology, and that I'll expect him to pay it on my way back in a fortnight or so. Don't, though," continued the lieutenant, laughing, "or he might insist on giving me satisfaction instead."

As the colonel and his guest appeared outdoors, Sergeant Bors cried, "Fall in!" and the soldiers, seizing their pieces, placed themselves in file. Baptiste came running out, still at work on his last mouthful, and rubbing the back of his hand across his greasy lips with a satisfied gesture. The colonel and lieutenant advanced toward the magazine, till Corporal Cram, running excitedly from the stables, stopped them midway.

"Your honour!" said he, saluting, "the bay mare is gone."

"Gone! The bay mare!" cried the colonel.

"Harnessed! The red *cariote* gone too!"

"Strange!" said the colonel; "I never knew Bryan freakish before. Did you part with him on good terms last night, Marhaus? I heard you laughing most amicably after I retired."

"On the best of good terms, colonel," said the lieutenant.

"Strange!" exclaimed the colonel again. "What can have possessed the boy?"

As he spoke he inserted the great key in the magazine door and turned it in the lock. Sergeant Bors pushed the creaking door open and entered.

"You may meet him on the road, Marhaus," said the colonel; "and if—" He stopped short at the exclamation of Sergeant Bors.

"The keg is gone!" cried he.

"Gone!" said all together.

The colonel and lieutenant strode into the magazine.

"Is it the keg of gold?" said Corporal Cram, entering too.

"Yes; it's gone," said Bors, "and the young gentleman gone too," he added, significantly.

"Silence!" cried the corporal, threateningly, "don't ye dare to couple those two things together."

The colonel and lieutenant stared into each other's faces. There was deep pity in the expression of the younger man.

"It's a mistake, Marhaus," said the

colonel, hoarsely. "Not a word. Come with me into the house. Give me your arm; I am faint."

"It's a mistake," repeated the colonel as he sank into a chair. "Bryan will be back soon; I'll stake my life on it. You will wait quietly awhile, Marhaus?"

"Certainly! certainly!" answered he. "It's only camping at the Rouge to-night instead of the next river."

"Perhaps not. Bryan will be back very soon," said the colonel.

"But where can the money be, then?" asked Marhaus.

"You suspect him, Marhaus!" exclaimed the colonel, angrily. "I will answer for his honour with mine. Lieutenant Marhaus, I demand an apology," he went on fiercely.

"If he returns voluntarily I will give it," added the lieutenant, stiffly.

But Bryan did not return. They sat together silently for an hour, for two hours, for three. Then the old colonel disappeared into his office. Soon he called Corporal Cram to his aid, and a sound of knocking and mending came from the room. Half an hour afterwards the corporal rolled a heavy keg into the hallway.

"Here is your gold, Mr. Marhaus," said the pale colonel, as the corporal retired. "I am getting old and forgetful. 'Twas I who brought it in and housed it overnight."

The lieutenant saluted his superior officer reverentially.

"I must apologise for your detention through my forgetfulness," went on the old colonel.

"Luncheon is ready, your honours," said Corporal Cram, re-entering. "Mr. Bryan will likely be back before it's over," he added, miserably.

The two officers sat in silence through the meal; at its conclusion Marhaus went to the door and called Sergeant Bors.

"Send a file of men here," he said. "We had forgotten that the keg was brought into the house last night. Sergeant, carry it to the *traineau*, and march instantly. I will overtake you," he concluded.

"No other story, colonel, shall be known," said the lieutenant, turning to the veteran as the men retired, and holding out his hand.

The colonel sank into a chair and let his head fall on his breast.

"Tristram's boy! Tristram's boy!"

he murmured. "Tis impossible! Dishonoured! No! 'Tis impossible!"

"God bless and keep you, colonel," said Marhaus, much moved by his senior's distress. "I wish you would take my hand."

The old colonel lifted his head and gazed into the lieutenant's eyes. Then he held out his hand.

"I would stake my life on Bryan's honour, Marhaus," he said.

"Mr. Bryan!" exclaimed the corporal;

"I'd like to see the non-commissioned officer that would point at him."

They were the last words that Marhaus heard as he strode away.

(To be continued.)

FISHING IN FOREIGN WATERS.*

ON several occasions we have referred to the skill and bravery displayed by the islanders of the Pacific in the capture of the various fish which throng the waters which wash their coasts. For instance, we have spoken of the courage shown by the Fijians in attacking the shark in its own element, and placing a noose around its body as it takes its after-dinner nap at the bottom of the clear water.

The Fijians do not, however, see the necessity of exposing themselves to danger unless such a course is absolutely requisite, and they have a method of capturing the voracious tiger of the deep after a fashion which at the first glance strikes one as altogether ridiculous and certain to fail. Nevertheless, we have the best of authority for stating that it does not fail, and that it is constantly adopted in order to procure the right royal addition to his cuisine which the strong-stomached South Sea Islander finds in shark meat.

All that the aforesaid Islander does is to procure a large log, which he then chops and chips until it bears a rough resemblance to a canoe. He next fastens a rope securely round the middle, makes a slip-noose in its free end, paddles out some little distance, and sets the log afloat in the water; after which he returns to shore, leaving the shark to do the rest of the business.

And it is an extraordinary fact that before long some hungry white shark, on the look-out for prey, will discover the log, and by some means or another will entangle his head in the noose and remain there a helpless prisoner, prevented from drowning by the buoyant log until it suits his captors to come off from the shore, and after chasing the bewildered animal until he is exhausted, to beat him about the head with their heavy clubs till the breath leaves his body and he is dragged ashore in triumph.

Leeches at one time held a very important place in the pharmacopœia of the European medical practitioner, but, like the adoption of bleeding, which was insisted upon even to excess during the latter part of the last century and the beginning of the present, the practice of applying leeches to the human body on all and every opportunity has fallen almost entirely into desuetude.

To procure leeches at the time of which we are speaking the ponds of France and Hungary, Poland and the Ukraine, Turkey, Wallachia, Russia, Egypt, Algeria, and other parts were periodically ransacked, and in 1846 it is computed that no less than 20,000,000 to 30,000,000 were used in France alone. But, as we have said, the use of the leech in surgery is rapidly dying out, and where hundreds were required in former days but one or two would be needed now.

On the leech farms of France it was the practice to drive old and worn-out horses and cows into the water in order that the leeches might thrive and fatten at their unfortunate expense. The same plan was also sometimes adopted for gathering the contents of the ponds, the creatures being picked off by hand

when they were full of the blood of their victims.

In some parts, however, a different plan is adopted. Either the cattle are not to be obtained for the purpose or are considered too valuable, and the bipeds who rear the leeches have therefore to make use of themselves in a somewhat similar manner.

A writer in the "Journal des Hôpitaux" of about fifty years since says that the country about Brienne is perhaps the most uninteresting in France; the people are miserable-looking, the cattle wretched, the fish just as bad, but the leeches are admirable. If ever you pass through Brienne you will see a man, pale and straight-haired, with a woollen cap on his head, and his legs and arms naked. He creeps along the borders of a marsh among the spots left dry by the surrounding waters, but particularly wherever the vegetation seems to preserve the subjacent soil undisturbed; this man is a leech-fisher.

To see him from a distance, his woe-begone aspect, his hollow eyes, his livid lips, his singular gestures, you would take him for a patient who had left his sick-bed in a fit of delirium. If you observe him every now and then raising his legs and examining them one after the other you might suppose him to be a fool, but he is an intelligent leech-fisher.

The leeches attach themselves to his legs and feet as he moves among their haunts; he feels their presence from their bites, and gathers them as they cluster about the roots of the bulrushes and seaweed, or beneath the stones covered with green and glutinous moss. Some repose on the mud, whilst others swim about, but so slowly that they are easily gathered with the hands. In a favourable season it is possible in the course of three or four hours to stow ten or twelve dozen of them in the little bag which the gatherer carries on his shoulder.

Sometimes the leech-fisher is to be seen armed with a kind of spear or harpoon. With this he deposits pieces of decayed animal matter in places frequented by the leeches. They soon gather round the prey, and are presently themselves gathered into a little vessel half full of water. This is the leech fishery as it is carried on in the spring.

In summer, however, the fisher has a much more unpleasant time of it. Then the leeches retire into the deep water, and the fishers have to strip themselves to the skin and walk immersed in the water to their chins. Some of them construct little rafts of twigs and rushes, but the weeds and aquatic plants make it difficult to propel them through the water.

At this season, too, the supply in the pools is scanty; the fisher can only take the few that swim within his reach, or those that get entangled in the structure of the raft.

It is a horrid trade in whatever way it is carried on. The leech-gatherer is constantly more or less in the water, breathing fog and mist or fetid vapours from the marsh; he is often attacked with ague, rheumatism, or half a dozen other diseases induced by the miasmatic exhalations. But the trade was at that time lucrative, and gave employment to a very large number of persons.

The leech may certainly lay claim to being a creature out of the common run. To wit, one meal lasts him a whole year, and he, together with his companions, may become frozen into a solid mass, and may yet be

thawed into life again. Indeed, he seems proof against hard usage, for the carriers pack thousands of them together in moist sacks, which they hang behind their horses' saddles, placing on top of them their heavy boots, or anything else of which they may be desirous of disburdening themselves at the time.

We have been referring hitherto to the leech of medicine; but there are, of course, many other kinds of leeches, and all our boys are doubtless acquainted with the horse-leech of English pond life. Unprepossessing as this creature may appear to the eye, it is, however, harmless to anything above the grade of an earthworm, for which humble relative it betrays a particular, not to say a greedy, predilection.

Some lands are, however, favoured with the presence of leeches whose room is much preferred to their company. For instance, in parts of Ceylon, Java, Sumatra, Chili, and other places land leeches abound, and the ground looks like a huge pincushion, the pins being represented by the leeches, whose black bodies protrude from the soil in all sorts of attitudes, their tails just keeping them safe in their holes whilst they are on the look-out for any warm-blooded animal coming in their direction.

They are only an inch long, and as fine as a common knitting-needle; but woe be to the unlucky traveller whom they favour with their advances, for when fixed upon him they can distend themselves to the thickness of a quill and a length of nearly two inches; and as they are all stomach the consequences may be faintly imagined.

In their ordinary condition they can insinuate themselves through the mesh of the finest stocking, and the coffee planters are obliged to wear specially woven "leech-gaiters" for protection.

Horses are driven wild by them, and stamp the ground in fury to shake them from their fetlocks, to which they hang in tassels of blood, and the bare legs of the palanquin-bearers are adorned with clusters of them, like bunches of grapes. Men compelled to spend several days at a time where they abound have often lost their lives through the attacks of these terrible pests.

There is a vast tract of barren half-frozen country at the extreme north-west of the continent of North America, formerly belonging to the Russians, but purchased from them some years since—for what reason it is difficult to define—by the United States. Corn and other cereals will not ripen there, and vegetables cannot be made to thrive.

Owing to the rigour of the climate and the arduous nature of the work, the trapping of animals is left by the few settlers for the most part to the Indians, who, to their credit be it said, are very ingenious in this respect.

The rivers abound with salmon, and in our illustration we have an Indian engaged in catching these valuable fish. He has, with the assistance of his squaw, lowered himself from top of the cliff upon the platform he has manufactured, and, standing just at a sharp bend of the rushing river, he intercepts with his cleverly-made net such of the salmon as, fatigued by their efforts to ascend the stream, have not strength sufficient to avoid the snare set for them. The scantiness of his costume may excite astonishment, but these Indians are very like the Highlander of bygone times who laid himself down naked in the snow to sleep, explaining to a bystander who thought

* See also B. O. P., Vol. V., page 819.

SHARK TRAPPING

LEECH CATCHING

ALASKAN SALMON NETTING

BAKALAI POND CLEARING

CATCHING THE GYMNOTUS

it a somewhat extraordinary proceeding that he was "all face."

The Alaskan is particularly clever in the manufacture of hooks exactly fitted for the purpose he has in view. For instance, he is great in the capture of the halibut, and to effect this object the more readily he uses the hook represented in the engraving. To this the line is attached in a peculiar manner, so that when the bait is placed on it the hook hangs as shown directly in a line with the mouth of the fish, and the tempting morsel, together with the deadly barb, finds an easy entrance into the creature's gullet.

Immediately below the Alaskan hook in the illustration is an artificial stone bait used by certain savages in remote times, which is very remarkable for the ingenuity with which it is manufactured.

It consists of a piece of red quartite pebble of great hardness, about an inch and three-quarters in length and weighing about an ounce and a half. A small hook is hidden within it, and the whole arrangement is so clever that it might be successfully used by a fisherman of the present day, hundreds of years after it passed out of the possession of its original owner.

Next is seen a needle suspended by the middle and sharpened at both ends. This is used with considerable success in many parts of France in place of a hook, and might furnish a hint to our youthful anglers.

The North Russian hook in the drawing is constructed very much on the principle of the Alaskan halibut hook. It will be at once seen that when the hook is seized by a fish, and the angler pulls upon the line, the point of the barb and the line are almost in one and the same direction. Hooks for deep-sea fishing have been made on this principle, and have been found to answer admirably.

The aborigines of some parts still use hooks made of thorns, and on the coast of France they are in great favour with many fishermen, as they are said to possess the recommendation of not fouling the bottom, and they certainly have the advantage of costing nothing.

One of the most important of the tribes of Equatorial Africa is the Bakalai, which—a very curious fact for negroes—has colonised the whole of the surrounding country, extending its settlements north, south, east, and west.

Like many of the darker-skinned races of humanity, these negroes never consider it necessary to wash themselves, although they select whenever possible the banks of rivers for their settlements, and can swim like ducks. This is the only chance their bodies get of cleansing from the oil with which they delight to cover themselves; for when away from the river water is never used for the purpose for which we in England consider it of the first importance.

They live principally upon cassava or manioc, which is allowed to ferment until it becomes sour, and is very unpleasant to the palate of any but a Bakalai. Indeed, after

a long course the natives themselves get a fierce craving for animal food—a craving, in fact, amounting to a disease—known by the name of gonamba. Attacked by this, they behave like wild beasts at the sight of meat, devouring it with horrible voracity.

This disease also overcomes Europeans who are travellers in their country, and M. Du Chaillu at times suffered very seriously from the "real and frightful torture," as he terms it, which ensued.

Under these circumstances the Bakalai make the best use of the ponds and rivers of the district, and some such scene as that represented in our illustration is one of everyday occurrence in the dry season.

At such times, when the water has receded from the banks of the river, leaving pools here and there extensively stocked with fish who have been driven into closer and closer contact as the water has decreased in volume, the Bakalai, bringing all their forces, both of men, women, and children, to bear upon the proceeding, wade into the pools armed with pots, bowls, gourds, or anything else that will hold water, and bale away with energy until the pool is sufficiently shallow to permit the agile fishermen to capture the struggling prey, who are then cooked and eaten with great gusto on the spot, the overplus being taken away for smoking and preserving for future banquets.

These heathen, supported by no such hope as animates those who are enlightened by the belief which animates the Christian, look upon death with most extraordinary terror, driving away from their villages the old and infirm that they may perish at a distance from their dwellings. Should a death occur in one of the villages the inhabitants at once remove their houses and everything else from the spot, migrating to some other place not, as they think, thus polluted.

All of our readers will have heard and read of the gymnotus, or electric eel, and possibly some of them can remember the specimen that was kept in captivity at the Polytechnic some years back, its method of capturing its food by means of the electric power it possessed forming a staple attraction at the exhibition.

It is a native of tropical South America, and Humboldt has given the most interesting details of the method adopted for its capture by the Indians of Guiana.

The Indians conducted him to a reservoir of miry and stagnant water surrounded by luxurious vegetation, and proceeded to catch about thirty half-wild horses. It must be remembered that horses in that part of the globe are almost "as plentiful as blackberries," and, as a modern writer on natural history well known to these pages* has remarked, of about the same value as are pigeons in this country.

Having secured the unfortunate horses, the Indians with loud cries drove them through and through the pond, whilst the eels,

stunned and confused by the noise of the bipeds and the plunging of the quadrupeds, laid themselves along the bellies of the latter, discharging again and again the electric fluid which is their only instrument of attack and defence.

For a long time it appeared as if the eels would gain the victory, as horse after horse sank exhausted into the muddy waters, and every exertion was required on the part of the Indians to prevent the affrighted horses from scrambling on to the borders of the pond.

However, the repeated shocks given by the eels appeared rapidly to exhaust their stores of electricity, and after a quarter of an hour the horses were less affrighted, their manes no longer bristled, nor were their eyes expressive of fear and suffering. And now the eels, conscious of their loss of power, no longer darted fearlessly upon the animals, but rather endeavoured to escape from them by swimming to the shore. Then the Indians rushed in and secured the reptiles, which are held by them in high estimation as food.

A very curious method of catching fish is that adopted by the Chinese, and observed by Mr. Fortune on his way down the Lun-ke river. The practice appears to be confined pretty much to this particular stream, or, at all events, to be by no means universal throughout the Flowery Land, for Mr. Fortune's boatmen and servants regarded it with quite as much curiosity as was evinced by the traveller himself, and did not refrain from noisily expressing their delight whenever a fish was caught, much to the disgust of the fishermen, who earnestly begged that they would moderate their transports.

The method adopted, then, is as follows. The Chinese go out by night in long and narrow boats, specially made for the purpose. On one side of the boat is stretched vertically a net, whilst from the opposite gunwale extends a piece of white canvas, which dips towards the water at an angle of from thirty to forty degrees.

The fisherman sits in the stern of the boat and so arranges his seat as to cause the canvas to dip slightly beneath the surface of the water. Meanwhile he slowly propels the boat through the water by means of a short paddle worked on the opposite side from the canvas.

Arrived at the fishing ground he remains perfectly motionless and silent, and presently there is a splash in the water, and hey! presto! a fish has jumped over the boat into the vertical net, from which he is thrown back into the little craft to flounder helplessly at the bottom until the enforced absence from his native element puts a period to his existence.

Mr. Fortune conjectures that the white canvas, which dips like a painted board into the water, has the effect of attracting and decoying the fish in some peculiar manner and of causing them to leap over it. He watched the fishermen for upwards of an hour, and then bought some of the fish for supper.

* The Rev. J. G. Wood.

THREE SCENES IN A GREAT MAN'S LIFE.

BY W. HAIG MILLER.

WE must ask our readers to accompany us to the Cathedral City of Lichfield as it was some hundred and fifty years ago.

Here in one of its old-fashioned streets is a bookseller's shop. Let us step inside. There is nothing very particular to notice about the owner of it, a middle-aged respectable-looking man, except that he seems dressed as if about to take a journey. In front of him is a youth whose face is full of character. He may be about sixteen years of age; his features are

strongly marked with smallpox, and twitch about in an unpleasant, convulsive way. There is great decision about him, however, and he looks as if he would have that thing which is so dangerous when not rightly guided—a will of his own.

Yet, in spite of its present sullen look, the face is, we should say, on the whole a good-humoured one, and the lad is also one we should like if we knew him better. His schoolfellows, at all events, we are told esteemed him so much that three of them came

every morning and carried him in a sort of triumphal procession to school—one on his back, the other two supporting him. Young as he is, he is a great student, and will read books whenever he has an opportunity, but they must be what he calls "manly" books. On one occasion, having imagined that his brother had hid some apples behind a large folio upon an upper shelf in his father's shop, he climbed up to search for them. There were no apples, but the large folio proved to be a work written by one of the restorers of

learning, Petrarch; he sat down with avidity and read a great part of the book. Thus he is always gathering knowledge.

On the present occasion, however, the youth is in as sad a position as youth can well be. *He is in the act of disobeying his parent!* The latter has another place of business in the town of Uttoxeter, to which he is going to take for sale some of his literary wares. Food for the mind was not so much in demand then as now. There was no BOY'S OWN PAPER. He is glad, therefore, to push his trade not only in Lichfield, but by going to neighbouring places such as Uttoxeter. He has asked this morning his son to accompany him there, and he refuses to do so. He has done that most wrong thing, disobeyed his parent. Foolish youth! He little thinks what a stab this act gives his affectionate father, and what a crop of future regret he is sowing by it for himself.

II.

Many years have passed away since that scene in Lichfield. Now we are in London, and again among books. It is a large and magnificent library, in a noble apartment, with cases filled with richly-bound volumes. * Before us stand again two figures. One of them has an air of superiority, and is richly dressed, with a diamond star on his breast. It is the monarch of the Great Britain of that day, George the Third. He is conversing with another person who stands before him in a manly but very respectful attitude. That person is Doctor Samuel Johnson. He is the boy whom we saw in the previous scene. He has grown up to be a most learned man, and has had to encounter great difficulties, but his perseverance has overcome them all. He has written many works, and in particular he has published a dictionary of the English language in two large folio volumes, a very marvel of ability and patient enduring labour.

The king has had a desire to see him, and is now conversing with him in the royal library. He praises his books, and expresses a wish that he had written more, a great

compliment to come from a king to a subject. Yet Samuel Johnson was in some respects a king too. He was a monarch in the world of literature. Men everywhere honoured him for his great talents, and the good use he made of them, for it is not the least of his merits that he has in his books pleaded for virtue and discountenanced vice and infidelity. Indeed, for the service he has done society by his writings a pension of three hundred pounds a year has been granted him. He stands on the very pinnacle of literary fame, and his name is respected in England, on the Continent, and in America as that of one of the greatest men of his age.

III.

We have yet a third scene to look at. The place is Uttoxeter Market. We do not see in it the father of Samuel Johnson, whom we saw in the first picture. He has been in his grave for many a long year. But we see his distinguished son again, the same figure that we saw lately conversing with the king.

He is an old man now, bearing the burden of some sixty or seventy years. He is still greatly honoured, however, by his fellow-countrymen. His days of struggle with poverty are long since over, and now he treads a path of ease, having everything to make life comfortable. But what is he doing here? The day is rainy, yet he stands, having his head uncovered, with a look of grave sorrow imprinted on his countenance, and heedless of the people who stand round him wondering at the strange spectacle he presents. After a time he puts on his hat and walks away. What does it all mean?

Well, it means this. Some fifty years or more have passed away since he disobeyed his parent by refusing to accompany him to Uttoxeter Market. In the interval he has become a learned man, a great man, an honoured man. But his memory, amidst all the wonderful knowledge it has gathered, retains one thing that gives him deep pain—the remembrance of that act of disobedience to his father half a century before; and being in the neighbourhood of Uttoxeter, heedless

of the shame and ridicule it might bring, he has gone and expressed in the manner we have now seen his regret for that act committed so long ago. His father was not there to witness his sorrow, but by this action he wishes to express it, and to show to others how great a sin he considers disobedience to parents to be.

This action of the great Dr. Johnson has been so much thought of by those who have studied his life that it is, we believe, the subject of one of the mouldings on the statue erected to his memory at Lichfield. True, it was an eccentric proceeding, and even bordered a little upon the erroneous notion of some followers of the Romish Church, that sins could be atoned for by penance. It was not, however, an action that was needful for the forgiveness by God of the sin of Dr. Johnson's youth. All that was needful for that was for him to confess it to God and get it forgiven for Christ's sake. But what men have been struck by in the action was this—the evidence that it gave of the deep sense entertained by so strong-minded a man as Dr. Johnson of the wickedness of an act of disobedience to parents. No man can say that such disobedience is a little fault, when a man like Johnson felt it was so great a one, and when it pained his memory for so many years.

Sir Walter Scott, his biographer tells us, did not think any the worse of Dr. Johnson for this act at Uttoxeter Market-place. Sir Walter esteemed highly the memory of his own parents, whom he had honoured in their lifetime. After his death, on opening his desk there were found the old-fashioned boxes that had been part of the ornaments of his mother's toilet-table, when he, a sickly child, used to sleep in her dressing-room. There too was the silver inkstand which he had bought for her with the first money he had earned. There also was his father's snuff-box. Pictures of his father and mother were the only ones allowed to be in his dressing room. Even his father's rickety wash-hand stand was used by him in preference to more expensive furniture, because it recalled the memory of a loved departed object.

OUR PRIZE COMPETITIONS.

(SEVENTH SERIES.)

V.—Literary Composition.

"A Story Needing Words."

IN announcing this competition subject (*vide page 284*), we wrote, it may be remembered, as follows:

"For this 'Story Needing Words' we offer *Three Prizes, of One Guinea and a Half, One Guinea, and Half-a-Guinea* respectively, for the best story founded on the picture. Competitors will be divided into three classes, according to age, and one prize will be awarded in each class. First class, from 18 to 24; second class, from 14 to 18; third class, all ages up to 14. The highest prize will go to the class showing the greatest merit. In addition to the prizes, handsome 'Certificates of Merit,' suitable for framing, signed by the Editor, will be awarded to all the more meritorious competitors who may fail to secure prizes. The work must in every case be the competitor's own—that is, must be the product of his own hand and brain; though of course any aids received merely in the way of suggestion, whether from books or friends, are admissible."

We are happy to be able to state that a very large number of readers in all parts of the world have taken part in this pleasant literary tourney, and much of the work submitted has been of high promise and excellence. After very careful examination—and the duty, as will be readily understood, is no light one where many thousands of MSS. are concerned—we are able to publish our Award, as follows:—

JUNIOR DIVISION (*all ages up to 14*).

Prize—*Half-a-Guinea*.

WALTER HOGG (aged 12), Montgomery Street, Eaglesham-by-Glasgow.

Extra Prize—*7s. 6d.*

ARTHUR HERBERT LONG (aged 13), Leopold House, Burdett Road, E. (Dr. Barnardo's Home for Little Boys.)

Certificates.

ERNEST RICHARD POLLEY, 3, Stoneleigh Villas, Limes Road, West Croydon.

ARTHUR HERBERT WHITE, Dorset House, East Grinstead, Sussex.

JOSEPH SMITH, 34, Fernbank Road, Pollard Lane, Bradford.

ERNEST F. G. TUCKER, Fairfield, Malvern, Worcestershire.

FRANCIS BURMAN, 20, Bristol Road, Birmingham.

WALTER THOMAS LEFORT, 23, Morval Road, Brixton.

GEORGE HADLEE, High Street, Leyton.

PHILIP STUART DEERING, The Bank, Tipton.

THOMAS OSWALD WONNACOTT, Wadham House, Liskeard.

G. MARSHALL, The Market Place, Blandford, Dorset.

CHARLES NEWBOULD, 49, Netherton Road, Worksop, Notts.

ALBERT EDWARD FELLINGHAM, 31, Market Street, Brighton.

WILLIAM JAMES WEATHERLEY, 18, Court Street, Toronto, Canada.

ALBERT WALTER, 6, Gladstone Cottages, Gladstone Road, Buckhurst Hill.

ALBERT JOHN SIMMS, 2, Sandrock Villa, Southfields Road, Wandsworth.

FRANCIS WALTER THELWALL, Westleigh Vicarage, Bideford, Devon.

E. S. HARVEY, Hurstbourne, Highgate, N.

CHRISTOPHER EDGAR FIELD, Leopold House, Burdett Road, E. (Dr. Barnardo's Home for Little Boys.)

RONALD E. RUTTER, Head Street, Halstead, Essex.

CLIFFORD CRAWFORD, 21, Windsor Street, Edinburgh.

WILLIAM DRAIN, 35, Carlton Road, Mile End, E.

M. LA TOUCHE THOMPSON, Aurora P. O., Ontario, Canada.

ERNEST FOX, Melrose, South View, Basingstoke.

REGINALD P. W. MARSLAND, 2, Cumberland Gate, Kew.

ERNEST RIVAZ HUNT, Shermanbury Rectory, near Henfield, Sussex.

JOHN NIX PENTELOW, Cowper's House School, Huntingdon.

PETER HAMILTON STEWART, Sydney Villa, Grove Hill Road, Woodford, Essex.

HAROLD MERRITT STOCK, 16, Westbury Park, Durham Down, Bristol.

CECIL ERNEST BULLER, Box Cottage, Twickenham (very good for 7½).

Correspondence.

R. ROWE.—You can make a bichromate battery out of a marmalade jar, two plates of carbon, a plate of zinc, and two strips of thin mahogany. Put the zinc plate in the centre with the mahogany strips, which should be long enough to rest on the jar, at the top of it on each side and against them fix the carbon plates. The battery so made is Wiesendanger's, and you can find it by referring.

CHINEE.—The coin is a quarter anna, and, like the Irish coins, is practically worthless.

FIDDLER JOE.—You can have violin strings sent you by post on enclosing price and postage. Try Withers, St. Martin's Lane, W.C., or any violin-maker you find in the directory. Under no circumstances do we answer by post.

BATH BUN.—1. The cavy is the guinea-pig. Its proper name is *Cavia cobaya*, which you will find in the natural history books. The spotted cavy belongs to another genus—*Caloenys paca*. 2. Give the dog a good washing in warm water, with plenty of carbolic soap, and rinse him in cold water. 3. Yes. Smoking came from both east and west.

A. LIVINGSTON.—In most volunteer regiments you have to find your own uniform and pay a subscription; but you should apply for information to the headquarters of the regiments in the neighbourhood.

DARK CRICKET.—1. The secretary of a club is the servant of the committee, and must carry out their instructions. 2. All runs made in a match are counted in the average. It matters not if the match is decided only on the first innings, or on an uncompleted innings. 3. We do not recommend particular tradesmen. You can get good bats from Lillywhite, Page, Cobbett, Wisden, Dark, Daft, Barlow, Shaw, and Shrewsbury, and dozens more.

SWALLOW.—There is no doubt whatever as to swallows migrating. Only the other day, during the last winter, that is, a case occurred which leaves the fact of at least "one swallow going south" undeniable. Last autumn a bookseller named Meyer, of Ronneburg, tied a waterproof label under the wing of a swallow which had occupied a nest at his house, and had become comparatively familiar. On it he wrote a query in German, to the effect that he wished to know where the swallow would pass the winter. The bird returned to its former nest bearing an exchange label similarly fastened, saying, in German also, "in Florence, at Castellari's house, and I bear many salutations."

A. S. L.—1. The first yacht club started in Great Britain was the Royal Yacht Squadron, formed in 1812, but not officially enrolled till 1815. See our article on "Club Flags and Racing Flags." 2. The yacht tonnage of the kingdom is now about 120,000. 3. The Sunbeam is 181ft. over all, and 27ft. 6in. broad; the Wanderer is 133ft. on the water-line, and 29ft. 3in. beam. The water-line measurement of the Sunbeam is 154ft. 9in. The engines of the Sunbeam give 70 horse-power nominal, and 10·2 knots; those of the Wanderer give 100 horse-power nominal, and 12 knots.

VILLAGER.—1. All astronomical telescopes show the object reversed. You must get what is known as a reversing eyepiece if you want to see the things in the same position as they seem to be to the eye. A shilling book on Light or Optics, such as is obtainable from any educational publisher, will tell you why. Read up the subject of lenses, and note the way in which the rays are bent as they pass through them. 2. In laying leather on wood you should work from one edge and iron outwards and to each side. The gilt edging should be put on afterwards. 3. All in good time. We are glad to hear you gained a prize for the model engine made after our instructions.

CYDONIA.—You can get a shilling book on Cork Modelling from Houlston and Sons, Paternoster Buildings, London, E.C.; or you will find an article on the subject in that very useful book, "Enquire Within."

C. B. T.—The finest beech in Britain is in the grounds of Newbattle Abbey, near Dalhousie Station. It is a hundred feet high, a hundred and twenty yards round, and the bole is thirty-three feet in circumference. Close to it is a cypress sixty feet high.

C. SANDERSON.—The "Boy's Own Museum" articles were continued in "Waterton's Method of Preserving," by the Rev. J. G. Wood, in the August, September, and October parts for 1883.

L. R. B.—Apply to the Canadian Government Offices, Westminster Chambers, Victoria Street, S.W.

E. E. JAMES.—You can consult a suburban directory at the Guildhall Free Library, where nearly all such books of reference are easily obtainable.

C. R.—Get "Professional Book-keeping," price two shillings, of Messrs. Wyman and Sons, Great Queen Street, W.C., and read up the subject for yourself.

AN ARCTIC TRAGEDY AND ONE OF MARKHAM'S CREW.—On page 541, No. 332, Greely's farthest should be long 40° 46', lat. 83° 24'. Markham's farthest was 83° 20' 28".

THE POETS OF THE FUTURE ask, "Are the poems you get from other boys anything like ours?" Unfortunately in many cases they are! "The Poets of the Future" seem to fancy that verse is another name for nonsense cut up into short lengths. We can not use such verses.

A MECHANICAL AMATEUR.—A metallophone, or even a glass harmonicon, would answer the purpose of a chime of bells for the clock, but you must get the hammers to rebound very smartly. A good toyshop would be the best place to purchase it, but you might get one at a music-seller's. A stroll down the Lowther Arcade in the Strand would show you dozens.

J. BAGNALL.—You will find the arms of our principal cities duly given in our third volume. Thanks for your suggestion, but it would be well to consult our indexes before writing again.

ADMIRAL TCHITCHAGOFF.—You will find the values of nearly every coin and weight now current in the "Bijou Calculator," published by Warne and Co., price eighteenpence.

F. JONES.—1. Wear a small bit of lint between the nail and the flesh, so as to keep them apart. Renew this every morning, and you will soon find that the nail, instead of growing in, will grow out. 2. Learn sufficient Latin to construe our motto.

MODEL.—1. In smooth water paddles have more power than a screw. So long as the floats strike at the same depth no power is wasted. 2. Make your boat of wood instead of zinc. 3. Because of the divergent nature of the rays. 4. We have already given a plate of the Volunteers.

H. O. W.—1. We would not tell you if we knew. Birds have quite enemies enough without being killed wholesale by poisoned grain. 2. Please do not send us coins to name or value. The risk of their being lost is great, and we do not hold ourselves responsible for their safety. If you want them named or valued take them to the curator of your local museum. As a rule you may take it for granted that the coin is worth a little less than the metal of which you think it is made, and that nine-tenths of the coins in your collection are practically valueless.

S. NOLAN.—The subject was discussed and settled years ago; and our recommendations are in accordance with the teachings of all the modern gymnasiarchs and physiologists. The old idea was that the heavier the dumb-bell the more efficiently it did its work, and that has been proved a mistake. Consult any work, English or foreign, in which the subject of gymnastics is scientifically treated, and you will discover the reasons for yourself. A Government department is the very last place in which to look for progress.

C. H. S.—The "Boy's Own Museum" articles on "Taxidermy," etc., were in the third volume. You may perhaps get a copy of Morris's "British Birds" for four pence. There is a smaller edition now selling at about 30s.

TELEGRAPH MESSENGER.—A popular error, due to the misunderstanding of a symbol. There is no such thing as a thunderbolt. You have only to study electricity to find that it is impossible; and the phrase is now mainly used by people who are ignorant of elementary science.

F. H. G.—1. Bones for nigger music can be bought from almost any instrument shop. 2. The tidal wave is independent of the wind.

J. WIDDUP.—See our plans of sails and rigging in the second volume, and try Captain Chapman's "All about Ships." At the same time for a lad "un-acquainted with ships" to make a model three feet long as a drawing-room ornament would, in our opinion, be a mere waste of time. Better postpone the attempt until you have seen a clipper, and then you will be saved from the absurdity of endeavouring to model one of the extraordinary dimensions of three feet long and two feet broad.

OUR HOLIDAYS.—"A very quiet place!"

No. 349.—Vol. VII.

SATURDAY, SEPTEMBER 19, 1885.

Price One Penny.
[ALL RIGHTS RESERVED.]

REGINALD CRUDEN:

A TALE OF CITY LIFE.

By TALBOT BAINES REED,

Author of "My Friend Smith," etc., etc.

CHAPTER XXV.—THERE IS NO PLACE LIKE HOME.

It is strange how often our fortunes and misfortunes, which we are so apt to suppose depend on our own successes or failures, turn out to have fallen into hands we least expected, and to have been depending on trains of circumstances utterly beyond our range of imagination.

Who, for instance, would have guessed that a meeting of half a dozen business men in a first-floor room of a New York office could have any bearing on the fate of the Cruden family? Or that an accident to Major Lambert's horse while clear-

"Mother!" "My boy!"

ing a fence at one of the —shire hunts should also affect their prospects in life?

But so it was.

While Reginald, tenderly nursed by his old school friend, was slowly recovering from his illness in Liverpool, and while Mrs. Cruden and Horace, in their shabby London lodging, were breaking into their last hundred pounds and wondering how, even with the boy's improved wages and promise of literary success, they should be able to keep a comfortable home for their shattered but shortly to be reunited family—at this very time a few of the leading creditors of the Wishwash and Longstop Railway assembled in the old office of that bankrupt undertaking, and decided to accept an offer from the Grand Roundabout Railway to buy up their undertaking at half price, and add its few hundred miles of line to their own few thousand.

A very important decision this for the little Dull Street family. For among the English creditors of this same Wishwash and Longstop Railway Mr. Cruden had been one of the most considerable—so considerable that the shares he held in it had amounted to about half his fortune.

And when the division of the proceeds of the sale of the railway came to be divided it turned out that Mr. Cruden's administrators, heirs, and assigns were entitled to about a third of the value of that gentleman's shares, or in other words, something like a sixth of their old property, which little windfall, after a good deal of wandering about, and search for an owner, came finally under the notice of Mr. Richmond's successors, who in turn passed it over to Mrs. Cruden with a very neat little note of congratulation on the good fortune which had made her and her sons the joint proprietors of a snug little income of from £300 to £400 a year.

Of course the sagacious reader will remark on this that it is only natural that towards the end of my story something of this sort should happen in order to finish up with the remark that "they lived happily ever after." And his opinion of me will, I fear, be considerably lowered when he finds that instead of Reginald dying in the smallpox hospital and Mrs. Cruden and Horace ending their days in the workhouse, things looked up a little for them towards the finish, and promised a rather more comfortable future than one had been led to expect.

It is sad, of course, to lose any one's good esteem, but as things really did look up for the Crudens—as Reginald really did recover, as Mrs. Cruden and Horace really did not go to the workhouse, and as the Grand Roundabout Railway really was spirited enough to buy up the Wishwash and Longstop Railway at half price, I cannot help saying so, whatever the consequences may be.

But several weeks before Mr. Richmond's successors announced this windfall to their clients, the accident to Major Lambert's horse had resulted in comfort to the Crudens of another kind, which, if truth must be told, they expected quite as little and valued quite as much.

That worthy Nimrod, once an acquaintance and neighbour of the Gardenvale family in the days of their prosperity, was never known to miss a winter's hunting in his own county if he could

possibly help it, and during the present season had actually come all the way from Malta, where his regiment was stationed, on short leave, for the sake of two or three days of his favourite sport in the old country.

Such enthusiasm was worthy of a happier fate than that which befell him. For on his first ride out his horse came to grief, as we have said, over a hedge, and left the gallant major somewhat knocked about himself, with nothing to do for half a day but to saunter disconsolately up and down the country lanes and pay afternoon calls on some of his old comrades.

Among others, he knocked at the door of an elderly dowager named Osborn, who was very sympathetic with him in his misfortunes, and did her best to comfort him with afternoon tea and gossip.

The latter lasted a good deal longer than the former. One after another the major's old friends were mentioned and discussed and talked about as only folk can be talked about over afternoon tea.

"By the way," said the caller, "I hear poor Cruden didn't leave much behind him after all. Is Mrs. Cruden still at Gardenvale?"

"No, indeed," said the lady; "it's a sad story altogether. Mr. Cruden left nothing behind him, and Gardenvale had to be sold, and the family went to London, so I was told, in very poor circumstances."

"Bless me!" said the honest major, "haven't you looked them up? Cruden was a good sort of a fellow, you know."

"Well, I've always intended to try and find out where they are living, but really, major, you have no idea how one's time gets filled up."

"I've a very good idea," said the major, with a groan. "I have to sail in a week, and there's not much spare time between now and then, I can tell you. Still, I'd like to call and pay my respects to Mrs. Cruden if I knew where she lived."

"I dare say you could find out. But I was going to say that only yesterday I saw something in the paper which will hardly make Mrs. Cruden anxious to see any of her old friends at present. The eldest son, I fear, has turned out badly."

"Who? young—what was his name?—Reginald? Can't believe it. He always seemed one of the right sort. A bit of a prig perhaps, but straight enough. What has he been up to?"

"You'd better see for yourself, major," said the lady, extracting a newspaper from a heap under the dinner-waggon. "He seems to have been mixed up in a rather discreditable affair, as far as I could make out, but I didn't read the report through."

The major took the paper, and read a short report of the proceedings at the Liverpool Police Court.

"You didn't read it through, you say," observed he, when he had finished; "you saw he was let off?"

"Yes, but I'm afraid—well, it's very sad for them all."

"Of course it is," blurted out the soldier, "especially when none of their old friends seem to care anything about them. Excuse me, Mrs. Osborn," added he, seeing that the lady coloured. "I wasn't meaning you, but myself. Cruden was an old comrade, who did me more than one good turn. I must certainly take a day in town on my way back and find them out. As for the boy, I don't

believe he's got it in him to be a black-leg."

The major was as good as his word. He sacrificed a day of his loved pastime to look for his old friend's widow in London.

After a good deal of hunting he discovered her address and presented himself, with not a little wonderment at the shabbiness of her quarters, at Dull Street.

Barely convalescent, and still in the agony of suspense as to Reginald's fate, Mrs. Cruden was able to see no one. But the major was not thus to be baulked of his friendly intentions. Before he left the house he wrote a letter which in due time lay in the widow's hands and brought tears to her eyes.

"Dear Mrs. Cruden,—I am on my way back to Malta, and sorry not to see you. We all have our troubles, but you seem to have had more than your share; and what I should have liked would be to see whether there was anything an old friend of your husband's could do to serve you. I trust you will not resent the liberty I take when I say I have instructed my agent, whose address is enclosed, to put himself at your disposal in any emergency when you may need either advice or any other sort of aid. He is a good fellow, and understands any service you may require (and emergencies often do arise) is to be rendered on my account. As to your eldest son, about whom I read a paragraph in the papers the other day, nothing will make me believe he is anything but his honest father's honest son. My brother-in-law, whom you will remember, is likely shortly to have an opportunity of introducing a young fellow into an East India house in the City. I may mention this because, should you think well to tell Reginald of it, I believe there would not be much difficulty in his getting the post. But you will hear about this from my brother-in-law, whom I have asked to write to you. I don't expect to get leave again for eighteen months; but I hope then to find you all well."

"Believe me, dear Mrs. Cruden,

"Yours truly,

"THOMAS LAMBERT."

This simple warm-hearted letter came to Mrs. Cruden as the first gleam of better things on the troubled waters of her life. Things were just then at their worst. Reginald lost, Horace away in search of him, herself slowly recovering from a sad illness into a still more sad life, with little prospect either of happiness or competency, nothing to look forward to but a renewal of the old struggles, possibly single-handed. At such a time Major Lambert's letter came to revive her drooping spirits and remind her of a Providence that never sleeps less than when we are ready to consider ourselves forgotten.

All she could do was to write a grateful reply back, and then await news from Horace, trusting meanwhile it would not be necessary to draw on the major's offered help.

A few days later Horace was home again, jubilant at having found his brother, but anxious both as to his immediate recovery and the state of mind in which restored health would find him.

"He told me lots about the past, mother," said he. "No one can conceive

what a terrible three months he has had since he left us, or how heroically he has borne it. He doesn't think so himself, and is awfully depressed about his trial and the way in which the magistrate spoke to him—the brute!

"Poor boy! he is the very last to bear that sort of thing well."

"He's got a sort of idea he's a branded man, and is to be dragged down all his life by it. Perhaps when he hears that an old friend like Major Lambert believes in him, he may pick up. You know, mother, I believe his heart is in the grave where that little office boy of his lies, and that he would have been thankful if—well, perhaps not so bad as that—but just at present he can't speak or even think of the boy without breaking down."

"According to the letter from Major Lambert's brother-in-law, the post that is offered him is one he will like, I think," said Mrs. Cruden. "I do hope he will take it. To have nothing to do would be the worst thing that could happen to him."

"To say nothing of the necessity of it for you, mother," said Horace; "for there's to be no more copying out manuscripts, mind, even if we all go to the workhouse."

Mrs. Cruden sighed. She knew her son was right, but the wolf was at the door, and she shrank from becoming a useless burden on her boys' shoulders.

"I wonder, Horace," said she, presently, "whether we could possibly find less expensive quarters than these. They are—"

"Hullo, there's the postman!" said Horace, who had been looking from the window; "ten to one there's a line from Harker."

And he flew down the stairs, just in time to see the servant-girl take a letter from the box and put it in her pocket.

"None for us?" said he.

The girl, who till this moment was not aware of his presence, turned round and coloured very violently, but said nothing.

"Show me the letter you put into your pocket just now," said Horace, who had had experience before now in predicaments of this kind.

The girl made no reply, but tried to go back to the kitchen. Horace, however, stopped her.

"Be quick!" said he. "You've a letter for me in your pocket, and if I don't have it before I count twenty I'll give you in charge;" and he proceeded to count.

Before he had reached ten the girl broke out into tears, and took from her pocket not only the letter in question, but three or four others.

"There you are; that's all of them. I've done with it!" sobbed she.

Horace glanced over them in bewilderment. One was in Reginald's writing, written three weeks ago; two were from himself to his mother, written last week, and the last was from Harker, written yesterday.

"Why," exclaimed he, too much taken aback almost to find words, "what does it mean? How do you come—"

"Oh, I'll tell you," said the girl; "I don't care what they do to me. I'd sooner be sent to prison than go on at it. He told me to do it, and threatened me all sorts of things if I didn't. Oh dear! oh dear!"

"Who told you?"

"Why, Mr. Shuckleford. He said Mr. Reginald was a convict, or something,

and if I didn't mind every letter that came to the house from Liverpool I'd get sent to prison too for abetting him. I'm sure I don't want to abet no one, and I can't help if they do lock me up."

"You mean to say Mr. Shuckleford told you to do this?" said—or rather roared—Horace.

"Yes, he did; and he had them all before that one," said the girl, pointing to the letter from Reginald. "But he's never been for these, and I didn't dare not to keep them for him. Please, sir, look over it this time."

Horace was too agitated to heed her tears or entreaties. He rushed from the house with the letters in his hand and made straight for the Shucklefords' door. But, with his hand on the bell, he hesitated. Mrs. Shuckleford and her daughter had been good to his mother; he could not relieve his mind to Samuel in their presence. So he resolved to postpone that pleasure till he could find the young lawyer alone, and meanwhile hurried back to his mother and rejoiced her heart with the good news of Reginald contained in Harker's letter.

How and when Horace and Shuckleford settled accounts no one exactly knew, but one evening, about a week afterwards, the latter came home looking very scared and uncomfortable, and announced that he was getting tired of London, the air of which did not agree with his constitution. He intended to close with an offer he had received some time ago from a firm in the country to act as their clerk; and although the sacrifice was considerable, still the country air and change of scene he felt would do him good.

So he went, much lamented by his mother and sister and club. But of all his acquaintance there was only one who knew the exact reason why just at that particular time the country air promised to be so beneficial for his constitution.

* * * *

Three weeks passed, and then one afternoon a cab rolled slowly up to the door of No. 6, Dull Street. Horace was away at the office, and Mrs. Cruden herself was out taking a walk.

So the two young men who alighted from the cab found themselves monarchs of all they surveyed, and proceeded upstairs to the parlour with no one to ask what their business was.

"Now, old man," said the sturdier of the two. "I won't stay. I've brought you safe home and you needn't pretend you'll be sorry to see my back."

"I won't pretend," said the other, with a smile on his pale face, "but if you're not back very soon, in an hour or two, I shall be very very sorry."

"Never fear, I'll be back."

And he went.

The pale youth sat down, and looked with a strange mixture of sadness and eagerness round the little room. He had seen it before and yet he seemed hardly to recognise it. He got up and glanced at a few envelopes lying on the mantelpiece. He took into his hands a piece of knitting that lay on one of the chairs and examined it. He turned over the leaves of a stray book, and read the name on the title-page. It all seemed so strange—yet so familiar. Then he crept silently to the half-open door of a little bedroom and peeped in, and his heart beat strangely as he recognised a photograph on the dressing-table, and by its

side a letter written in his own handwriting. From this room he turned to another still smaller and more roughly furnished. A walking-stick stood in the corner that he knew well, and there was a cap on the peg behind the door, the sight of which sent a thrill through him.

Yet he felt he dare touch nothing—that he scarcely dare let his foot be heard as he paced across the room, or venture even to stir the little fire that was dying out in the grate.

The slight flush which the excitement of his first arrival had called up faded from his cheeks as the minutes wore on.

Presently his ears caught a light footfall on the pavement outside, and his heart almost stood still as it halted and the bell rang below.

It was one of those occasions when a man may live a lifetime in a minute. With a mighty rush his thoughts flew back to the last time he had heard that step. What goodness, what hope, what love did it not bring back to his life. He had taken it all for granted and thought so little of it; but now, after months of loveless, cheerless drudgery and disappointment, that light step fell with a music which flooded his whole soul.

He sat almost spellbound as the street-door closed and the steps ascended the stairs. The room seemed to swim round him, and to his broken nerves it seemed for a moment as though he dreaded rather than longed for what was coming. But as the door opened the spell broke and all the mists vanished; he was his own self once more—nothing but the long-lost boy springing to the arms of the long-lost mother.

"Mother!"

"My boy!"

That was all they said. And in those few words Reginald Cruden's life entered on a new era.

When Horace half an hour later came flying on to the scene they still sat there hand in hand, trying to realise it all, but not succeeding. Horace, however, helped them back to speech, and far into the night they talked. About ten o'clock Harker looked in for a moment, and after him young Gedge, unable to wait till the morning. But they stayed only a moment, and scarcely interrupted the little family reunion.

What those three talked about it would be hard for me to say. What they did not talk about in the past, the present, and the future would be almost easier to set down. And when at last Mrs. Cruden rose, and in her old familiar tones said,

"It's time to go to bed, boys," the boys obeyed, as in the days long ago, and came up to her and kissed her, and then went off like children, and slept, like those who never knew what care was, all the happy night.

(To be concluded.)

MY FIRST AND ONLY DEBT.

A TRUE NARRATIVE.

BY SURGEON-GENERAL COWEN.

DURING the whole of a long and active career I have had a most wholesome dread of getting into debt. Often and often I have wanted many of the "dulces" and some of the "utiles" of life, and, being "hard up" at the time of such need, have been close upon being tempted to borrow the wherewithal for their

purchase from friends, or, in In-

dia, from those ever ready with a loan—soucars (native bankers); but the recollection of the little story which I am about to relate has cropped up and put a salutary stopper upon the application.

Once, I call to mind, the suppositiously honest Hindoo factotum of my bungalow, having been sent to the paymaster's office with a "chit" (note) for my monthly pay, obtained and decamped with the rupees, leaving me with scarce a shot in the locker, to put it nautically, to fight the bazaar men with for thirty days to come. It was a great temptation to borrow, but then and there the ghost of my first and only debt rose before me. I obeyed the monitor, and somehow or other things came right.

And what, then, is the story which has been my deterrent from debt, boy and man, these fifty years and more?

When I was between eight and nine years of age, my father, a retired army chaplain, sent me to Dr. Roddie's school in—let us say, the town of Whippingham, not many miles from our homestead. On the morning of my departure he took me into his study, and gave me no end of good advice, finishing up by saying, "Bertie, my child, above all things avoid running into debt, either at the 'tuck' shop with your schoolfellows, or with any one who will trust you. 'Out of debt out of danger' is, like many another well-worn proverb, full of wisdom, but, as John Bridges the writer puts it, 'the word danger does not sufficiently express all that the warning demands.' See here." He opened a volume and read me a page or so of all the anxieties and miseries of a debtor in respect to his creditor. Then, making me promise to steer clear of this rock upon which so many a good ship has struck and foundered, he put half-a-crown into my pocket for present use, and, telling me that Dr. Roddie had been instructed to give me threepence weekly for future exigencies, the dear old dad saw me off by the coach for Whippingham, there to be indoctrinated into the habits and idiosyncrasies of the schoolboy of more than forty years ago.

With only two shillings and sixpence

in esse, and the hebdomadal threepence in posse, I cannot say that I considered myself either a Rothschild or a Baring. Truth to tell, I had expected a larger "tip," and at least a sixpence every Saturday, and was disappointed accordingly. Still, I determined to be frugal, and to make the money go as far as possible. Vain resolve; for, arrived at my destination, introduced to my schoolfellows, and forced to stand the usual new-comer's treat, in less than no time the half-crown had gone the way of all half-crowns in that educational establishment—to wit, into the canvas bag of Mother Tucker in exchange for her tarts, puffs, and sweeties generally.

Then came the very early day when my purse was dry, but my mouth-watering propensities for confectionery of sorts full to overflowing. In that hour of hankering and covetousness the tempter, one Jack Sharkie, a fellow-scholar, met me.

He was a lad considerably older than myself, clever, and the best French scholar in the school. His personal appearance was not attractive; his little sharp grey eyes spoke of cunning and deceit if ever eyes did. He was a duffer at cricket, football, or hockey, but put him at any sum in arithmetic and he was happy.

"Hullo, young chap!" said he, as he saw me hovering not about the skirts of Mother Tucker herself, but about the outskirts of her habitual place in the playground; "no tin for even the *bonne bouche* of a half-price tartlet, flat, stale, and unprofitable?"

"Not a farthing," I replied.

"Bad, that. Want any tuck?"

"Awfully!"

"So don't I! Just walked into three splendidous raspberry 'turnovers,' Mother T. has excelled herself to-day. But come, I've taken a fancy to you, Newman, and I'll tell you what I'll do. I'll lend you threepence now, and you pay me sixpence next Saturday."

"Thanks, no! I can't pay, and I won't borrow."

He looked disappointed, but presently began to chaff.

"All right, youngster; then it is cocksure that under these circumstances you'll not eat and be filled with other delectables than 'sky-blue' and 'scrape.' But I'll whisper something in your ear—your going without the *six sous* which I am disposed to loan you will not prevent your going without *souci* for the goody-goodies for the rest of the afternoon. If you don't know what I mean ask the French master, he will enlighten you. However, should you think better of my offer—you know my diggin's, desk two, third form in the dominie's room—there you'll find me."

He went his way, and I mine. But towards evening some cause or other took me to Sharkie's "diggings." It certainly was not to borrow the money, for, Mother Tucker being gone, I had no chance of getting at her saleables, if even I could have bought them.

Brum, as Jack was called, was conning over his lessons. He had Horace open before him, and curiously enough was construing this passage: "Animum rege, qui nisi paret, imperat" ("Subdue your passion, or it will subdue you").

He was labouring at the line word for word in regular schoolboy fashion, thus: *rege*, rule thou; *animum*, your inclination; *qui nisi*, which unless; *paret*—what is *paret*? Hullo, Newman! Do you know the English for *paret*?"

"No."

"Then I must look it out."

He opened his desk for his lexicon—no doubt a plant, for he must have known, clever as he was, what *paret* stood for—and in so doing disclosed to my astonished gaze a stack of tarts, puffs, buns, and so on, backed by two or three stone bottles of ginger-beer.

"Whew!" I exclaimed; "tuck!"

"Tuck it is," he observed, unconcernedly; "I always have a store by me, especially for Sunday. I'm 'nuts' on pastry stuff, aren't you?"

Again I replied, "Awfully!"

"Well, help yourself."

I needed no second invitation; what schoolboy would? Three tarts of sorts and one bun speedily went the way of all pastrycook's confections. Then I thirsted, and a bottle of ginger-beer effervesced and disappeared, to "float the solids with," as Jack facetiously put it.

Increase of appetite now grew by what it had fed on, and as mine host had let drop a hint that I might come again and *be welcome*, upon that hint on the following afternoon I disposed of jam "cocked hats," open fruit tarts, sponge-cakes, and ginger-beer, until, to use a vulgar but common school expression, I felt "stodged."

Then, as digestion struggled within me, I thought, "This Brum, this stingy, selfish churl, as he is dubbed, why he is sterling gold! Close-fisted, mean! Never! When I happen to be flush I must mete to him the same measure he has measured out to me."

Then I went to bed, slept, and awoke next morning, if not a better, still a wiser boy.

For standing beside me was Sharkie.

"I say, Newman," said he, "you owe me two-and-nine."

"Owe you! What for?"

"Two days' tuck-out."

"Why, I was your guest, wasn't I? You distinctly told me to help myself."

"Did I? Over the left, young man."

"Besides," I continued, "how do you make it two-and-nine?"

He took out of his pocket a slip of paper, and, tossing it towards me, said, "Count it up." I did, and thus it ran:

	s.	d.
Two bottles ginger-beer, at 3d. ...	0	6
Eight tarts of sorts, at 2d. ...	1	4
Buns, biscuits, and sundries ...	0	6
Sitting room (at my desk) ...	0	1
Loan of my knife ...	0	1
Interest on outlay of my cash (2 days, at 1½d. per day) ...	0	3

"Why, Sharkie," I said, "this is simply horrible; and even supposing that I had bought the things of you, which I did not, your prices are monstrous. Mother Tucker charges only a penny a bottle for pop, you demand threepence; any boy can buy her tarts, full ones as well, for one penny each; yours, which had been 'doctored' by the abstraction of one or two cherries or gooseberries, or a fingertip of jam, you ask double for. How's that?"

"There is always a great difference existing between cash and credit prices, youngster. However, be that as it may, you are in my debt two-and-nine, and I must be paid sharp; I can't afford to wait."

"I have not got it, Brum."

"I don't care, you must ask your governor for it. Why, it's a case of fraud; obtaining goods under false pretences; you can be 'run in' for it."

"Oh, Brum, I can't ask my father, he made me promise to owe no one anything; he would be very angry."

"Bosh! Every chap's governor pays his son's lawful accounts, and that antediluvian prig of yours is bound to settle mine, if he is a gentleman."

"My dear old father is no prig, and he is a gentleman every inch of him."

Then came a quarrel, and we went into the playground and fought. Sharkie punished me, for he was taller and stronger than I, but one or two nasty clips I gave him made some amends to me. Still the money was due, was to be paid, and was not forthcoming. For days and days that two-and-nine haunted me. I saw it in every sum I added up; it came before me in every copy I wrote; it stared me in the face in my tasks of Ovid and Virgil; Anacreon had it in every ode; and once when the English master made me recite that speech of Polonius to Laertes, and I came upon the lines,

"Neither a borrower nor a lender be,
For loan oft loses both itself and friend,
And borrowing dulls the edge of husbandry,"

I positively writhed with mental agony.

In my sleep, too, the nightmare of my debt sat heavy upon me. I was always seeing two silver shillings and nine copper pence twisting and twirling upon their edges close within my grasp, and when I stretched out my hand to seize and to give them to Sharkie, the Queen's effigies upon their surfaces shook their heads, and seemed to say, "No, you don't!"

In the midst of this brain-whirl my father drove over to Whippingham to hear how I was getting on. I did not know of his coming, and the first intelligence I had of it was, "Master Newman, you're wanted; there's somebody in the parlour wishing to see you."

I burst into tears, for it so happened that only a few moments before Brum had been dunning me sorely, and I fancied that he had got a policeman to carry me off to gaol, as he had more than once threatened to do.

"Why, you silly boy!" said the housemaid who had summoned me, "whatever are you a-crying for? It's only a kind-looking old gentleman, who says he is your father. Run upstairs and tidy yourself."

I rushed into the room, and in a second was hanging about the dear pater's neck.

"Why, Bertie," he said, "whatever is the matter with you? You look pale, thin, and worried, and your mother would be shocked to see you. Are you ill, boy?"

"No, father!"

"Don't they give you enough to eat?"

"Plenty; but I can't eat anything."

"Indeed! You used to possess at home a first-rate capacity for disposing of fish, flesh, fowl, and pastry—especially pastry."

"Oh please, father, don't say anything about pastry. I hate to think of it; the very word makes me shudder!"

"Hoity-toity! What nonsense is this? What in the world has come over you?—overworked?"

"No. I—want—some—more—money, dad dear, please."

"The half-crown expended, eh! Well, that's not much to take to heart so sorely. Here's a shilling for you."

"Not enough, father," said I, weeping, "not half enough; I want nearly three shillings."

"What for, child?"

"I have been a very wicked boy; I have disobeyed your injunctions and got into debt; I owe Jack Sharkie—one of the fellows—two shillings and nine-pence."

"Bless the boy! what for? tell me all about it at once."

I related the whole transaction from beginning to end. He was angry with me, but he was positively in a most unclerical rage with Sharkie, whom he stigmatised in no measured terms.

"You shall have the money, Bertie," said he, "to liquidate your liabilities with that trickster and decoy-duck of a Brum, as you call him; I'll not have you a defaulter; but—you'll be put under stoppages until the advance I make is repaid. If you get a practical lesson now it may be of benefit to you all the days of your life. Three halfpence, young gentleman, *three ha-pence* are mulcted from your *batta* (the old leaven of his former calling in India was rising) per week, that's your punishment; and in regard to that young Shark I'll report him to the general—I mean the doctor, at once."

My father gave me the cash, then had a talk with the doctor, and that same afternoon there was wailing and gnashing of teeth in Solon House. For Jack Sharkie, after due inquiries, which proved I was but one of numerous victims, was hoisted, soundly whipped, expelled the school, and the two-and-nine, the head and front of my offending, put into the poor-box.

But the deprivations and inconveniences that I, Albert Newman, experienced for twenty-two weeks upon reduced allowances may, as the reporters say, "be better imagined than described."

Yet, like many another of this world's trials, they proved in the long run most salutary, for, as I began by saying, throughout my whole life I have feared the demon of debt, and have never lost sight of my first and only one to my schoolfellow Brum.

OLD BARNBY'S POND.

BY H. D. BRAIN.

THE following little escapade of my youthful days took place in a village which may be vaguely spoken of as "up north," for there is no need to more accurately describe its whereabouts.

"Old Barnby," or, as he was more commonly called, Old Hunks, owned a farm on the outskirts of the afore-mentioned village, which was principally interesting to me and one or two kindred spirits from the fact that it contained a pond inhabited by numbers of splendid trout.

In his younger days Old Hunks must have been a fine specimen of the "genus homo," but now age was beginning to tell upon him, and he lost a great deal of the advantage of his height from a habit of stooping forward as he walked. His hair was iron-grey and his face wrinkled, with a morose, sullen look about it, giving colour to the village rumour that he was

a sordid old miser. He possessed a temper by no means angelic, and we youngsters used to make tracks with marvellous expedition whenever we saw him coming with his gnarled old stick that he was very fond of using upon our juvenile backs.

The only thing that rivalled our dislike to "Old Barnby" was our fear of his inseparable companion, Grip, a dog of the mastiff breed. He was the only living thing, I believe, his master had the slightest feeling of human kindness for, but that he did love the old dog was an undoubted fact. They lived together in the farmhouse, which was a small one of its kind, "Old Barnby" seeing to all the household matters himself, and never allowing a human creature beyond the doorstep. The dog appeared during the many years they had been together to

have become a canine edition of his master in regard to his temper and unsocial habits, and it would have been a brave man indeed who would have cared to tackle the two of them.

I think that next to the foregoing pair I excited most attention in the village. It always seemed to me that it was a case of "Give a dog a bad name," etc., for from shooting a neighbour's cat to orchard-robbery the verdict used to be, "There's that young Tom Dean again;" and yet I was for the most part wholly innocent of the charges thus lavishly preferred against me. Not that I wish to make excuses, however.

My chief hobby was fishing, and I could spend days in the pursuit of this my favourite amusement, but up till now I had never been able to satisfy a great longing of mine to get permission

to catch some of the fish in Old Barnby's pond.

It was a pool, *par excellence*, for fish to thrive in, and was situated in a lovely wood not far from the farmhouse. At the top a good-sized brook entered, sending a current throughout to the floodgates at the other end, where the overflow rushed over, and after running through another pool on a lower level, finally mingled its waters with the river about half a mile away. I do not believe it held many coarse fish, but that it contained shoals of trout could be clearly proved any day one cared to go and cautiously survey the shallow part, where as a rule there would be scores of them lazily rising at the flies, or perchance only in sport.

On a fine day we used to go and lie under the trees and longingly watch the handsome spotted beauties we could see sheltering themselves from the sun under some large water-lily. They must have been as unsophisticated as possible, as for years previous they had been left to fatten and lazily dream their lives away with no such little excitement to rouse them up as an introduction to a fly with a steel sting in its tail or wretched-looking minnow which yet could prove one too many for its would-be devourer.

I have no doubt, if he had been able to do so, "Old Barnby" would have prevented us from even looking at his finny property, but a right of way ran close by the end of the pool, so he was powerless to prevent it. He did not care for fishing himself, but seemed to find a fund of pleasure in the fact that he possessed the power, or, at all events, exercised it, of refusing permission to fish to so many who were anxious to obtain it.

An old friend of mine, Harry Lang, and myself had often made fruitless attempts to induce the old man to make an exception in our favour, promising to give him all the fish we might catch and do almost anything to assist on the farm as well.

One fine summer afternoon Harry and I were gazing wistfully at the pond and thinking what a grand haul we might have the next day, which happened to be a holiday, if we only had leave to bring our rods and astonish some of the lordly "dorsal-finned ones."

"Look here, Harry!" I at last exclaimed; "let's have one more try. He can only say no, and there is just the faintest chance that he may be in a good humour."

"All right, old fellow," replied he; "I am afraid that it is no good, but I vote we go and get it over now."

Accordingly we set out on a search for the crusty old owner of the pool, and fortunately had not far to go before we came upon the inseparables—Grip and his master.

"Well, what are you boys arter now? I see you've got summat you want to say—some mischief, I'll be bound!" was the greeting we received as soon as he saw our wish to speak to him.

It was not by any means a cheerful commencement, but, pulling ourselves together, we, in our politest manner, preferred our request. The old man seemed fairly thunderstruck for a moment at our audacity; then, shaking his stick in such a manner as made us get out of striking distance with astonishing rapidity, he burst out with, "Want to fish in my pond, an idle lot of young vagabonds!"

Let me catch yer at it, and I'll break every bone in yer body! Remember, my lads, I'll hide yer if I catch yer trying it on!" and, with one or two personal allusions of a painful character, he left us in anything but a Christianlike frame of mind.

We were naturally indignant at the way our polite request had been treated, and looked upon it as a fair challenge to despoil him of his trout if we could possibly do so. After that we had some anxious consultations, and finally decided that on the very first opportunity we would risk our thrashing and have a try at the pool, proposing as a salve to our consciences that all the fish we caught should be packed up and left at Old Hunks's doorstep, with "With compliments" written on the parcel.

The chance came sooner than we expected, for we heard that our enemy was going to a horse fair, fortunately taking place on one of our half-holidays, and that he would be detained until late. This was just what we had been looking forward to, and so on the day arranged, after making sure that he had really gone, we started, with inward quaking, on our expedition, taking our home-made rods with us, cunningly stowed under our jackets so as to excite as little observation as possible. Rods were not so cheap in those days as they now are, and we youngsters used to make our own, generally consisting of a good straight piece of hazel, with a slip of lancewood for a top.

It was a splendid afternoon for the object we had in view, the sky being dull and overcast, with not more than enough wind to assist us in casting. On arriving at the forbidden spot our rods and tackle were put together with much listening and anxious peering about, and I must say in fear and trembling we made our preliminary casts. But in a few moments we were oblivious of all else but the immediate present, for the trout were well on the rise, and we were both quickly in with a couple of good fish, who tried our little rustic fly rods as they had never been tried before. The fun was fast and furious, and never do I remember having such a day with the trout; they were rising everywhere, and especially at the place we were fishing. The brook entered here and broadened out into a wide, rippling shallow before becoming sobered and quiet in the deep parts of the pool. The ripple greatly assisted us in working the fly, and the result surpassed even our expectations.

We caught several trout averaging about a pound each, and then noticing a quiet steady rise at the side of the bank like a good fish feeding, I essayed a cast in that direction, with the result of getting hung up. It was rather a difficult place to get at, for a bush projected a short distance over the water, and it was just under this that the fish was rising. I tried several times to get the fly over him, but it was only after losing several "alders" and using, I am afraid, some rather explosive language, that I did at last manage to present my invitation in a becoming manner.

The old trout did not refuse it, but finding it rather more than he bargained for, endeavoured to get rid of it by every means in his power. What a glorious fight we had! I shall never forget it; he was first to one side, then to the other, trying by a succession of splen-

did leaps to shake the stinging insect from his jaws; but finding his best efforts in that direction unavailing, he tried sulking at the bottom. I soon, by the judicious application of a large stone, forced him from that position, and then for a good ten minutes more we had as sharp a contest as I have ever seen, and it was only when perfectly helpless and hardly able to stir a fin that he allowed himself to be drawn on to a shelving bank and transferred to *terra firma*. He was a splendid fish, and I should think must have scaled at least five pounds, but unfortunately I had no means of accurately ascertaining his weight.

After that we caught several more good fish, and then decided to make a final effort to complete the three dozen, for we then had caught over thirty fish. The rise still continued, and we were both soon busy with a couple of lively trout. I landed mine, but Harry had the misfortune to smash his rod, and not having the necessary implements for splicing it, forced us to finish our fishing. We then gathered together our tackle and were taking a last look at our spoil before packing it up, when, to our unutterable horror and dismay, we heard a voice we knew only too well to exclaim, in anything but cheering tones,

"Yer young warments, so you've taken to poaching at last. I'll make it warm for the two on yer. Don't ye move or I'll loose Grip, and ye'll remember him for a good time to come, I'll be bound."

We stood like prisoners condemned to be tortured, while "Old Barnby," who had, unfortunately for us, returned from the horse fair long before he was expected, proceeded in the most leisurely manner to cut a good strong springy sapling, muttering at the same time in a manner by no means calculated to raise our spirits.

When he had got a stick to his liking he came up to where we were standing, and giving it a preliminary swoosh through the air, said,

"I'll begin wi' the worst, and that's you, young Tom Dean, I be certain; but I'll tache yer to remember fishing in my pond, my lads."

He did so too, for, catching hold of my collar, he proceeded to inflict such a thrashing upon my unfortunate self that, as he said, I should remember for some time to come poaching on his place. My companion came off a little better, for Old Hunks had expended most of his energy upon me; but we both crawled home that evening minus rods and fish, but in their place the effects of a thrashing which, though I have no doubt well merited, rather disgusted us for a considerable time with the bare idea of trout-fishing.

Shortly after this I left home to accept what was considered a first-rate berth in "the City." Since that time many changes have taken place in the little village, and the farm has passed into other and more hospitable hands than Old Hunks's. I often spend my yearly holiday down there, and invariably take my rod and have a try for the trout in the pool on the farm, but I have never yet gazed on that familiar spot without memory bringing back, with a too faithful minuteness, the difficulty I experienced in assuming a sitting position for some considerable time after my first trouting experience on "Old Barnby's Pond."

COLONEL PELLINORE'S GOLD.

BY E. W. THOMSON,

Author of "Petherick's Peril," etc.

CHAPTER V.

BRYAN drove down the dark forest glades, making a fresh track in half an inch of new-fallen snow that had blown out of the clouds early in the night.

He burned with an intolerable feeling that the glory was all gone from the face of

the earth. His old clear world was changed, life had become tangled and tragic. To have to trust his senses against the colonel made him wild with perplexity. It was as though Truth itself had become base, the clean soul of Honour polluted, Virtue a mask! He could in no way reconcile what he had seen with his innate understanding of his uncle's character.

With the conflict of faith and distrust, with the misery of being forced to maintain an inexplicable charge against his earthly mirror of chivalry, the boy was desperate. Had he not fled he must have run or leaped or dashed himself madly against some immovable obstacle to relieve the mental agony by making the body endure pain.

For the first half-hour he urged the mare to greater speed whenever her pace showed signs of slackening. As yet his dominant impulse was merely to get away; he had not considered what he should do, had not any definite plan in his flight, scarcely knew where he was going.

After a while he perceived that the mare had taken the road towards Montreal and Quebec, towards the sea and England, towards Europe and the wars. Upon this he fell into a long waking dream of keeping straight on, and at last finding himself in a pigtail and laced red uniform holding up the Lion flag in the midst of a roaring battle.

Though large and strong beyond his years, he was yet as much a child in his conception of the actualities of life as when he left his English school two years before. In the woods he had learned nothing to mar his simplicity, while his romantic disposition had been fed full by the colonel's quaint old books. Froissart and Sir Thomas Mallory, and like volumes of chivalry and high-flown accounts of British deeds by sea and land, had been all his reading, the corporal's tales of campaigns his main source of information as to real life. Never was Spartan or Roman or Norse boy more convinced that fighting was the only worthy occupation of man. So he went on now in the grey morning, soon letting his horse walk, dreaming of adventures and glory till he wholly forgot what had sent him from his uncle's home.

Not till the sun is well up does he look

through the deep woods. With his first rosy glint on the snow before Bryan Pellinore, the boy suddenly woke up to reality and the events of the night. Now he was shocked at his act. The circumstances all recurred to him indeed—Colonel Pellinore's need of money, his mutterings about robbery and Marhaus, the arrival of the lieutenant with the gold, the colonel so furtively bringing in the keg at dead of night, his so carefully concealing the coins under the hearthstone. But these things seemed strangely, ludicrously inconsequential to Bryan in his new mood. There must be an explanation, he felt, and blushed with shame to think how he had wavered in loyalty to his uncle.

Halting the mare, he thought intently over the whole matter. Now he would no longer trust appearances against his reverence for the colonel. The direst need of his nature was to believe in, to go back to his perfect trust in his uncle. Bitterly accusing himself, he turned the mare about. She pricked up her ears, tossed her small head joyfully, and trotted swiftly towards home.

* * * *

When Lieutenant Marhaus turned into the main road his men and the *traineau* were considerably in advance, and out of sight in the woods. Looking down the river before marching after them, the lieutenant was amazed to see a red cariole approaching, and to recognise Bryan Pellinore in the driver.

"He has repented soon," thought the lieutenant, while still he was indignant at the imagined offence of the boy.

Bryan, on his part, approached with trembling and deep anxiety to hear the disclosure of Marhaus. His excited demeanour was mistaken for a sign of guilt.

"You've thought better of it!" cried Marhaus, contemptuously.

"What do you mean?" asked Bryan, startled at the tone.

"You've brought back the gold," said the lieutenant.

"The gold!" cried Bryan, shocked—not at the accusation, which he did not fully understand at the moment, but at the confirmation of his darkest fears. The gold *was* gone, then!

"The gold!" repeated the lieutenant. "Come, stare no more at me with that affectation of innocent surprise. You couldn't have supposed but what you were smoked before this!"

"Do you mean that I took the gold?" asked Bryan, in amazement.

"Do you mean that it went off with you of its own sweet will?" said the lieutenant, angry at what he supposed the hypocrisy of the boy.

"By my honour," cried Bryan, carried away by a rush of indignation as he fully comprehended the accusation, "you shall answer for this!"

Springing out of the cariole with the drawn sword of his father in his hand, he rushed against Marhaus. So furious

was his onset that the lieutenant instinctively drew his blade, and in a moment found all his dexterity required to keep his defence against the youngster's impetuous attack. Bryan, when cool, was indeed no despicable opponent, even for so fine a swordsman as the lieutenant. Morning after morning had he learned from the old colonel all his sleights of fence, and not less regularly every afternoon, come rain or shine, had Corporal Cram, a perfect master of arms in his time, taught to the eager boy his utmost skill.

Bryan, in addition to good training, had a quick eye and a strong wrist, as the lieutenant soon perceived when now the long, fine blades were crossed with that slipping, grinding, stern pressure on each other which must end with an advantage to one side that may mean death to the other.

Looking into the youngster's eye, Marhaus saw there a light which was not all the fierce joy of his first real combat. Bryan was indeed furious with conflicting emotions: horrified because the accusation of the lieutenant signified everything against his uncle, scornfully angry that he himself should be suspected, wild because he could not explicitly deny without bringing the charge nearer to the colonel.

Marhaus, parrying Bryan's rapid thrusts, became gradually angrier, nor could he spare a moment from his defence for such speech as might have brought about an explanation. He had resolved to disarm his boyish opponent, but now felt that he would be compelled to wound him.

"Back! boy, back!" he cried, as Bryan pressed him more severely. "Back! or I must do you a hurt."

"You shall eat your words, or one of us falls here," answered Bryan, quietly. He was getting cooler and warier with every motion of the fight.

Instantly the lieutenant took the offensive, but Bryan, cleverly parrying in his turn, converted his defence once more into attack, and lunged straight at the heart of Marhaus. With wonderful dexterity the lieutenant caught the thrust, but not quickly enough to turn it entirely. Bryan's weapon passed through his shoulder, inflicting a slight flesh wound. The stout soldier withheld himself no longer, nor could he have done so except at peril of his life. Catching the young swordsman's next thrust, he turned the glittering blade beneath his left arm, and the next instant passed his blade through Bryan's body. The young fellow sank to the snow with a moan.

Lieutenant Marhaus, horrified at the wound, by which he had intended merely to disable, knelt beside the lad and strove to staunch the quick-flowing blood. Then, lifting him tenderly in his arms, he placed him in the cariole, and, ascending the hill, soon gave him to the arms of the colonel.

(To be continued.)

HEROES OF THE BACKWOODS.

KIT CARSON.

PART IV.

AND now after sixteen years spent in the wild woods Kit Carson resolved to visit his home and take with him his little daughter to place her at school in St. Louis. The scenes of his boyhood had, however, under-

lady, and two months afterwards he went off as hunter with a waggon-train from Fort Bent. On the Santa Fé trail he met with a band of Mexicans, who, fearing an attack from the Texan Rangers, offered him three

shoot him down. There was a short, sharp struggle, and then Carson with his clenched fist gave his treacherous enemy such a blow between the eyes as knocked him on to the grass with the blood streaming from his nose.

The Road to the Rockies in Kit Carson's Day.

gone a considerable change. The old log cabin where his father and mother had dwelt was deserted, and its dilapidated walls were crumbling with decay. His people were all scattered over the face of the earth, and he was a stranger in a strange land. Ten days at St. Louis proved enough for him, and he was on his way to his hut in the west when, on the steamboat up the Missouri, he met Fremont, then starting to explore the Rockies.

Finding that he was in want of a guide, Kit volunteered for the post, and was accepted. The expedition left the mouth of the Kansas on June 10th, 1842. Its history and adventures belong more specially to the life of Fremont, and need not detain us here. It was successful in its main objects, and in September returned in safety to Fort Laramie. In February, 1843, Carson married a Mexican

hundred dollars to carry a letter to Santa Fé asking the governor to send them an escort. To do this meant a journey of nearly four hundred miles through a wilderness swarming with hostile Indians.

Kit accepted the commission, and returning to Fort Bent departed thence alone. With much care and circumspection he managed to get through the Indians unperceived and reached Taos, whence the despatches were sent on, and then the governor in return requested him to take back despatches to the Mexican caravan. With a boy as companion he began the journey. Soon they found four Indians across the road ready to intercept them. One of the Indians came forward as a herald and shook hands in sign of friendship, but the instant the hands were unclasped he snatched at Kit's rifle and tried to wrench it away from him so as to

The Indian was up and away in a moment, and his friends came on to the attack. Warning them off, Kit told them in their own tongue that two would certainly be shot with the rifles, and that his revolver would answer for the other two, and, after hesitating for a moment, the redskins thought discretion the better part of valour and sulkily retreated. A few days before Kit again reached Fort Bent, Fremont had been past on his second expedition. Anxious to see his old comrades, Kit started in pursuit, caught them up at the seventieth mile, and was prevailed upon to again give his services as guide.

After much hard work the expedition, gradually reduced and consisting entirely of volunteers, reached Fort Dallas, and passing through Oregon went on over the mountains to California. The snow was a fathom deep. There was neither game nor forage

within reach. Many of the mules died of starvation. "We were forced off the ridges," says Fremont on the 23rd of February, "by

occasionally rocks and a southern exposure afforded us a chance to scramble along. But these were steep and slippery with snow and

exhausted our patience. Some of us had the misfortune to wear moccasins, with soles of buffalo hide so slippery that we could not

the quantity of snow among the timber, and obliged to take to the mountain sides, where

ice, and the tough evergreens of the mountains impeded our way, tore our skins, and

keep our feet, and generally we crawled along the snow beds. Axes and mauls were

The Road to the Rockies now.

necessary to make a road through the snow. Going ahead with Carson to reconnoitre the road, we reached this afternoon the river which made the outlet of the lake. Carson sprang over, clear across a place where the stream was compressed among the rocks. But the sole of my moccasin glanced from the icy rock and precipitated me into the river. It was some seconds before I could recover myself in the current, and Carson, thinking me hurt, jumped in after me, and we both had an icy bath. We tried to search awhile for my gun, which had been lost in the fall, but the cold drove us out. Making a large fire on the bank, after we had partially dried ourselves we went back to meet the camp. We afterwards found that the gun had been slung under the ice which formed the shores of the creek."

Thus over the Sierra Nevada went Fremont and his men, reaching Fort Sutter, of gold-finding fame, in March, 1844. On their way back they came up with a Mexican and a little boy, the sole survivors of a party that had been attacked by the Indians. Touched with sympathy at the poor lad's grief, Kit and another old trapper, Godoy, started off together in pursuit of the redskins, hoping to rescue the father and mother for whom he was nearly broken-hearted. They followed the trail, rode a hundred miles out and back, charged into the Indian camp, shot the two leaders, put the rest of the band, twenty-eight in all, to flight, and recovered the stolen property, but found that all the prisoners had been killed and mutilated. And from the time they started to the time they returned was just thirty hours!

Fremont went on to Washington, Kit went home to Taos, and there he stayed until he received a despatch asking him to join the explorer on his third expedition. He was soon at his post again, and led the way through the desert. With three men he was sent on in front to mark out the trail. For sixty miles they went without finding a drop of water or a blade of grass, and then they reached the oasis, where they lit the fire which was the agreed-upon signal for Fremont to advance. Fremont saw the smoke across the plain, and brought up the main body of the expedition, which then kept on, until at last it arrived at Monterey, on the Pacific coast.

Here they were ordered by the Mexicans to leave the country. They formed a camp to defy them, but finding that they could not force their way through Castro's followers, they turned northwards to the mouth of the Columbia, and on the road met and defeated a band of hostile Indians a thousand strong. The war with Mexico then broke out, and Fremont's exploring expedition became Fre-

mont's army corps, with Carson as lieutenant. Sonoma was taken, and cannon and small arms were secured for armament; and then the march was resumed on Monterey, which fell to Sloat before Fremont arrived. Thence Fremont and his men took ship for San Diego, and thence they marched on Los Angeles, whence Kit and fifteen men started on a four-thousand-mile ride with despatches. After many adventures, Kit fell in with General Kearney on his road to California. Joining him, he shared in the battle near San Diego, and with him was surrounded. It became necessary to communicate with the garrison of that town, and Carson volunteered to creep through the Mexican lines and carry the message. Beale, then a naval lieutenant, offered to accompany him.

When night fell they started together on their hands and feet, feeling for the tall grass, the hollows in the ground, the shady thickets, and everything that could hide them from the triple row of sentinels that begirt the Americans. Foot by foot they crept along in silence, and to make their progress more noiseless they slipped off their shoes and stuck them in their belts. They passed the first line, then the second, and were just thinking they were clear, when a sentinel rode up to within a yard of where they were lying hid in the long grass. With flint and steel he began to strike a light, and Kit could hear his comrade's heart beat as the sparks flew out. The Mexican dismounted. The suspense of the Americans was terrible. Click, click! went the flint and steel, and then came the light, and the sentinel's eyes, intent on his pipe, were too much occupied to see them. At last the tobacco caught, and, with a grunt of relief, the Mexican mounted and rode off smoking. For two miles did the messengers creep along through the brushwood, and then by a roundabout route Carson led the way over the rocks and hills. They had lost their shoes, and all next day they struggled on with bare feet over the slippery shale and through the prickly pear-bushes. Another night closed in, and it was not till early morning that they reached San Diego, and brought Stockton the news of Kearney's peril. Instantly the troops were called out and marched to the rescue, and the Mexicans retreated, baffled of their prey.

In March, 1847, Kit was sent off with despatches to Washington. He took three months on the road, triumphantly outwitting the ever hostile Indians. And several times he went backwards and forwards across the continent with despatches for the seat of war. When the war was over he settled down at Taos, where he had selected and stocked a ranche.

Once, when travelling with a caravan from

St. Louis to his farm, he found himself surrounded by Cheyennes. Throwing up an entrenchment, he sent out an interpreter inviting the Indians to a palaver. They agreed, and he entered their camp and talked to them through his interpreter of his desire to be friendly. The Cheyennes began to chat amongst themselves, Kit understanding every word. He heard the whole of a plot to massacre him and his men, and plunder his own and his neighbours' houses. Suddenly springing to his feet, he told the Indians of their treachery, revealed his name—till then unknown to them—and ordered them to disperse; and so great was the terror he inspired that the astonished Cheyennes beat a hurried retreat.

He was never molested again, and so feared and respected had he made himself by the Indians that in 1853 he was appointed United States Indian Agent for New Mexico. In this responsible post he did his utmost to help and direct aright the sons of the wilderness with whom he had lived so long. Only once did he meet them on the war-path, and the result was as it ever had been—the Navajos were effectually overpowered. When the War of Secession broke out Kit became lieutenant-colonel of volunteers, and did welcome service; and at the close of the struggle he obtained the rank of brigadier-general. It is, however, solely with him as a backwoodsman that we have here to deal, and we need not dwell on his marchings and countermarchings as a soldier.

He died at Fort Lyon, in Colorado, on the 23rd of May, 1868, leaving behind him a spotless fame. He was one of nature's gentlemen—a true man in all that constitutes manhood, pure, honourable, truthful, sincere, and ever ready to defend the weak against the strong, regardless of reward other than the approval of his own conscience.

(THE END.)

AN ENCOUNTER WITH CROCODILES.

BY W. STOBIE.

WHILE residing in India I was once stationed on the Nepaul border, where

the great Terai forests begin, that extend from Assam to Cashmere, forests whose slopes culminate in the mighty peaks of the Himalayas towering in the distance nearly two hundred miles off.

Here, if rather solitary, I used to have plenty of scope for *shikar* in the occasional raids into the jungle and in the shape of stray tigers or leopards that now and then strolled down into the plains for better feeding. My ever-present *shikar*, however, was a herd of crocodiles that had come into my lake from the river during the floods of the rainy season, and which, like the Frenchman's pheasant, afforded a continuation of sport through failure in bagging the game.

Once within the lake, they had been unable to get out again as the water fell, owing to the sudden forming of a sandbank in their way, which the natives vigorously added to to keep in the supply of water for the sake of their rice crops and irrigation. The croco-

diles did not appear to like risking a journey on foot till they could get into deep water, and the very rapid falling of the river and drying of the intermediate ground soon put this out of their power. So, unable to get back to headquarters, there remained nothing for them but to make the most of their situation, which they seemingly did by multiplying and flourishing, to the great disgust of many a Hindoo who had been wont to recite his prayers as he stood waist-deep in the lake, praying and plunging alternately, and also to the vexation of spirit of the fisherman. The luxurious cool bath of the peasant as he left his field labours heated and tired, and the net-casting of the fisherman as he waded from the shore neck-deep into the water, had all to be abandoned. An ever-present dread of a lurking enemy had now to be taken into account.

Every now and then as I came out to *chota-hazri* (six o'clock breakfast) in the

morning I used to have a pot from the verandah at one or more of the skulking invaders as they lay basking in the sun on the opposite bank of the lake, some two hundred and fifty yards off. Generally after such warm receptions I would see nothing of them for a few days, till their alarm at the unseen missile that buried itself with a thud in the bank beside them had subsided and love of sunshine (for it was the cold season) had got the better of their habitual caution and cunning. Then they would reappear as before, lying motionless, like dark logs of wood, a yard or two from the water.

My shikar was attended with little trouble, for I had merely to rest the gun on the back of my chair for steadier aim. Then there was the sound of the bullet striking, the sudden start of the "logs" and the plunge into the water. But often though I fired, I am afraid that, owing to the distance, the only time I struck was once when a sharper crack of the bullet varied its usual dull thud in the bank and a wild floundering of the crocodile for some seconds preceded his laboured descent and plunge into the lake. For a moment I thought I had fairly bagged my game, but to my great disappointment neither floating carcass nor wounded crocodile appeared afterwards to prove the efficacy of the shot. Had the bullet struck other than perfectly straight, it had probably glanced with little damage off the thick horny hide.

At first I was at a loss to account for the scaly monsters returning again and again to the same spot after the treatment they habitually met, till I found it was almost the only part of the lake where an open bank with deep water below and a clear offing above afforded security against surprise. Nearly all the rest of the lake was either less secluded or had a broad belt of rushes and rank strong weeds, which shut out the sun, and, with gradually shallowing water, rendered access both to and from the bank more difficult. Like most of the plain lakes—horseshoe-shaped, and once the beds of rivers—it was subject to annual flooding from the river during the rainy season, bringing in a fresh supply of both water and fish, and though some four miles in circumference, it was only of a uniform width of from two to four hundred yards.

For myself, fond of swimming as I was, these unwelcome settlers had completely spoiled the lake now, except as a field for boating and duck shooting and as an ornamental part of the landscape. Often, after a hot ride, had I stood on the steps leading into the water below my bungalow, longing to plunge into its clear depths, but not daring to venture. So I was resolved to wage a more determined war against the common enemy, and an incident happened about this time that strengthened this resolution. I had rowed over to the other side of the lake near their basking-ground to pick up from among the reeds a duck that I had dropped from a passing flock, and, crushing in through the dense growth, came up to where I had seen it fall. Right in the way lay a log of wood parallel to the boat, and just beyond it the duck; so, thinking the log buoyant enough amid its strong support of reeds to bear some weight, I put out one foot to rest on it while I stretched over to pick up the bird. In an instant the log became animated, and I just managed to recover my balance and footing in the boat, when, with a few tremendous plunges, the black mass disappeared beneath the reeds and vanished outside them into the deep water.

The same day word was brought to me in the afternoon of the first sad testimony of these ruthless invaders' presence. A child of some three years, that had been paddling knee-deep in the edge of the lake, suddenly disappeared, and there seemed no room for doubt as to its fate. It had probably been noted from a distance by a crocodile, who had advanced stealthily below the surface and swept it from its feet in the shallow

water, so quickly and quietly that there had never been time for a cry to give alarm of the fact. Mentioning the matter to my friend Brown, who arrived that day on a week's visit, he was delighted to volunteer his experience and assistance in a plan of extermination.

Next morning, about an hour before day-break, we were silently slipping along the lake in shadow of the rushes towards another favourite reputed camping-ground of the enemy. This was about a mile distant, and the heavy drenching dew with almost frosty air of the coldest period of the twenty-four hours—that of transition from night to day—required all our wraps to keep us comfortable. Our guns lay beside us ready loaded, and a *mulah* (fisherman) perched on the stern of the boat quietly and swiftly paddled us along. On the way Brown narrated some of his experiences of crocodiles during a residence in Assam.

"Once when crossing a large tributary of the Berhampootra," he said, "which abounded with crocodiles, we came alongside a herd of elephants that were swimming across, led by one a little in advance bestrode by a mahout. Often only the tips of their probosces were visible above the water for air, and even these from a little distance being undiscernible, there was the curious appearance of a man moving along on the surface in a sitting posture. Suddenly again the huge heads would emerge with a plunge, as if their owners were gambling in the enjoyment of their bath. While steadily moving forwards, suddenly one elephant gave a heavy plunge, and, trumpeting loudly, obstinately refused to advance in spite of all persuasion. The others, who had moved a little ahead, now veered round in a body, and, forming a cordon round their friend, all, save the trumpeter, plunged, as if at a signal, headforemost downwards, and for nearly a minute remained below. When they reappeared one held triumphantly in his trunk a large crocodile. Another then seized hold of it, and together they tugged and pulled at it till we expected every instant to see it fly into fragments. After every bone in its body must have been crushed and broken, they left it lying lifeless in the water, and the herd quietly resumed their march. The mahout, who had been softly unseated while this was going on, and left swimming about in the water, mounted into his seat once more and led the way. It seemed that the crocodile had fixed on the elephant's leg, and refused to let go till torn away by the other elephants, who had somehow divined the plight of their companion. My only wonder was that the brute had not seized the mahout's leg instead, and so found an easy victim; but probably the covering from the elephant's ear and the proximity of the trunk had been his protection."

"On another occasion," Brown said, "when waiting for the down Calcutta steamer at a ghaat (ferry) of the same river, near its junction with the Berhampootra, where heavy jungle close at hand reached down to its banks, the rather alarming sight greeted me of a tiger emerging from the jungle on the opposite bank and descending to the water, which he entered and began swimming across. The distance from where I stood was not more than a couple of hundred yards, but though so near I had little to fear, as where I was standing I could easily obtain the means of protection or escape. While watching him through a binocular I noticed him, when about half across, begin to give signs of uneasiness, which unaccountably increased rather than diminished as he neared the opposite bank; and at last I made out a small black object about the size of a billiard ball floating alongside him on the water, and steadily progressing in his company. As he drew near the bank the object drew nearer him, and his plunges became more violent, till at last I could hear his roaring as he fairly bellowed with fright. When a few

yards from the bank the black ball disappeared, and immediately after the tiger, with a final piteous yell, sank below the surface, and we saw no more of him. The black ball was the horny nose of a crocodile that had been keeping him company—had, in fact, been playing with him as a cat with a mouse, of which the tiger was fully aware, before drawing him under, in an element where there could be no equality in the struggle. The crocodile would hold on by some part where there was least risk from the tiger's jaws—probably by the tail—till the poor brute was suffocated, then he was at his disposal. The only thing I grudged the wretch, however, on reflection, was his getting such a beautiful skin to mangle!"

By the time Brown finished his yarn we had come near enough the enemy for the *mulah* to whisper "Silence," and presently we doubled softly in through the rushes, and found ourselves in a large deep ditch that opened into the lake. This at the top of the bank bent suddenly round and ran parallel with the lake in the direction in which we were proceeding. This ditch we purposed making use of as a cover to approach the crocodiles. Hitherto the belt of rushes had afforded us cover, concealed approach by land being impossible owing to the open ground which the crocodiles' usual caution had selected. So getting out of the boat we crept up the ditch, and, turning the corner, came silently along for about a hundred yards till we reached an open plain *tope* (grove) that fronted the ditch, and was the landmark of the crocodiles' camping-ground. Rising cautiously, we found some small tufts of grass on the edge of the ditch, which served as a veil to peer through, and enabled us unseen to get a view of the bank below. There sure enough they were, quite a family of them, of all ages and sizes, from the truculent patriarch of eight foot to the infant of two, all perfectly motionless, and lying mostly broadside towards us, with one eye for the bank and another for the water. Not a movement betrayed that there was life in them, and they might easily be mistaken from a little distance for dirty logs of wood left by the water on the bank; but their wicked grey-green eyes were all the same fully awake, as well as their ears, to catch the slightest sign or sound of a suspicious kind.

Selecting two of the biggest for aim, who lay broadside towards us, at a signal we fired. For a little we could see nothing through the cloud of smoke, but could hear the snapping of jaws like the reports of percussion caps, which told that one bullet at least had taken effect. When the smoke cleared we saw one crocodile just reaching the water and making laboured efforts to get into it; while another, the *percussion-cap* one, still remained where he had been hit, practising his faucial muscles with terrible vehemence. Opening his jaws each time to their full width, he closed them again with a crash that suggested the temper he was in, and the use he would fain make of them. All the others had decamped to their aqueous strongholds.

Thinking the higher-up one *safe*, we made a rush for the one entering the water, and, though failing to arrest his escape, Brown, who reached him first, dealt him a thundering whack with his gun, which, however, only rebounded off his back without seeming to do much harm. The brute succeeded in getting into the water, but we soon found he was so disabled from the bullet that he could not dive, and only paddled slowly away on the surface, chiefly with the aid of sundry sweeps of his powerful tail. This evidently suggested to Brown his being *in extremis*, for, angry at losing his prize, and carried away by the excitement, without hesitating he began wading in after the enemy, till, getting beyond his depth, he turned round, threw his gun on the bank, and struck out in pursuit.

Being a powerful swimmer he was soon up

with the brute, and at once seized hold of the part nearest him—the tail. This was more than the crocodile could put up with, for, finding his progress arrested, he swung round his head, and I saw the gaping jaws close over Brown's arm. In the meantime I had dispatched the *mulah* in hot haste for the boat, and never did the time seem more interminable till it hove in sight. Badly disabled though the crocodile was, he was sufficiently dangerous, and I had still another fear, that some of his brethren might appear on the field in search of their missing companions.

Already I thought I could detect tinges of blood on the water, and Brown now seemed to have a hold of the monster's jaw with his other hand, as if making a vain attempt to relieve the imprisoned arm from its vice-like grasp. Rushing along the bank to meet the boat, and wading out to save delay in getting into it, in a second or two more with a dexterous use of the paddle we were alongside the crocodile and his victim, and a crashing

blow from an oar unlocked the iron grip and set Brown's arm free. In a pretty exhausted condition we took him on board, and he was breathless enough to show that we had just come in time to terminate the unequal struggle. His arm was severely lacerated, and he had lost a good deal of blood, but neither large blood-vessel nor bones seemed damaged, so, binding up the wounds securely, we turned our attention towards number two, that we had left practising muscular feats on the bank.

Brown with unimpaired spirits and energy urged the way. "Number two" had so far made use of his time that he was now within a foot or so of the water, and was making redoubled efforts to reach it on seeing our approach. On coming close up to him he met us with open jaw, but a few vigorous applications of the oar permanently put a stop to his progress. Turning now to look at the one on the water, we saw, what I had dreaded, several dark "knobs" floating round about the carcass, which showed that we had got

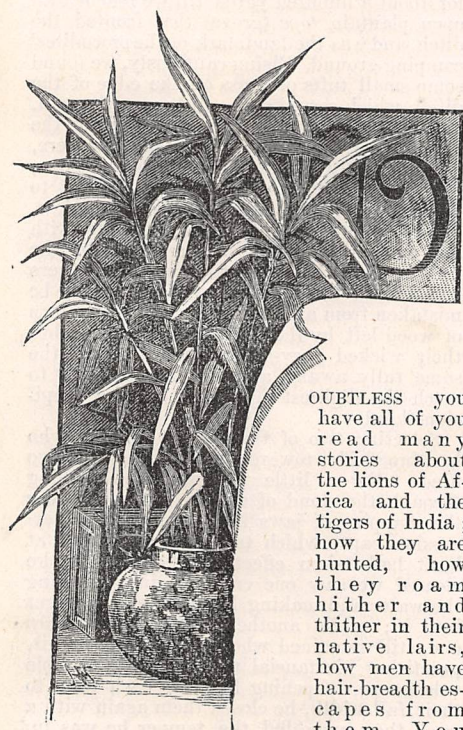

Brown out of the water not a minute too soon. They were the noses of the other crocodiles, who had come back to search for their missing friends! The sight gave Brown rather a turn, and he felt some satisfaction in making them suddenly vanish as a couple of bullets struck within an inch or two of their snouts.

The day was now breaking and the heavy mist rolling upwards in the sunshine like a silver cloud as we hurried home to get Brown rid of his drenched clothes and partake of breakfast with keenly-whetted appetites. On having the monsters opened we found too sure proof of the sad fate of the child in the shape of some poor calico fragments of the clothing it had last worn, which made us feel the more satisfied at the very unusual success of our shikar. Brown was little the worse either of his wounds or drenching, though he now bears several long ragged scars on his arm sufficient to remind him of his adventure.

(THE END.)

THE WILD ANIMALS OF CIVILISATION.

BY ALICE KING.

OUTLESS you have all of you read many stories about the lions of Africa and the tigers of India; how they are hunted, how they roam hither and thither in their native lairs, how men have hair-breadth escapes from them. You

have heard a great deal also about the buffaloes that frequent the trackless prairies, and travellers and hunters have given such exact accounts of all their habits that many of you could repeat them by heart. All these animals, dwellers in foreign lands, are as familiar to you, though they live in desolate, unpopulated parts of the world, as if you met them constantly walking down the street.

Very few, however, of our readers are probably aware that in England, within a short day's journey by rail from the roar and bustle of London, there is a region where wild animals wander about quite as much at their ease as the panther in the jungle or the giraffe on the plains of Africa. They are close to modern civilisation, and yet it does not drive them from their long-accustomed haunts. Let us pay them and their home a short visit to-day and see what they are like.

It is a crisp, sparkling September afternoon; we pass through the valleys, where the

red hand of autumn has just begun to stain the leaves, where the brooks are laughing and singing as brooks only do laugh and sing in this land so dear to the water-sprites, where the deep, warm colour of the Devon cattle is flecking here and there the green meadows; we get entangled in a long, winding lane, roofed with entwining branches, and draped with velvety green moss and feathery ferns; then all of a sudden we have emerged upon what seems a wondrous garden—a garden all radiant with purple and gold, as if it were prepared to welcome a king. We are out now on Dunkery, the highest hill in West Somerset—the hill which is the close neighbour of the wide, uncultivated tract of Exmoor.

What is that rising in front of us? It is Dunkery Beacon, a mass of rough stones now, but said formerly to have been a huge fire-place, which used to be set blazing to send a message concerning war or rebellion in troublous times to the distant mountains on the other side of the Bristol Channel in Wales. We are standing in the midst of a sea of golden gorse and purple heather, amid which there rise, here and there, the little whortleberry bushes, the speciality of this region. Let us throw ourselves down on the elastic couch of heath under the beacon, and when we have done looking at and admiring the stag's-horn moss—a rare plant, which is a native of the moorland, belonging to its highest botanical aristocracy, and which, in its growth, resembles in such a remarkable manner the antlers of a stag—let us watch to see if we can get a view of any of the animal inhabitants of the heath and moorland.

We have grown just a trifle tired of gazing at the heather-bells nodding to the breeze as it passes by, and our eyes have strayed, by way of a little change, out towards the sea, where a white-sailed vessel is dancing across the waves, and a steamer is speeding up Channel, with its pennant of wavy blue smoke floating behind it, when suddenly our attention is attracted by a whirring sound as of a wheel in some piece of machinery just set in motion. We turn quickly and see a glossy black wing glistening in the sunshine as it rises from among the gorse. This is a blackcock, a very eminent native of our West Somerset hills and moorlands, to shoot whom is the highest ambition of sportsmen in these parts. The black-game are an entirely different species of birds from the grouse of the Scotch and Cumberland moors; they are singularly elegant in shape and swift in flight, and as they dart through the sunbeams they

seem like the very embodiment of the brisk winds that bound over the heather. The black-game are peculiarly wary and cunning in the way in which they conceal themselves among the gorse. When you are riding over the hills they will often lie hidden till your horse's feet are almost upon them, then they will rise with a swing and a rush, and will often nearly unseat the bravest and most experienced rider that gallops over the moorland, for what horse will not bound and snort at such an unexpected apparition in his path?

Hark! What was that? It is like the sound of a little bell; tinkle, tinkle, tinkle, it comes over the hill-side, seeming to mount up from one of the little sheltered hollows, which, in this part of Somersetshire, they call "combes." A little party of the wild Exmoor sheep, which have been taking a siesta down in the cosycombe, are now coming up for a leisurely stroll over the heath. Their owners—for all these wandering flocks have owners, though it is difficult to say how they make their rights of ownership of any avail with such property—have fastened small bells round their necks in order that they may be able to find them should they be buried beneath the snow in winter, as is sometimes the case on the hills and moor.

They are curious little people, these Exmoor sheep. We apply the word "people" to them most advisedly, for their faces have as much wise expression, as much gravity of thought, in them as the countenances of the most venerable judges in the land. They have small, pert-looking horns that add to the piquant peculiar character of their physiognomy, and which convey the same impression as we should receive if we beheld one of the above-mentioned judges with a coquettish bonnet stuck on the top of his head. They are endowed with a cleverness and delicacy of instinct not found among the sheep family in general, and they stand gazing at us with as much meaning in their eyes as if they were making up their minds whether they should or should not find us pleasant company. The inspection does not appear to be regarded by them as very satisfactory, for, after a while, they turn and trot away with a rather contemptuous air.

We are falling into a light doze, for the September sun has a hot touch to-day in his rays, and nothing particular seems likely to happen, when we are roused with a start by a noise which is like nothing so much as a number of large sponges splashing in thick

water. We look wonderingly in the direction from whence the sounds come, and see a whole troop of fiery-eyed, tossing-maned, tiny horses splashing through a patch of green marshy ground not far from us. We have noticed before this island of verdure in the middle of the purple heather, and have come to the wise conclusion that there must be a strip of meadow land out here upon the hill, and have made a note in our minds of the remarkable fact. But now there comes a moment of rapid undeceiving. This bright emerald patch, which looks as if it might be a ballroom for the moorland fairies, is nothing more or less than a genuine Exmoor bog. There are many of these bogs on the hills and the moor, and some of them are so deep and treacherous that to get into them, especially after dark, is no laughing matter.

But to return to the brigade of small riderless cavalry which is charging towards us. These are the far-famed wild Exmoor ponies, who roam at will all over the moor and hills. They are a breed of beautiful and spirited little animals, remarkable for their small, mobile ears, which seem always to be in energetic, restless pantomime about something, their large brilliant eyes, and tiny heads, full of intelligence and expression. They are said to inherit these small, fine heads from an Arab horse that long ago was turned loose on Exmoor.

When caught and broken in the Exmoor ponies are found to be strong, courageous, and singularly sure-footed. They retain, however, their wild habits even in civilised stables, and start at the slightest sound and stare at every object they pass as if it were a ghost, and always show a rooted dislike to treading on soft ground, the bogs of their native moor always apparently living in their memories. They are often inveterate shyers, and it requires no mean horsemanship to sit and guide them. Small though they are, they are famous for peculiar wriggling, uncertain movements, which will sometimes speedily bring about a divorce between even experienced riders and their saddles.

We keep as still as statues on a monument as we lie on the heather, and, in consequence, the ponies draw near us and glance at us shyly but inquisitively. One little

fellow, who is evidently not much more than a baby, and who looks like a charger fit for an elfin king, even stretches out his head and snuffs the air around us curiously, and seems half inclined to come close and examine us with his small velvet muzzle. But see! one of us has made a sudden unwary movement. The ponies start back as if by a word of command given somewhere in the air. There is a snorting, a plunging, a flinging aloft of heads, a waving of manes, a switching of long tails, a scampering, a hurrying, and the whole band are out of our sight in a shorter space of time than it has taken to write this sentence.

The ponies have vanished, and we begin to ask, a little restlessly, Will there be anything more to be seen on the heather to-day? Let us wait with patience a while, and as we wait pick a piece of the stag's-horn moss and twine it round our hats, as Exmoor lads and lassies do in seasons of any village merry-making; it is an adornment which no Paris milliner can excel. Then let us look closer into the purple heath and notice how there is a little plant with a small white flower which creeps about among it, weaving with the heather-bells a delicate pattern that no loom can imitate. This is the little dodder, a native of the moorland and the hill, the very breath of whose life is the wind which bounds over the heath. Now let us turn our eyes again towards the far expanse of the hillside, just where it slopes downward, and see what we can discover there.

Several animals' shapes have just come in view in that direction, and as the sun shines upon them they appear to be of a reddish-brown colour. Are they cattle which have strayed up from the lowland farms? Let us look at them through our field-glass; what does it reveal to us? It shows high, broad-spreading antlers, which certainly belong to no bovine heads; it shows us a herd of the red-deer which wander all over the hills and valleys in these parts of West Somerset.

To judge from those spreading antlers, of which we have spoken above, there must be among them what is called "a warrantable deer," that is, a stag who has attained to the full honours of his head. For the first three years of his life a young red stag has yearly

a fresh branch added to his antlers, and when he is adorned with them all he is said to have "brow, bay, and tray." A full-grown stag with his full growth of antlers branching on his head is a splendid animal, with grace and strength combined in every movement. He and his hinds are not so shy of men and their habitations but that they will often trespass on the fields of a hill-country farmer and help themselves liberally to young wheat or turnips; and the farmer's wife and daughter frequently enjoy a view of them from their window.

The red-deer are hunted in the autumn of every year, and vast crowds, who come from miles distant, assemble for the first meet of the West Somerset staghounds, which is a most picturesque and beautiful sight, taking place, as it invariably does, in one of the most romantic valleys among the hills. Carriages flock to the rendezvous filled with ladies, and more adventurous dames and damsels are there in the saddle; there are gentlemen on thoroughbred horses, and village lads on their legs. The chase of the Exmoor red-deer is becoming year by year more popular, and not long ago it was honoured with the presence of Royalty in the person of the Prince of Wales.

If we have made acquaintance now with the highest nobility that dwell upon the heather, since we have seen a herd of red-deer, so we will leave it for a woody valley not far off, and watch beside a stream which is wandering through it with many a tricky, capricious wind and turn. Here, if we watch long enough, lying in the shade of the trees and keeping very still, we may perhaps catch a glimpse of a strange-looking animal with a head something like a big, awkward dog basking in the sunshine on the bank of the brook. This is the otter, the ogre of the streams, who makes dire havoc among the spotted silver trout; but a day of reckoning comes sometimes for him too, for there is a breed of hounds kept for the special purpose of hunting him.

Such are some of the wild animals who live next door to civilisation, and whose varied habits make, for any who have eyes to see, a new and happy study.

(THE END.)

OUR NOTE BOOK.

LONG BICYCLE RIDE.

Mr. H. R. Goodwin, of the North Manchester Bicycle Club, has lately completed one of the most remarkable rides ever accomplished on the bicycle. Leaving Land's End on June 1, he rode to John o' Groat's, having reached which point in seven and a half days he at once turned southward, and arrived again at Land's End on the 16th, having completed the double journey from one extremity of England to the other, or about 1,800 miles, in less than sixteen days. From Land's End Mr. Goodwin rode to London, where he arrived on the 19th, the total distance ridden being 2,050 miles in exactly nineteen days, or an average of 108 miles per day. He rode a 40in. "Facile," and arrived in London fresh and well, feeling, indeed, better in health than when he started. It is worthy of notice that Mr. Goodwin is a strict teetotaler and a non-smoker.

NATIONAL FLORAL EMBLEMS.

A list of National emblems may be worth preserving:—

England—The Rose.
Prussia—Corn Flowers.

Spain—Pomegranate.
Russia—Lime.
Saxony—Mignonette.
Ireland—Shamrock.
Scotland—Thistle.
France—Lily.
Greece—Violet.

It invests flowers with greater interest when we know their associations. Thus the violet, so shyly lurking in the village lanes, becomes a thing of dignity, as well as of beauty, when we know that it was the adored flower of the classic Greek when the Groves of Academus welcomed philosophic crowds.

THE SURGEON AND THE TIGER.

Many of our readers will be interested in a recent surgical operation which took place at Cincinnati. The unwilling subject was a tiger, who was suffering agonies from a malformation of one of its claws. "Dickie" was a powerful beast, and not too good-tempered in his most gracious moods, so it may be inferred that he was a difficult subject. However, the claw was clipped most successfully, though not without much trouble and no little danger. This is how it was done. In

one of the small compartments of the inner cage a low, strong temporary ceiling had been built. Several pieces of timber nailed together firmly were placed at one end of the compartment, and to these were attached four ropes reaching outside of the cage. The tiger was driven into the compartment, the sliding door closed, and six strong men began to pull at the ropes. This drew the frame close to the iron bars of the cage, with the tiger, now howling with rage, wedged between. He fought terribly, and with an enormous effort once broke the timbers. One of the operators, at the risk of losing an arm, reached into the cage over the writhing beast, and fastened the ropes. Finally, the tiger's right leg was caught in a noose and pulled straight out, while he was held in position by iron bars above, braced in the timbers at the back of him. All this time one of the men held a board in her jaws, which was crunched as if it were a biscuit. For a time it looked as if she would overpower the men, and the operation would prove a failure; but the keen-eyed surgeon watched his chance, and finally succeeded in extracting, with a knife and a heavy pair of pincers, the offending claw, and the beast was released. The claw was carried away as a relic.

HOW TO MAKE AN ASH COURT.

BY A CLUB SECRETARY.

LAWN TENNIS grows so much in popular favour that many who are without a suitable lawn, or who have neglected to attend to one, may be glad to know how a first-rate "court" can be made on any spare piece of ground at a comparatively trifling expense; one, too, which can be played on not only in summer but throughout the winter.

It is of course too late in the year to lay down turf for use this season, or even to roll a good surface on a piece of ground which is very rough. The dry summer which we have had this year has allowed the ground to bake too hard to allow of the roller having much effect. My suggestion is that a very excellent court can be made of cinders.

If any reader should think of carrying out my plan I would suggest that he should get up a "working bee"—that is, invite half a dozen or so of his friends to meet him and bring their spades, etc., and then all set to work to dig up turf, level the ground, roll, and do whatever else is to be done. In this way, if all work with a will, the court can be almost finished in one half-holiday, with the exception of rolling the surface.

But to begin at the beginning. Having obtained your ground—and any waste piece will do if it is not less than ninety feet by forty-five feet—the first thing to be done is to remove any grass or other plants upon it. It should then be levelled, and salt should be sprinkled over it in order to kill any roots or seeds which may remain, and so prevent them from growing up through your

court. If the soil is light, whether sandy or gravel, the court may be made level; but if stiff or clayey it is as well to allow a slight dip of from four to six inches from the middle to both ends; and if required for use throughout the winter, a foundation of brick rubbish is desirable, or the clay, as it becomes wet and soft, will work up through the cinders, and may give trouble in places, forming hollows in which rain will collect and prevent play.

Having levelled your ground, it is ready to receive the cinders, which, if the domestic supply fails, may be obtained to any amount from a factory or gasworks for a mere trifle. They must be sifted and the large cinders spread over the ground first, and rolled in so as to make a good solid foundation for the final layer of fine cinders. These should then be raked over the ground in strips of three or four feet in width, each strip being well rolled down before adding the next strip—much in the same manner as asphalt may often be seen laid down in the City. Great care should be taken to ensure a uniform depth of cinders all over the court, so that the surface shall be level. The depth of cinders will of course depend upon the quantity at disposal, but if enough can be obtained to allow a depth of from two to two and a half inches of the sifted material, that will be found quite sufficient.

Before commencing to play, the court should be well rolled every day for a week or ten days, until the cinders have become

thoroughly set. It may then be marked out in the usual way with whitening—seventy-eight feet in length and thirty-six feet in width for a double, twenty-seven feet for a single court, and the service-line twenty-one feet from the net.

If a sufficient quantity of cinders cannot be obtained, a mixture of cinders and brick-dust has been found to answer, but this requires more watering in dry weather. If gravel is more easily obtained than either of the above a very fine court may be made of it, having this advantage, too—that it is cleaner and does not blacken the balls. In rolling it, however, a very plentiful supply of water must be used, so as to work the fine particles up, making a kind of cement, and when once made it should be left for a day or two until it is perfectly set and dry before playing or even walking over it. If any of my readers have spent a holiday at Ilfracombe, in North Devon, they will remember the gravel court on the pier, which is always well patronised.

Such a court as I have described will, if proper care is taken in making it, play as true, and even truer, than a great many turf courts. I was playing on one which cost but a few shillings to make last Easter Monday, and had many exciting games, and I was assured that it had been played on all through the Christmas holidays. The gentleman who had made it had merely taken off the turf in the corner of a field, spread cinders over the ground, and well rolled them.

OUR PRIZE COMPETITIONS.

(SEVENTH SERIES.)

V.—Literary Composition—"A Story Needing Words."

(Continued from page 799.)

MIDDLE DIVISION (ages from 14 to 18).

Prize—One Guinea.

THOMAS DALE (aged 17), 33, Coupland Street, Greenhays, Manchester.

Certificates.

WILLIAM JOHN JOELING, 154, Evelyn Street, Deptford, S.E.

JOHN BULL, Great Milton, near Tetworth, Oxon.

ERNEST H. HOLDEN, Whitechurch, Salop.

IVYRE MCILWRAITH, Kirklauchlin, Sandhead, Wigton.

EDWARD NOEL HUMPHREYS, 8, Derby Place, Hoole, Chester.

J. A. CRUMPLEN, 26, Albert Street, Regent's Park, N.W.

HARRY VINCENT PRISK, 6, Woodland Terrace, Plymouth.

THOMAS HENRY JENKINS, 21, Leadworks Lane, Chester.

WILLIAM L. CAREY, Munster Bank, Skibbereen, Co. Cork.

HERBERT HAMILTON FOX, 13, Cromwell Crescent, South Kensington, S.W.

LESLIE GORDON SARJANT, The Vicarage, Burbage, near Buxton.

D. N. LANG, 92, Hill Terrace, Middlesboro'-on-Tees.

ALFRED HUNTER, 24, West Hill Street, Brighton.

JOHN MITCHELL, 28, Orchard Street, Paisley.

ROBERT MASSON SMITH, P. O. Box 86, St. Boniface, Manitoba, Canada.

ALEXANDER TAIT, Slap, Turriff, Aberdeen.

ARTHUR E. FREEMAN, 223, Brockley Road, Brockley, S.E.

J. G. MELVIN, Crown Hotel, Claremont, South Africa.

JAMES STEWART, Home for Little Boys, Farningham, Kent.

GEORGE A. J. FRASER, Goderich, Ontario, Canada.

JOHN TEASDALE SPENCER, 9, Townend Street, Groves, York.

RODERICK MACLEOD, Windhill, Beaulieu, Inverness-shire.

HAMILTON POOLE LYNE, 9, Victoria Gardens, Southsea.

EDWIN DAVIES, 27, Santley Street, Ferndale Road, Brixton, S.W.

GRACE LILIAN BRIGHT, Alvaston, Park Hill, Forest Hill.

ARTHUR EDWARD SCHOLES, 23, Nursery Street, Pendleton, near Manchester.

ALFRED THOMAS PAGE PHILLIPSON, Canbury Bank, Kingston-on-Thames.

HUGH WILLIAMS, Coffee Rooms, Builth, Brecon.

HENRY THOMAS SPENCER, 7, Fairfield Terrace, West Park Street, Dewsbury.

ALFRED ERNEST LAMBERT, 26, Hampton Road, Redland, Bristol.

LUTHER SEDGWICK, 12, Eastham Street, Burnley, Lancashire.

W. A. STANTON, 6, Shaftesbury Villas, Hornsey Rise, N.

JOHN WILLIAM TRISTRAM, The Barracks, Middle Head, Sydney, N.S.W.

GEORGE GREEN, Holmsdale, Blundellsan's, Liverpool.

WALTER TOTTLE, Chiltern House, High Wycombe.

GEORGE MELVILLE, The Parsonage, Calliaqua, St. Vincent, W.I.

JAMES EDWARD S. TUCKETT, 1, West Shrubby, Lower Redland Road, Bristol.

PERCY C. MAYWOOD, Westgate, Southwell, Notts.

LEONARD MARTIN, Sunny Side, Palace Road, Tulsa Hill Park, S.W.

WALTER MAY, The Green, Marlborough, Wilts.

JAMES MOFFATT, 18, Burnbank Gardens, Glasgow.

JOHN WILLIAM HENRY EYRE, Deal College, Deal, Kent.

GEORGE PERCY DUCKWORTH, Anantapur, India.

JAMES NORVAL NOBLE, Bean Street, Kimberley, South Africa.

JAMES DUNLOP, 1, Wellpark Place, Ayr.

WM. C. TAYLER, Jun., 20, Bridge Street, St. Helens, Lancashire.

ROBERT BARNES NAYLOR, 18, Round Hill Crescent, Brighton.

PERCY RAYMOND McDUGALL, Riversdale Road, Hawthorn, Melbourne, Australia.

ARTHUR CECIL HICKMAN, 3, Macklin Street, Derby.

THOMAS PERCY NUNN, The College, Weston-super-Mare.

JOSIAH HERBERT CUSHING, 39, Newmarket Street, Norwich.

JAMES VINCENT HORROCKS, 20, Newton Street, Darwen.

THOMAS GRENFELL, 17, Tregenna Terrace, St. Ives, Cornwall.

WILLIAM HENRY COOK, 69, Nisbet Street, Homerton.

ADAM LUKE GOWANS, 12, Campside Crescent, Langside, Glasgow.

ALBERT ERNEST WHITE, Grosvenor House, South Cliff, Scarborough.

JAMES CARGILL THOMPSON, 9, Queen Street, Arbroath.

CECIL BURNET, 40, Nottingham Place, W.

J. H. CHORLTON, Pitsmoor Vicarage, Sheffield.

FRANCIS GEORGE HILL, Kroonstad, Orange Free State, South Africa.

OUR OPEN COLUMN.

CANADIAN CANOE.

C. W. H. writes from Chew Magna, near Bristol: "I have built a canoe from instructions given in your valuable paper, under the heading 'The Canadian or Birch-bark Canoe,' and it answers admirably. I used red deal for everything except the ribs, and those I made of ash, an eighth of an inch thick and two inches wide, and covered it with stout canvas outside. It is very light and buoyant; I can easily carry it myself. It is thirteen feet long, two feet wide, and one foot deep amidships. It will hold two comfortably. I screwed on a small exterior keel about two inches deep as advised, and that makes it very steady. I have not had a capsized yet."

"I should advise any one making one of these canoes to tack a narrow strip of zinc or copper round the gunwale, as the canvas is very liable to wear through."

"I painted mine drab inside and mid-blue outside, with a stripe of white running round. It was very easily made, and does not require much previous knowledge, if you follow the instructions given in your valuable paper."

SHOOTING THE RAPIDS.

Amy J. Taylor writes to us from Montreal: "I have been so interested in reading your account of shooting the Lachine Rapids that I can not help writing to you. We spend every summer in Lachine, and often make up a party to shoot the rapids, coming back *via* the locks; and I think there is a delight that does not wear off in standing at the bow of the vessel and watching the waves whirling around the rocks and dashing against the sides of the boat as it swings in and out, zigzag fashion, between the masses of

rocks; and then the feeling that all on board are in the power of Big John (whose portrait you have published), makes one regard the benign and sociable old Indian with a sort of reverential awe. Coming up the locks is a pleasant reaction, as everything is smooth and calm in the quiet moonlight, as we rise higher and higher, till the sound of rushing water ceases, and we once more regain level water and quietly resume our way, till a light in the distance proclaims our little trip almost over. Gradually slowing up to the wharf, one feels as though we were approaching a city of the dead, as, though not yet ten o'clock, most of the Lachmiers have retired, and the rest, with lights extinguished, are enjoying the moonlight.

"The last time we ran the rapids we learnt that a friend of ours and two English gentlemen were to shoot them in a 'frail, brown-papery-looking' canoe with three Indians. As they started before we did, when we reached Montreal we anxiously inquired after our ambitious friends, and were told that nothing had been seen of them. Farther on, however, we overtook the canoe, and the enthusiasm which was manifested on their part made us feel that, though going down on a steamer was grand, yet it was not to be compared with doing it in a canoe."

A. C. GREEN.—1. An "odometer" is probably a log of distance measurer. 2. The Riachuelo steams seventeen knots, the Esmeralda eighteen knots. 3. Send to Mr. T. Fletcher, F.C.S., Warrington, Lancashire, for a price list of his gas cooking-stoves; or apply to Deane, Monument Yard. 4. The Williseden waterproofing process consists in the application of Schweitzer's solution of cellulose in ammoniacal oxide of copper. 5. It is said to require a hundred distinct machines to make the movement of a watch—that is, excluding the case, dial, hands, spring, and balance.

GODDARD.—To etch on silver you have to cover the plate with a thin layer of wax—a mixture in equal parts of asphaltum, Burgundy pitch, and beeswax is best—scratch in the design with a needle-point, and bite it out with dilute nitric acid. The wax prevents the acid attacking the silver, hence the metal is only affected where the wax has been scratched away.

J. C.—Quite so; but there is no mystery. The "Model Yachtsman" used to cost one penny, and its price was raised to twopenny while our answer was in the press.

W. SMITH.—Mr. Harrington Keene's "Practical Fisherman" is published at 170, Strand, by L. U. Gill, and costs ten shillings and sixpence. "Fishing Tackle, and how to make it" can only be had by purchasing our third volume, price seven shillings and sixpence.

A. MCKENZIE.—See our article on the Highland Clans in the fifth volume.

T. F. L.—An orange-tree in the third year of bearing is estimated as being worth £10; and as there are about sixty trees to an acre, you can calculate the value of the plantation for yourself. A new orange-grove is worth about £100 per acre.

J. WESSLER.—1. The trade with the Carolines is done by means of small craft, making Fiji or Tahiti their headquarters. 2. A very serviceable canoe, one foot deep, two feet wide, and eighteen feet long, could be built of cotton; but the cotton should be so strong that canvas would be just as light, and under any circumstances would wear longer. 3. Give up the idea of corresponding with foreigners. Books are the best friends.

KENULF.—1. Always throw the accent back as far as possible, and pronounce the words with the emphasis on the first syllable. 2. An unintentional coincidence, due to old-style English having been used where possible.

A. O. Z.—We have so many plates in hand that we shall not have a vacancy for some time. However, we have made a note of the subject, and may bring it on in the good time coming.

M. CHOLMONDELEY.—The coloured plates are only presented with the monthly parts; but they can be purchased in a packet at the close of the volume for about twenty pence. As an annual subscriber you would have no advantage over other purchasers. We have a special cover for binding the volumes; it is that used for the Annual. The price is given in the last number for September in each year.

POLES.—The seven senses are—seeing, hearing, tasting, feeling, smelling, understanding, and speech. The seven virtues are—faith, hope, charity, prudence, justice, fortitude, and temperance. The seven deadly sins are—pride, wrath, envy, lust, gluttony, avarice, and sloth.

T. A. L.—Troy weight was current in England at the time of the Confessor. The name is said not to come from Troyes, but from Troynovant, the old name for London. See "Faery Queene"—"And Troynovant was built of old Troyes' ashes cold." Troy, with the twelve—the old English ten—is the old English weight; avoirdupois, with the sixteen, is the Norman weight. Troynovant was the Civitas Trinobantium.

G. T. P.—1. Shot are of standard sizes. Of No. 12, which is .05 inches in diameter, 2,326 go to the ounce; the sizes then increase by hundredths of an inch up to .23 of an inch; and of these twenty-four shot go to the ounce. Buckshot range from .22 to .38, and are moulded, not dropped. 2. You can make a pencil to write on glass by mixing together one part of lampblack, one part of tallow, and four of white wax. Dark-blue pencils are made of three parts of Berlin blue, two of tallow, and one of gum-arabic.

N. N.—The examination in most cases merely consists of half a dozen long bills of parcels or practice sums, and a few of heavy compound addition—in fact, the first four rules of arithmetic—and handwriting.

EDWARD F.—The pay of a private in the Life Guards is 1s. 9d. per day; in the cavalry of the line 1s. 2d.; in the Foot Guards 1s. 1d.; in the infantry of the line 1s.; in the West India regiments 9d. A corporal in the line regiments gets 1s. 8d.; in the infantry 2s.; in the cavalry, a sergeant 2s. 4d. and 2s. 8d. A colour-sergeant has 5s.; and a sergeant-major five shillings. In the scientific corps the pay is slightly higher. Trumpeters, buglers, fifers, pipers, drummers, etc., get from 1s. 1d. a day in the line to 1s. 11d. in the Life Guards. All boys under eighteen get eightpence a day. The pay of an able seaman in the Royal Navy is 1s. 7d. per day. Boys in the Navy, second class, get 6d.; first class, 7d. per day. Ordinary seamen, second class, get 1s.; first class, 1s. 3d. per day. Leading seamen get 1s. 9d. Captains of the mast and mizen-top get 1s. 11d. Quartermasters, captains of the quarterdeck, forecabin, hold, foretop, and maintop get 2s. 2d. per day. The chief quartermaster, gunner's mate, or boatswain's mates, get 2s. 7d. per day. The warrant officers, from the chief gunner, chief boatswain, or chief carpenter downwards, get from 9s. to 5s. 6d. per day.

D. S. C.—1. Calico printing is "dyeing wholesale," so is glove-dyeing, wool-dyeing, silk-dyeing, etc., etc. All coloured fabrics are dyed. You will find the various processes fully described in the second series of Spon's "Workshop Receipts." 2. With regard to "domestic tints" you can choose from the following scale, which gives the usual colours and the colours they can cover:—

Amber will dye amber, black, brown, claret, crimson, green, maroon, scarlet.
Black Wool goods will dye black, brown, claret, dark green, or maroon.
Black Velveteens will dye brown, crimson, claret, green, prune, violet, or ruby.
Black Silks, Satin, Broad Cloth, and Velvets, being fast, can only be re-dyed black.
Light Blue will dye black, brown, claret, crimson, green, maroon, prune, violet.
Dark Blue will dye black, brown, claret, green, maroon.
Brown will dye black, brown, claret, dark green, maroon.
Claret will dye black, brown, claret, dark green.
Crimson will dye black, brown, claret, crimson, green, maroon, prune, navy blue.
Drab and grey will dye black, brown, claret, crimson, green, prune, scarlet, navy blue, violet.
Green will dye black, brown, claret, crimson, green, maroon, prune.
Lavender will dye almost any colour, except light blue, pink, scarlet, straw.
Mauve will dye black, brown, blue, claret, crimson, green, maroon, prune.
Magenta will dye black, brown, blue, claret, crimson, green, prune, violet.
Maroon will dye black, brown, claret, dark green, maroon.
Pink will dye nearly any colour.
Prune will dye black, brown, claret, green, maroon.
Rose will dye black, brown, claret, dark and light crimson, maroon, green, magenta, mauve, violet, prune, scarlet.
Straw will dye almost any colour.
Scarlet will dye black, brown, dark blue, claret, crimson, green, maroon, prune, scarlet.
Slate will dye black, brown, dark blue, claret, maroon, green, violet, prune.
Violet will dye black, brown, claret, maroon, prune, or violet again, if not too faded.
White Silks, Satins, Wools, etc., will dye any colours.

A YOUNG CLERK.—"A form of a letter from a clerk to his master asking for a rise of his weekly salary" is one that has not yet got into the commercial handbooks. Are you not equal to the task yourself? Say that you beg to apply for an increase of wages, having been in the employ so many years, and done your work efficiently, and to your master's satisfaction. End with "yours respectfully."

EGG COLLECTOR.—The plate of Birds' Eggs was in the second volume; that of the British birds was in the part for June, 1882.

ORNITHOT.—1. The first good book on British Birds was Montagu's "Ornithological Dictionary" in 1802, which has appeared in many editions, the last under care of Mr. Newman in 1883. Selby's "Illustrations of British Ornithology" appeared in 1833, or rather finished in that year. Jenyns' "Manual of British Vertebrate Animals," in which due honour was given to the birds, appeared in 1835. Meyer's "Coloured Illustrations of British Birds and their Eggs" appeared in 1843, and there have been subsequent editions. Macgillivray published a "History of British Birds" in 1837, and Yarrell's first came out in the same year. Yarrell's has been often reprinted, and ranks as the standard book on the subject. In the Naturalists' Library there are four volumes on the "Birds of Great Britain and Ireland." 2. Birds are only glorified reptiles; they are animals so similar to reptiles in all the most essential features of their organisation that they may be said to be merely an extremely modified and aberrant reptilian type; and it is on this fact that all the modern classifications are based. That now in vogue divides the class aves into—1. Saururus, with Archaeopteryx the only known form. 2. Ratites. 3. Carninate. In the Ratites are two divisions, the first with teeth, as Hesperornis, and the second without; and in the Carninate are two divisions, the first with teeth, as Ichthyornis, and the second without. The Ratites have six orders, of which the representatives are the ostrich, the rhea, the emu, the dinornis, the kiwi, and the apyornis; and all the rest of the birds belong to the Carninate. The crow is the bird of the highest development; he is the chief of the kingdom, with the largest brain, and the most wit and wisdom.

TOM SMITH.—We strongly advise you to choose another trade. In an actor's calling, taking it at its best, and saying nothing of its associations, there are so many blanks to the few prizes that it is more of a starving than a living to thousands that follow it. You may of course have the exceptional ability that may bring you to the front, but, judging from your letter, we should think that the very reverse was the case.

W. P.—1. Use a little ammonia in cleaning the coins. Do not rub them too hard with the brickdust or rottenstone, or you will erase the inscriptions. 2. An acid that will dissolve the rock will dissolve the fossil it contains, hence the only way to work out specimens is with a hammer and small pointed chisel. In chalk and the softer rocks it is a good plan to saw down the block to a proper size; you thus save the chance of an unlucky fracture.

P. F. W.—A particular lugger may sail closer to the wind than a particular cutter, but that is because the hull is of better design. Sail plan for sail plan, the cutter's is the most weatherly, and it is simply not the fact that luggers sail closer to the wind.

ZECMOLOGIST.—1. The figures on the carboys in a druggist's shop are the old symbols of the metals supposed to be used in producing the coloured liquid which the jar, or the skins of the jar, contain. It is merely supposition. We have given instructions how to make the colours; see back. 2. You would be ineligible for any Government appointment. What is the use of a medical examination if it is not to weed out the sickly and the faulty?

D. N. D.—1. You will find a great deal about insect fertilisation, and the different plans of the flowers, in Dr. J. E. Taylor's "Sagacity and Morality of Plants." 2. Samaras are characteristic of the maple, ash, elm, and birch families. They act on the principle of the screw propeller, so that the seeds are borne great distances. The sycamore of our parks is not the sycamore of the Bible. Our sycamore is a maple, the Syrian sycamore is a fig. If you will translate the botanical name of our sycamore, *Acer pseudoplatanus*, you will see at once how the mistake arose.

PHILEMON ET BAUCIS.—1. He was Major Wolsley, of the King's Own Borderers. 2. Yes: see answer to CHRISTOPHER.

CHRISTOPHER.—An M.C.C. eleven is merely selected as a trial team, just a little stronger than their opponents, to teach them how the strict game should be played. The fact of the match being drawn or lost is only of value for comparison with schools and clubs that have played on the same tour the same M.C.C. eleven; and it is simply ridiculous for a club to consider itself more than the equal of the Australians because it happened to win by one wicket a match against a trial team from Lord's. The M.C.C. beat the Australians; the Fly-aways beat the M.C.C.: ergo, the Fly-aways are the champions of the world! Delightful! What next?

LITTLE-A-JOOK.—Unless you can clean off the finger-marks with turpentine or ammonia you will have to re-copper the boat.

J. R. S.—1. A tortoise does not require much water. Feed it on lettuce and vegetables. 2. You could not do better than join a volunteer corps, but do not join unless you mean to be an Efficient.

DESIROUS TO KNOW.—Defacing coins of the realm for any purpose, ornamental or otherwise, is a punishable offence. Practise the art of jewellery on foreign money, and then you will be safe.

T. HEDDLE.—1. The address is Messrs. Simpkin, Marshall, and Co., London; or, if you wish to be very particular, Stationers' Hall Court, London, E.C. 2. Racing boats are built of mahogany, but pine will suit your purpose very well, and is easier to work.

IGNARUS (Perth).—All the volumes are kept in print as volumes, but not as separate numbers, except in the case of the last three volumes, which can be had in any form.

E. A. V.—Natural gas is used in many places, among others at Pittsburg, in the United States. The gas there issues from strata from 1,200 to 1,500 feet below the surface, and when bore-holes are put down to the natural accumulation it rises under a pressure of from 150 to 200 pounds per square inch. The first of the gas wells in the district was discovered at Murraysville, where a company of oil seekers were boring for oil but hit upon the gas. Pipes were laid down, and the gas was conveyed to the neighbouring mills. Other wells were afterwards bored, and the whole district is now fitted with six and eight-inch mains, taking the gas from the wells to the mills and foundries.

A RUGBY SCHOOL BOTANIST.—The buttercup belongs to the Ranunculaceae, the stock to the Cruciferae. The best plan is to fix the plants to the page with little strips of paper arranged so as to hold down the chief stems. Do not gum the plant to the paper; if you do it will blacken and spoil.

BRIERLEY HILL.—As soon as the present competitions are cleared off we shall have a new series.

S. LOWER.—1. The ball first fell at one o'clock at Greenwich Observatory in 1833. 2. The lead soldiers come from Berlin; the tin carriages from Wurtemberg; and the Noah's Arks from Saxony.

M. BARSLEY (Port Lyttleton, N.Z.).—Many thanks for your letter regarding the albatrosses and flying-fish in our last volume. We quote from it: "During my experience of more than thirty years of nautical life in all climes, I never yet saw flying-fish more than a few degrees outside of the tropics; while the albatross, as is well known, never comes much farther north than the latitude of 30° S. Again, the albatross does not catch its food on the wing, but always, as far as my experience goes, first settles down in the water. Further, I have caught numbers of albatrosses, and, on being opened, never found in the stomach of any of them any fish except squids, which may be often seen floating dead on the surface."

W. J. PALETHORPE.—The articles were in the second and third volumes, now only to be had in volume form, price seven shillings and sixpence each.

L. P.—You procure a coconut costing threepence, and a lathe and tools costing five pounds; and with these, after much practice, you may succeed in making a farthing ring. Could you not employ your time more profitably?

A. M. BRADFORD.—To get the canvas to fit the canoe begin to nail it on from the straight edge, and, tightening at each half inch, nail it gradually round, and it will stretch to shape as you go.

INQUISITEUR.—There is nothing so very strange about it. See our article on Chinese Gordon on May 3, 1884, in the June part twelve months before the portrait.

A WOULD-BE MIDDY.—In the second volume you will find three plates of a full-rigged ship—one showing her spars, another showing her rigging, and the third showing her sails.

O. S. B.—Vast quantities of flowers are gathered for perfumery purposes. Each year it is estimated that 1,860 tons of orange flowers are used, besides 930 tons of roses, 150 tons each of violets and jasmynes, 75 tons of tube-roses, 30 tons of cassia, and 15 tons of jonquills! The orange-flower harvest is from the 20th of April to the end of May; the rose harvest extends through May; the violet harvest takes place in January, February, and March; the jasmine harvest from July to October; the cassia harvest in the last three months of the year; and the jonquill harvest is in February and March. Nearly 60,000 gallons of scent are made annually; and 10,000 ounces of musk alone are imported. *Rondeletia* is made of two pints of vanilla added to one each of musk and civet, and an ounce each of attar of roses and Mitcham lavender.

J. NORTH.—1. Petroleum has been known by civilised man from the dawn of history. Even Herodotus describes the springs of Zante; and Pliny and Dioscorides had something to say about the oil of Agri-gentum. The springs of Baku were noted by Marco Polo. 2. By no means; the Britons had a gold coinage for 150 years before the birth of Christ. The coins were copied from those in use in Gaul, which were themselves copied from those of Philip of Macedon. Hence the early British coins have the head of Apollo and the two-horsed chariot.

AREONORT.—You seem to be rather up in a balloon as regards orthography! To prevent the gas making its way through the rubber, fill the balloon, and give it a coat of varnish while it is inflated.

Reginald Cruden

A TALE OF CITY LIFE.

BY TALBOT BAINES REED,

Author of "My Friend Smith," etc., etc.

CHAPTER XXVI.—TURNING OVER LEAVES, NEW AND OLD.

A VERY few words more, reader, and my story is done.

The trial of Medlock and Shanklin took place in due time, and among the witnesses the most important, but the

most reluctant, was Reginald Cruden. It was like a hateful return to the old life to find himself face to face with those men, and to have to tell over again the story of their knavery and his own folly. But he went through with it like a man.

The prisoners, who were far more at

"Turning over leaves, new and old."

their ease than the witness, troubled him with no awkward cross-examination, and when presently the jury retired, he retired too, having neither the curiosity nor the vindictiveness to remain and hear their sentence.

On his way out a familiar voice accosted him.

"Cruden, old man, will you shake hands? I've been a cad to you, but I'm sorry for it now."

It was Blandford, looking weak and pale, with one arm still in a sling.

Reginald took his proffered hand eagerly and wrung it.

"I've been bitten over this affair, as you know," continued Blandford, "and I've paid up for my folly. I wish I could come out of it all with as easy a conscience as you do, that's all! Among them all I've lost a good deal more than money; but if you and Horrors will take me back in your set there'll be a chance for me yet. I'm going to London University, you know, so I shall be staying in town. Harker and I will probably be lodging together, and it won't be my fault if it's far away from your quarters."

And, arm-in-arm, the old schoolfellows walked, with their backs on the dark past and their faces turned hopefully to the future.

Had Reginald remained to hear the end of the trial he would have found himself the object of a demonstration he little counted on.

The jury having returned with their expected verdict, and sentence having been passed on the prisoners, the counsel for the prosecution got up and asked his lordship for leave to make one observation. He spoke in the name of the various victims of the sham Corporation when he stated that his clients desired to express their conviction that the former secretary of the Corporation, whose evidence that day had mainly contributed to the exposure of the fraud, was himself entirely clear of any imputation in connection with the conspiracy.

"I should not mention this, my lord," said the counsel, "had not a certain justice of the peace, in another place, at an earlier stage of this inquiry, used language—in my humble opinion harsh and unwarranted—calculated to cast a slur on that gentleman's character, if not to interfere seriously with his future prospects. I merely wish to say, my lord, that my clients, and those of us who have gone fully into the case, and may be expected to know as much about it even as a north-country alderman, are fully convinced that Mr. Cruden comes out of this case with an unsullied character, and we feel it our duty publicly to state our opinion to that effect."

The counsel sat down amid signs of approval from the Court, not unmixed with amusement at the expense of the north-country alderman, and the judge, calling for order, replied, "I make no objection whatever to the statement which has just fallen from the lips of the learned counsel; and as it commends itself entirely to my own judgment in the matter, I am glad to inform Mr. Cruden, if he be still in court, that he will quit it to-day clear of the slightest imputation on his character unbecoming of an upright but unfortunate gentleman."

Reginald was not in court, but he read

every word of it next day with grateful and overflowing heart.

Three months have passed. The winter has given way to spring, and No. 3, Dull Street is empty. Jemima Shuckleford still nurses her sorrow in secret, and it will be a year or two yet before the happy man is to turn up who shall reconcile her to life and disestablish the image of Reginald Cruden from her soft heart. Meanwhile she and her mother are constant visitors at the little house in Highbury where the Crudens now live, and as often as they go they find a welcome. Samuel writes home from the country that he is doing great things, and expects to become Lord Chancellor in a few years. Meanwhile he too contemplates matrimony with a widow and four children, who will probably leave him among them very little leisure for another experiment in the amateur detective business.

The Shuckleford ladies were invited, but unfortunately were unable to go, to a little quiet housewarming given by the Crudens on the occasion of their taking possession of the new house.

But though they could not go, Miss Crisp could, and, as a matter of course, Mr. Booms, in all the magnificence of last year's spring costume. And Waterford came too, and young Gedge, as did also the faithful Harker, and—with some little trepidation—the now sobered Blandford.

The company had quite enough to talk about without having to fall back on shouting proverbs or musical chairs. Indeed there were several little excitements in the wind which came out one by one, and made the evening a sort of epoch in the lives of most of those present.

For instance, young Gedge was there no longer as a common compositor. He had lately been made, youth as he was, overseer in the room of Durfy; and the dignity of his new office filled him with sobriety and good humour.

"It's no fault of mine," said he, when Mrs. Cruden congratulated him on his promotion. "If Cruden hadn't stood by me that time he first came to the 'Rocket,' I should have gone clean to the dogs. I mean it. I was going full tilt that way."

"But I went off and left you after all," said Reginald.

"I know you did; and I was sorry at the time you hadn't left that cab horse to finish his business the evening you picked me up. But Horace here and Mrs. Cruden—"

"Picked you up again," said Waterford. "Regular fellow for being picked up, you are. All comes of your habit of picking up types. One of nature's revenges—and the last to pick you up is the 'Rocket.' What an appetite she's got, to be sure!"

"I should think so from the way she swallows your and Horace's lucubrations every week," says Gedge, laughing. "Why, I actually know a fellow who knows a fellow who laughed at one of your jokes."

"Come, none of your chaff," said Horace, looking not at all displeased. "You never laughed at a joke, I know, because you never see one."

"No more I do. That's what I complain of," replied the incorrigible young overseer.

"Never mind, we shall have our revenge when he has to put our joint novel in print," said Waterford. "Ah, I thought you'd sit up there, my boy. Never mind, you'll know about it some day. The first chapter is half done already."

"Jolly work that must be," says Harker. "More fun than higher mathematics and Locke on the Understanding, eh, Bland?"

"Perhaps they would be glad to change places with us before they are through with it, though," observes Blandford.

"Never knew such a beggar for grinding as Bland is turning out," says Harker. "He takes the shine out of me; and I'm certain he'll knock me into a cocked hat at the matric."

"You forget I've lost time to make up," replies Blandford, gravely; "and I'm not going to be content if I don't take honours."

"Don't knock yourself up, that's all," says Reginald, "especially now cricket's beginning. We ought to turn out a good eleven with four old Wilderhams to give it a backbone, eh?"

And at the signal the four chums somehow get together in a corner, and the talk flies off to the old school days, and the battles and triumphs of the famous Wilderham Close.

Meanwhile Booms and Miss Crisp whisper very confidentially together in another corner. What they talk about no one can guess. It may be collars, or it may be four-roomed cottages, or it may be only the weather. Whatever it is, Booms's doleful face relaxes presently into a solemn smile, and Miss Crisp goes over and sits by Mrs. Cruden, who puts her arm round the blushing girl and kisses her in a very motherly way on the forehead. It is a curious piece of business altogether, and it is just as well the four young men are too engrossed in football and cricket to notice it, and that Gedge and Waterford find their whole attention occupied by the contents of the little book-case in the corner to have eyes for anything else.

"Jolly lot of books you've got," says Waterford, when presently the little groups break up and the big circle forms again. "I always think they are such nice furniture in a room, don't you, Mrs. Cruden?"

"Yes, I do," says Mrs. Cruden; "especially when they are all old friends."

"Some of these seem older friends than others," says Waterford, pointing to a corner where several unbound tattered works break the ranks of green-cloth gilt-lettered volumes. Look at this weather-beaten little fellow, for instance, a bit of a 'Pilgrim's Progress.' That must be a very poor relation; surely you don't count him in?"

"Don't I?" says Reginald, taking the book in his hands, and speaking in a tone which makes every one look up at him. "This little book is worth more to me than all the rest put together."

And as he bends his head over the precious little relic, and turns its well-thumbed pages one by one, he forgets where he is, or who is looking on. And a tear steals into his eyes as his mind flies far away to a little green grave in the north country over which the soft breezes of spring play lovingly, and seem to whisper in a voice he knows and loves to remember—"Come there too, gov'nor."

(THE END.)

FIGHTING THE FLAMES.

A. FOREST FIRE IN CANADA.

BY THE REV. W. H. WITHROW, M.A., TORONTO.

It often happens that from the carelessness of settlers or lumbermen in Canada forest fires break out and sweep over many miles. Perhaps a farmer is clearing his land by burning the trunks and stumps of felled trees, and leaves the log-heap partly burned out. But at night a rising wind may fan the embers to a flame and carry the sparks to a neighbouring fence or the adjacent forest, and before he is aware the whole countryside is ablaze. The same result may follow from hunters or lumberers leaving their camp fires not completely extinguished.

This is especially apt to be the case in the "fall" of the year, when the whole country is dry as tinder from prolonged summer drought. Sometimes many farm-buildings, and even entire villages, have been thus destroyed, and even navigation on the St. Lawrence has been obstructed by the smoke of these forest fires.

In the year 1825 the greatest of these disasters on record befell the province of New Brunswick. For two months not a drop of rain had fallen, and the streams were shrunken to rivulets. On the 7th of October a storm of flame swept over the country for sixty miles—from Miramichi to the Bay of Chaleurs. A pitchy darkness covered the sky, lurid flames swept over the earth, consuming the forest, houses, barns, crops, and the towns of Newcastle and Douglas, with several ships upon the stocks. Resistance was in vain, and escape almost impossible. The roar of the wind and fire, the crackling and crashing of the pines, the bellowing of the terrified cattle, and the glare of the flames, were enough to appal the stoutest heart. When that fatal night had passed, the thriving towns, villages, and farms over an area of five thousand square miles were a charred and blackened desolation. A million dollars' worth of accumulated property was consumed, and the loss of standing timber was incalculable. One hundred and sixty persons perished in the flames or in their efforts to escape, and hundreds were maimed for life. The generous aid of the sister provinces and of Great Britain and the United States greatly mitigated the sufferings of the hapless inhabitants made homeless on the eve of a rigorous winter.

But such forest fires are quite exceptional in Canada; the writer, although a native of the country, has never seen but one—that which he endeavours to describe in the following sketch.

As he was sailing one day on one of the beautiful island-studded bays on the northern shore of Lake Huron—on this lake are no less than thirty thousand islands marked in

the Government charts, and many more unmarked—he became aware of a pungent odour in the air, and soon after of a dense smoke drifting from the land. He thought nothing of it, however; but next morning Mr. Perkins, the farmer with whom he lodged, remarked, "The fire's a-gettin' nearer; I wish the wind 'ud change—been burnin' in the woods north there better'n a week."

All day the smoke grew denser, darkening the sun and irritating the eyes. During the night the flames could be seen leaping from tree to tree in the forest that engirdled the little clearing, and running rapidly along the ground in the dry brushwood. The tall pines could be seen burning like gigantic torches in the darkness, and then toppling over with a crash, scattering the sparks in a brilliant shower far and wide, to extend the work of destruction. Great tongues of flame hissed and crackled like fiery serpents enfolding their prey.

No human effort could avail aught to withstand or avert this fiery plague. Only the good providence of God by sending rain or turning the wind could stay its progress. The next day was intensely hot. The earth seemed as iron and the heavens as brass.

All in a hot and copper sky
The bloody sun at noon
Right up above the trees did stand,
No bigger than the moon.

It seemed like the terrors that followed the trumpet of the fifth angel in the Apocalypse: "There arose a smoke out of the pit like the smoke of a furnace; and the sun and the air were darkened by reason of the smoke of the pit."

On came the flames, roaring like a hurricane. The heat became unendurable, the smoke almost stifling. The cattle fled to the streams and stood in the deepest pools, sniffing the heated air. The water became gradually warm as it flowed over the heated rock and through the burning woods; and the fish that were in it floated on the surface in a dead or dying state. Fences were torn down, and broad spaces of earth were turned up by the plough, to break the progress of the deluge of fire, before which stacks of hay and straw were licked up like tinder.

Many of the villagers stored their little valuables, and as much of their grain as they could, in the underground "root-houses," and banked them up with earth. Many had abandoned everything and fled to the islands. Mr. Perkins, with most of the men, remained

to fight the flames till the last moment. When compelled to fly they sought the shore, where they had moored a boat as a means of escape at the last moment. But, oh horror! the lapping waves and the fierce wind created by the fire had loosened the boat, but insecurely fastened, and it was rapidly drifting away. All hope of escape seemed cut off. The men were about to plunge into the water, as preferring death by drowning to death by fire.

"Let us die like brave men, if die we must," said Mr. Perkins, "trusting in God. He will be with us as He was with His servants in the fiery furnace."

"Father," cried Tom Perkins, a boy of thirteen, "I know a cave where we can hide!"

"Quick, my son, show us the way!" was the eager reply.

"This way, up the stream a bit, near that cedar root. The bears used to live in it;" and he pointed out a concealed entrance, through which they crawled into a small grotto caused by a dislocation of the strata.

"God hath opened for us a cleft in the rock. He will keep us in the hollow of His hand," said Mr. Perkins, with feelings of deep gratitude.

On came the flames, roaring louder and louder. The crackling of faggots and falling of trees were like the rattle of musketry and firing of cannon in a battle. The smoke and heat penetrated the grotto. They were almost perishing with thirst.

"I hear the trickling of water," said Perkins. "I will try to find it. Lie low on your faces so as not to inhale the smoke. Here is the water," he cried as he found it; "now wet your handkerchiefs and tie them over your heads," he said, as he did the same himself; and they all found the greatest relief therefrom.

At last the fiery storm seemed to have passed away. They crawled forth from their refuge to view the desolation it had wrought. The ground was still hot and smoking, many of the trees were still burning, and everything was scathed and scarred and blackened with the flames. Perkins's house was burned, but his barn, which he prized more, was, with its contents, spared—saved by the adjacent clearing and fallow.

By a special providence, as it seemed to these simple-minded men, unversed in the sceptical objections to the efficacy of prayer, the wind had veered so as to blow the flames away from the village. This they devoutly attributed to their prayers in the cave. That night a copious rain fell, and further danger was averted.

FURTHER HINTS ON SCREEN PAINTING.*

BIRDS.

BY FRED MILLER.

THE illustrations accompanying this article contain some good suggestions for our amateur screen painters. Birds, especially storks, have long been favourite subjects for decoration, and with reason, for they afford much scope both as regards colour and skill in draughtsmanship.

The expressions that can be given to storks are another great feature, and those of our readers who have studied the "adjutants" or scavenger birds in the Zoological Gardens must have noticed how quaintly humorous they are. They exhibit every variety of character, being sly, imbecile, crafty, knowing, as though they were human beings.

Mr. Marks, the Royal Academician, has painted these birds many times, and he has invested them with a quaintness which is almost irresistible. He has made them quite human; so cleverly has he caught them in their various moods, and we should advise our readers before attempting to paint any birds to go and spend an hour or two in

* See also Vol. V., pages 460, 764, etc.

the Zoo, carefully watching their movements and habits and making notes of their attitudes.

This is not as difficult a task as some may imagine, for these scavenger birds remain very stationary, and will keep in one attitude for some length of time, quite long

enough for any one to make a rough sketch. I have frequently drawn these birds at the Zoo, and I will just give my readers a few "wrinkles" which from experience I have found useful.

Do not be too hasty in putting anything on paper. Quietly wait and watch one par-

ticular bird until you have noted some characteristic action or expression, and having got this fixed in your mind, jot it down on paper as simply as you can without attempting any finish. Remember a few lines put in the right place will convey more than any number of lines put on without thought and

Designs for Screen Painting—See p. 819.

meaning. You may make several of these sketches before you put one in which really suggests the action of the bird, and it is better to keep starting fresh sketches than to waste time in botching up a poor one.

I have found that out of perhaps half a dozen there may be only one sketch which conveys the character of the bird, and yet this one may have taken less time to do than any one of the failures, because you put down at once what you saw without the need of patching or altering. When you have two or three good outline sketches of the entire bird you can begin to study the details of the form, for in the general sketch you only want to fix the attitude. Watch say the head, and make brief notes of this part of the bird as seen from various points of view, then the legs, wings, and other points. These rough pencil jottings are like your alphabet, and want putting together to render them intelligible. In making a finished drawing of a bird you take one of your general sketches for the position and action, supplying the details from your pencil notes. In this manner you build up your bird bit by bit.

Although we give in our illustrations the design for a screen, yet any of our readers desirous of carrying them out should not merely enlarge the cuts to the required dimensions without any reference to nature if it be at all possible to go to nature. A good illustrated natural history—say that of Rev. J. G. Wood—is a great help in drawing birds, and there are some good photographs published now of studies of animals, birds, etc., from nature, which are most useful to artists, professional or amateur. Illustrations from pictures by great artists are also very useful—such as “The Parliament of Storks,”

by H. S. Marks, R.A., as one can always learn how best to render nature by studying the methods adopted by the men of acknowledged excellence in their art.

The instantaneous photographs which are now sold in so many shops will prove of the greatest use to artists, and indeed we are beginning to learn for the first time what is really the position of the legs of a horse in action. Many of our readers have doubtless seen the series of photographs of the motions of a horse in trotting. Messrs. Marsh, of Henley, have published a capital series of photographs of swans on the Thames in every conceivable position, and a very fine series (photographed, I believe, by Mr. Dixon) of animals and birds in the Zoological Gardens is now to be obtained.

In carrying out the designs accompanying this article the first consideration is the colour of the ground. A pale-blue light towards the horizon, and gradually deepening towards the top, would be effective. Antwerp blue and white, with the least touch of pale chrome or cadmium to give it a slight greenish hue, will make a good harmonious colour, and you might increase the yellow and white for the lightest part of sky.

Clouds are indicated in two of the panels, but I should recommend them to be put in rather straighter and stiffer than is shown in the cuts, instead of attempting to make them blend into the sky. Screen panels are more effective when treated quaintly and conventionally than in a highly naturalistic manner, and the clouds, if taken across the panels in broad and narrow streaks, will give a character to your work which can be carried out by putting a slight outline round your birds and foliage, and not at-

tempting too much light and shade or distant effects.

The foliage introduced behind the birds is of a rather nondescript character, and some of our readers would perhaps prefer to study this part of their work direct from nature. The yellow flag would look well in some of the panels, and then you could introduce the bulrush, feather grass, flowering rush, meadowsweet, water-lily, arrow-head, and other aquatic plants as fancy dictates. Be careful not to get your greens too bright and strong, but try and make them harmonise with the colour of your ground. Warm tones should prevail, though you can occasionally introduce some light silver-grey tints, especially for the back of the leaves.

Cobalt, raw umber, and plenty of white, with a touch of pale chrome or pale cadmium, will make a good grey; indigo, with raw sienna and white, or with light or middle-chrome, gives good greens, which can be subdued or warmed with a little burnt sienna. Indeed burnt sienna is invaluable in toning greens, and is one of the most useful colours in the box. Avoid emerald green and do not use Antwerp blue for making any but very pale grey greens. Do not attempt to put too much minute finish into your foliage, such as the markings and veins in the leaves.

Work so that your painting looks well at a little distance, and keep it as simple as possible. Do not attempt too much. It is better to be humble and succeed than ambitious and fail. Gold grounds look well when decorated, and there is a material sold called Linestra Walton which can be had gilt about 7s. per yard, and just wide enough for a screen panel.

(THE END.)

CHESS.

NOTES.

(a) He ought to have played B×Kt; 8, R×B, Q—Kt 2, in order to prevent White playing 8, P—K 4, and winning the Kt's P.

(b) If 17, P×B, then Q×P (ch.); 18, K—R sq., Q×R P (ch.); 19, Kt—R 2, Q×K P; 20, Q—Q sq., Kt—K 5; 21, Kt×Kt, R×R; 22, Q×R, Q×Kt (ch.); 23, B—B 3, Q×Q P, etc.

(c) The Q might have taken, and then, after Kt—K 5, gone to K sq.

(d) Better to have taken the Kt.

(e) If 25, K—Kt sq., Q—Kt 6 (ch.); 26, R—Kt 2, Q×R at K 8 (ch.); 27, B—B sq., Kt—Q 7; 28, Q—Q 3, Kt—B 6 (ch.); 29, K—R sq., Q—R 5; 30, R—K 2, Q—Kt 6, and White must play R—Kt 2, whereupon Black mates in two more moves.

AU REVOIR!

ONE more year gone! Years flew less fast
In the good old days we've already passed;
Old Time is running a furious race,
And turns his glances at a rapid pace.

One more big volume to grace the shelf,
The B. O. P. needs a niche to itself;
The vols. mount yearly towards the top,
They threaten to fill the whole room with
“BOP.”

We have spent together another year,
We have helped each other with words of
cheer;

As months roll by and the volume ends
We're still, let us hope, the best of friends.

And now we must part; that we can't deny,
But the case scarcely calls for the word
“good-bye;”

Au revoir is much better; we meet again
When October commences her chilly reign.

COLONEL PELLINORE'S GOLD.

By E. W. THOMSON,

Author of "Petherick's Peril," etc.

CHAPTER VI.

WHEN Bryan opened his eyes they rested on the rafters of his accustomed sleeping-room, in which, save for the crackling of a wood fire, perfect stillness reigned.

He tried to raise his head, but was surprised to find he had not the power. He could, however, turn it from side to side, and, doing so, found the room without another occupant. A sensation of blissful ease which comes to extreme weakness with returning consciousness was over him. Closing his eyes dreamily, he made no further attempt to move, but abandoned himself to languor.

Soon he heard the careful tread of some one coming into the room, and the colonel's gentle fingers were laid on his wrist and pulse. Bryan gave no sign of returned consciousness, and in a few moments his uncle drew a chair to the fireplace and sat down. Not many minutes elapsed before the firm step of Corporal Cram came along the hall-way, and Bryan knew that the faithful servant, after standing at his side a moment, had gone over to near the colonel. At first the boy but faintly heard their whispered talk, which soon became more distinct.

"No, your honour, no; never begin doubting Mr. Bryan," said the corporal.

"I will not, I do not, I try not, corporal," answered the colonel. "But where can the money have gone?"

Bryan pricked up his ears, suddenly recollecting the events that had led to his wound.

"A keg of three thousand guineas never flew away through the keyhole," continued the colonel.

"I wouldn't be too sure of that, your honour," responded the corporal, superstitiously.

"Nonsense!" answered Colonel Pellinore; "human hands carried away the gold. I cannot indeed reconcile Bryan's character with the opinion that he did it. But who else could have obtained the keys? who else could have entered without the dogs giving the

alarm? Then his unaccountable departure!"

"Oh! colonel, you honour! Oh! colonel dear, don't go for to distrust Mr. Bryan," groaned the corporal. "He's your flesh and blood, colonel, so he is."

"Agravaine was my flesh and blood," said the colonel, mournfully.

"But wasn't it proved that Mr. Bryan could have had nothing to do with the keg, your honour? Didn't the lieutenant follow the track of the cariole in the fresh snow till where he'd turned back, and there never was a sign of a stop, nor a foot getting out of the sleigh, nor any hint of him concealing anything? Haven't we searched high and low in every nook and cranny about the place? Oh, colonel dear, but it was proved impossible, and you and me knew it was impossible at the start for Mr. Bryan to do such a thing."

While this conversation went on Bryan's horror grew to an extreme; an intense fear of his uncle beset the boy, and hot anger against the guilt which had let him be suspected. He felt that he must defend his own honour at all hazards, here or elsewhere, however weak, and was about to speak when the colonel's next sentence made the words die on his lips.

"True, corporal, true; it was proved impossible. I rejoice in the proof; I rejoice that even Lieutenant Marhaus went away exculpating my nephew and asserting an inexplicable mystery. But what can have become of the money?"

"It's a dreadful puzzle, your honour, so it is," returned the corporal. "Unless Mr. Marhaus himself—"

"Impossible," said the colonel. "Not another word of that. By the way, the lieutenant should be back again in a day or two."

"I wouldn't wonder to see him to-day, sir," said the corporal. "It's just two weeks since he stretched out poor Mr. Bryan, bad luck to the sword!"

At that moment the dogs outside broke into a loud baying, as a galloping horse with bells rushed up the hill. A voice was heard calling too.

"It's Marhaus," cried the colonel.

They went hastily downstairs, leaving Bryan to an intense curiosity. For what seemed to him a very long time there was no noise. Then Bryan heard a great cheering, and soon afterwards the tread of feet on the verandah. Then the door opened, some weight was set down, and he heard a sound precisely similar to that of the keg rolled by the colonel on that memorable night. It ceased at the stair-foot. Then the party ascended, and entering the room where Bryan lay, placed a keg of gold on the floor!

Marhaus, seeing Bryan's eyes open, went straight to the bedside.

"I owe you a deep apology," he said. "We have found the lost keg!"

It was all a mystery to Bryan, and he did not answer.

"It was thus," said the lieutenant, turning to Colonel Pellinore. "I fell in

by accident with queer old half-cracked General Scarlett—old Dungeon Scarlett—at the mouth of the Rideau. He was fishing through the ice. You know he has built a house on the model of this somewhere back in the woods there. We fell into talk, and after a while, moved by a sudden suspicion of the truth, I told him of the strange disappearance of the coin. To my astonishment he burst into a loud fit of laughter after hearing the particulars.

"Go back," he said. "Go back instantly, and examine the wall of the magazine. The gold is in the hill behind it." Then he explained the contrivance that we have seen. I was rather angry, as you may imagine, in spite of the welcome discovery.

"What in the world was the recess for?" I asked.

"A dungeon!" said he, in a matter of course way.

"What did you want a dungeon for?" I inquired.

"What does any one want a dungeon for?" said he, and that was the only satisfaction I could get."

* * * *

Before Bryan was able to get about the whole story had been explained to him, but he never told what had taken him off that desperate morning. Indeed to his dying day, though he reaped great honour, he never forgave himself for that short distrust of his noble old uncle.

Bryan's first visit outdoors was to the magazine. Its back, as I have explained, was against a hill—and is yet, for that matter. This hill is excavated back of the magazine wall for some twenty feet, and to this cave a secret entrance from the little building had been prepared. It was a swinging door, as high as the wainscoting, and apparently part of it, hinged behind the bead that ran round the upper edge of the perpendicular boards, and by its own weight closing on a spring. This spring was connected with the middle board of the wainscoted door, and a smart blow on this board was enough to loosen the catch. No doubt the heavy keg quickly rolled had struck this board sharply, and, retaining momentum, had passed through and dropped into the cave, where it was found, the door closing as it fell back in its place.

You may see the contrivance to-day in perfect order, "for," says the existing Pellinore, "my great-grandfather, General Sir Bryan Pellinore, who fought with glory in every quarter of the old world, left strict injunctions in his will that his descendants should carefully preserve the old magazine. It was used for long years as a family mausoleum. Colonel Persant Pellinore rested therein for many a year, with Corporal Cram at his feet. And General Sir Bryan and his lifelong comrade, General Marhaus—they married the lovely sisters Fay, you know—were both, after all their loud days of terrible battle, laid there in peace and quiet too."

(THE END.)

HEROES OF THE BACKWOODS.

JOHN CHARLES FREMONT.

AMERICAN exploration has hitherto differed considerably from exploration in the other parts of the world. In America the advance of the white man has been led by

Louis on the 18th of June. Up to then the west had only been known through the reports of such men as Carson, who, as we have seen, had been many times on the

sun's rays rarely reached its depths; snow lay along the border of the small stream which flowed through it; and every now and then came patches of ice, alternating with

San Francisco, 1849.

the hunter and the trader, and the scientific explorer who takes such prominence in the older world makes few independent discoveries, and merely confirms and definitely

Pacific slope. Fremont's was the first scientific survey of the country, which for so long had been the happy hunting-ground of the redskin and the trapper, and though he was

the cold damp rocks and the spongy morasses.

Soon the explorers found themselves riding along the huge wall which forms the central

Salt Lake City, 1850.

localises what his humbler predecessors have fallen upon and reported. Fremont has been more fortunate than his fellows. He has made two or three original finds; and when he met Kit Carson on the Missouri steamer he was on his way to the west to immortalise himself by scaling the highest peak of the Rockies.

He was then a lieutenant in the United States Topographical Engineers, and having been born at Savannah, in Georgia, on the 21st of January, 1813, was in his thirtieth year. He had left Washington on the 2nd of May, and started with his complete outfit from St.

not a backwoodsman in the usual acceptance of the term, yet he was a true hero of the backwoods, and his adventures, more especially as completing the story of the redoubtable Kit, can be conveniently dealt with here.

The discovery of Wind River Peak, as it was called—it is now known by the name of its discoverer—was the chief event of Fremont's first plunge into the wilderness. He started to reach the highest point of the ridge on the 15th of August. The road lay up a dark defile, with many a rough and slippery place to check the progress of the mules. The

summits of the chain. Then at last it rose by their sides a nearly perpendicular wall of granite, ending three thousand feet above their heads in a long toothed line of jagged and broken cones. They rode on until they came almost immediately below the main peak, which they christened Snow Peak, as it exhibited more snow to the eye than any of the neighbouring summits. As they rode on they came to three small lakes of bright green water, each of nearly a thousand yards in diameter, and apparently very deep; and on a ledge about a hundred feet above the lakes the mules were left to graze, while the

party, divesting themselves of every needless encumbrance, began the ascent.

Leisurely they went up. At intervals they

of the Nebraska. Around the whole scene seemed to have been wrecked by some terrible convulsion, the backbone split into

chasms and fissures, between them thin lofty walls, with slender columns and pinnacles rising from the mantle of snow.

Yellowstone Lake.

reached places where springs were gushing from the rocks, and about eighteen hundred feet above the lakes they came to the snow-line, and thenceforth their progress was uninterrupted, climbing along a sort of comb of the mountain which stood against the wall like a buttress, and which the wind and steepness had kept almost clean of snow. In a few minutes they reached a point where the buttress was overhanging, and there was no other way of surmounting the difficulty except that of passing round the face of a vertical cliff several hundred feet in depth. Putting hands and toes in the crevices between the blocks, Fremont succeeded in reaching the top. He sprang upon the summit where another step would have shot him into an immense snow-field five hundred feet below. To the edge of this field was a sheer icy precipice; and then with a gradual fall the field sloped off for about a mile until it struck the foot of another lower ridge. He stood on a narrow crest of about a yard in width.

He mounted the barometer in the snow of the summit, and, fixing a ramrod in one of the joints of the rock, unfurled the stars-and-stripes to wave in the breeze where never flag waved before. During the morning's ascent they had met no sign of animal life except one small sparrowlike bird. A stillness the most profound and a solitude that was terrible forced themselves constantly on their minds as the great features of the place. There on that summit, where the stillness was absolute, unbroken by any sound, and the solitude complete, they thought themselves beyond the reach of anything breathing; but while they were sitting on the rock a solitary humble-bee came winging his flight from the eastern valley and settled on one of the men's knees!

They were 13,570 feet above the Gulf of Mexico. On one side they looked down on innumerable lakes and streams, the headwaters of the Colorado of the Gulf of California; on the other side was the Wind River valley, with the heads of the Yellowstone. Far to the north they could just discover the snow caps of the Three Tetons, where were the sources of the Missouri and the Columbia; and at the southern end of the ridge the peaks were visible, amid which there rise the springs

"One was just sinking when he was clutched."

Nine days afterwards, when on their way back, they ran the canyons of the La Platte. They passed three cataracts in succession, and finally, with a shout of success, issued from the first tunnel into open day. In another hour they were in the next canyon,

was the reply of the voyageur. "Je m'en vais mourir avant que de te lâcher." For a hundred yards below the current was covered with floating books and boxes, bales and blankets, and so strong was the stream that even the heavy instruments, the sextant,

Auger Holes in Tree.

a winding chasm in the rock seven or eight miles in length, and in places five hundred feet in vertical height. They made fast to the stern of the boat a strong rope about fifty feet long, and three of the men, clambering along among the rocks, let her down through the first pass. In several places high rocks lay scattered about in the channel, and in the narrows it required much strength and skill to keep the boat from being stove. At one place she proved a little too broad, and stuck fast for an instant, while the water flew over her and swept away the sextant and a pair of saddle-bags. Fremont caught the sextant as it dashed by him, but the saddle-bags were lost. The second pass was worse than the other, and Fremont would have gone back, but to do so was impossible. Before him the cataract was a sheet of foam, and, shut up in the chasm by the rocks, which in some places seemed to meet overhead, the roar of the water was deafening. He pushed off again, but in a few yards the force of the current became too great for the men on shore, and two of them let go the rope! Lajeunesse, the third man, hung on, and was jerked head foremost into the river from a rock twelve feet high. Down the boat shot like an arrow, Lajeunesse following in the rapid current, his head only seen occasionally like a black spot in the white foam. At last an eddy was reached, the boat stopped, and Lajeunesse and his companions, who had come running along the rocks, were taken on board.

Then, cutting off all communication with the shore, the passage was resumed. They cleared rock after rock, and shot past fall after fall, the boat seeming to play with the cataract. The men grew flushed with success and familiar with the danger, and, yielding to the excitement of the occasion, broke forth together into a Canadian boat song. Singing, or rather shouting, they dashed along, and were in the midst of a chorus when the boat struck a hidden rock at the foot of a fall and was whirled over in an instant.

All scrambled safely out, though three could not swim. One of these, Descoteaux, was just sinking when he was clutched by the neck by Lambert. "Lâche pas! Lâche pas! cher frère," said he. "Crains pas!"

circle, and long black box of the telescope, were in view at once. The boat was recovered, again launched, and the daring rush was resumed, and Goat Island eventually reached.

On Fremont appearing at Washington he received an enthusiastic welcome, and began preparing for his second expedition. This left Kansas on the 29th of May, 1843. Great Salt Lake was explored, the Rockies were crossed, and Sutter's rancho reached, as we have seen in our notes on Kit Carson, the path of the travellers forming an immense circuit of twelve degrees diameter north and south, and ten degrees east and west, making up some three thousand five hundred miles never out of sight of the snow.

The third expedition started in 1844 and ended in the annexation of California. Like its predecessors, it was no pleasure trip. Take Kit Carson's description of the night attack by the Tlamaths. "Mr. Gillespie had brought the colonel letters from home, the first he had had since leaving the States the year before, and he was up and kept a large fire burning until after midnight; the rest of us were tired out and all went to sleep. This was the only night in all our travels, except the one night on the island in the Salt Lake, that we failed to keep guard; and as the men were so tired, and we expected no attack now that we had sixteen in the party, the colonel didn't like to ask it of them, but sat up late himself. Owens and I were sleeping together, and we were waked at the same time by the licks of the axe that killed our men. At first I didn't know it was that; but I called to Lajeunesse, who was at that side, 'What's the matter there? What's that fuss about?' He never answered, for he was dead then, poor fellow, and he never knew what killed him. His head had been cut in in his sleep; the other groaned a little as he died. The Delawares (we had four with us) were sleeping at that fire, and they sprang up as the Tlamaths charged them. One of them caught up a gun, which was unloaded, but although he could do no execution he kept them at bay, fighting like a soldier, and did not give up until he was shot full of arrows, three entering his heart. He died bravely. As soon as I had called out I saw

it was Indians in the camp, and I and Owens together cried out, 'Indians.' There were no orders given, things went on too fast, and the colonel had men with him that did not need to be told their duty. The colonel and I, Maxwell, Owens, Godey, and Stepp jumped together, we six, and ran to the assistance of the Delawares. I did not know who fired and who did not, but I think it was Stepp's shot that killed the Tlamath chief, for it was at the crack of Stepp's gun that he fell. He had an English half-axe slung to his wrist by a cord, and there were forty arrows left in his quiver, the most beautiful and warlike arrows I ever saw. He must have been the bravest man among them from the way he was armed, and judging by his cap. When the Tlamaths saw him fall they ran; but we lay every man with his rifle cocked until daylight expecting another attack. They had killed three of our men and wounded one of the Delawares, who scalped the chief, whom we left where he fell."

It was while on this third expedition that Fremont accomplished his wonderful ride of nine hundred and sixty miles in seven days. The party that performed this feat were three in number—Fremont, his servant, Jacob Dodson, and his friend Don Jesus Piconda—each of them had three horses to start with, making nine in all. The six loose horses ran ahead, without bridle or halter, and required a good deal of attention to keep them straight on the track. When wanted for a change, say, at the distance of twenty miles, they were caught by the lasso, thrown either by the Don or Jacob. None of the horses were shod, and the usual gait was a sweeping gallop.

They started from Los Angeles on the 22nd of March, 1847, and the first day ran one hundred and twenty-five miles, passing the San Fernando mountain and the defile of the

First Log-Hut, Mariposa Grove.

Rincon, and halting at Santa Barbara, the only fatigue complained of being in Jacob's right arm from throwing the lasso and using it as a whip to keep the loose horses on the

track. The next day they passed the mountain of St. Barbara, and reached San Luis Obispo. Here the nine horses from Los Angeles were left and eight others taken in their place, and a Spanish boy joined the party to assist in managing the loose horses. The run stopped short at seventy miles. While the party was asleep the horses were almost stampeded by white bears, but the Spaniard scared off the bears, and the journey was resumed for eighty miles to Monterey. The return run was then commenced, during which one of the horses was ridden unchanged for ninety miles without showing distress, and Los Angeles was safely reached within the seven days out and home.

In 1848 Fremont went off on his fourth exploring expedition, and crossed the mountains

in the snow during a spell of severe cold. After undergoing great hardships he found his way to Taos, where he took up his quarters with Carson until he had recovered sufficiently to move on and complete the possession of his estate in the Mariposa valley, which has since become so well known. Fremont had bought it for three thousand dollars, and it is said that when he first passed over it he actually picked up the gold as it lay upon the surface of the soil.

After being commissioned to run the boundary-line between California and Mexico, he was elected to the Senate for the State in which he had chosen to settle, and returned to Washington to attend to his political duties. In 1853 he led his fifth and last expedition to find a new route across the

continent to the Pacific. This he succeeded in doing along the line of 38° north latitude. Here again he was favoured with a full share of adventure. On one occasion, when he was away from them, his men were caught in the midst of a prairie fire, and he and a few that were with him came galloping through the circle of flame to join and rescue them.

In 1856 Fremont was a candidate for the Presidency, and was beaten by Buchanan with 174 votes to 114. During the War of Secession he fought on the Federal side, but Stonewall Jackson proved too much for him, although he never suffered a decisive defeat. The drawn battle of Cross Keys on the 8th of June, 1862, was the largest affair in which he held independent command.

CURIOUS CRAFT.

II.

(See also Vol. VI., B. O. P., page 108.)

BEGINNING at the top left-hand corner of the illustration on p. 823, we have the Egyptian *Dahabéh*, a vessel which has obtained an unenviable notoriety for dirtiness. It is chiefly used for the Nile passenger traffic, and it is no uncommon event for the experienced traveller, when hiring one of these craft, to make it a *sine quâ non* that it shall be sunk under the water for a couple of hours before starting, in order that the hull may be purified from the vermin with which it invariably is infested. A very fine model on a large scale may be seen at the South Kensington Museum.

The mode of furling the large lateen sails is for the crew to shin up the mast in a twinkling, scramble along the lofty swinging yard like monkeys, and perform the operation with a neatness absolutely surprising in an Egyptian.

Immediately beneath is shown a curious demonstration of moveable ballast as it is to be seen amongst the Cochin Chinese. Sometimes the pole on which the extemporised counterpoise is placed will break, when there is nothing for the clumsy vessel but to turn bottom upwards. Some of their vessels, however, like the little craft below, sail exceedingly well, and are first-rate sea-boats.

The fishing-boat shown at the left-hand bottom corner of the page comes from Corea, the forbidden land of Eastern Asia, which until very recently was known only to the civilised world by name, and by a few meagre reports received from Japanese and Chinese sources. Our readers will perhaps recollect the confusion that arose when a treaty opening up certain ports to foreigners was, a short time since, forced upon the inhabitants. A revolt took place, the Queen was killed, and for a time general anarchy prevailed.

The fishing-boats of Corea are very clumsily built. They are put together with wooden nails, and are very deep, and in place of a deck a few beams are fixed from gunwale to gunwale. The build is very much after the Japanese model, minus its artistic qualities. It is open to the bottom, and the fish are thrown down as they are caught. Each vessel carries a crew of from thirty to sixty men.

Returning to the top of the page, we come to a canoe of the Upper Zambesi. Major Serpa Pinto, one of the most recent of African explorers, likens this vessel to a gigantic skate, wherein the native has to use all the balancing powers of a skater upon the ice to maintain a firm position. The boatmen always paddle standing, and the paddling in such boats is of course a true acrobatic performance.

The vessel depicted is a canoe which was scooped for the explorer from the long trunk of a *Mucusse* tree. It had the following extraordinary dimensions—Length, 33 feet; breadth amidships, 17 inches; depth, 16 inches! The giant of the forest from which it was carved is a tree of excessive hardness, possessing a specific gravity greater than water.

Whenever Pinto reached one of the numerous cataracts it was necessary to convey this vessel overland until the obstacle was surmounted, and for this purpose the services of the natives living on the bank were called into requisition. Poles were placed across the vessel and fastened to it by tendrils of neighbouring trees. The natives, to the number of twenty or thirty, then took the poles on each side, and with great labour got through the work.

Next to Australia, Borneo is the largest island in the world. Here we find the women treated with far greater respect than is usually the case amongst savage or semi-civilised nations, and boats are built specially for their use. In these boats the women do their marketing, and at Bruni there is a floating bazaar, where the boats are moored in tiers, forming regular lanes upon the river, the purchasers gliding about here and there in their canoes in search of the "boat-shops" containing the particular provisions of which they are in quest.

Next is the outriggered canoe of the warlike Marquesans, with its overhanging stern, on which the steersman stands when the sail is hoisted, and its projecting bow, which affords some sort of protection to the rowers when advancing to the attack of an enemy.

The Japanese, except so far as they have imitated Europeans in the construction of their vessels, are a long way behind most of the nations of the earth in their knowledge of naval architecture. Witness the curious row-boat with its crowd of oarsmen standing upright to work their strangely-bent oars. As they row they chant a monotonous song, every alternate man swinging his body in an opposite direction in perfect time, the one pushing, the other pulling.

Their sailing junks are no better than the row-boats, and have the same open sterns with strong bulkheads to prevent the ingress of the water. The rudder is also fixed and worked after a like awkward fashion. It is little wonder, however, that the Japanese have for centuries made no progress in their ship-building, for at any rate until very recently all vessels were required to be built to uniform rule as to shape, dimensions, rigging, and interior arrangement.

The natives of Ceylon have from time immemorial manufactured a peculiar kind of catamaran. One extraordinary feature of the vessel is that it is put together entirely without nails, and even the wash-boards which surmount the log which forms the body of the vessel, and which is hollowed out until it is nothing but a cylinder with a narrow strip of from eight to ten inches cut from end to end, are fastened to it with coir yarns, the seams being stopped with loose coir padding. They carry no ballast, and are almost as safe as a lifeboat.

The third column is headed with the *canoa* of the River Amazon, a singular construction. Both stem and stern are square, and the hull is covered with a heavy erection, which causes it to bear some resemblance to a Chinese junk. These vessels are never required to go against stream or to sail anywhere near the wind, and all that is expected of them is that they should float lazily along with the tide. This is fortunate, for they are so top-heavy that if any more intricate manoeuvres were attempted when anything beyond a breath of wind was blowing they would inevitably capsize.

Animal life is plentiful enough on the

shores of the river, and the men make pets of the monkeys to be found there in any numbers. These are frequently to be seen disporting themselves upon the spars, etc., of the boat.

The jangada is a curious kind of raft, belonging chiefly to the coast about Pernambuco. It is usually built of from three to six solid logs bound together by two or more cross-pieces. There is a hole in the centre log in which is placed the mast, and at the foot is a small stool for the captain, as the water every now and again covers the deck. The steersman is furnished with a like seat. The only

other erection is a slight framework to preserve the bag of manioc, which forms the food of the crew, from the wet and to support the bottle of drinking water.

These vessels have the property of sailing very near the wind, and are able to go at the rate of ten miles an hour. All things—including passengers—which are proof against moisture are carried on these remarkable craft.

Then we have the elaborately carved and decorated war canoe of the New Zealanders. These are made from the huge trunk of the Kauri pine, and measure sometimes eighty feet in length. They are covered from stem

to stern with the wonderful and unique carving indulged in by the Maori race, and painted a bright vermilion and hung with bunches of feathers and dog's hair. When not wanted they are hauled up on to the shore and carefully thatched to preserve them from the weather.

The last illustration is the strongly built bunder-boat of the harbours of Bengal and other parts of India. It is used for little else than harbour traffic—in fact, it derives its name from *bundur*, a harbour. Occasionally it carries a couple of masts, each furnished with a large lateen sail.

Curious Craft.

7. Salvage.

ENGLISH ARCHERY.

THE origin of the bow as an instrument of war is lost in obscurity. With all the ancient peoples, both civilised and barbaric, the bow was a favourite weapon, and skill in the use of it was regarded by the Scythians as a princely accomplishment. The Greeks and Romans employed archers to draw the enemy into action, and the exploits of the ancient Egyptians rivalled those of the archers of the middle ages.

There is no record of the use of the bow in France until the beginning of the eighth century, although we have evidence that in England both the Anglo-Saxons and the Danes employed it in the chase as well as in battles against the primitive inhabitants of England many years before the Conquest.

It was under the Norman rule that the practice of archery in this island was not only greatly improved, but generally diffused throughout the country, so that England soon became famous for its archery, and her archers took precedence of those of every other nation. To preserve this superiority by constant practice appears to have been the study of many of our monarchs, and numerous statutes for enforcing and regulating the use of the bow among the people were enacted from early times until after the invention of firearms. Many laws were also made for securing the presence in distant and obscure parts of the country of persons skilled in the manufacture of bows and all the apparatus appertaining to archery, for guarding against fraud by those artificers, and also for the procuring of a constant supply of bow-staves from abroad. These laws appear to have been absolutely necessary, for in the olden time the English chiefly depended for their success in battle upon the bravery and expertness of their archers, whose appearance in the field generally led to success. William the Conqueror is reputed to have been so admirable an archer that few could bend the bow he used, and his victory at Hastings was certainly due to the skill and intrepidity of his cross-bow men. Richard the First performed great exploits with his archers in the Holy Land, where, according to Gibbon, 300 archers and seventeen knights, headed by the king, sustained the charge of the whole Turkish and Saracen army. It was in his reign that the renowned Robin Hood flourished in Sherwood Forest. Edward the Second levied a company of "Northumbrian Archers" in the year 1314 for the invasion of Scotland.

The battles of Cressy and Poitiers were gained by the English archers in the years 1346 and 1356 respectively. Edward III. was extremely jealous of the honour of the bow, and anxious that its glory should be maintained. In the early part of his reign it was ordered that most of the sheriffs of England should each provide 500 white bows and 500 bundles of arrows for the then pending war with France. In the following year this order was reissued, with the difference that the sheriff of Gloucester should furnish 500 painted bows in addition. This king embodied a company of soldiers, whom he called the "Archers of the Guard." Edward III. also, in 1363, commanded the general practice of archery on holidays by the people in lieu of the ordinary rural pastimes, which were forbidden on pain of imprisonment. In this reign the price of bows was regulated by Government. A white bow was 1s., a painted bow 1s. 6d., a sheaf (twenty-four) of sharp arrows 1s. 2d., and a sheaf of blunt arrows 1s. Richard II., in 1392, directed that none of his servants should ever be unfurnished with bows and arrows, and that they should avail themselves of every opportunity of practising archery.

In the year 1402 the English archers won the battle of Homildon; and in 1403, at the battle of Shrewsbury, where Hotspur was

slain, the most terrible havoc was created by the archers on both sides. In the reign of Richard III. it was enacted that for every ton of Malmsey or Tyne wine brought into England, ten good bow-staves should also be imported, under penalty of 13s. 4d. for every deficient staff; and to encourage the import of bow-staves those above six feet and a half long were freed from duty.

In the manufacture of bows yew was generally preferred to all other woods; but to prevent a too rapid consumption of yew bow-ymers were ordered to make four wych-hazel, ash, or elm bows, to one of yew; and no person under seventeen years of age, except those possessed of portable property worth forty marks, or the sons of parents owning an estate of £10 per annum, was allowed to shoot with a yew bow, under penalty of 6s. 8d. for each offence.

That distant counties might be properly supplied with bows and arrows, the king claimed and exercised the prerogative of sending, if necessary, all arrow-head, bow-string, and bow-makers, not being freemen of the City of London, to any part of the realm that required the services of such artificers.

In the reign of Henry the Fourth it was enacted that all arrow-heads should be well brazed and hardened at the points with steel, and stamped with the name of the maker, under penalty of fine and imprisonment and forfeiture of the arrows, etc., in default; and by another statute passed in the same reign it was enacted that persons from places whence bow-staves were derived should import four bow-staves for every ton of merchandise taken on board, under penalty of 6s. 8d. for every bow-stave deficient. In this reign the highest price permitted for a yew bow was 3s. 4d. In the reign of Edward the Fourth it was enacted that every Englishman and every Irishman living with an Englishman should have an English bow of his own height; and also that in every township shooting butts should be set up, at which the inhabitants were commanded to practise on holidays, under the penalty of one halfpenny for each neglect. In the same reign the king, in preparing for a war with France, directed all sheriffs to procure a supply of bows and arrows for the service of the State. In 1405 it was made penal to use bad materials in the manufacture of bows and arrows. In 1417 the archers of the army of Henry the Fifth won the battle of Agincourt. This king directed the sheriffs of counties to take six wing feathers from every goose for the feathering of the arrows. In 1478 archery was encouraged in Ireland by statute. In the year 1424 James the First of Scotland, who was himself an excellent bowman, revived the practice of archery among his subjects. Richard the Third lent 1,000 archers to the Duke of Bretagne. The same troops afterwards fought at the battle of Bosworth. In 1485 Henry the Seventh instituted the yeomen of the guard, who were all archers, and in the nineteenth year of his reign the use of the cross-bow was forbidden by Act of Parliament because the long-bow had been of so much greater benefit to the nation. In this reign archery occupied an important position in the fashionable pastimes of the kingdom, and upon the marriage of Henry with the Princess Elizabeth it formed a great feature among the nuptial festivities, the king himself joining in the shooting with heartiness and glee.

Several Acts were passed in the reign of Henry VIII. for the encouragement and promotion of archery; one ordered that butts should be erected and kept in repair in all townships, and that the inhabitants should practise shooting at them on holidays. The same Act directed that every able-bodied man, not being an ecclesiastic or judge, should practise shooting with the long-bow.

In this reign the practice of archery was strongly advocated from the pulpit by Bishop Latimer, and so jealous were the English of rival nations competing with them, that aliens were forbidden to use the long-bow. The English victory at the battle of Flodden Field was due to the skill and courage of the archers.

Archery continued to be an object of attention and solicitude with the Legislature during the reign of Elizabeth, and the price of bows was again regulated by statute; also, bowymers were commanded to keep in hand always a sufficient stock of bows. Charles I. issued commissions to prevent the enclosure of fields near London, so "as to interrupt the necessary and profitable exercise of shooting with bows and arrows," and also for the restoration of all shooting-marks that had been already removed. The Earl of Essex, at the beginning of the civil war, raised a company of archers for the defence of the king. In the time of Charles II. archery was a highly fashionable and popular recreation with all classes of society, and the "Merrie Monarch" used frequently to take part with the ladies and gentlemen of his court in toxophilite meetings. Queen Catherine also showed deep interest in the fascinating pastime, and in the year 1676 she presented a silver badge to the "Marshal of the Fraternity of Archers." Both the king and queen frequently reviewed the numerous associations of archers then existent. In the spring of 1682 a grand fête was given by the London Artillery Company at the Artillery Grounds, at which there were present upwards of a thousand archers; and it is said that the gala outshone anything of its kind that had previously been seen in England. But from that time until the beginning of the present century the attractions of archery appear to have been overlooked and its practice neglected.

Although the bow has long been disused as a military weapon, it has ever been cherished in Great Britain, and particularly among the upper classes of society, as an instrument of delightful and healthful recreation; and it would be impossible to overrate the physical and moral advantages accruing from the regular practice of archery—one of the few "outdoor amusements" that are as suitable for delicate ladies as for strong men. As an exercise for ladies, it brings all the muscles generally into healthful action, and is admirably suited to meet the requirements of the fair sex—general and equal, without being violent—calling the faculties both of mind and body into gentle and healthy play, yet oppressing none—withal most graceful and elegant.

Another era in the annals of the art may be dated from the year 1844, when a national meeting of the archers of Great Britain and Ireland was held at York, since which time archery has assumed much importance as a national pastime, and year after year the wider competition which such assemblages have secured has brought forward bowmen and bow-women, who by their persistent efforts in carrying off honours, and that by the most remarkable achievements, have carried the art as near as possible to perfection.

Under the auspices of the Grand National Society, archery has been conducted through all the stages of actual revival and establishment as a British pastime. It was only in the year 1845 that ladies began to compete publicly with men for the prizes offered by the above-mentioned society, but at some of the matches which have without interruption annually taken place since then as many as 150 archeresses have participated in match-shooting, whilst at least an equal number of gentlemen have competed with them—on some occasions with a guaranteed prize-list of about £400.

A. T. SIBBALD.

OUR OPEN COLUMN.

A PET MONKEY.

H. L. sends us, from Leytonstone, the following story of a pet monkey. We know the writer, and can vouch for the truth of the narrative. The monkey has since died. "Being the fortunate(?) possessor of a monkey, and not for the first time, I know something of the right management of such a pet. I am, of course, careful that no flesh food should be given him, yet one morning I was surprised to find some small feathers scattered about the cage and on the wires. Upon making inquiries, I was told that nothing but fruit and bread and milk had been given him. As I was approaching his cage to make further observation I noticed that 'Jack' was scratching a hole under the bottom board of the back of his house. I approached cautiously, taking advantage of trees, bushes, etc., until I reached the side (which is boarded), through the cracks of which I could make my observations without being seen. And this is what I learnt. Firstly, Master Jack scraped a hole under the board, large enough to get one of his arms through; then he lay on the ground on his side and inserted one arm into the hole, holding in his hand a piece of sopped bread that he had saved from his breakfast. Next, by dexterously moving his arm about, he managed to skake some loose mould over his hand, so that his brown fingers were fairly hidden, only leaving the white bread above the ground. Then he kept perfectly still for some time, so long, indeed, that I began to grow tired of watching, and was about to retire when my attention was arrested by a plump young sparrow, who, by a series of hops, approached the bread, which formed a very conspicuous and also, no doubt, to the bird, a very tempting morsel. But, alas! to secure the bread the bird had to stand on Jack's fingers. It gave the final hop, and was just about to commence the feast, when snap! and the poor bird was a captive, caught by one of his legs. Jack quickly dragged it through the hole, and had begun to pluck it alive, when I, having seen quite enough, gave a cry and a clap, which so worked upon Jack's nerves that he sprang up in a fright, and in doing so let go the bird, which promptly flew through the wires and escaped, much to the disgust of Jack, who, having discovered my retreat, gave me a series of grimaces anything but complimentary."

Correspondence.

W. R. THOMSON.—What is your authority for the statement that Wales gives up a county to England every hundred years? Which are the counties it has given up?

H. W. SMITH.—The proportions of the boat should depend on the work the boat is to do, the harbours she is to enter, the place she is to be moored. If you want a fast boat with outside ballast your design would have to be different from what it would be for a beamy boat of the old type. The best plan for you to adopt would be to expend twenty-five shillings—less discount—on Mr. Dixon Kemp's "Manual of Yacht and Boat Sailing," published at the "Field" office, Strand. You will therein find the lines and measurements given of nearly every sort of fore-and-aft boat afloat, in addition to full particulars of fitting, rigging, and sail-making. A cutter thirty feet by seven would prove a good, useful, seaworthy boat.

A READER OF THE B. O. P.—1. It depends entirely on the umpire. There is no reason why the ball should not so pitch that you might be out leg-before from a bowler bowling round the wicket. 2. To be out "hit wicket" you must have hit the wicket in striking at the ball.

H. G. S.—Most of our large schools have now their magazines. In addition to those you have mentioned there are the Blundellian, the Cliftonian, the Epsomian, the Felstedian, the Glenalmond Chronicle, the Mill Hill Magazine, etc., etc.

J. GREENE (St. Kilda).—1. Faraday's "Chemical Manipulation," published in 1827; his "Experimental Researches in Electricity" in 1839, 1844, 1855; his "Experimental Researches in Chemistry and Physics" in 1859; and his "History of a Candle," "Non-Metallic Elements," etc. The best thing would be for you to get his life by Tyndall. The "Chemical Manipulation" has long been superseded by more modern works. Try Roscoe, Valentin, Fownes, Meldola, etc., etc. 2. The measurable angle of the parallax is so small that more accuracy is required than your plan would seem to offer. 3. It is quite true that diamonds have been made artificially, and that the only objection to them was that it cost more to make a diamond than to buy it. The successful experiment was performed by Mr. Hannay at Glasgow about ten years ago. 4. A civil engineer has to pass through a course of apprenticeship and practical work at the bench, besides passing examinations.

J. H. REED.—There are no such examinations. There are now no cornets in the cavalry. For all the army examinations consult one of the guides, or apply to the Civil Service Commissioners, Cannon Row, S.W.

LORD CECIL.—Apply for a prospectus, personally, to the Secretary, Birkbeck Institution, Bream's Buildings, Chancery Lane. The classes begin in October.

PISCATOR.—Fishing is quite free at Putney and Hammersmith, but the fish are too clever to hold on. Better try above Teddington Lock.

YOUNG MECHANIC.—The knife is a Corsican dagger. The "Morti al—" is "Death to —," and the "Vendetta Corsa" is the Corsican style of feud, which can only be quenched in an enemy's blood, and so continues till the families are all killed off.

LITTLE DORRIT AND LITTLE NELL.—Pylades was Agamemnon's nephew, Orestes was Agamemnon's son, and the cousins were great friends. Pylades married Orestes's sister Electra.

T. J. HAYES.—Get "Under the Red Ensign," or "Hints on Going to Sea," by Mr. Thomas Gray, C.B., Assistant Secretary of the Board of Trade, price one shilling, of Messrs. Kent and Co., Paternoster Row.

AMATEUR PHOTOGRAPHER.—The number of glasses is correct: what you have mistaken for a frame is the diaphragm. See our article on the telescope, or get a shilling book on optics, and, with the aid of the diagrams, work out the theory of the lenses for yourself.

A. C. P.—We know of no book that would teach you to be a poet; and, from the specimens you send, we should consider your efforts mere waste of time. Poets are born, not made; why, then, seek to be a poet with the aid of a shilling book?

X. Y. S.—1. There are many good openings in the colony for people with capital. See an account in Gordon and Gotch's "Australian Handbook." 2. There is a depot for the BOY'S OWN PAPER in Fiji at Levuka, and we have a considerable circulation in the islands.

T. D. ASHDOWN.—Our rule as to not touching on party politics precludes our complying with your request to define a Radical. We may, however, go as far as to suggest that a Radical would reform about the root while a Conservative would reform about the branches.

D. M. E.—Go in for gymnastics; play cricket and football, swim, run, climb, and row, and your pigeon-breast will soon open.

STANLEY O'GRAHAME.—1. All candidates for appointments under Government have to pass a medical examination. 2. The parts of Vol. v. are still in print. 3. The indexes are all in print. They cost a penny each, or three-halfpence post free.

H. W. S.—Throw-down crackers are fragments of crushed quartz screwed up with a particle of fulminate of silver in tissue-paper. Fulminate of silver is a very dangerous explosive, and has to be handled with the greatest caution, and kept in small quantities in pill-boxes wrapped carefully in paper. The slightest jar will set it off, and it is too violent for percussion caps.

AN OLD BOY.—If you were to pick the tow into fluff, and mix it with the boiled resin and oil, you would get a handier caulking material, in the event of the resin and oil alone being not quite thick enough. Tamarisk is a misprint for tamarack. If the seams are very true an extra coat of lead paint, with a finish of "indestructible paint," might answer the purpose.

AMATEUR ARTIST.—The illustrations are from woodcuts. The drawing could be either on the wood or on paper. If the drawing is on paper it is photographed on to the wood.

PRINTER.—Type bodies are all made the same length hence "type high."

W. AHRENDT.—Why not look in the index? The subject has been treated over and over again. Read the "Boy's Own Museum" articles in the third volume.

G. H.—The umpire was right, as you will see if you refer to the cricket laws. A man is not out hit wicket unless he hits the wicket when hitting at a ball bowled from the opposite wicket to that at which he is standing. He can not be given out for hitting his wicket during a run.

J. G. WILSON.—Apply to Messrs. Street and Co., advertising agents, Cornhill. They will give you the information as to the best paper in which to look for the advertisements.

JACK SMITH.—1. The seed for the plant that grows on the outside of the flower-pots is sold by Dick Radclyffe and Co. 2. Apply to Goy, Leadenhall Street. 3. The volumes are all kept in print. The price of the first volume is six shillings. 4. The best fish to keep in a globe are goldfish.

SPECIAL NOTICES.

We complete our seventh volume with this number, and next week commence a new volume with a very strong list of attractions. We would ask our readers kindly to make the best use of the prospectus of the new volume which they will receive this week, as now of course is the most suitable time in the whole year for new subscribers to begin.

The Title and Index to Vol. VII. are now ready, and may be had by order through any bookseller, price 1d. All who intend to bind their numbers or parts should at once obtain these.

The plates issued with the monthly parts during the year may now be obtained by weekly readers in a neat packet, price 1s. 8d. *The Title and Index will be included in this packet; though, as already explained, they may be had separately by those who, as monthly subscribers, already possess the plates.*

As we have more than once explicitly stated, we cannot undertake binding for our readers; this they should find little difficulty in getting done at a fair charge by local bookbinders. We have, however, prepared handsome cases or covers, in which any bookbinder will insert the numbers or parts at a small cost. These cases cost 2s. each, and may be obtained through the booksellers in the usual way. In the post they are apt to get damaged.

* * * We hope that all readers of this "Annual" will endeavour to do something, however small, to help on the "Boy's Own" Gordon Fund, of which full details have already been given in these pages.

Office: 56, Paternoster Row, London.

THE BOY'S OWN PAPER

Where'er thy fields of pleasure lie,
Where'er thy lot of labour fall,
Raise thou an altar in the midst,
And offer there a sheaf of all.

For now, since once the Lamb hath died,
Whose blood doth sprinkle every shrine,
Our common things may there be laid,
All hallowed unto use divine.

Fairly off for the Holidays

FÜLE-GIBBIE: AN ADVENTURE AMONG THE ROCKS.

BY JESSIE M. E. SAXBY,

Author of "The Song of the Cal-loo," "The Yule Bau," etc.

CHAPTER I.

THE minister and his wife were sitting enjoying their afternoon cup of tea when Bill, their youngest boy, rushed into the Manse parlour, breathless and excited.

"Oh, father—mother! what do you think?" he gasped, and could say no more, partly for want of breath, partly for laughing.

"You dreadful boys!" exclaimed Mrs. Mitchell; "what have you been after now?"

"All right, little mother," Bill answered, when he could speak coherently; "the Manse boys aren't in it at all. It's Füle-Gibbie. Oh, what a lark!" and Bill laughed uproariously.

"Poor Gibbie! what has he done?" the minister asked.

"What hasn't he done!" said the mischief-loving laddie; and then in his rapid, disconnected, terse, boy-fashion he gave an account of the poor half-wit's misdeemeanour.

It appeared from Bill's narrative that Mrs. Holtum (the doctor's wife), thinking to teach Gibbie to be useful, had entrusted him with the charge of her poultry-yard.

She had a number of rare and beautiful birds, of which she was very proud; therefore she took infinite pains to teach Gibbie the duties of "henwife," and was

much gratified to find that he performed the work required of him in a praiseworthy manner. He kept the poultry-yard as neat as a flower-garden, fed the fowls regularly, saw that they had a plentiful supply of fresh water, and he brought to his mistress every morning a large basket piled with snowy eggs.

Mrs. Holtum was quite delighted, and even the doctor said, "Perhaps we shall make something of Füle-Gibbie yet."

But, alas! one of Gibbie's "crazy fits" came on at a time when he was more than usually required to watch over the poultry. The yard walls were being repaired and heightened, as the fowls frequently made their escape, and Gibbie had many a chase after vagrant chicks and enterprising chanticleers. He was required to remain by the yard while the repairs were going on, and in his restless mood that was not what Gibbie wished to do.

A wild longing to break through all restraints would seize him at times, and was known in the isle as his "crazy fits." But Gibbie was cunning enough to conceal the approach of those lawless moods until he had secured the means of indulging them, so that Mrs. Holtum had not suspected his state of mind at the time of which I am telling you.

One morning Svein Holtum, who kept

his window open all night, as all hardy and sensible lads should, was awakened by a terrific noise in the poultry-yard.

Thinking that dogs or ravens were dealing havoc among his mother's pets, Svein hastily dressed and dropped from his window as the shortest road to the scene of disturbance. But what an extraordinary sight met his eyes when he got there! All the fowls were rolling together, fighting, screaming, struggling in a cloud of gravel and dust.

A number were dead, the rest were maimed or bleeding; yet dead and wounded alike were tossing to and fro as if they were undergoing the torture of galvanic shocks.

Svein soon discovered what was wrong. Füle-Gibbie had tied a cord to one leg of each bird, and knotted all the cords together. Then he had attached the end of the longest to a stake which was driven into the ground. Evidently he had not meant to be either cruel or neglectful, but had fancied such a plan would merely prevent his charge from wandering while he followed the bent of a crazed and vagrant inclination. It was some time before Svein, with the help of his jack-knife, could liberate the captives, and by the time that was done other members of the family had been roused by the din. When at last the

prisoners were set free, it was found that more than half of Mrs. Holtum's valuable birds were maimed or dead.

Naturally the lady was highly indignant at the perpetrator of the mischief; yet what could she do? It was useless to attempt punishing Füle-Gibbie, whose intellect was not equal to that of a child in some respects. Scolding only frightened him, and he soon forgot it.

When the first burst of righteous anger was over, Dr. Holtum gently reminded his wife that he had warned her not to trust much to Gibbie's rare moods of seeming rationality; and then the lady—like a sensible person—said, "Oh, well, it can't be helped, I suppose. Now, where has Gibbie hid himself, I wonder?"

No one could answer that question. Gibbie had gone off on one of his wild wandering expeditions, and as he was in the habit of absenting himself for days, the doctor's household gave no further thought to the matter.

But a whole week went past, and Füle-Gibbie did not reappear, and then Dr. Holtum asked some of the neighbours what had become of the poor half-wit since his exploit at Collaster. The Holtums had forgiven his fault, of course, and were anxious to remove any apprehension he was feeling from his mind.

Gibbie had been seen just once, the day following the tragic end of the fowls. He had visited a cottage and received a quantity of broken victuals from the gude wife, who had also informed him of what had happened to Mrs. Holtum's poultry, and who advised him to return to Collaster and apologise for his thoughtless folly.

If Gibbie had been as sane as a little child he would likely have followed such excellent advice, but, being what he was, instead of doing so he burst into tears and ran away over the hill towards the cliffs of Westervoe.

From that time no person in the isle had set eyes on Füle-Gibbie, and Dr. Holtum, thoroughly alarmed for the poor creature's safety, had sent parties of men and boys out to search for him.

This was the story which Bill Mitchell told to his parents, and the minister was soon on the alert to render assistance with counsel and personal supervision.

"It is a whole week," said Bill, "since Gibbie hid himself, and the doctor is now afraid that he may have got off to some skerry, or clambered down the cliffs, and is unable to return."

"Gibbie has a number of hiding-places," said the minister, "and I understand he keeps store of broken food there, so that it is not likely he is starving in his retreat."

"But," answered the boy, "Svein knows all Gibbie's haunts, and has searched them in vain. He can't be found anywhere in the isle, so this afternoon it is proposed that we rummage every cliff, and geo (creek), and skerry all round the coast. Eric and Harry have joined Svein, and I was told to follow with some more fellows and our scaling-ropes."

"But if you are going down the cliffs some of the men should be with you," said Mrs. Mitchell.

"We don't need any better men than Eric and Svein Holtum," said Bill; "besides, the men are at it in different places already. Our party is going where only the best climbers can venture."

"Oh, my dear!" the mother exclaimed, "is it wise to let the boys do that?"

"Eric is very cautious; so is Svein," answered the minister.

"And Fred Garson will be there too," said Bill; whereupon his mother's face cleared, and Mr. Mitchell nodded.

Having discharged his budget of news, off went Bill to find suitable ropes for his purpose, and to join the party of youths, who were all in high spirits at the prospect of a stirring adventure.

CHAPTER II.

THE party consisted of the Manse boys, their faithful chum Gloy Winwick, Fred, the laird's only son, Svein Holtum, and his brother Tom. Seven lads of true mettle, not to be matched for courage, ready wit, and self-forgetful manliness in all the Shetland Isles.

The spot which they purposed exploring in search of Füle-Gibbie was a range of cliff overlooking both Westervoe and Collaster. It was a lofty headland, rising in steep and frowning majesty from the depths of the ocean. Its precipitous front projected over the sea, and was broken here and there by deep rifts and dark caverns, the haunt of sea-fowl, seals, and mighty waves.

The Manse boys and their special chums were wont to boast that they seldom required to use a rope when climbing among their native crags; but not even reckless Tom Holtum or plucky Harry Mitchell ever ventured to descend the head of Collaster without a cord attached to their person and well secured on the land overhead.

The lads had chosen that place as the scene of their explorations because it was in the neighbourhood of those cliffs that Füle-Gibbie had last been seen. Also Eric remembered that the runaway had often declared *he* knew a way to the caves of the Head which could be followed without help from boat or rope. Of course, the Manse boys treated such assertion on Gibbie's part as the idle invention of an unsettled mind, for they believed that *they* knew every crevice of the Head of Collaster better than anybody else.

But in the present crisis it occurred to Eric that there might have been truth in the poor half-wit's assertion, and when Fred and Svein were consulted they agreed that something might come of a more thorough inspection of that locality.

It was certain that Gibbie had fled there when he discovered the result of his treatment of the fowls. It was also certain that he entertained the most extreme terror of death, and would never dream of seeking a madman's refuge in suicide. There was every reason to believe that if Gibbie knew of some secure inaccessible shelter in the Head of Collaster he would hide there in preference to any other place, and it was quite possible that he had reached such a refuge, but could not find a way of returning.

All those points our young friends took into consideration, and they soon decided upon their line of action.

One of the ropes Bill had brought was attached to a boulder on the brow of the cliff, and Harry, being the most lithe and light of the party, was cautiously lowered over the most inaccessible part of the precipice, while Svein and Fred swung themselves down two of the geos, and Gloy explored some of the lower crags.

Tom Holtum and Bill remained with Eric, by his express command, beside the rope from which Harry was suspended. They were both rather reckless, and younger than the rest, and Eric knew that the doctor and minister would hold him responsible for the small boys of the party, so he thought it right to keep them employed in guarding the rope upon which a life depended, and the two boys were soon so interested in watching Harry's progress that they forgot to regret their own inactivity.

As I said, Harry was lithe and light, a master of athletics, and wary as well as bold. He never trusted both feet on a rock until he had made sure that it could bear his weight.

You must remember that these cliffs overhung in many parts, so that before long Harry was swinging in the air many hundred feet above sea-level, fathoms of ocean far below, and nothing keeping him from destruction but that trusty cord guided by his companions. Slowly, slowly they lowered him until he was suspended in front of a narrow ledge of rock, where numerous sea-fowl had their nests. There was a large cave lower down, and Harry thought if he could gain a footing on the ledge he might reach and explore the helyer (cave), but the cliff overhung a good deal at the point where he found himself, and it seemed impossible to get nearer.

"I wish I had brought one of the sticks with me," he thought, as he glanced keenly around, hoping to discover some means of "landing."

While doing so there suddenly appeared on the ledge, within a few feet of him, the gaunt wild form of Füle-Gibbie!

He had been hiding behind some crags, and on recognising Harry had crept near with the human instinct of gladness at sight of a human being.

"Hullo, Gibbie!" cried Harry. "This is a queer place to meet in! How did you get here?"

"The birds—they can tell," said Gibbie.

"Well, I can't fly, if you can. So reach out, if you please, and give me a hand that I may get my feet on something."

"I dinna dare do it for yon awesome sea," whimpered Gibbie, covering his eyes and shivering with fear. "Oh, Maister Harry, I never thought the sea was sae dreedful till I came here, but it has sounded in my head for a' the nichts and days like ghosts and trows roaring for a body's soul; and whenever I tried to creep awa' its voices held me to the spot."

There was evidently no help to be had from Gibbie, and Harry was wondering what he should do next, when, a few yards to the right of him, Fred Garson appeared, hanging on to a rope also, and carrying a long pole in his hand.

Before many minutes the two adventurers had gained a footing on the ledge where Füle-Gibbie sat, sobbing and quite cowed by the solitary awfulness of his position.

The question, then, was, How was he to be removed? There was no possibility of bringing a boat below the crags, for rock after rock lay in the sea at the foot of the precipice barring the way, and making one shiver to think of being launched amid such breakers.

If all the wise heads in the isle had been on the spot they could not have decided on a better plan than that which

Fred Garson adopted. It took many minutes to persuade Gibbie to trust himself to Fred's guidance, and if the poor creature had not believed more implicitly in the laird's gallant young son than in any other body the plan would have failed.

At last he yielded, and the lads fastened one of the ropes to his waist, Fred promising at the same time to go with Gibbie and support him. Harry took possession of the other cord and the pole and gave the signal to those above to "haul away." He was soon going up the face of the precipice, followed by Fred, whose one arm was clutched by Gibbie, while the other was twisted round the rope.

There was great excitement among the other lads when they found that the one rope bore such a heavy weight, and before long they were gratified by a sight of the double burden. Right lustily they pulled on the lines, and half the

way was passed in safety, when Harry, chancing to look up, saw to his horror that the rope to which Fred and Gibbie were attached had got slightly frayed on the rocks, and was slowly untwisting. The double weight had been more than it could sustain, and in a moment or two more it must part if not lightened.

"Oh! Fred," Harry cried in terror, "your rope is breaking. There is too much weight on it. Can you reach mine?"

Alas! Fred had no hand to spare, and if he had had I do not think he would have deserted Gibbie. He gave one despairing glance upward and closed his eyes.

Gibbie, too, looked up and saw the peril; but in that supreme moment of impending doom the cloud rolled back from his shattered mind, and left him a man and a hero.

Fred's knife was hanging by its lanyard within reach of Gibbie's hand. In

a moment he had snatched at it and the steel was out.

"There's nane to sorrow for Füle-Gibbie, and ye are the laird's only boy," he cried. "Lord tak' me to Heaven this night!" With these words he severed the rope between himself and Fred.

One wild cry followed, which was echoed by Harry and the appalled spectators on the brink of the precipice, and a moment later Füle-Gibbie had disappeared among the seething, roaring breakers far below.

Faint with horror, Fred scarce knew what was happening; but Harry, by a violent effort, swung himself near enough to grasp his comrade's hand and lessen the tension on the failing rope.

Then both were rapidly borne aloft, and the pathetic story of Füle-Gibbie's death was told to the Islesfolk, who heard with tears of the noble self-sacrifice he had shown.

Home for the Holidays.

BY SOMERVILLE GIBNEY.

At home once again for the Midsummer "vac."

The jolliest "vac." that there is in the year;

It's hard to believe that I really *am* back—
It seems like a dream, and the waking I fear.

Hurrah! I'm at home. I was met at the door
By Mater, who gave me no end of a hug,
And Pater all smiles, who with rare calmness bore

The news that I'd left my new travelling rug.

And dear little Cissy; my word! how she's grown!

She's quite a big girl, and she's got very fat;

I fear I shall have to go climbing alone,
For Mater no longer will let her do that.

I *did* just tuck into my dinner, you see

The travelling gave me no end of a twist;

And Susan, the cook, knows my taste to a T,

Those cheesecakes of hers I could never resist.

And now there's a lot to be done before dark,

So come along, Cissy, don't let us lose time;
Let's see how the "pitch" has got on in the park.

You've rolled it, you say? You're a brick; that is prime.

A litter of twelve, with black ears and pink eyes?

Let's see them at once, it is all on our way;
They soon will be ready to try for a prize—

We'll send them next week, Cissy; what do you say?

Why, Viper, old man, do you know me again?

Of course you do, doggie, your tail tells me that.

Now, quiet! and let me unfasten your chain,
There, hi on! and try if you can't find a rat.

Oh, Cissy, you can't think how jolly I am

At being back here, with the "vac." all in store;

It's worth all the lessons and "puns." and "exam."

At last to discover yourself home once more.

A NIGHT IN A REED-BED.

BY CUTHBERT BEDE,

Author of "Verdant Green," etc., etc.

CHAPTER I.—A MERE DESCRIPTION.

TO pass a night on a bed of reeds is no hardship, and is what thousands of Fen-men have habitually done, to their own great comfort; for the dry reeds make a soft and yielding couch. But to pass a night in a reed-bed is quite another thing, and is as different from the other as the horse-chestnut is from the chestnut horse. Yet I once knew a lad who passed through this experience; and as it is one that is, happily, very uncommon, a record of it may, possibly, possess some interest for the readers of these pages. In order, however, to narrate the story more clearly, I must apologise for intruding myself into the narrative and being slightly autobiographical, after the fashion of the famous "My name is Norval, on the Grampian hills," which I well remember declaiming, in character, in my earliest school-days.

My first curacy was that of Glatton-with-Holme, in Huntingdonshire, to which I was ordained at Ely in October, 1850. Glatton is the village that gave its name to a succession of famous vessels in the Royal Navy, including the latest and largest, H.M.S. Glatton, a double-screw iron turret-ship, armour-plated, 4,910 tons, 2,870 horse power, with two guns for harbour defence. Holme is on the other side of the Great North Road, three miles distant from Glatton, on the east, with a station on the Great Northern Railway, and a branch line to Ramsay. This branch line did not exist in 1850, for the very sufficient reason that the tract now traversed by the railway was then a large lake or mere. But the Great Northern line existed, and had, in fact, replaced the Great North Road by robbing it of its forty-four four-horse coaches, its private carriages, its post-chaises, its bagmen, its carriers' waggons, and its traffic of all description. The portion of the line, however, skirting the village of Holme was in a very shaky condition when I first made its acquaintance in 1850; and gangs of navvies had to be kept constantly at work to prevent the rails from sinking in the bed of peat, and

to maintain the permanence of "the permanent way." The company took every care of these navvies, and paid a chaplain, the Rev. James H. Nowers (afterwards Rector of Yelling, Hunts), specially to look after their interests, and to supply them with Sunday services.

When the railway traveller who was hurrying from London to York was whirled by Holme—the engine slackening speed to proceed more carefully over the treacherous part of the line—he would, on looking out to the right, see a great bed of sedge and reeds growing out of the peaty soil, and, beyond that, a large expanse of water mirroring the floating clouds and grey sky with numerous windmills with whirling sails, and rows of stunted alders and pollard willows. This was the lake which Roger Wildrake, one of Sir Walter Scott's characters, dubbed as "Squattlesea Mere;" but its real name was Whittlesea Mere. Why it was so called was a matter for conjecture; for it did not belong to Whittlesea, but was almost entirely in the parish of Holme, with outlying portions in the parishes of Denton—of which I was subsequently rector for twelve years—and Conington. But Whittlesea was the nearest town to the mere, and its church, with the tall tower and spire, formed a great landmark in that level landscape; so the mere was called "Whittlesea" out of compliment. Nevertheless, we Holme folk always looked upon it as Holme Mere.

It was a very fine sheet of water, the largest that the traveller from London would meet with until he reached Windermere. It was three and a half miles long from east to west, two and a half from north to south, and covered 1,870 acres. Though its depth was inconsiderable—seven feet was the average—yet, as it was affected by tidal influence, its surface was sometimes very rough, as, once upon a time, King Canute and his sons discovered; for, when rowing over the mere they were nearly drowned in a sudden storm. Regattas were held there in the summer; and, in the winter, sledges were dragged over its frozen surface laden with peat for fuel, and supplies for home consumption. Then was the season when the thousands congregated there from Peterborough, Huntingdon, Ely, Cambridge, and other towns to watch Turkey Smart, Green, Smith, Shelton, Dyer, Tomline, Sharman, Needham, and other noted skaters flying—somewhat ungracefully as regarded action—"like the wind" on their "pattens," as the Fen-men term their skates. Indeed, Turkey Smart once did his mile in two minutes and two seconds, which I imagine to be the best performance on record; but he never succeeded in accomplishing the mile in two minutes, as he had fondly hoped to do.

Then wild birds abounded in Whittlesea Mere, some of which, such as the bittern—or "butter bump" as they called him—have long been extinct. Fancy! shooting seven bittern in one day! but W. Coles did this; and so did Mr. John Moyer Heathcote, of Conington Castle, whose pen and pencil have so ably illustrated "Fen and Mere," and

from whose faithful sketches the illustrations to this paper are taken. On that same occasion, too, Mr. Heathcote had an experience of the mud of the mere; for, after shooting the bittern in a field in the Holme Fen, two or three hundred yards from the New Dyke, he sank into a bog above his waist, and there had to remain, until ropes and assistance were procured from a distant cottage, and he was extricated with difficulty.

Besides the bittern there were numbers of plovers, coots, snipe, shrikes, kites, buzzards, falcons, ruffs, rheas, grebes, didappers, teal, widgeon, and wild swans. And there were famous wild-duck decoys, such as Skelton's, where as many as fifty dozen of ducks have been killed in one day. University men from Cambridge used to come there and sleep in house-boats, so as to begin work at daybreak with the punt-gun, which worked on a swivel, discharged a pound of shot, and was the very biggest blunderbuss that I ever saw. And there, in the clever screen of reeds and alders and sedge, was the pond wherein were the tame ducks who enticed their wilder cousins into the decoy, where the trained little dog jumped about and barked, and frightened the wild ducks into the ditches or pipes, from which they were driven into the hoop-nets and purse-nets, there to meet their doom. Sometimes the wild-duck shooters used the stalking sledge—of which Mr. Heathcote gives a representation. It was more of a raft than a boat, about sixteen feet long by three or four broad. In front of it was a fence of upright reeds, kept in position by cross sticks; and the long duck-gun projected through it. The shooter knelt at the other end and punted himself along by the aid of two short sticks terminating in iron prongs. By the help of his raft or sledge he could push himself along the mere by the side of the reeds, and as the morning sun fell upon the distant towers of Peterborough Cathedral he could approach sufficiently near to the ducks and wild-fowl to discharge at them his long punt-gun with deadly effect. The raft would often have to be pushed among the bright broad leaves and cup-like flowers of the water-lilies, while the queen of ferns, the *Osmunda regalis*, waved its graceful fronds from the bank.

Then there were the fish of the mere—the carp, and tench, and perch, and such eels as I have nowhere else seen; and great pike, one of which weighed fifty-two pounds, an oil painting of which, from the collection of Mr. Frank Buckland, was exhibited in the South Kensington Museum in 1873. Then there were the butterflies—the great Copper butterfly, purple Emperors, and Swallow-tails, all of which have disappeared with the bittern. The late Frank Coles told me that when he was a boy he used to catch these butterflies, and made quite a little fortune by selling them at sixpence apiece to the dealers. Old Whybury, too, the gardener at Holme Wood House, was especially clever in netting the Copper butterfly, knowing where to look for its rare haunts. Naturalists made journeys from London specially to procure specimens of the Copper and Swallow-tail butterflies, whose favourite habitat was between Holme Lode and Sword's Point. Gipsies, too, thought it worth their while to encamp on the borders of the mere for the purpose of catching butterflies—with perhaps a pike, or eel, or wild duck, or a few other unconsidered

* Published by Messrs. Longmans, in 1876, with twenty-five autotype illustrations from sketches by the author, and two others from drawings by P. Deynott and E. W. Cooke, R.A.; and three maps. One vol., price 28s.

trifles. It was a great country for gipsies, even in my time, and I frequently made them the subjects for my pencil. The mere was barely two miles distant from that spot between Washingley Hall and the Norman Cross Barracks (erected for the French prisoners), where George Borrow, of "Lavengro" fame, first made his acquaintance with the gipsies, including the "King of the Vipers" from Whittlesea Mere.

All round the mere was a great bed of tall reed waving in the breeze, the haunt of thousands of starlings as well as of the pretty little reed-bird, whose song was so sweet. This tract was called the Reed-shore, and, as seen from the high ground of Yaxley and Norman Cross, was a remarkably beautiful feature in the landscape, girdling the blue mere with a belt of gold. The reed grew to a considerable height; I have seen it fourteen feet from the level of the water. It was a great source of income, one reed-merchant alone possessing reed-stacks worth at least two thousand pounds. It was harvested from December to March, when that portion of the reed that grew in the water had to be cut down by men who stood in boats and punts, and used short scythes fixed on long poles. Two hundred acres of reed-shore—sometimes called "shoals"—around the mere produced a thousand bundles of reed, and was worth five pounds an acre. The sedge that grew outside the reed was cut once in three years, and the crop formed about one thousand bundles, the land being worth one pound an acre. When the gangs of men, in their stuff jackets and high fen-boots, had cut down the reed they laid it upon sledges, which ran on narrow-bones, and were dragged along the

years with occasional dressings and sweeping down.

Readers of Charles Kingsley's "Hereward"

features in the landscape. The mills stood on the banks, and their large revolving wheels scooped up the water from the lower

Fen Sledges.

will remember his vivid description of the fens of Crowland and Ely; but those fens had long since been drained by the system of great cuttings and canals known as the "Middle Level." Whittlesea Mere remained

level of the drain and delivered it into the main river, from whence it flowed down the lodes with a fall of three inches in a mile, and eventually found its way to the sea. But when the fen was saturated with wet and the winds ceased to blow, the mills could not work, and the drainage was at a standstill. Very often the land around the mere would be drowned for weeks together, the water standing a foot or so deep on the cottage floors.

At length the chief owner of the mere, Mr. William Wells, of Holme Wood House, wisely and bravely determined to risk the great expense of draining the whole mere and the adjacent fen, and converting three thousand acres to a more useful condition, devoting to agriculture what had been given up chiefly to sport. It was a great enterprise and encountered many forebodings, but the numerous obstacles that presented themselves were promptly dealt with and duly overcome. The drainage became an accomplished fact, the mere disappeared from the landscape, and now, at the distance of thirty years, the railway traveller looks on a scene studded with cornfields, dotted with farmhouses and buildings, with large plantations of trees, all which trees and houses I well remember being planted and builded; with good roads, of which I witnessed the making; and with a branch line of railway from Holme to Ramsay, which I also saw laid out and constructed.

And all this tract of land, rich in crops of corn and all other agricultural produce, was Whittlesea Mere in the year 1850. In the summer of that year the water was begun to be drawn off, and in the following November it was allowed to enter the rivers, thus by degrees leaving the widespread bed of the mere a vast expanse of mud. From that mud I saw dug up the skeletons of wild boars, the last animals hunted there—after the earlier days of the hippopotamus, rhinoceros, elephant, and elk, bones of which were in Professor Sedgwick's collection—until, two years after, I saw hares coursed on that very spot, a circumstance that I described at the time in the pages of the "Field." The great drain was thirty feet wide, ten feet deep, and three miles long, and it was cut from its beginning near to the garden of Holme Wood House down to the Bedford Level Cutting, where barges sailed to and fro. At that point Mr. Wells erected a centrifugal pump, by Appold, to keep up the drainage of the mere, and its tall chimney is a feature in the landscape.

Pleasures of Entomology!

frozen rivers to the entrance of the lodes, where they were stacked on the banks for future removal when the river navigation was open. The reed was used for ceilings and floors and many purposes, but its chief use was for thatching, and a good reed-thatch would last for one hundred

alone in its glory, and, as Hereward the Wake was "the last of the English," so Whittlesea Mere was the last of the English meres of the fen country of East Anglia. Such drainage as there was, was kept up by numerous mills, whose wooden frames and whirling sails made them most picturesque

The wheel of the pump is four feet six in diameter, and it can pump 1,652 gallons of water in a minute. At the opening of the

There was an unusually good and well-endowed National School in the village of Holme, the master of which, soon after this,

The Stalking Sledge.

pump in August, 1851, I attended a grand public luncheon given by Mr. Wells in the large room of the engine-house, where, among the many appropriate decorations and mottoes that ornamented the walls, was the following very apposite couplet from Byron in reference to the altered aspect of the scene :

"We see, we recognise, and almost deem
The present dubious, or the past a dream."

I illustrated this scene in the "Illustrated London News," together with the various proceedings attendant upon the drainage, and

one piece from a solid oak trunk, twenty-seven feet long. And now, having given this description of the mere, and brought myself to the mud, I must proceed to bring to that same mud the small hero of my little story, whom I will introduce in the next chapter.

CHAPTER II.—SCARING AND SCARED.

It was in the early part of February, 1851, that the event occurred which I have now to relate.

went to Cape Town, where he was subsequently ordained, and has now a living some distance north of Cape Town. One of his best pupils was a lad of ten years of age, named John Beharral—a quick, intelligent, bright-looking lad, and a great pet of mine. I wonder if he is still alive; and, if so, if he will chance to read this record of how he passed a winter's night in a reed-bed; and not only a long winter's night, but also portions of two winter days; for he was immersed in mud in the reed-bed for nineteen hours, and it is a marvel that he ever lived to tell the tale of his recovery.

This was how the event came about. I have said that when the water was begun to be drained off in November, 1850, the surface of the mere gradually assumed the appearance of a vast bed of peaty mud. And such mud! I never knew anything like it for depth and tenacity, although I have sunk with my pony in a morass on the Cheviot Hills. I have already mentioned that Mr. John Heathcote, of Conington Castle—from whose drawings the woodcuts illustrative of Whittlesea Mere are now taken—sank in the mud when shooting bittern, and had to be dragged out with ropes. But that was before the drainage; and I had my own experience after the drainage. My daily duties, as curate of the parish, took me to Holme from the old Woolpack Inn, on the Great North Road—in those days it was more of a farmhouse than an inn—where I had most comfortable quarters for the four and a half years that I was curate of Glatton and Holme. It was two miles from the Woolpack to Holme, and there was not a house the whole of the way. Sometimes I walked by the road, and sometimes through the fields; but whichever way I went I was accustomed to enliven the monotony of my solitary walks by scribbling in note-books and on the backs of letters the first fancies for anything that I wanted to write, either for the press or the pulpit. These exercises beguiled the tedium of the way, and usefully employed time that would otherwise have been lost to me; and at night, when snug and quiet in my own bachelor's room, I could put my pencilled scraps in order, and write a fair copy of them in ink. If any reader of these pages is interested in knowing the

Cutting Reeds

fact, I may say that a considerable portion of "Verdant Green" was written at that period and under those circumstances.

When I got to the village, after I had been to the school and seen those that it was my

and sedge on its banks, where, in the hard frost, the water of the canal had frozen round the boats, and the skaters on their pattens sped merrily to and fro. To cross the mere it was needful to cross the mud. This could

wood fixed on one end, by the aid of which they could leap over the narrower dykes or lodes. Adders abounded; and when I knew that I was going to cross the mere I put on Wellington boots as some slight protection if

Holme Lode.

duty to see, I often had to cross the whole of the mere to get to the clusters of houses at Pond's Bridge and Storey's Bridge, and elsewhere, which hamlets at that time—it is not so now—formed portions of the parish of Holme. First of all I had to go by the side of the Holme Lode, with the stacks of peat

only be done by means of rude pathways laid with brambles and rushes. If any one stepped very briskly over this quaking pathway he could make tolerable progress. But the fen-men, besides wearing high boots, had flat boards strapped to their feet, and they also carried long poles with a round piece of

I inadvertently trod on the venomous beasts. I often saw old Whybury's collection of great adders nailed in patterns on the door of his toolhouse in the garden at Holme Wood; and I had not forgotten Peter Phillips's account, that he had seen from ten to twelve yards of a fen dyke "white with snakes,

twenty deep, lying one over the other, that had come out of a plantation of dry sedge to look for frog's spawn." So, in my journeys across the mere I put on Wellington boots, and I also took boards to strap upon them.

But one day when I was unprepared both with Wellington boots and boards, I was suddenly called upon to go from the Holme School and visit a house on the other side of the mere. I got on fairly well up to a certain point on the drained mere, and was briskly making a hop-skip-and-jump progress along the quaking brambly path, when my feet suddenly went through a treacherous place, and I began to sink. My progress was summarily arrested; although I was sinking slowly, it was none the less surely. The mud had got me in its tenacious grip, and I had not the slightest power to extricate myself, although I tried my very best to do so. I kept sinking, "deeper and deeper still." The calves of my legs disappeared; then my knees were lost to view, and I began to speculate on the probability of my never seeing them again. I hallooed as loudly as I could, and fortunately attracted the attention of two fen-men, with their poles, boots, and boards, who made their way to me, and, with considerable difficulty, lugged me out of my mud-bed. There was no terra-firma on which to land me; but they placed me on a bit of the path that was somewhat sounder than the rest, and they fitted my feet with a pair of boards. This was a caution to me for the future, for it was one of those "Recreations of a Country Parson" that was to be avoided. The depth of the mud may be guessed from the fact that the iron post driven into the underlying bed of gualt stood, in 1875, eight feet two inches above the ground, showing that the bed of the mere had gradually subsided to that depth. When Mr. Heathcote sketched the scene the iron pole or gauge was standing amid the sheaves of a luxurious cornfield, and the top of the pole marks the original surface of the muddy bed of the mere when the water had been first drawn off.

The foregoing will help to explain the adventure of little Johnnie Beharral. He had not ventured upon the brambly path over the mud, but he had merely wandered listlessly to the reed-shore, near to which he had been put to pass the day in scaring birds. It was Sunday, moreover, so he had to be taken away from church and Sunday-school. But at that time there was not, as there is nowadays, legal compulsion in school attendance, and boys were continually taken away from school on various pretences, and we could not persuade every farmer to abandon the system of Sunday bird-searing. They declared that the birds did them as much damage on that day as on a week day, and the only concession that they would make was that the boy who "scared" on one Sunday should not be taken for the same purpose on the next Sunday.

So on that particular Sunday in the year 1851 it came to pass that little Johnnie Beharral was passing his day in scaring birds down in the Holme Fen. It was February, and very cold, though there was no snow on the ground and no ice in the lodes. The reed shore was close at hand, and the reed harvest would begin next month. The flocks of starlings had come in such numbers to feed and lodge in the reed that they would break it down and damage it, and it was the duty of the bird-scarers to endeavour to frighten away the starlings. Johnnie Beharral had to do this, and his voice was pretty well exercised on this particular Sunday, far more so than if he had been joining in the hymns and chants at school and in church.

He had not forgotten his mother in the midst of his duties, and he had gathered for her a little bundle of what was locally termed "cat's-tail." This was the graceful feathery filament that formed the flower of the reed, and was one of its great ornaments. It was

something like the waving fluffy tail of a Persian cat, and the poor people in the Fens were very glad to have this "cat's-tail" wherewith to stuff mattresses and pillows, for which it was admirably adapted. As I said at the beginning, to sleep on a bed of reed, and, moreover, to have a cat's-tail pillow under your head, was anything but a hardship; but to sleep in a reed-bed was quite another matter, as poor Johnnie Beharral was soon to discover.

He wandered on and on, now shouting at the starlings, and now plucking a bit of cat's-tail, which was only now and then; for as the reed was so high the greater part of its feathery brown flowers were far above him and out of his reach. At length he found that he had wandered round to the mere side of the reed-shore. It was now time for him to retrace his steps and to get home before it grew dark. It was some time since the church bells at Holme and Conington had stopped their summons to prayer; and he knew the time pretty well, and that it would be getting on for four o'clock, and that darkness would be coming on soon. He stopped just one moment longer to pluck a very tempting bit of cat's-tail to make up the bundle for his mother, and in so doing he stepped from the firm soil on to the dark mud.

In a moment he began to sink. He had no more power to extricate himself than I had under somewhat similar conditions. He could not lift either leg from the grasp of the peaty mud, which gripped him with the utmost tenacity; and he knew that he was gradually sinking lower and lower into the slime. He cried lustily for help, but his shouts did no more than they had done before—flutter the starlings that were nearest to him; and, probably, if his cries had been heard they would only have been taken as a part of his bird-searing work. But no one seems to have heard them. Being Sunday afternoon, workmen were not likely to be anywhere near to that part of the reed-shore, and as to any one seeing him from a distance, it would not have been possible, even if it had been broad daylight instead of the gathering gloom of a February evening. The great, tall reed swaying to and fro in the chilling breeze formed an effectual barrier to prevent any one from witnessing the sight of the poor lad held down by the mud and sinking gradually to his fate.

Poor Johnnie's thoughts flew to his father and mother at home, and his three sisters and two big brothers, though one of these was in service in a distant county; and he felt within himself that he should never see them again; for, at the rate at which he was sinking, he knew that in another hour he would have sunk out of sight, and that it would be all over with him. Then he wondered if he should ever be discovered; and what they would do when they found his body. But possibly they would never find it, and would never know what had become of him. They might perhaps think that he had taken that opportunity to run away from home; and they might still think him to be alive somewhere, though they would not know where.

He had sunk so far now that the mud was up to his chest. He had kept his arms up on the surface, as he shouted for help, and he had not loosed his hold of the bundle of cat's-tail that he had gathered for his mother. Soon the mud was quite up to his armpits; so before it could reach his mouth Johnnie said his prayers, and repeated some hymns and texts that he had learned in the Sunday-school. This occupied his mind and calmed his despair and fright at the fate that had overtaken his young life.

It was now nearly dark; the gloom had rapidly increased, and the tall screen of reed had turned to a brown purple. He distinctly heard the trains rushing along the Great Northern Railway, past the Holme station, and within sight of his own cottage, where

his mother and sisters would be by the fire, boiling the kettle and getting ready his tea against when he had come back, tired and cold, from his long day of bird-searing. How little could they know the sad plight that had befallen him, and that he could not expect ever to see them again!

Then he distinctly heard the striking of five o'clock from the tall tower of Conington Church, the sound swelling over the mere in the stillness of the Sabbath evening.

CHAPTER III.—HOLME AND HOME.

HAD the prayers of little Johnnie Beharral been heard? To his wonder, half an hour had passed, and he found that he had not sunk any deeper. His arms were still resting upon the mud, which was up to his armpits, but it had not got any higher. There it appeared to stop, and, being so close to the solid land, the mud had shelved from the reed-shore, and was not so deep as it would have been a yard farther away.

The starlings were swooping down to roost in the reed; he could hear them twittering as they settled themselves for the night, and the sharp cry of a snipe would also break the stillness. It had now got very dark; the purple had turned to indigo, and blackness crept over the mere. When Johnnie heard six o'clock strike from the Conington clock he felt assured that, as he had not sunk any farther, he should not now do so. But could he last out till the morning? And if so, would any one find him? Or would he by that time have been starved to death from cold and privation? These were the problems that busied his young brain, without his being able to bring them to any favourable solution. He was but ten years of age, and no difficulties of life had come to him till now.

Singular to say—so at least he afterwards told me—he was neither overpowered by fatigue nor cold, and kept himself awake through the whole of the night, and was perfectly sensible, and marked the time and counted the hours, not only by the Conington clock, but also by the railway trains, with the movements of which he was tolerably familiar. I imagine that he may have deceived himself on this point, and that he may have slept, by snatches, during many portions of the long and dreadful night; and that he may for some of the time have fallen into a state of torpor. But any way—and Johnnie stoutly declared that his own version was the truth—he passed the whole of that February night in that terrible position, sunk up to his armpits in the tenacious mud of Whittlesea Mere.

And it not only was a very dark night, but also very tempestuous. Soon after the darkness had set in the rain began to fall—at first softly, and then with an increasing patter, pelted into the mud and on to the reed, and the wind howled drearily. Johnnie had long since given up shouting for help, for he well knew that it would be useless; and would also exhaust his strength. He could not tell whether his parents, when they found that he did not return, would set off to the fen to seek for him. If so, they would go to that portion of it where they knew he would have been scaring; and unfortunately in his search for the cat's-tail he had wandered away some distance from the scene of his duty. Then, again, on such a dark and tempestuous night they would need lanterns for the search, and they could never see him down there in the mud, behind the tall dark screen of reed. Altogether there seemed to be no hope of deliverance.

Thus the night passed away, very slowly and very sadly. Johnnie, keeping awake (as he said and believed) all the night, and counting every hour as it was proclaimed from the Conington belfry, waited hopefully for the morning. He said his prayers again and again, and repeated all the hymns and texts

that he could remember, and he felt great comfort in so doing.

He watched eagerly for the dawn, which was anticipated by the fluttering of the starlings in the reed, and the sharp cry and clanging noise of some wild-fowl that were early on the wing. The rain had now ceased,

night looking and searching for him. Another hour passed, and he then saw one or two labourers striding along on the other side of the fen, with their long poles to help them. But they were too distant to hear him, even if he had been able to shout to them, and on trying to do so he found himself unable. He

stood up dark and brown against the clear sky, their sails fixed like crosses; the pollard willows glistened with the night's rain; the sedge and bulrushes found a home for the coot as she splashed through the water; the old boats lay listlessly on the stream; the labourers on their way to work crossed the

Whittlesea Mere as it is.

the first pale gleam of greeny-gold appeared in the sky, and the flush of light gradually spread and spread, and the tall swaying reed was no longer a dark-brown purple, but turned to yellow and maize-colour. The reed was dripping with the night's rain, and the great expanse of the muddy mere shone brightly in the faint light of the early morning.

At length, after waiting so long and wearily for the sound, six o'clock was pro-

had lost his voice, and could not summon up the ghost of a cry. The cold and wet and long exposure had now begun to tell upon him, and on trying to lift up his arms to wave hands to the fen labourers, if haply they should see his movements, poor Johnnie found himself quite powerless. His arms lay over the mud as they had done all the night, but they were quite stiff, and he could not lift them. He was in the terrible position of the shipwrecked sailor, who is tossed on the

arched stone bridge; and out of the dim, hazy distance rose the tall tower and spire of Whittlesea Church. The rising sun sent a flicker of bright light across the grey sky, which was reflected in the waters of the lodes. It was a scene that Cuyp, Hobbema, or Ruysdael would have loved to paint, and which has been admirably rendered by De Wint, George Frupp, Edwin Cooke, and Mr. Heathcote, from whose sketch the present illustration is taken.

Scene on the Fens.

claimed from the Conington tower, and Johnnie knew that in the ordinary way of events his father and mother would be up and about by now, and he wondered whether they had been to bed or had been up all the

waves on a small raft and eagerly and madly scans the horizon for the sight of a sail that may, Heaven knows how, bring him relief.

The early morn brightened into the day. The old windmills on the banks of the lodes

Johnnie Beharral, sunk to his armpits in his mud-bed, heard the Conington clock strike nine o'clock, and the bell of Holme School ringing out its summons—a summons that he ought to be answering, but he was

powerless to do so. Another hour passed away, wearily and painfully, for he was now suffering much from his continued exposure.

his fen-boots and stepped on to the mud. Even then it was with the very greatest difficulty that he was able to extract the

taking off his boards, and, by their aid, scraping off some portion of the mud from the boy's clothes, picked up Johnnie in his arms, and, marching round the reed-shore, strode with him across the peaty fen, and made straight for Holme and home.

And now I may quickly bring this little story to an end. If it were not a true story I might depict the acute grief of the parents on missing their child; and I might narrate their agonised talk, and how they had gone down to the fen and had passed the whole of the Sunday night in searching for him with lanterns—torches might also be effectively introduced—and how they had never gone to bed; and a great many more things that even the dullest brain might readily fancy. But, as I am telling "an ower true tale," I am constrained to say that nothing of the kind occurred, and as this is a real experience and not a fancy sketch, I am bound to keep to stern facts.

And the facts were these. When Johnnie did not come home from his bird-scaring to his tea and supper his parents accepted his non-appearance in the most matter-of-fact and philosophic way.

"You may depend upon it," said the mother, "that Johnnie's walked across to see his grandmother at Sawtre, and it isn't likely as she'll let him come home to-night. But she'll send him in the morning in time for school."

It seems that Johnnie had done so on more than one previous occasion, for he and his grandmother were very fond of each other, and, by crossing the fields near to Conington Castle, his nimble legs soon carried him to the village of Sawtre, on the other side of the Great North Road. So the mother's supposition was quite sufficient to dispose of the subject satisfactorily and to allay all family

A Fen Bank.

No one could be seen by him, even at a distance. Those who would have to pass over there on their way to their work would have gone by some time since.

Ten o'clock had struck, when he heard footsteps; they were not very far from him, and were on the other side of the reed-bed. He exerted himself to cry for help, but was quite unable to produce any sound. He was voiceless. His only chance for succour was that the man should come that way round the tall screen of reed and should see him. Hope sprang joyful within his breast. He might be rescued ere it was too late! I believe that the poor boy endured more silent agony during the next five minutes than he had experienced through all that long night. He could plainly hear the footsteps, apparently only a few yards from him, and from the sound of the breaking reed he knew that the man was gathering cat's-tail. Oh! would he come there and see him?

The hope was illusory and was doomed to die within his breast. After those few minutes, filled to the full with dire agony, the footsteps had passed away, and all was again silent. Poor Johnnie gave himself up for lost.

The man was Frank Bellamy, of Holme. He afterwards told me that he never "could exactly make out" what made him retrace his steps and return to the very spot that he had left. But he did so, and not only so, but, mercifully and providentially guided, he passed round the reed in order to gather some more cat's-tail, and there on a sudden saw a sight that took away his breath, and, as he told me, "made a great lump come in his throat." It was little Johnnie Beharral—for he knew him well, and at once recognised him—gazing at him with a piteous, pleading look, and sunk in the mud up to his armpits.

"Why, Johnnie!" cried Frank Bellamy, as soon as he could recover breath and conquer the lump in his throat, "why, my poor lad, whatever brings you in the mere? How long have you been here?"

But he soon found that the boy was unable to speak and was powerless to help himself. No other person was near enough to be summoned to assist, so Bellamy had to do everything himself, rightly divining that not a moment was to be lost. Fortunately he had his boards in his pocket, and he had also his fen-pole wherewith to steady himself. He put down his bundle of cat's-tail, and quickly strapped his boards on to

poor boy from the tenacious grasp of the mud, which by this time had become moulded to his body, and kept him firmly held in its substance.

Sinking and floundering in his labour of mercy, Frank Bellamy could only, with considerable exertion and strength, draw the lad out of his perilous position in the mud-bed;

A Corner of the Fen in Winter.

but at last he did so, and laid him on the firm ground. Johnnie Beharral had been in that mud-bed for nineteen hours, and was now completely paralysed and unable to move or speak. His utterly prostrate condition was sufficiently apparent to his deliverer, who,

fears, and parents and children retired to rest as usual and slept soundly through the night, all unconscious that their bright and dearly-loved little Johnnie was wide awake in his mud-bed.

When Bellamy carried him into the cot-

tage and told his mother how and where he had found him, and that he had probably been in the mere for many hours, then, of course, the poor woman was greatly excited, and all her maternal affection was at once aroused.

"Oh, my poor dear Johnnie!" she sobbed hysterically. "Oh! he won't get over it! Oh! send for Dr. Wright!"

Johnnie was too far gone to be capable of noticing his mother's grief.

Said the practical Bellamy, "Don't take on so, missis. I'll go myself to Stilton for Dr. Wright; but you strip Johnnie's wet things off and put him between the blankets, and get him some warm tea or a sup of hot broth."

And he at once set off for Stilton, after calling on Mrs. Beharral's next-door neighbour, and sending her to assist with the lad.

Mr. Wright was entering the village at the time, and had galloped up to the Beharrals' cottage within a few minutes after Bellamy had left it. So no time was lost, and Johnnie was promptly and duly cared for.

He must have been a very wiry lad and with an excellent constitution, for after the first two or three days he seemed to have pretty well got over the worst effects of his nineteen hours' exposure in the mud-bed. It might have killed him, or have turned his hair white with fright in a single night, like another Prisoner of Chillon, or done some-

thing very sensational. But truth compels me to say that it did nothing of the kind, and that on the following Monday he appeared in his usual place at school as though nothing very remarkable had occurred since he was last there.

In our modern Arcadia the bucolic mind is torpid and the body is inured to bad weather from early years, and so my little friend Johnnie Beharral was enabled to live through what would probably have speedily killed a more imaginative and tenderly-reared lad. But I should think that he would remember to his dying day his winter's night in a reed-bed.

(THE END.)

Maternal Musings.

(ON THE EVE OF THE HOLIDAYS.)

By JESSIE M. E. SAXBY.

With clatter of voices,
With lessons all done,
With restless young spirits
Concocting new fun,
With hurry and laughter,
With mischief and noise,
From school and from college
They're coming—our Boys!

Of course they will frighten
Weak nerves and dull wits
By startling vagaries
And haphazard hits.
Of course they will ruffle
Some tempers and frills;
Will knock over gimcracks
And have many "spills."

With headlong impatience
And radical march
They'll tramp in confusion
O'er old-fashioned "starch."
They'll cripple our hobbies,
Make light of our fears,
And platitudes answer
With good-humoured jeers.

But what does it matter?
We all have been young,
And know that a laddie
Can't bridle his tongue.
When thoughtless speech vexes,
Or joking annoys,
We'll smile and remember
That boys must be boys.

We'll smile and look forward
To happy days when
Those lads so tormenting
Will come to us—men!
The lords of creation,
The masters of State,
The guardians of homesteads,
The wielders of fate.

So rig the old shallop
And launch the canoe;
Search out bat and wickets,
Trim "flannels" anew.
Have breechloaders burnished,
Provide fishing-flies,
Make way for lawn-tennis,
Go bake savoury pies

Oh, sisters of brothers,
Be ready for play,
And matrons, with good hope,
Put worries away.

If we are the centre
Of innocent joys,
Then *Home*, glad as ever,
They'll hasten—our Boys.

MY HOLIDAY ON THE NORFOLK BROADS.*

BY THE REV. C. W. WHISTLER.

MY readers will doubtless remember the pleasant account Mr. Penrose gave us in the *BOY'S OWN PAPER* of a cruise in the Solent in the Rita and Mayflower, so that the little boat of my cruise is not altogether a stranger to us. Since those pleasant days in the south with Mr. Penrose she has been in Norfolk with me, and perhaps the log of one or two days' cruising will be interesting.

Rita is a mahogany-built cruising canoe, 14ft. by 3ft. dimensions. She has no centre-board, but a 4-inch fixed keel, into which is built nearly half a hundred-weight of lead. Her rig is the usual main and mizen—both battened Chinese lugs—together about 56 square feet area, just comfortable canvas for river work, though rather more than she carried on the Solent. All her cruising fittings are on board her as she waits at the station for the train to Beccles, and we can look at them as we use them after we get afloat.

July 14th.—Started from a station on a Suffolk cross line, for Beccles. We had to change at the junction with the main Great Eastern Railway, and I was doubtful as to taking a carriage truck for her. However, the station-master was positive that she would go into the van, and if not, they would carry her on the carriage roof. I doubted the safety of this last, but he showed me a clause in the Company's traffic arrangements which said the same, and I was answered for the time. She went into the van without much difficulty, and was taken out at the junction and carried across to the main down line without any trouble. While she was waiting for the train she attracted much attention, and there were many and quaint suggestions as to how she "went," these inland people evidently having never seen one of her build before. A youth remarked, "That's a ship," to which his companion responded, "No 'tain't, it's a steamer." One old gentleman asked me at last how she was driven, and I could not resist mystifying him a little. "By pneumatic force," I said, pointing to the sails, which were stowed inside her. "Oh, indeed," said the inquirer, peering under her after deck, "I see." It was the tin box into which the cooking apparatus packed that he saw, I fancy. At any rate he was quite satisfied.

When the train came up there was a difficulty. The van was a new one, doors opening outwards, and only to a right angle, so that she would not go in. Station-master derided the idea of putting her on the roof, as she would be smashed against the next bridge. So there was nothing for it, as there was not time to get a carriage truck, but to wait for the next train, which, being a slow one, had the old-fashioned van attached. The moral of all which is that one had better take a truck at once, and that the Company should say what they mean. I suppose the modern carriages are higher than the old, and that the clause has not been altered with them.

4.40.—Reached Beccles, a pretty old market town standing on a gentle hill commanding views of the Waveney Valley west and east. The church is worth seeing, the fine tower standing separate and holding a good peal of bells. However, the place is not new to me, and I was only anxious to get afloat as soon as possible. The river is about three-quarters of a mile from the station. So I found three loafers, and two of them borrowed,

or stole temporarily, a truck from some one else, on which Rita was secured, and wheeled to the corporation staithe, from which we launched her. "Staithe," by the way, is the local term for a riverside wharf. We excited no popular enthusiasm on our way through the town. Beccles is used to such processions, which was a relief.

5.30.—Got under way from the staithe, leaving the three loafers sitting on the truck and speculating where I was going to sleep to-night. Wind very light, and tide falling. Both in favour of my course down the river towards Lowestoft. Where are we bound? If you look at a map of Norfolk and Suffolk you will see that the Waveney runs almost due east from Beccles to Lowestoft, sending off there a branch into Oulton Broad, and thence north to join the Yare to form Breydon Water, the largest of the Broad, close to Yarmouth. From Yarmouth, running north-west, runs the Bure, which joins Breydon in the mouth of the harbour. We are bound for Acle, on the Bure, where a friend is to meet me, and I am not going to hurry, for I want to enjoy the few days I have. Knowing the rivers so well, it seems very pleasant drifting down with the light breeze and tide again after five years' absence, over the old cruising ground.

The wind fell light as the sun set, till it died quite away, leaving me becalmed close to the swing bridge where the railway crosses the river. So I looked out for a well-remembered creek, and, finding it, lowered mainsail and paddled into its mouth; anchored, and proceeded, as there was a heavy dew, to set the tent before making tea. Some canoeists prefer camping ashore, but for myself I always like to make the canoe my home, and sleep on board her. The tent is made of calico, waterproofed with boiled linseed oil, and is set up in less than a minute between the mizenmast and a little mast for the fore end stepped just forward of the well. Having no ridge pole, the top being kept extended by three wooden arches, it rolls up into very small compass, and stows aft alongside the mizenmast step. The little mast forward has a pair of wooden "jaws" at the top, into which the furled mainsail lowers, being so kept from rattling about and out of the way overhead. The ends and sides of the tent hook down to eyes outside the well, on deck. Either corner can be lifted separately, or either end, or side, can be lifted and rolled up without interfering with the others. Four little plate-glass circles let into the canvas, fore and aft, and on each side aft, act as "windows." So that altogether it makes a most comfortable little "cabin," with plenty of room to move about in—5ft. by 2ft. 9in. by 2ft. height from deck.

Tent being set, the "stove" comes out of the tin box. The "stove" is made of stout tin (copper would have been better), and into it fit the Réchaud spirit lamp below, and the kettle or saucepan above. It looks something like a box with one side cut half out, and a circular hole cut through the lid. It hangs to the side of the well by a broad brass hook, so that even in a sea way one can use it without fear of lamp or kettle being upset. All the tins of provisions are stowed forward in a square box on purpose, which leaves room on either side for spare sails and spars. There are lockers, three on either side, along the well, but these are full of other stores and things which are wanted while sailing. In one, too, is the "crockery," consisting of a japanned iron plate, saucer

and mug, and the knives and spoons and the fork.

It was a lovely night, perfectly still and quiet, and as the kettle began to boil I felt that I was comfortably out of the way of everything in the way of business—that there were no patients to call me in the centre of the night to ride three miles or so, wet or fine. So, as the kettle sang, I sang in discord, and a wakeful reed-sparrow sang in company in a different key.

As I ate my tea-supper I heard a boat coming up stream, and the men lay on their oars as they passed me to look at the brightly-lighted tent. "What's that, Bill?" said one. "That's a yacht," said Bill, in return. "What cheer?" Rita, feeling flattered, replied accordingly, and the men pulled on with "good nights" exchanged.

Bed next. Carefully washing plates, etc., I stow them in their places. The great secret of comfort on board a canoe, as everywhere else, is to put things back into their places directly you have done with them. One soon learns that in so small a craft. Next I lift the after-hatch and bring out the waterproof bag, in which are bedding and dry clothes. I always keep an extra pair of "flannels," and a flannel shirt to sleep in rolled up with the blanket which forms the bedding. It is just a red and grey Austrian rug, folded in four, and then sewn up along one end and about eighteen inches up the side, so that it makes a kind of bag of that end. Into this one's feet go, and run no risk of having their covering kicked off. The advantage of the four thicknesses of blanket is obvious. One can sleep on one covered by three if it is cold, or sleep on three with one thickness over one if it is hot. Whereas, if it is doubtful, one takes the centre, of course. Clean shirts, shore-going clothes, and such-like, are in a bag stowed aft the mizen under the after-deck.

No need to set up a riding light here, as I am out of the river in this snug little dyke. So to sleep soundly, but not for long. Alas for habit! I woke up with a start, thinking I heard the night bell ringing over my head. It may have been a fish jumping alongside perhaps, but I don't know. Anyhow I am relieved to find that I am not "wanted," for above me is a bright arch of moonlit canvas, and through the forward "window" I can see the river glistening in the moonlight without a breath of wind to stir it. Quite warm and pleasant, and so to sleep again.

July 15th.—Woke up at 6.0 a.m. with the sun shining through the port "window," feeling fresh and very hungry. I lifted the port side of the tent and looked out. Never such a lovely morning surely! Just the last curls of the morning mist floating off, and across the meadows the square grey tower of Beccles Church standing out against the sky and the red roofs of the houses below, with the quiet reedy river in the foreground completing the picture. Every sign of a lovely day.

Had a good swim; then breakfast, and under way again at 7.30. Tide setting down towards Lowestoft, and a nice s.w. breeze getting up. I planned to reach Reedham on the Yare to-day, going through the Haddiscoe Canal. However, I don't feel bound to any special port if circumstances change.

The wind was very light. Past the railway bridge—and wonder how it was I didn't break something when I fell off it years ago. I had been on the bridge in the dark to borrow a candle of the signalman, we having come out in a yacht without lights; missed

* For further details of the Norfolk Broad see the illustrated article by R. A. M. Stevenson, M.A., in the last Summer Number of the B. O. P.

my footing on the top rung of the ladder, and fell, lighting luckily in a soft bog, and not on the beaten path, as I fell on one side. I got back to the yacht none the worse, except for mud, and the candle was all right. The fall was ten or twelve feet perhaps. Rita's mast just clears the bridge now, but I have to drop the peak of the mainsail to get under.

It kept on getting hotter and closer as the sun rose higher. At 8.0 p.m. I began to wonder what it would be like at midday, and whether the varnish on the deck would stand it. Then I remembered that the station-master at Beccles had reminded me that St. Swithin's Day fell this year, as usual, on July 15th. Here was a fine St. Swithin at last! Past Worlingham; and from there the river runs nearly due east, so that I drifted slowly on with the sun in my eyes, and quite peacefully—just enjoying myself.

Presently the breeze died away altogether, and it grew very close. The sun was scorching, and I felt that my nose was growing redder and redder under it. Then suddenly I heard a noise astern of me as if there was a steam launch coming up—such a swish of water. I looked round, and saw, to my intense astonishment, that the whole western sky was covered with an inky bank of cloud, and that the noise I heard was caused by a solid wall of rain coming up fast across the river and meadows. There was no time to be lost; so, still in bright sunshine, I shipped the waterproof well-cover, put on my cape, and took a reef down just as the first drop fell with a *rap* like a marble thrown on the deck. Then came a squall, and for five minutes it rained and blew hard, while the little boat flew gunwale under down the reach. Presently the rain slackened and the wind dropped, and I thought the worst was over; but no. There came a blinding flash of lightning with a perfectly simultaneous clap of thunder that seemed to be all round me. The flash lit in the meadows not more than fifty yards off to starboard, and with it there was the most distinct smell of what Dr. Scoffern would tell you was ozone. I felt that I was the only projecting point for miles, and very uncomfortable it was. Where would the next flash light? It occurred to me that I was in much the same position as the terrapin in "Uncle Remus," when the man set the field on fire, so "sot and tuk it"—the rain following the flash being the heaviest I ever knew.

About eighty yards ahead there were five or six cows feeding along the bank. The next flash fell among them, killing one, and sending the rest flying dazed across the meadow. It was too near to be pleasant; evidently I was in the very focus of the storm, and running with it; so I luffed sharp to let it pass over. The third flash fell in the river, and I was thankful that I had hove-to, for I calculated it was about where I should have been had I held on. After that the storm wore off to port, and in half an hour's time I was in sunshine again, mopping out the boat with the sponge and thinking of that cow. There were two men cutting reeds a little farther along, and I sent them back to look for her, and held on towards Burgh St. Peter's.

Rain came on again, but no more lightning; and when I reached the staithe at Burgh I concluded, as it was just 12.30, to go up to the inn and get some dinner. Too wet to be pleasant in the canoe. Went alongside the staithe and made fast. Ordered some cold beef and bread and cheese, and while waiting for them just glanced out of the door towards the canoe. Generally, in Norfolk, one can leave a boat anywhere in safety, but here there were three big boys investigating the canoe—one of them just trying to board her by holding on to the mainmast and stepping on the fore deck. Of course, if he had gone on he would have got a ducking, for even a good-natured canoe like Rita will capsize if you swing on her mainmast; but, much as I

should have liked to see him in the water, my stores and deck were in danger. So I yelled, and they fled promptly; but the marks of those hobnails are yet on the polished cedar deck.

The people at the inn were strangers to me—not the old host I remembered. However, they knew every one, and told me about several friends I inquired for. As I was leaving I saw several large baskets full of ducks' eggs in a pantry, and asked them to sell me some, but they gave me a dozen, saying that they had more than they knew what to do with, and would not take any payment.

1.30.—Under way again. Wind shifted to S.E., and raining in fitful showers. As I beat up the next reach I heard a hail astern, "Canoe ahoy!" Thinking that I must have left something or other at the inn, I luffed and looked round. There was a man sculling after me in a gun-punt, and ejaculating "Canoe ahoy!" at intervals. Seeing that he wanted to catch me, I went about and ran back to meet him. It was a friend for whom I had inquired at the inn. Hearing that I had just gone from the landlord, he had got out his boat, being smitten with curiosity to know who the strange canoeist could be. His first remark was, "Hullo! what are you doing here?"

"Enjoying myself," said I.
"Going on the Broad?"

I told him that I was bound for Reedham, but he was very anxious that I should go down to Oulton with him instead, as we should find a lot of yachts there, and some more men I knew. As we were just off the mouth of the "dyke" leading from the river to the broad, and we were evidently in for a wet afternoon, I concluded to follow his advice. So we went together down the dyke—which is practically a branch of the river, perhaps an old mouth—to the open water of one of the prettiest broads there is. Oulton is in Suffolk. There is only one other Suffolk broad—Fritton—which is quite landlocked, and cannot be reached from the river. It is well worth the two miles' walk from St. Olave's to see it, though, as there is a celebrated decoy upon it, and it is very prettily wooded to the water's edge, and full of fish. The number of wild duck taken in the decoys in the winter is very large occasionally.

Reaching the broad, my friend pulled right across, leaving me to fetch the staithe at the Lowestoft end in two long boards, and meeting me as I dropped alongside the landing-place with many comments on the weatherly qualities of the canoe.

Several yachts on the broad; too wet for pleasant sailing, and their owners were congregated in the smoking-room of the hotel. I left Rita moored alongside the staithe, comfortably battened down with the canvas well-cover and sails stowed, and joined them with my friend. There were several whom I knew, and, wet as the afternoon was, we had a pleasant chat till my friend left, the rain having ceased about 5 p.m. I went out and set sail on the canoe to dry the canvas, and the other men came out and overhauled her. Then one or two of them sailed her in turns round the broad, and we came in to the hotel to dinner, joined by my friend D—, of Little Mary, three tons, who was anchored off the north shore.

8.30 p.m.—D— offered to take me off in his dinghy, towing Rita with us to a safe berth astern of his yacht. So he, two friends who were with him, and I crowded into that cockleshell. How we managed it I don't know, but we reached Little Mary safely, dropping Rita's anchor about five fathoms astern of her. Then on board the yacht for an hour's pleasant talk, and to wait till the rain, which came on again heavily as soon as we were on board, ceased. However, at 9.30 it was still pouring, and I concluded to go on board Rita in spite of the wet. D— was very anxious about my comfort, for all my assurances of Rita's capabilities in that

line, and wished he had a berth to give me. I dropped alongside the canoe in the dinghy on a long line, set the tent from outside, and crawled on board. Then I hailed D—to recover his boat, and proceeded to light the lamp and get out the stove to make tea before turning in. While I was doing so I heard D— open the cabin-door.

"Rita ahoy! Are you all right?"

"Yes, thanks."

"Sure you are quite comfortable?"

I held the teapot between the lamp and the fore end of the tent, so that D— could see the shadow.

"Do I look so?"

"Yes, that you *do*. Shall be easy in my mind now."

"All right. But I say, D—, does your cabin-top leak?"

"Why, yes—a little."

"Well, *mine doesn't*."

Whereon D— told me to "score one," and shut his cabin-door again with a parting "Good night."

And though it poured, the little tent never leaked a drop, the only water finding its way into the boat being down the masts, as I had no housing at the foot. But that was not enough to cause any inconvenience.

July 16.—Woke at 7 a.m. by a hail from D—, asking if I meant to sleep all day. Answered by lifting the tent side, and sliding into the water, to his intense surprise; as, though it is easy enough when one knows how, like most things, it looks impossible to an outsider. D— joined me in the water, and we had a good swim. Then I climbed on board again, dressed, and made breakfast, and then chatted for a short time on Little Mary's deck, and enjoyed the lovely morning after the rain.

The broad was looking at its best, and as one of the typical Norfolk lakes I will try to describe it. It is perhaps a mile in its greatest length, and half a mile across—a fine expanse of dark water rippling in the morning breeze and flashing in the sun, as I think only the broads can flash, the water is so perfectly pure and bright. Down to the north shore slope cornfields, the foot of the hill bordered along the water's edge by a deep belt of purple-topped feathery reeds, standing six or seven feet high, with their stems rising from among a fathom-wide expanse of white water-lilies, now in full flower; and reeds and lilies extend right and left around the broad everywhere. Over on the south shore are trees, and a farmhouse or two; and east the village of Oulton stands, at the lower end of the broad, with red-tiled malt-houses and cottages reflected in the water. Into the western end of the broad the river runs, and creeping up against the wind are two brown-sailed wherries, always picturesque, and forming a characteristic of Norfolk river scenery everywhere. Over at the east end, by the staithe at Oulton, there lie several yachts moored, while off the village, in a deep arm of water from the broad, are a number of disused fishing smacks and yachts at their moorings.

There is deep water nearly everywhere on Oulton. Some of the more northern broads are very shallow, Hickling, the largest next to Breydon, having an average depth of three feet only, with a channel through it which alone can be used by yacht or wherry.

Tide on the broads there is none strictly speaking, though the tidal current raises and lowers the water vertically, making perhaps two feet fall in Oulton at the most, less on the broads on the Bure. In the rivers themselves, excepting near their mouths at Breydon, there is little current. However, as I want to get to Yarmouth with the falling tide, and go on to Acle, up the Bure with the flood, it comes into my plans to-day. D— was not sailing that morning.

8.30 a.m.—Under way again. Nice fresh south-west breeze, and tide just full. Made a long stretch across to the south shore, and then about and fairly into the day's work,

heading down the dyke into the Waveney again. If the wind only holds where it is it will be a fair passage all the way to Acle.

Passed a wherry yacht—*Kiama*—lying alongside the bank just outside the dyke. Owner coming on deck and making sail. Then past a wherry or two heading for Oulton, and on, down reach after reach, setting spinnaker now and then as the river turned and brought the wind aft. The river is wide and very deep, bordered on either bank by the reed-ronds, and the meadows beyond them stretching away to the hills on either side of the valley. Looking across the land one can see the reaches yet to be passed and those we have left behind us marked by black pumping mills, and here and there by the sail of a yacht or wherry, sailing apparently among the meadows.

As we turn each bend we startle heron and water-fowl feeding along the roud; while overhead in the bright sky the hawks are hanging watching the birds below. One cannot help thinking of Kingsley's description of the fen country in Saxon times as we sail down these rivers; the loneliness and peaceful animal life are the same as then, and like that in no other part of England; and, withal, the air is so perfectly clear and bright—fresh, too, like sea breezes, and steady as it blows across the level meadows.

Past St. Olave's bridge—lowering mainmast to pass under. Here, if it had not been for the perversity of St. Swithin, I should have turned north, through the Haddiscoe Canal connecting the Yare and Waveney, to Reedham, yesterday. However, I save nothing by going through it now, but hold on down the river.

Flying down a long reach under spinnaker, I passed a man cutting reeds, who left work to look on, observing, "Yeu 'on't be long gittin to Yarmouth *that* pace!" which was true, but now and then the river turns back upon itself to an extent that renders a few boards to windward necessary.

12.30.—Off the Cement Works at Burgh. Here the river runs under a low hill, crowned with the ruins of a vast Roman walled camp—the old "Garianonum." The walls on two sides stand firm and massive as ever; the third has fallen, from landslips. It commands the mouths of the Yare and Waveney now, Breydon Water opening out to the north of the hill. When it was first built, all the meadow land over which it looks, with the rivers running through it, were covered by the salt water of a great estuary like that of the Severn, the tide reaching Norwich and Beccles. Yarmouth did not exist then, only there was a sandbank growing up across the mouth of the estuary on which, centuries later, as it rose, the town was built.

Breydon Water is about four miles long by three wide, and at high water is a grand lake; at low water it is reduced to a wide channel along the south shore, which is marked by posts, and finds an outlet to the sea through Yarmouth and Gorleston, forming the harbour.

Five miles from the Cement Works to Yarmouth—not much ebb left, but just time to get there before the flood began, and here I made a mistake, which nearly lost me my tide. From under the hill stretch out a series of sands, "Burgh Flats," into the mouth of the broad, barely covered by water at low tide. I had been ashore on them once before in a yacht, and ought to have known better, but thought that with the light draught of the canoe I could venture across, as it would save me a long way round by the regular channel. So I headed gaily over them. By-and-by I saw a cloud of sand rise alongside me, then there was a scrape along the keel, and I knew I was wrong. I luffed, and made at once for the channel, heading back again. The sand flew from under the boat, and there was another scrape, but I got off. Then I went round the usual way, humbly enough, and making mental remarks about "ought to have known better."

The wind had freshened up considerably in

the last hour, and was getting puffy. It had worked round to the west, too, so that there was a fair four-miles run across Breydon before me. Too puffy for the spinnaker though. I was getting very hungry, and having one hand full with the sheet, proceeded to get a one-handed lunch with the other. I got out a pound tin of corned beef and wedged it into an open side locker, and eat out of it with the fork. Presently I met a yacht beating up the broad, whose owner had evidently made out with his glasses what I was at, for as I neared him he hailed, "Canoe ahoy—got any beer?" "Yes, thanks," I said, as I shot past. However, I suppose he misunderstood me, for he hailed me again, and looking round, I saw him waving a bottle. "Canoe ahoy—heave-to and have some." But tempting as the hospitable offer might have been to some, I would not lose my tide, and I could only lift my arm in acknowledgment and hold on.

Passed several wherries coming up from Yarmouth on the slack tide. Yarmouth at 1 p.m. Good sailing, very. As one enters Breydon on a clear day the town from the level of the canoe is "hull down," as the sailors would say, the water running up to the horizon, so that the houses seem to stand out of the water itself with a very pretty effect. The land on which they stand, being so low, is entirely lost.

Left the canoe in charge of a wherryman, and took a small walk for the sake of the change of position. I had taken her into the mouth of the Bure, and waited for the flood to set in. There were five or six wherries alongside the wharf at the suspension bridge waiting as well. These wherries are all alike, and well fitted for the river cargo traffic they are built for. They are very long, low in the water, and rigged with one large gaff mainsail on a mast stepped in the bows, something after the style of a "Una" boat, and, like the Una, very handy, and will sail remarkably close to the wind. They carry perhaps one hundred and twenty tons of cargo, coal and malt or timber, between the inland towns and the ports. There are two or three wherries on the rivers built and fitted as yachts, and very handsome comfortable boats they are.

Just at the end of the suspension bridge over the Bure there is an ancient round tower and part of an old wall—some say that it is Danish in origin—and it well may be. Perhaps even the first building on what was then an island, and a rendezvous for the Danish fleets in their marauding excursions inland along the shores of the then estuary.

All along the coast here the Danes have left their names of town and broad, Filby and Ormesby, Scroby, and many others showing, by the Danish ending, "by," that they were their settlements.

2 p.m.—Under way, and up the Bure. The wind had dropped entirely as the tide changed. The Bure runs almost due north-west for eight or nine miles from Yarmouth, and Acle is about ten miles up, so that any wind from the south would be more or less favouring. Paddled through the outskirts of the town, passed two yachts waiting for the tide to rise, as the lower reaches of the Bure are very full of banks. Out of the town there was more wind, which, to my disgust, was getting round to the west. These lower reaches are not pretty. The river is narrow and bounded on either bank by high "sea walls," strong embankments, against floods and high tides. So that one's view is limited to the stretch of river fore and aft—what Humpty Dumpty would call the "wabe," in fact.

Breeze kept freshening, but of little use to me under those walls, my sails being hardly lofty enough to catch it, though from deck to peak of the mainsail is twelve feet perpendicular. Was passed by the larger of the two yachts I had seen in Yarmouth, she making the most of the wind I could hardly feel. She had hardly passed me before she grounded, and the inevitable "quant" came

into use. This is a very necessary adjunct to Norfolk river yachting, and is a long twenty-foot pole, shod with a wooden fork, and used for poling up narrow reaches against wind, or on such occasions as the present. Half a mile on they grounded again, and I passed them, with some small chaff on either side.

Later on they overhauled me as I was beating with a reef down against a very nasty puffy north-west wind. Evidently I had an afternoon's hard work before me.

3.30.—Raining. Battened down and put on cape and sou'-wester. 5.30.—Only seven miles from Yarmouth, not having had one reach on a fair wind, every inch of it to windward. I never care to try to paddle to windward. Rita, being built for sailing, will hardly do better under paddle than sail against wind. She is so good to windward, too, that it is really far more pleasant.

The wind had dropped rather suddenly, so I shook out a reef and was beating up a fine broad reach, when I nearly had a catastrophe.

Just as the boat was in stays, and I was gathering in the sheet for the next tack, there came an awful puff from the north. She had not way enough on her to luff, so that she was blown on her beam ends—almost keel out. If it had not been that I had battened down, she must have filled and sunk under me, but as it was, letting go the mainsheet and leaning out to windward, I righted her. As she righted I became aware of a sound like thunder behind me, and a voice observing, in tones of congratulation, "Well done, sir, thou'rt you were over!"

There was a great wherry just astern of me, and the man was standing on her bows with a long boathook ready in case I required fishing out. He had luffed up to me directly he saw my predicament, making sure that I was over. But Rita never has been capsized in that way yet—near enough this time, though.

After which I took that reef down again and beat on steadily to Shottesham. Here a yacht passed me, going to Acle. The owner asked me where I was bound, and hearing that I was for Acle myself, he remarked that I should hardly manage it this evening, he thought. Now I had just begun to wonder whether I wouldn't drop anchor here for the night myself, but this decided me. I must not be beaten, anyhow. So I said I would be with him presently, whereat he smiled, and in a few more turns was round a bend and away from me.

7.30.—Hard work, but Acle bridge in sight. Lowered mast and paddled through, taking a berth just astern of the yacht I have mentioned. The other yacht that had passed me near Yarmouth lay higher up, beyond us, and while I was making up sails for the night one of her crew of three came along the bank to speak to me. "Where were you in that squall?" he asked; "we thought of you, and wondered if you were capsized, for we carried away our foresail halliards ourselves." So I told him, and while we were talking the owner of the other yacht looked out. "Hallo, Rita, I didn't expect you to-night—good little boat that!"

The world of non-canoeists have very vague ideas as to what a well-built and decently-handled canoe can do. Practically the canoe is as safe a craft as any, if properly managed; and I may say, too, that there is no boat more easily handled, even by a beginner, with very little practice. And as one learns more of her capabilities, one can do almost anything with a good canoe.

I went on board the yacht next which I lay, and had a pleasant chat with her owner—asked him to supper, too, which invitation, as it was turning out a lovely night, he accepted with some doubts as to what it would be like, I think. However, when he came alongside in his dinghy in half an hour's time I had a supper ready for him which fairly astonished him. "It did the resources of

the canoe credit," he said, "and still more to whoever taught me to cook." Supper consisting of poached eggs, hot Irish stew, potatoes "in their jackets," marmalade and bread for sweets, winding up with cheese and biscuit, of course.

Then we had a gossip together ashore, and turned in. I was asleep the moment my head touched the air pillow, and never stirred till I woke at 7 a.m. next morning.

July 17.—Under way at 8.30. Fine morning, with fresh south-west breeze. Turned up the reach in which we lay, and down the next towards Oby Mill, and on towards Thurne Mouth. The country here is a perfect paradise for an ornithologist. Here and there I saw the rare bearded tit—the local name for which is the "reed-pheasant," from its long tail, I suppose; and rounding a bend near St. Bennet's Abbey, a fine old ruin standing close to the river's bank, I saw the rarest of our water birds—the crested grebe. Nearly extinct now is this handsome bird, will be soon entirely so, for every yacht's "hand" is on the look-out for it, and several are shot every year. I wish men would be content to have seen the bird in its wild state, and to know it without requiring its stuffed skin on their study shelves. And it is the same with our other wild birds. The Preservation Acts have done something, but unless we carry out the *spirit* of them, it is little enough.

Rounding every bend of the river I came on moorhen and dabchick, one pretty family of the latter specially, six little yellow balls of down round the two parent birds, evidently quite a freshly hatched brood.

Above Acle the Bure runs almost northwards to Wroxham Broad, with many other broads lying on, or just off, the course of the

river. Joining the Bure is the Thurne, running east to Hickling, the largest broad, and thence almost to the seacoast, only a mile or so of sand separating the sea from the fresh water.

I turned, with the wind aft, up Thurne Mouth, and on past Martham Broad, now almost overgrown with reeds, and away up to Hickling. This is a grand sheet of water, something like 700 acres in extent. There is a channel for wherries through the centre, but the greater part of the broad is shallow, with a clear gravel bottom, over which one can see shoals of reach and bream darting as the boat alarms them. Rita, of course, could go anywhere on the broad, and I had a grand run down and beat back again. I touched ground once, but only for a second, in the shallowest part towards the south shore.

Then back, and slept near St. Bennet's, where a colony of reed-sparrows sang persistently all night long.

July 18th.—Up the Bure to Wroxham. The country round is very pretty, and Wroxham itself the yachting headquarters for Norfolk yachts—as Oulton for Suffolk. Very wet and squally all day. I passed a wherry near Hoveton. Going to leeward of her, and thinking probably that I was a stranger, the man at the helm said, "Beg pardon, sir, always keep to windward of a wherry"—just an instance of the good feeling one meets everywhere from the water folk on the east country rivers. The rule is quite necessary, as the great sail of the wherry becalms the canoe sail, and then as it passes there is a dangerous puff out of the sail which is likely to take one aback. However, I knew it of old, and was prepared for it, luffing to meet it as it came.

Hoveton Broad—or rather Little Hoveton, for there are two—has a large gullery on it, and is shut off from the river by a chain across the backwater leading to it during the breeding season. The gulls are the black-headed gull, which breeds only on the broads here and at Scoulton farther north, and in one or two less frequented spots on the coast. The eggs are collected systematically and sold in London as plovers' eggs, which they almost exactly resemble. Indeed, a large proportion of the "plovers' eggs" come from here and Scoulton, the latter gullery being rented some years ago to a dealer for £300 for the season.

Anchored for the night at Wroxham; still very wet.

July 19th.—Cruising. And from this time there is little to tell but of pleasant sails from broad to river, and on to fresh broads, all pretty, and some meriting even stronger terms; all with their splendidly bright water and margins of reeds and white water-lilies, flowering rush and loosestrife, with here and there a patch of tropical-looking *Osmunda* fern growing six or seven feet high in a perfect jungle.

Just a record of sunshine and rain, with nothing to mar the pleasure of rest and change of scene. So we will stay here for the present. I have given you an idea of what a cruise through Norfolk is, and for detailed description of the broads you will find better pens than mine. May be some of my readers will meet the red flag with a white talbot's head among the reaches of Waveney or Bure some day, and if so that is Rita's owner, and he will welcome you to his favourite cruising-ground.

(THE END.)

A MYSTERIOUS CRYPT;

OR, NOTES OF A HOLIDAY TRIP.

By THOS. W. ROGERS.

NOT very long ago I happened to be spending a holiday with some friends at Sandgate, a pretty little village, which lies in sweet repose at the foot of a range of beautiful well-wooded hills between Folkestone and Hythe, and on the very brink of the sea.

There used to be a castle there, built, so the story goes, by Henry VIII., and I have read somewhere that Queen Elizabeth was entertained there, but now, I think, the only evidence of its having existed is a large gun-tower, which is never utilised. There are many tales told of ghosts and goblins that flitted about the great halls of the old stronghold in times gone by, but they are, of course, only idle fancies. Few boys believe in such fignments nowadays.

The village of Sandgate itself consists of but one long street, with small shops kept by obliging people who deal in all sorts of stores which daily needs demand. The road thence to Hythe runs now, since the new parade has been constructed, along the sea all the way, some three or four miles, and affords to

pedestrians one of the most charming strolls conceivable.

Indeed, Sandgate is a delightful spot, just the sort of place for those to visit who love quiet and seek relaxation from the noise and bustle of busy town.

Well, one day, my friends and I thought we would visit Hythe. We had heard a good deal about it, and about its quaint gable-roofs and old-fashioned shops, and so on, and became anxious to see it. So we took coach there, travelling on the roof of one of the small omnibuses which ply between it and Sandgate, and over the old coach road which runs past, amongst other objects of interest, the great canal, made between the road and the sea in the troublous times when it was feared that the Great Napoleon would make a descent upon our shores.

Our horses' feet rattled up the town until we pulled up at an old-fashioned inn, the scene doubtless of much activity in the coaching days of olden time.

Having been safely landed upon the narrow pavement, we inquired the way to the parish

church, which we had been informed was full of interest, and thither we accordingly wended our way.

The church itself, which is dedicated to St. Leonard, is a fine structure, and bears traces of great age; and I could not help thinking, as I gazed upon it, what exciting stories its time-worn stones, if they could but speak, could relate of many a sanguinary strife of which they were, perhaps, the silent witnesses 'twixt Briton and Dane on those grassy slopes beyond.

Having examined the churchyard, where are many a curious moss-grown tablet and headstone whose inscriptions time has almost obliterated, but which mark the "narrow cell" where many a "rude forefather of the hamlet sleeps," we passed down to the entrance to the crypt, or charnel-house, and there witnessed the most extraordinary sight I ever saw. Arranged upon rows of shelves on both sides, as we entered, were almost countless human skulls of all sizes, but all hideous, with their great hollow gaping eye-sockets and grinning teeth, some

of the skulls bearing marks of sword and weapon cuts, the evidence of many a hand-to-hand fight, while farther inwards were thousands of bones—limbs of the silent dead—stacked with orderly care in one great mass, and I shuddered as I looked at them, and contemplated on the havoc that must have been played amongst the turbulent spirits of Briton and foe in the troublous times long ago.

What astonished me much, seeing the methodical way in which these blanched bones were piled, was that there was no reliable, intelligent explanation as to when they were collected in that crypt, or where they were collected, or at whose pious instigation.

In Cassell's "Our Own Country," alluding to these mysterious relics, I find it says: "Local tradition asserts that the bones were bleached on the beach after a great battle, but the story is too vague to be of any value." The "National Gazetteer of Great Britain," speaking of Hythe Church, observes: "In the crypt is a large quantity of human bones, supposed to be the remains of Britons who fought a battle with the Saxons between this town (Hythe) and Folkestone in 456."

From another source (Hasted's "History of Kent") I learn that in 456 a great battle was fought in the neighbourhood between the hosts of the Welsh king Vortigern, and the Saxons, who, it is said, retreated on Hythe. But whether the bones in the crypt are the bones of those killed in that battle we are left to surmise.

In the crypt itself, however, hanging upon

the walls, there is an announcement in print professing to be "the only genuine account of the human bones deposited in this charnel-house." And this is what it says:

"Anno Domini 843 (in the reign of Ethelwolf) the Danes landed on the coast of Kent near to the town of Hy-ta, and proceeded as far as Canterbury, a great part of which they burned. At length Gustavus (then Governor of Kent) raised a considerable force, with which he opposed their progress, and after one engagement in which the Danes were defeated he pursued them to their shipping on the seacoast, where they made a most obstinate resistance. The Britons were, however, victorious, but the slaughter was prodigious, there being not less than thirty thousand left dead. After the battle the Britons, wearied with fatigue, and perhaps shocked at the slaughter, returned to their homes, leaving the slain on the field of battle, where, being exposed to the different changes of the weather, the flesh rotted from the bones, which were afterwards collected and placed in heaps by the inhabitants, who in time removed them into a vault in one of the churches at Hy-ta, now called Hythe."

Now how much of this may be mere idle dream or how much of it may have foundation in fact it is impossible to say. It speaks of a great battle alleged to have been fought between the Britons and the Danes, but that was nearly 400 years after the great struggle between Vortigern and the Saxons already alluded to. It moreover anticipates one of my inquiries by telling us that the bones were collected by the inhabitants of Hythe,

put in heaps, and then removed to the church.

Who the writer of this "only genuine account" was does not appear, nor does he give us any authority which would lend confirmation to his story. How is it that there is no authentic record of the collection and deposit in their present resting-place of this mass of human bones? They were gathered somewhere, at some time, by some one, and piled in that crypt in the order in which they now appear. But when? where? and by whom? We are left to conjecture. There is a mystery about the whole thing, and it is that mysteriousness which imparts special interest to that charnel-house.

We can mentally portray the terrible scenes which, in the early history of this country, were enacted on those hilly slopes east and west of ancient Hythe, and believe that the bones of the slain, friends and foes, were left for ages to bleach in the sun; but whose pious hands gave those whitened remains of our brave ancestors their last resting-place in the crypt of Hythe Church no one seems to be able to give us the smallest clue.

My young friends, a visit to that sacred spot will well repay you. Go and see it. You will look upon those bones certainly not with indifference, and the thought even might arise within you that, after all, to a few of the courageous spirits who tabernacled some of those skulls may be owing not a little of the priceless freedom which we in this mighty little island of ours are privileged now to enjoy.

Real Enjoyment!

BY SOMERVILLE GIBNEY.

Now, off with your garments, boys; quick, look alive, No waiting about in a funk on the bank; A run, and a spring, and a clean clever dive, Just leaving a bubble to show where you sank.

Or if you prefer it, a "header" then take, Your head popping out as your feet disappear; If managed aright you will no splashing make, But enter as stiff and as clean as a spear.

A shake of your head, and your eyes will be free From water, and now you start off for your swim;

The side stroke, or breast stroke, which one may agree The best with your fancy, your style, or your whim.

You're blown? Then turn over and rest while you float, It only wants pluck and is easy to do. That's right; you're as safe and secure as a boat, You see there's no need to get into a stew.

Now make for the bank, clamber out, and prepare To try some new trick, such as diving for eggs, Or turning a summer-sault cleverly ere The water you reach, or else swim with tied legs.

When tired of all, and before you grow chill, Come out (you may easily stay in too long) And rub yourself down with a hearty good will, You can't scrub too hard, and you can't scrub too strong.

Then jump in your clothes and be off for a run, And do not pull up till you glow in each limb; Then, boys, believe me, when that run shall be done You'll find yourself better by far for your swim.

MR. BOWLES'S EXPERIMENT.

BY PAUL BLAKE,

Author of "School and the World," etc. etc.

I.

The little room was stuffy, the little room was hot ;
There was nothing disagreeable that the little room was not ;
The boys were more than half asleep, the master gave a nod,
Then roused himself to rattle up a youngster with his rod.

III.

The boys made no objection, so they trooped out in a mass,
They perched themselves along a wall or settled on the
grass,
Whilst Mr. Bowles, the master, showed in low, impressive
tones
The lessons to be gathered from the leaves or mossy stones.

II.

"Now, boys," he said, "just follow me ; for once I think we'll
yield
To summer's overwhelming power, and seek the pleasant field ;
There Nature spreads her treasures ; open wide your sleepy
eyes
And look on Nature's wonders ; learn her secrets and grow
wise."

IV.

The boys thought this grew gloomy ; they were yearning to
be free,
For lessons and the meadow didn't seem to quite agree,
So Simpson Junior watched his chance and slipped away
unseen ;
The gentle zephyrs wandered o'er the spot where he had been.

V.

Then whilst the learned dominie went softly maundering on,
The boys stole slyly out of sight till five of them had gone ;
But still the master lectured on with scientific zeal,
And showed the way the ruminants digest their grassy meal.

VI.

But Short, and Tommy Jones, and Dick were stripping for a swim ;
Smith thought that Bowles could get along without more aid
from him ;
And Robinson was hunting for some non-existent eggs,
And damaging his nasal tube and barking both his legs.

VII.

Yet Mr. Bowles dilated on the progress of the sap
Within the switch he carried, and he laid it on his lap,
And produced a pocket microscope and carefully explained
The extraordinary methods by which Nature's ends are gained.

VIII.

Next he lifted up his spectacles to ask his little class
Some questions on the method of the growth of meadow
grass,
When, lo ! the sight that met his eyes abruptly made him
stop—
No boy was left but Jenkins, *who was sleeping like a top !*

IX.

So Mr. Bowles determined his new system wouldn't do
If boys preferred to climb a tree to learning how it grew.
He thrashed them all next morning, and they had no further chance
Of leading learned Mr. Bowles another such a dance.

ALONE AT SEA:

A RECORD OF STIRRING ONE-MAN BOAT VOYAGES.

BY W. J. GORDON,

Author of "A Race for a Christmas Cup," etc.

OUR business in this summer article is with mere pleasure-cruising on summer seas.

We have happily no thrilling tales to tell of shipwreck or disaster, nor do we purpose touching on the perilous boat voyages that of late years have become so frequent in the Atlantic. All we have to do is to dwell as lightly as possible on the logs of the chief cruises that have gradually brought into popularity a new and healthy way of spending a summer holiday.

The fashion of solitary sailing in this manner is of no very ancient date; the first to set it was Mr. John MacGregor of the Rob Roy. Of canoeing we have here no space to speak; we must keep entirely to the yachting side of the question, and so the voyages of the Rob Roy canoe must be passed by with the mere mention of their having taken place. The Rob Roy with which we are now concerned is not the first or second canoe of that name, but the little yawl in which Mr. MacGregor made his third cruise.

This famous boat, the pioneer of a new water craze, was designed by Mr. John White of Cowes, and built by Messrs. Forrest, who make the lifeboats for the National Institution, and in whose yard at Limehouse the Boy's Own boats at Poole and Looe came into existence. She was twenty-one feet long by seven feet broad, full-decked, double-skinned—outer skin of polished Honduras mahogany, inner of yellow pine, with canvas between them—and with four water-tight compartments. In the stern was an open well about a yard square, separated from the next compartment by a strong bulkhead sloping forward so as to give as much room as possible. This formed a comfortable back inside the cabin supporting a large soft pillow, and serving as a sofa to recline on when read-

ing or writing or as a bolster when lowered for the night. Fronting the seat was the binnacle with lamp, and above it the square of the chart, framed and glazed to keep it dry and legible. At the bottom of the well was a sharp axe ready for instant use to cut a rope or do some other deed of emergency, and near it the sounding-lead, with its line wound on a stick like a boy's kite string. In the left wall of the well there was a door a foot square, hinged so as to fall downwards and form a kitchen dresser, with the cooking apparatus—copper kettle, lamp, and what not—stowed away behind it. On the same side, but inside the cabin, were the portmanteaus and two tin boxes holding the necessary tools for dressing and reading and writing, and on the right side were the store cupboards. The rig was that of a yawl without topmast or topsail, and the sail-plan was so moderate that the Rob Roy only showed her real paces in half a gale of wind.

A voyage alone is not necessarily lonely, if the sailor is adapted for his place. As Mr. MacGregor says, "He must have good health and spirits, and a passion for the sea. He must learn to rise, eat, drink, and sleep as the waters and winds decree, and not his watch. He must have wits to regard at once the tide, breeze, waves, chart, buoys, and lights; also the sails, pilot-book, and compass, and more than all, to scan the passing vessels, and to cook, and eat, and drink in the midst of all. With such pressing and varied occupations he has no time to feel lonely, and indeed he passes fewer hours in the week alone than many a busy man in chambers. Of all those I have met with who have travelled on land or sea alone, not one has told me it was lonely, though some who have never tried the plan as a change upon life in a crowd may fear its unknown pleasures. As for myself, on this voyage I could scarcely get a moment to myself, and there was always an accumulation of things to be done, or read, or thought over when a vacant half-hour could be had. The man who will feel true loneliness is he who has one sailor with him, or a pleasant companion soon pumped dry, for he has isolation without freedom all day and night, and a tight cramp on the mind. However, each man to his taste; it is not easy to judge for others, but let us hope that, after listening to this log of a voyage alone, you will not call it lonely." Which very few did, for though Mr. MacGregor was not by any means the first to sail alone, yet his cheery, adventurous cruise, as we hinted above, gave birth to a host of imitators.

Leaving Limehouse on the 7th of June, 1867, the Rob Roy made her first halt at Erith, to be present at the first sailing match of the Canoe Club. Next day, as inevitable for one who takes so much interest in training-ships and sailor boys, her captain attended Sunday service on the Worcester, "listening to the clergyman of the Thames Mission, who had been rowed down here from his floating church, anchored at present in another bay of his liquid parish." By easy stages the Rob Roy cruised round to Dover, the crew having an afternoon's drill off the Goodwin Sands in reefing sails and shifting canvas and getting the tiny dingy out and in.

Leaving the yawl at Dover, the captain ran up to London for the annual inspection of the London Scottish, and having led his fine company of kilted riflemen through Hyde Park, he sheathed his claymore to handle the tiller again, and struck boldly across channel

for the coast of France. At Boulogne a slight difficulty arose. "The police came in proper state to fill up the numerous forms, certificates, schedules, and other columned documents. I had hours of walking to perform, and most courteous and tedious attention to endure; and then paid for sanitary dues two sous per ton, that was threepence. Finally there was this insurmountable difficulty, that though all my ship's papers were *en règle*, they must be signed 'by two persons on board,' so I offered to sign first as captain and then as cook. They never troubled me again in any other port, probably thinking the boat too small to have come from a foreign harbour. In France the law of their paternal Government prevents any Frenchman from sailing all alone."

The Rob Roy went westward along the coast and then up the Seine to the Paris Exhibition, where her captain assisted in the good work of Bible and book distribution that was there carried on by the Religious Societies. It was at Quillebeuf, after being towed back, that the Rob Roy had her most dangerous adventure, and for it we must find room in her captain's own words. It was about one o'clock in the morning. "Then there came a new noise—a low, steady rap, tap, tap, tap on the boat, and from underneath. For a moment or two there was sensation without apprehension—a sort of mesmeric, irresistible spell; but a sudden thought burst through the trance, and with a powerful impression of what was doing—one no less horrid than true—I dashed off covering, roof, hatchway, and all, and stood on deck to meet a terrible scene. Our steamer had drifted in the dark until we closed upon another steamboat astern. My yawl, tied to the stern of one, was between that and the bows of the other, the anchor-chain of which had already got under the waist of the Rob Roy, and had been ringing the rap, tap, tap of a warning that undoubtedly saved her life. Light flashed from the riding lamp hanging at the steamer's bow full on my boat's deck, now heeled over deeply until the dark water rushed through her gunwale; and it seemed that only a few seconds more, and the poor little Rob Roy would sink in the flood or be ground into splinters by the two great iron monsters nearing each instant in the dark. All this was seen in the same rapid glance which in such dangers grasps a whole scene in a moment, and stamps it on the mind for years. My boat hung on the chain, yet wavered with equal poise to go this way or that. If she could be swerved to the stern she might possibly escape destruction, but if to the other side, then the strong rope at her bow would entirely prevent her escape. With a loud shout to arouse the crews, I put every atom of force in my body into one desperate shove, straining nerve and muscle in one desperate endeavour, until I could not see. She trembled and surged—it was successful, and I fell into the water, but my yawl was saved. Crash came the two steamers together. I heeded nothing of their din and smashing, and the uproar of the men, but I had scrambled all wet into my cabin, nervously shaking with excitement, and a chattering of the teeth. Then I sat down to sum up my bruises—a barked shin, sprained thigh, and bleeding cheek-bone. A survey of the yawl was made next day by placing her on the gridiron at Havre; and when the tide left her dry there was to be seen (as still there is) the marks of the iron-chain links impressed

deeply in the mahogany planks of her waist. The bowsprit also was found to have been nipped at the end (though it had been drawn in close to the stern) and the squeeze had quite flattened the strong iron ring upon it, and jammed up the wood into a pulp as if it were cork."

The next time the jib was hoisted the bowsprit broke off and the sail flew away into the air just like an umbrella blown inside out. It was soon secured, however, and the Rob Roy was off on her long channel passage, and after lying to under storm mizen, while the crew slept, found herself off Littlehampton, whence she went to the Isle of Wight. Here she stayed awhile, and then she returned to Dover, where her crew went to the Lord Warden, to write home, dine, and go to bed, after fifty-three hours without sleep.

But while waiting for the servant to bring the hot water he lay down for a moment. It was then about three o'clock in the afternoon. Soon, it seemed, he was awake again. It was still light and the sun was shining, but the watch had run down, the water-jug was cold, and it was a puzzle to make out how he felt so wonderfully fresh. It was *next day*, and he had soundly slept for seventeen hours!

When the Rob Roy reached Erith some fireworks she had brought from France were sent up to amuse the Worcester boys. "In a quiet night the rockets sped aloft, and the Roman candles ejaculated fireballs, and the Chinese floats spat flame as they blazed on the flowing tide, and the red light made our sails blush deeply, and the Jack-in-the-box caracoled over the deck, scorching us all inordinately. When everything pyrotechnic was burned out on the yawl the show was yet to begin; Worcester was not to be beaten by Rob Roy. Up sprang the blue-lights from her tops and yards. Ports blazed with lamps, and skyrockets whizzed into the ether. Then came, best of all, from young and glad-some hearts those ringing cheers, and the lively band roused up the quiet night waves with 'Rob Roy MacGregor, O!'"

As one of the original founders of the Chichester ship for poor lads without home or friends, Mr. MacGregor was successful in obtaining the 20-ton cutter Dolphin—a present from the Rev. C. Harrington of Bromyard—in which the lads could learn practical seamanship. And his yawl-book concludes with an account of how he brought the Dolphin up the Thames to her future owners. "Clouds withdrew from above as we neared the Chichester, and the full moon came out and looked upon the gift for boys with her long pendant streaming in the mild and onward breeze. Then to me, silent, lying on the deck as if in a summer eve, came many thoughts—the Rob Roy's roivings by river and sea in brightsome days and thunderous nights, the good seed sown by the shore, the thousand incidents of a charming voyage. But best of them all was the sail in the Dolphin. We may begin in faith, and continue in hope, but the greatest of the three is charity in the end."

The first to follow in Rob Roy's wake was Mr. E. E. Middleton, in the Kate. He was afloat from June to September, 1869, on a cruise round England from the Thames to the Thames, making the circuit to the north by way of the Bowling Canal. The Kate was a yawl, twenty-three feet along the deck and seven feet in beam. The hoist of her mainsail, from tack to jaws was thirteen feet, and the peak was just the height of the mast, twenty feet. Her mainboom was nearly twelve feet long, and her foresail was six feet in the foot. Like the Rob Roy, she was designed by Mr. White of Cowes, and like her she proved all that could be desired in the way of a sea-boat.

Mr. Middleton's cruise gave him plenty of variety in the way of wave and weather. From Limehouse he went to Ramsgate, on to Southampton, Dartmouth, and round the Land's End to St. Ives; from St. Ives to

Boscastle, and thence to Milford Haven, whence he boldly struck across channel to Kingstown; thence he coasted to Ardglass, and through the race off the Copeland to Donaghadee, where he left the shores of Ireland and made for Ayr, and so on to Bowling Bay, and through the canal to the Firth of Forth, and along the eastern coast to the Thames. The cruise was a daring performance, as her captain kept straight ahead without troubling himself overmuch as to calm or storm, and his log gives much pleasant reading. But we must leave it, for a while at least, and hasten on to notice the experiences of Mr. R. T. McMullen, who is quite a veteran in solitary sailing.

In one of the harbour books at Penzance, under date August 10th, 1855, may be seen an entry, "The Leo, 3 tons, of London, McMullen master and owner, 6d." The Leo was 20 feet long and 6 feet broad, with 23 cwt. of ballast, and rigged as a cutter. To her in 1855 her owner fitted for running before a light wind what he called a "stud-ding sail," which sail gradually came into use among larger yachts, and, from having been first sported in a race by the Sphinx, became by easy stages the Sphinxer, the Spinxer, the Spinker, the Spinnaker, such as it is called by us to-day.

In the Leo Mr. McMullen had a small boy with him, so that his first voyage "down channel" hardly comes within our ken. Nor does his cruise in the Sirius round Great Britain in 1863, the Sirius being an eleven-tonner carrying the owner, a man, and a boy. She is small enough, however, to be worth mentioning—32 feet over all and 9 feet 5 inches beam—and gradually leads us on to the most extraordinary voyage alone that we have on our list, as will presently appear. In the cruise round the island, 2,640 miles, Mr. McMullen was twenty-eight nights at sea; and altogether in the Sirius he sailed 13,503 miles, which added to 9,494 in the Leo and 5,984 in the Orion, yet to be noticed, gives a grand total for three boats up to date of 28,981 miles!

And now for the Orion, under her two rigs of cutter and yawl. And first as a cutter. She was of 16½ tons measurement, 42 feet over all, 10 feet 2 inches beam, of 5 feet draught forward and 7 feet aft, and carried nearly 12 tons of ballast. In her in August, 1868, Mr. McMullen with a superannuated coast-guardsmen and a boy from the Chichester, started from Greenhithe for the Scilly Islands. Both down channel and up channel the weather was stormy, and the cruise was a lively one. But our business is with the Orion in her second phase, when she sailed as a yawl. In 1873 she was converted, and her dimensions then became 48 feet over all, 10 feet 2 inches beam, 5 feet 6 inches draught forward and 7 feet aft, and her measurement from 16½ was increased to 19 tons.

This 19 ton yawl, fully rigged, did Mr. McMullen bring home single-handed from Cherbourg in 1877. His crew proved mutinous and he dismissed them. They went delightedly and boasted that they had "put the captain in a hole." To their utter astonishment they beheld their captain set to work, get up his anchor, set all his lower canvas, mainsail, foresail, jib, and mizen, and quietly sail off alone. The way in which the work was done is fully described in Mr. McMullen's "Orion," and affords a valuable lesson in fore-and-aft seamanship, though it is not to be supposed that an attempt to master such a monster is ever likely to be made unless no other way out of a difficulty presents itself.

All night long the captain-cum-crew worked getting his boat ready for sea, and putting all his provisions within easy reach. In the mainsail alone there was a hundredweight and a half of canvas. "My intention was to take the first reef down completely, the second partially; to do that I left the boom in the crutch to have it in a line with the mizenmast; hoisted the peak a few feet, overhauled the whole of the sail to lighten the

foot as much as possible; put a strop on the mizenmast, standing on the boom to fix it; hooked a tackle into it, and into the cringle of the second reef, and bowsed it aft; jammed the fall, while I lightened up the foot of the sail, and bowsed aft again until it was taut as a bar; rove the first earing, previously soaping it well; settled it satisfactorily in its place by hand, and then set up hard with the reef tackle; lashed the earing to the boom with about a dozen racking turns of small manilla line; and then proceeded to tie the reef up. All this is hand-cutting work. Including the slab reef, there is canvas more than a yard deep and 28 feet long to be partly gathered up and partly rolled if you wish to be neat. When there is no one to help, you must hold it on the boom with one leg or sit upon it, while tying the reef points."

To judge of the work necessary, we may note that the mast measured 27½ feet to the hounds and was 9½ inches in diameter, the gaff was 22 feet long, the main boom was 29 feet long and 7 inches in diameter, the bowsprit was a 7½ inch spar 16½ feet outboard, the mizen boom was 13 feet long, and the mizenmast 25 feet to the truck. The start is worth quoting. "I set the mizen, its head had to go 19 feet from the deck; unstopped the jib and foresail; rove foresheet; cast off all mainsail tyers, excepting the bunt; ran up my colours, fore and aft; hove the anchor a short stay peak; lashed the helm a-starboard, for sternway, to east to the northward; broke anchor out of ground and hove up, foul of the bobstay; I had therefore to go out over the bow, and stand on the bobstay shackle to reeve the cat-fall through the ring of the anchor. As she was driving to leeward, I secured it temporarily to the weather bowsprit shroud, until the jib was set and sheeted. Aft, and righted the helm; forward, and catted the anchor; set the foresail and sheeted it, with the wind from N. by E. I was approaching the reefs of Ile Pelée, to leeward of the eastern entrance, and had to fish the anchor—that is to get the fluke on the gunwale. In a most awkward position, with arms extended 15 or 18 inches from the body, it was an overpowering lift. The foresail halyards were in use; to get the topsail halyards there was no time, as the mainsail wanted setting badly. It is needless to say that I was more than comfortably warm from previous exertion, but made another effort that succeeded at the expense of the fine fresh paint on the bulwark; secured it temporarily; cast off the bunt tyer; walked aft with the fall of the peak halyards, and steered the peak well up between the topping lifts, then hoisted away throat and peak alternately, taking care to let neither get much in advance of the other, springing up from the top of the halyard bolts, which gave me a six-foot haul at a time." And then having worked the mainsail up into its place and let the foresail draw, he went aft to the helm, and four hours after commencing work in the morning he crossed the breakwater and was fairly at sea. The main and mizen sheets were kept moderately easy, the head sails were sheeted hard and flat as boards, and with a seven-knot breeze the Orion was soon past Cape Levi and off Bar-le-Duc.

Often the helm had to be left lashed while the one-man crew was busy elsewhere, and on one occasion when the crew was below the boat gybed and the mizen came to grief. Repairing it took some time, and the boom was shipped and sail trimmed only just before it became too dark to see. The lights were set, and what with looking after the log, marking the chart, and a thousand other things, the night was spent busily. At midnight the Orion was off Beachy Head, and at daybreak Dungeness was passed, and at eleven o'clock, twenty-seven hours after leaving Cherbourg, anchor was dropped at Dover. The first 130 miles had been done in twenty hours, the last eighteen miles had taken five hours against tide. It was a fine passage,

Alone at Sea.

with a reefed mainsail and storm head-sails. The proper canvas, had there been men to tend the sheets and hand the sails in case of need, would have been whole mainsail, large mizen, jib-headed topsail, foresail, and No. 2 jib.

In 1873 Mr. McMullen, in another of his boats, the *Procyon*, voyaged from Greenhithe to the Isle of Wight. She was a 7-ton lugger, 28ft. 6in. long, and 7ft. 9in. in beam, and fitted with a small centreboard. Her mainmast was 21ft. high, her mizenmast 13ft., and she carried no headsails. In this boat he had another cruise in a subsequent year, of which he has published the log. Early in August he started from the *Arethusa* (for like the owner of the *Rob Roy* Mr. McMullen is well known amongst our training-ships), and sailed down Thames and round the Forelands to Dover. Here he was wrapped in a sea-fog. "From eight o'clock in the evening until eleven o'clock next day not a vestige of the town or any other object was visible from my anchorage. That I had ample opportunity of estimating the merits of every species of sound signal incidental to a fog on the great highway of nations, and could not plead sleep as an excuse for neglecting the riding light, can be gathered from the following. Ships' bells and foghorns, and steamers' whistles, in every key, according to size and power of steam employed in producing the blast, were going all night long. A deep-toned bell at the Admiralty Pier uttered a solemn warning at intervals of seven minutes and a half, its funereal tone most forcibly reminding one of the uncertainty of life. Every two minutes the South Sand Head Lightship contributed to the babel of sounds the guttural screech of its foghorn—a detestable noise, calculated to warn the careless of the existence of an evil place beyond. For some hours during the night a gun was fired from the inner pier-head at intervals of ten minutes, to direct an overdue mailboat if she should chance to be within hearing. Lastly, the wind was so light that the chain hung up and down, and a worrying little swell from the southward caused it to strike against the stem of the boat with every roll. Although a most unpleasant night, I consoled myself with the thought that it might have been worse; for, if I might have been in harbour, the chance was equally great I should have been drifting helplessly at sea, and the compromise was much in my favour." Mr. McMullen got out of his fog, but at Dover we must leave him, although he cruised back to Whitstable and back again to the Downs and Dover, and then home, after spending only twelve nights in harbour out of three weeks afloat.

There have been other one-man cruisers, but these three are the chief, and their logs are the best known. Most of the adventurous boat voyages of late years have, however, been accomplished by a man and a boy, one to watch while the other sleeps. This can hardly be called cruising alone, but it is near akin to it, and for that reason we will find space to say a few words concerning the pleasantest cruise of them all—the thousand miles' run of the *Silver Cloud*. The little Scotch lugger is fortunate in having had its log written with a silver pen, for of all the charming stories of life on the water, none has yet been launched to excel Mr. Forwell's. *Rob Roy's* book is a delightful one—it was, of course, responsible for the perils of the *Silver Cloud*—but it has hard work to retain its laurels when pitted against the masterpiece of the genial Scottish minister. The Dundee "Cruise" is a book to be lingered over, and to be read again and again.

The *Silver Cloud* was a square-sterned fisher's yawl, 19 feet in the keel and 7 feet 9 inches in beam. She was rigged with foresail, main lug, and mizen, and was decked over forward, leaving enough room aft for full purchase on at least one pair of oars. In her Mr. Forwell and his son of fourteen sailed, from Dundee to France and back, a voyage

of a thousand miles, leisurely accomplished in fourteen weeks.

The West Ferry Roads were left on Friday morning, the 18th of May, 1877. Berwick was passed, and then the passage outside the Farnes was taken. "A lighthouse beam is a gladsome thing," says the captain, "as it dances on the waves; but a steamer's lights, if you see them all, and especially on a calm night, are like the fierce eyes of a wild beast peering through the dark, possibly on the way to send you all to destruction. Although we were taking the more dignified course, we gave due heed and honour to these dangerous desperadoes. Wherever we sighted a steamer and discovered the course she was steering, although we knew it, we let the rule of the road go to the wind, and took the rule of the hare, unless it was dead calm. We threw ourselves on the tack that sent us farthest out of her way, and when her lights disappeared resumed our course."

There is little interest in a mere itinerary. The charm of the story is in the quiet humour with which the various small adventures are described and in the graphic jottings at the resting-places by the way. Take the digression at Whitby, for instance. "Reader, go back with me 400 years before the beginning of the Christian era. There we see a Grecian, Pytheas by name, on a voyage of discovery sail down the Mediterranean. He boldly passes the Pillars of Hercules, braves the Bay of Biscay, bears down the English Channel, rounds the Forelands of Kent; but how changed the boundaries of our island home since then! What side of the Goodwins he took—whether they then bridged over the four miles of water called the Downs, and were joined to Kent, I cannot say; but this we know, they were not sands under sea then—nay, 1,000 years after his cruise they were good solid land, being part of the Earl of Kent's estate. But Pytheas must have neared the coast off Whitby. A rumour runs among these hills that some strange spectre is heaving in view, moving northward along the waters. Let us suppose now that among our painted sires we repair for a view to this elevated rock. Oh, how my heart would swell as the illustrious stranger, under full sail, pressed past on the waters below! Hurrah! Hurrah! Pytheas! Blow softly on him, ye southern winds, he craves a close view of the coast. Here was daring and adventure! In six days from the English Channel he reached the Orkneys, without chart, compass, or lighthouse beam. But hush the promptings of ignorance, ye old women of Greece; call him not hard names, and say he is tempting Jove. He knows what he is doing. That man can read his road home by the sky. He is one of the profoundest mathematicians, a contemporary and fellow-countryman of the famous Aristotle. The stars his guides were then as steady. The sights of nature that met his eye must have been similar to those that greet our own. The firmament then glowed as bright with living sapphires. Nay, if this vesture of the Almighty waxeth old as doth a garment, the patines of bright gold that stud the canopy were brighter then—less worn by three-and-twenty hundred years. The Queen of Night, as peerless then, unveiled her light and o'er the dark her silver mantle threw. As supremely beautiful then were the molten silver of a moonlit sea and the tints with which the headlands of the coast were touched."

Every pausing place has its history, every Sunday has its sermon, for the *Silver Cloud* always kept in port on the Sabbath, while her captain either took a service at some church on shore or else attended one incognito—and all along to Calais Harbour, by way of Dover, and back by way of the Goodwins, we are treated to those dainty gleams of playful humour lighting up the lucid prose with all sorts of quaint turns and queer reflections, which have placed the log in the forefront of holiday literature. It would be

too cruel to boil all this down into a bald waybill, and so with two quotations, one large and the other little, we will end our notes on cruising alone.

"The beauty of this morning's scenery is indescribable. So saith the log. Nine miles brings us to Filey Brig, which is guarded by a bell-buoy. Away behind is Filey Bay. Filey itself sits on the hill behind in lofty dignity and great beauty. The sun was peering through the early fleecy clouds, and six miles in advance now shone over the blue waters the white rocks of Flamborough Head. As the rocks whiten so does the sand of course, which is made from them, and so does the soil all as you go south. But this is the northern extremity, the first appearance to a Scotchman of the chalk rocks that gird the shores of England. When we started we had high hopes for the Humber, fifty miles on; but we get becalmed off Flamborough, and lie helpless in the hot calm noon just where James I. of Scotland, on his way to France for education, was taken captive, 472 years ago, by Bolingbroke, Henry IV. of England. The beautiful bay of Bridlington sweeps away from Flamborough in a westerly direction, the harbour being about six miles from the Head, and thither now we turn our thoughts—only our thoughts, however, for the wind is not strong enough to carry any more. By-and-by there is a little puff from the east, and along the lovely far-famed sand we enjoy a pure pleasure sail; then a sudden turn of the helm, and we are in a harbour of some acres, which we have nearly all to ourselves.

"Richard Beddington is an old sailor, who lives partly by hiring himself and boat to pleasure parties. He had manifested a kindly spirit to us from the moment we rounded the pier. The simple dead-eye gear for the lug-sheet was slow murder in a breeze, and in replacing it with two blocks and tackle Richard's advice and information as to where these and other such things could be found was of some value. Hence gratitude invited him to tea on board the *Silver Cloud*. As the steward spread a towel on the low seat, 'Ah,' said Richard, 'ee's 'avin' company to-day, so we've to 'ave a covered table.' But when he saw, without coal or stick, smoke or soot, the kettle steaming in two minutes, and the 'am and heggs' fried in about the same time, he declared he 'ad been 'hover' a good bit of the world, but he 'adn't seen 'hanything' like that. Tea over, he lit his pipe, and gave the first scent of tobacco to the inside of the small cabin. Now that his *gum* was going, the combined effect of the two weeds sent Richard into that state of mind in which we contemplate things only on their sunny side—that is, if they have any sunny side at all to contemplate. Along with two or three big pickles he let some things fall which were spickled up and remembered in all time coming with the deepest gratitude and comfort by the whole of the crew. Evidently eyeing the breadth of beam now that he was inside, the green cushions, nautical instruments, and cooking apparatus, he said, 'I wish I was going with ye to France. And look 'ere, skipper, I wouldn't be too particular about an off-shore wind. Them heasterly winds, especially this time of year, are often as steady and as nice as you please. Man, I could go with ye to France, ay, as 'appy as a laddie.' And it was often necessary to recall this speech. For in port after port, as we answered the question, 'From whence to where?' we got invariably such rejoinders as the following, 'You are not afraid!' 'You have a nerve!' 'Sell her now that you have done so well and go 'ome with the train.' For several days groups of fishermen gathered on Scarborough pier discussing the subject, 'From Dundee to France in that!' One old boatbuilder in Yarmouth was more pointed. Lifting his mallet and suiting the action to the word, he said, 'Four young men built a boat themselves and rigged her. I told them she'd be their coffin.'

Well, just as I said it they went out there, a squall upset them, and they were all drowned. And look 'ere, it will be the very same with you.' 'Ow,' yelled another at his back, 'ow would you do in a breeze of wind?' I generally assumed the learner's position and mentally took notes, but, feeling myself a little bitten, I answered the last question by submitting another, 'Do you think there has not been a breeze of wind since we left Dundee?' But sometimes they loaded me with the above crushing material so much that when I stepped on board again you would have thought she would sink in the harbour

without going out to sea at all. When it came to the worst we shouted out, 'Remember Richard, "appy as a laddie."' If it had suited to call at Bridlington Quay on my return (although I do not use tobacco) I certainly would not have denied myself the great gratification of purchasing a pound of the best black roll for Richard. Many a time we triumphantly mounted a threatening wave with the words, 'Appy as a laddie.'

And to sum up the whole matter—

"Grand, honest old sea! She does in daylight precisely as she would do in the dark. She is no respecter of persons, takes no cog-

nisation of human certificates, time has no effect on herself, and so to her it is no qualification. In the case of a tar of fifty years' experience, and especially if he has in a couple of glasses of grog, she will ignore the fact that she ever had seen him before. Nor does she regard your lingo. You may tie the rope, or bend it on; luff, or turn the bow to windward; turn to left, or port; it is all the same to her what is said if the thing is done. So we may sail and even sleep without a certificate on the broad, honest, fragrant bosom of the grand, fresh old sea!"

"The Molten Silver of a Moonlit Sea."

Some Holiday Thoughts.

MORNING.

REMEMBER all who love thee,
All who are loved by thee;
Pray, too, for those who hate thee,
If any such there be;
Then for thyself in meekness
A blessing humbly claim;
And link with each petition
Thy great Redeemer's name.

NOON.

Rejoice in the Lord! there is joy for thee
ever,
If thou in thy lifetime belongest to
Him;
A bond, all of love, which no change can e'er
sever,
A sun o'er thy head which no storm-cloud
can dim.

NIGHT.

Glory to Thee, my God, this night,
For all the blessings of the light;
Keep me, O keep me, King of kings,
Beneath Thine own Almighty wings!

Forgive me, Lord, for Thy dear Son,
The ill that I this day have done,
That with the world, myself, and Thee,
I, ere I sleep, at peace may be.

OUR NOVEL:

A SUMMER HOLIDAY ACHIEVEMENT.

BY TALBOT BAINES REED,

Author of "A Night on Scafell Pike," etc.

CHAPTER I.

IT was a bold undertaking, no doubt, at our tender age, to propose to take the world by storm. But others had done it before us. We had read our "Wonderful Boys" and our "Boyhood of Great Men" carefully and critically. We had seen that Mozart had composed music at six, and written it down very untidily too; we had seen that Marlborough had, by sheer cheek, been made an officer at about our age; that David Wilkie, one of the dullest of boys, had painted pictures while at school; that Scott, a notorious blockhead, had written poetry at thirteen; and that James Watt, at the same age, with very little education, had pondered over the spout of a tea-kettle. All this we had seen, and been very greatly impressed, for surely, if some of these very ordinary boys had succeeded in startling their generation, it would be strange if we two—Sydney Sproutels and Harry Hullock, who had just carried off the English Composition prize at Denhamby, couldn't write something between us that would make the world "sit up."

That English Composition prize had really been a great feather in our caps. It was the first thing of the kind we had done—not the first English composition, but the first sustained literary effort—and it had opened our eyes to the genius that burned within us.

The exercise had been to expand the following brief anecdote into an interesting narrative which should occupy two pages of Denhamby paper with twenty lines in a page:—

"Orpheus, son of Oeagrus and Calliope, having lost his wife Eurydice, followed her to Hades, where, by the charm of his music, he received permission to conduct her back to earth, on condition that he should not look behind him during the journey. This condition he broke before Eurydice had quite reached earth, and she was in consequence snatched back into Hades."

I need not say that two pages of Denhamby paper were all too short to express all we had to say on this delightful subject. I, being by nature a poet, could have used all my space in describing the beauties of the spring morning on which Orpheus made his unusual expedition; while Hullock, whose genius was of a more practical order, confided to me afterwards that if he had had room

he had intended to introduce a stirring conversation between the widower and his wife's ghost, in which the latter would make certain very stringent conditions before consenting to return once more to household duties. However, by dint of severe self-denial, we both managed to restrain our muses to the forty lines prescribed, and sent in our compositions with quite a feeling of envy for the examiner who would have to read them. When the results were announced, the Doctor publicly stated that "though many of the compositions were meritorious, yet, on the whole, those of Sproutels and Hullock showed most originality, and, indeed, gave considerable promise. The prize would be shared between them."

Of course, after that, all question as to our calling in life was at an end, and the sooner we "fleshed" our pens before the world the better. So it was arranged that Hullock was to get his father and mother to invite me for the midsummer holidays, and that before Denhamby saw us again, "Our Novel" should be started.

The Hullock family, it is necessary to say here, consisted of my partner, his two parents, a maiden aunt, and a sister. Mr. Hullock, a good and worthy little man, who had not had all the advantages of education which his son possessed, was a retired coal merchant, spending the afternoon of his days at St. Leonards. His wife, as kind and motherly as she was tall and portly, treated me like her own son from the moment I entered her house. And with her to look after me, and Alice to fall in love with, and Harry to collaborate with, I was about as comfortable as a restless genius could be—that is, I should have been so had it not been for the damp and frigid influence of Aunt Sarah, who sympathised neither with genius nor youth, and certainly not with the two in combination. Twenty times a day she grieved me by calling me "silly little boy," and twenty times a day she exasperated me by reminding Harry, and, through him, me, that "little boys should be seen and not heard."

However, we decided to ignore this uncongenial influence, and bury our sorrows in "Our Novel."

"Tell you what," said Harry, as we walked on the pier the first evening, "we ought to look sharp and get our plot."

"Wouldn't it be better to settle on the characters and get the plot afterwards?"

"All serene!" said Harry; "can you suggest any one for a hero?"

Harry said this in a half significant, half off-hand manner, which made it evident to me he expected I should at once nominate him.

But, in my judgment, Harry hardly possessed all the qualifications necessary for the hero of our novel. So I replied, half significantly, half off-handedly too,

"Haven't you better think of some one?"

Here we were in a fix at the very start. For Harry insisted he would much rather that I should select, and I was equally anxious for him to do it.

At length we compromised the matter and decided we should make the hero a mixture of two fellows—the fellow Harry liked best and the fellow I liked best.

After this amicable arrangement it was comparatively clear sailing. We had not to look far for the heroine, and it occurred to both of us that it would be original as well as pleasant to make the villain a female and middle-aged. As for

minor characters, we were able to draw on our acquaintance at Denhamby to supply them, and, failing that, Harry was magnanimous enough to offer his father and mother as "not bad for some of the side plots."

We had got our characters. That one walk on the pier settled them all. We also stopped a bit to watch the people, we entered into conversation with a sailor (who turned out to be deaf), and insinuated ourselves into the front of a street row, all with a view to reproducing our observations on life into "Our Novel."

The street row indeed furnished an inspiration for our plot. It was the arrest of a make-believe Italian female organ-grinder, whose offence appeared to be that she was carrying about in a cradle attached to the organ an infant that did not belong to her. And as the infant brought her in much more money than her music did, she protested in very strong English against having it removed.

With the quickness of genius we saw in this incident the pivot on which our novel should be made to turn.

The baby was the heroine, the organ-grinder the villain who had stolen her from her high-born station in life. Two of the characters fitted at a blow! We had even got the high-born parents ready if required, and when sixteen years later the little truant was to discover her noble station, we had our hero ready to take her home!

Between the pier-gate and Warrior Square we had the whole story worked out.

"What has kept you little boys out so late?" asked a voice as we entered Mr. Hullock's hall. "It's not right. You should have been in bed by eight."

It was Aunt Sarah! and we secretly condemned her on the spot to a public execution in our last chapter.

As we undressed that evening another point was cleared up.

"We can't keep the hero hanging about sixteen years before we bring him in," said Harry.

"Humph," I observed, "unless we said 'sixteen years passed' at the end of the first chapter, and then we might get him in in the second."

"It strikes me," said Harry, dubiously, "he ought to be in it all through. What do you say to making him another stolen baby belonging to another organ? Just as likely to have two stolen as one."

It did occur to me that if it came to that all the characters in the story might begin life in this romantic way. However, there seemed no objection to starting the hero in an organ-grinder's cradle, and we closed with the suggestion at once and got into bed.

I woke very early. I had the hero on my mind. I wanted him to be a good one after the best model, and I could not help thinking that the Harry in him ought not to be overdone. Besides, if he was to make himself pleasant to the heroine, the less he was like Harry and the more he was like Harry's chief friend the better. For sisters in fiction never make much of their brothers, but they often make a lot of their brothers' friends.

I nudged Harry with my elbow in order to represent the case to him from this point of view. I did it delicately and in a most conciliatory manner.

"I was thinking, old man, as Alice is the heroine and you're her brother I

might—don't you know—perhaps you'd like if—well, what I mean to say is perhaps I'd better do the gush when it comes to that."

Happily Harry was scarcely awake and did not take in all my meaning.

"All serene," said he, "we'll have as little of that as we can."

"I mean I think you'd do the parts about the villain and that sort of thing better—don't you?"

But as Harry was asleep again I had to take silence for consent.

The day that followed was an anxious one. It is easy enough to get your characters, but it is awful having to fix their names. And it is simple work getting a plot, compared with the agony of dividing it up into forty chapters!

This was the task before us to-day, and we retired as before to the pier-head with pencils and paper, in order to do it beyond the sound of Aunt Sarah's voice.

We endured agonies over the names. The hero's name should naturally have been a judicious combination of the names of the two fellows we had in our mind's eyes. But neither "Sydney Sproutock" or "Hardney Hulltels" exactly pleased us. Finally we decided to call him Henry Sydney, and, strange to say, it occurred to me it would be best as a rule to speak of him by his surname, while Harry was equally strong about calling him by his Christian name. At last we agreed that when we, the authors, spoke of him it should be as Sydney, and that when the heroine or any one else mentioned his name it should be as Henry—Harry explaining that "as they're to be kids together there won't be anything strange in her calling him by his Christian name." The heroine, after much searching of heart, we christened Alicia Dearlove, and the villain Sarah Vixen.

The other names we made up from a local directory which we were lucky enough to stumble across in the pavilion.

Then came the formidable work of slicing up our novel into forty pieces.

We wrote the figures in a string down the side of a long sheet of paper, and looked with something like dismay at the work we had set before us.

"Seems a lot of chapters," said Harry; "couldn't we make it thirty?"

"Wouldn't run into three volumes if we did," said I.

That settled it, and we set ourselves to fill up the blanks.

"Chapter I," wrote I. "Theft of Alicia—Sorrow of her Parents—The Organ-grinder's Lodgings—Suspensions of the Police—The Hero in the Room Underneath."

"Hold hard!" cried Harry; "that's too much for one chapter. We shall have to make that do for four of 'em, or else we shall run out in ten."

"How on earth can you make four chapters of that?" said I.

"Well, you can make 'Theft of Alicia' spin out into one."

"Oh, ah! Why, all there is to say is that Aunt Sarah—I mean Mother Vixen—came across her in the square and collared her. However are you to make a dozen pages of that?"

"Oh," said Harry, "we shall have to make her call at public-houses on the way, and that sort of thing, and describe the scenery in the square, and have the nursemaid go off to see the militia band

go by and leave the baby on the seat. Bless you, it'll spread out!"

Harry seemed to know all about it. So we went on with our skeleton, trotting our little foundling round town on the organ, where she witnessed with infant eyes street rows, cricket matches, bicycle races, a murder or two, and such other little incidents of life which we deemed calculated to enliven our story. About the twelfth chapter she and our hero had already exchanged tender passages. In the twentieth chapter her real father and mother happen to see her in the street (she being then sixteen), and are immediately struck by her resemblance to their lost baby. By chapter twenty-five our hero had saved the lives of his future mother and father-in-law, and had rescued the heroine, single-handed, from a Hatton Garden mob. In the twenty-ninth chapter Aunt Sarah had committed her murder with every circumstance of brutality and unpleasantness, the victim being one of our schoolfellows whom we neither of us loved. Then for a chapter or two there was some very active police play, interspersed with a few love scenes between the hero and heroine, who—though it never occurred to us at the time—must have enjoyed independent means, which made it quite unnecessary for them to follow the ordinary avocations of organ-grinders. About the thirty-fifth chapter there was to be a sudden drawing-in of threads from all quarters. Chapter thirty-sixth was to be devoted to Sarah in the condemned cell. Thirty-seventh—Alicia discovers her name by seeing it marked on a pocket-handkerchief she had been using at the time she was stolen. Chapter thirty-eighth—The hero discovers his name by being told it by a solicitor who has known all about it all the time. Chapter thirty-ninth—All comes right; everybody goes back to their mothers and fathers, and a quiet wedding ensues. Chapter forty—Execution of Sarah, scenes on the scaffold, general execration. The hero and heroine witness it from a distant window. *Finis*.

We were tired and hungry by the time our paper was full, but we were jubilant all the same.

"Stunning fine plot!" said Harry. "If we only work it out it ought to be as good as 'Nicholas Nickleby.'"

"Rather! By the way, we ought to have one or two funny chaps in it to work off some of our jokes. There's that one about the sculptor dying a horrid death, you know—because he makes faces and busts! I'd like to get that in somehow."

"All serene! That might come in in the last chapters. I've got the 'Family Jest-Book' at home; we might pick a few things out of that, and then settle where they come in, and work in for them as we go on."

We accordingly made a judicious selection, and, having marked the initials of the character who was to bring them in against each, and also the number of the chapter in which they were to "come on," we really felt as if everything was now ready for our venture.

We went to bed early, so as to get a good night and arise fresh to our work, not, however, before we had made an expedition to the stationer's and expended half-a-crown in manuscript paper, J. and D. pens, blotting-paper, blue-black ink, and forty small paper-fasteners.

These provided, and the servant being particularly charged to call us at five o'clock, we retired to rest, and slept with our "skeleton" under the pillow.

CHAPTER II.

A GRAVE question arose the moment we opened our eyes next morning. Who was to write the first chapter? A great deal depended on how it was done. The style of the first chapter would give tone to the whole novel, and, so to speak, show the way for all the other chapters.

"I thought," said Harry, in his suspicious off-hand way, "if you took the even numbers and I took the odd, that might do."

Might it? That would mean he would write Chapter I. I wanted to write Chapter I. On the other hand, it would mean I should have Chapter XL., with the execution in it, which would suit me very well. I mentioned the fact, and could see that Harry had forgotten it, for he tried hard to back out of his arrangement.

"I think you'd do the first chapter best," said he. "There's some scenery in it, you know, and you're more of a dab at that than I am."

But my modesty preferred the even numbers, and our novel looked very like being water-logged before she had even been launched.

A compromise was, however, arrived at. As the question of style was very important, it was decided we should *both* write Chapter I., and then, after comparing the two attempts, arrange our further procedure accordingly.

So I with a J pen, and Harry with a D, retired to opposite corners of the room and plunged headlong into "The Theft of Alicia." It was a hard morning's work, and by the time the breakfast-bell rang we were both getting the steam up. The sight of Aunt Sarah brooding over the tea-tray had but one meaning for us, and Sister Alice's pretty face and soft voice spoke to me only of that baby I had left in my chapter lying on the seat in the square.

"Now, little boys, are you going to play on the beach to-day?" said the villain, as the meal concluded.

"No, aunt," said Harry. "Syd and I have got some work we are doing."

"What work?" demanded Aunt Sarah. "English composition," said Harry, boldly.

And under cover of this truthful announcement we escaped.

It was midday before I laid down my pen and gathered my scattered sheets together. Harry had been done before me, but he had only written eleven sheets, so our pace was about equal.

"Done?" said he, as I sat back in my chair.

"Yes; lock the door," said I.

I must beg the reader's pardon if I do not lay before them the whole of the two lucubrations. They must be content with a few impartially chosen selections.

My chapter began with a poetical description of London in early morning.

"London in the morning! What a scene! The whistle of the workmen's trains sounds, and the noise of vegetable carts going to Covent Garden Market gives the place an animated appearance. Very few people are awake, and those that are look sleepy. In such a scene as this a hideous-looking woman, about fifty

years old, with a long nose and a shabby barrel-organ, wended her way from some of the slums near Farringdon Street Station in the direction of Euston Square. It was not a very pretty walk. There were no birds twittering in the trees, or cuckoos. You could not hear the gentle roar of the ocean, and what flowers there were were in pots on window-sills. The ugly woman chose the road where there were most public-houses, and I am sorry to say that any one who had walked close beside her would have heard her talking to herself in very bad language."

Here followed the description of a few of the public-houses and their natural beauties, and my narrative proceeded.

"In this way the wicked woman reached Euston Square. She was greatly intoxicated and not able to play the tunes on her organ correctly. Nobody gave her anything, which was not surprising, and the police moved her on all round the square. At last it was plain she would have to do something to get some money. After thinking over all the different things, she thought she would steal a baby and get money that way. So seeing a baby lying on a seat close by, whose nurse had gone off to see a militia band marching towards Gower Street, she stole it and went off as fast as she could. There was a cradle hanging on to the organ, and when people saw the baby in it the wicked woman got as much money as she liked. My reader will have guessed by this time that the baby, which was of the feminine gender, is the heroine. She was really high-born. Her father was a retired coal merchant. He was a very little man, and dropped his h's. Her mother was what the vulgar would call a 'whopper.' Let not the reader think she whopped her baby or her husband. On the contrary, she was kind but big. They lived at Highbury, and the nurse always took the baby out for walks before breakfast."

It was at this point that it had suddenly flashed across me that I had left out the joke allotted to chapter one, and as the narrative was well advanced I ought to work up for it without delay. So I proceeded.

"We left Alicia, for that was the name of our heroine, being wheeled back on the organ to Hatton Garden. It was an unpleasant journey. The bad woman called at a lot more public-houses and left Alicia and the organ outside in the rain. It was a wonder Alicia was not stolen again. She began to cry. People who came by couldn't make out what it was, for she was hidden under the quilt, and some thought instead of an organ it must have been some strange animal. An organ that cried like a child would be a very queer animal, nearly as queer as an author whose tale comes out of his head; and some of the people said so."

I was hot and tired by the time I had worked off this piece of humour, and began to wish I saw my way to the end of my twelve sheets. Two more I occupied with a picture of the organ-grinder's quarters in Hatton Garden, and concluded with the following poetical passage:—

"Little thought the wicked Vixen as she huddled her stolen infant into a damp corner of the filthy room how much would happen before Alicia and her poor parents next met. We know very little of what is going to happen, and perhaps it is a good job. At any rate it was a

good job for Alicia as she lay fast asleep.

The world is all before the little baby—
It doesn't know what's all in store for it;
If it did know, it seems to me that maybe
It wouldn't like the prospect—not a bit.

End of Chapter I."

Harry looked a little uncomfortable as I finished reading my chapter aloud. I concluded he felt rather out of it, and I was not surprised. For on the whole it read well, and in some respects I flattered myself it had rather a pull on "Nicholas Nickleby."

Harry wisely reserved his criticisms until he had read his own chapter, which I awaited with a smile of brotherly resignation.

"You know," explained he, before he began, "I tried to get more incident than you, that's why I left out the scenery."

Aha! my scenery had fetched him, then! I wondered what his incident would be like.

"Fire away!" said I.

"Her name was Sarah Vixen—[I'm beginning now]—Her name was Sarah Vixen. She was a horrid old maid. One morning she went and played her organ in Euston Square. She played 'Wait till the clouds roll by,' and 'Sweethearts' waltz, and the 'Marseillaise,' one after the other, after which she paused and watched a tennis match which was going on in the square. It was a four-handed match between two rather good-looking boys who wore red and green ribbons on their straws—[those were the Denhamby colours]—and two big London fellows. The schoolboys won the toss, and the fair one served first. He put in a very hot service just over the net, which broke sharp as it fell, and bothered the Londoners completely. The dark hand in played close up to the net, and was very neat in the way he picked up balls and smashed them over."

Harry paused and looked doubtfully at me for a moment, and then went on.

"The schoolboys pulled off the first three games, and then the Londoners scored a game owing to the wind. A large crowd collected to see the match, and shouts of 'Well put over' greeted the schoolboys on every hand. The Londoners didn't score another game in the first set, and scored nothing in the second. The crowd became thicker and thicker every moment. In the last game the fair schoolboy spun a ball into the far left-hand corner which the Londoner could not reach, and the match ended in a glorious victory for the two schoolboys, who, apparently unaware of the cheers of the crowd, walked home arm-in-arm as if nothing had happened. On their way they met a runaway horse, and loud cries of 'Take care,' 'Get out of the way,' met them on all sides. A nursemaid was wheeling a child across the road at that moment, and quick as thought the fair boy sprang at the horse and brought him to a standstill just in time. The crowd seeing it, rushed with a great cheer to the young hero, but he seeing it, took his friend's arm and walked on as if nothing had happened."

"What are you so pale for?" asked his friend.

"Oh, nothing very much. I have broken my arm; but it really doesn't matter much."

"While he spoke he fainted, and if it

had not been for his friend, might have fallen.

"Meanwhile the baby, left to herself in the perambulator in the middle of the road, began to cry, which attracted the notice of Vixen, who, seeing she was a nice child, went and lifted her out of her perambulator and put her in her cradle on her organ while nobody was looking, and took her to her home."

"Whose home?" I asked.

Harry did not condescend to notice this interruption. He may have guessed I was jealous. All that about the heroic fair boy had been taking an unfair advantage of me, and I think he knew it. For I was of a dark complexion! His narrative went on to describe a fight in the organ-grinder's lodgings, and a burglary followed by a fire at the residence of the parents of the lost child. As a matter of course the fair boy with his broken arm turned up on the fire-engine, and brought most of the family down the escape with his sound arm. Then by a sudden transition the scene changed back to the organ-grinder's "cottage," on the ground floor of which in another cradle slept another infant, a boy, fair, of course, and beautifully made, showing great promise of physical force and heroism of disposition.

"He was older than Alicia, and could speak a little. There was no one in the room, and as he sat up in his cradle he felt very sad. Presently two young organ-grinders came into the room. One was dark and vicious, the other was fair [of course] and had a pleasant expression. They took no notice of the baby, but sat and smoked and asked riddles of one another. The fair one [of course!] was far the cleverer of the two, and caused much laughter by his wit."

"Can you tell me," said he, in a pleasant silvery voice very unlike an organ-grinder, 'why an author is a queer animal'?"

"Give it hup," said the vulgar one, who always put his 'h's' wrong.

"Because his tale comes out of his head!"

"It was long before the vulgar one saw it, and then he laughed so much that the baby began to cry, and they had to go into the next room for fear of disturbing it. Having left the door open, the fair baby got out of its cradle, and being old enough to walk, went quietly upstairs, and there what should he see in a cradle in the room above but Alicia. This was the first time the two met. They did not say much, but Cupid's arrow went through them both from that minute. That's all," said Harry.

There was a silence, which at last I broke.

"And which chapter do you think we'd better put in?"

"That's just what I was going to ask you," said Harry.

"You see," said I, cautiously, "you've got rather a lot about that fair chap in yours, and he's not in the plot."

"Oh, he turns out somebody," said Harry.

"Who?"

"I don't know yet."

"He's not the hero, of course?" said I, decisively; "he's to be a mixture of both."

"Oh, of course," said Harry. "But, I say, don't you think there's rather too much about scenery in yours? There's very little of that in 'Nicholas Nickleby,' or poetry either."

"No; that struck me as one of the weak points of 'Nicholas Nickleby,'" said I.

"I thought it was settled the hero was to be in it from the first?" said Harry, falling back on another line of defence.

"So he is. I shall say in the next chapter that he was in the room underneath all the time," said I, rather testily.

"Oh, well," said Harry, "of course if you think yours is the best, you'd better stick it in. I'm out of it if you're going in for poetry."

"You're not obliged to do any poetry," said I.

"Thanks. I shouldn't try unless I was sure of writing something that wasn't doggrel," said Harry.

This was hitting me on a tender point.

"Look here," said I, starting up, "do you mean to tell me I write doggrel?"

"I didn't say so."

"You meant it. I'd sooner write doggrel than stuff I'd be ashamed to read in a 'penny dreadful.' Call yourself a fair boy!"

Alas for our novel! We spent half an hour that evening in anything but a literary competition.

Aunt Sarah remarked on Harry's black eye and my one-sided countenance at breakfast next morning, and inquired artlessly if English composition had caused them.

We truly answered "Yes."

Our friendship was quickly healed; but our poor novel, after that one evening, has never lifted up its head again. We have sometimes vaguely talked of finishing it, but we have been careful to avoid all discussion of details, still less all reference to Chapter One. In fact we have come to the conclusion that it is better not to startle the world at too early an age. If you do you are expected to keep it up, and that interferes with your enjoyment of life.

When Our Novel does come out, the B. O. P. shall have an early copy for its readers!

A WEEK'S WALK IN BOLLANDSHIRE.

BY THE REV. H. H. MOORE, M.A.

I WANT my boys, and I should like *all* boys, to grow up with a strong love for walking, so that they may always be able and glad to make it their chief recreation. A walking tour, or excursion, is not only the healthiest way of taking our pleasure and spending our holidays, but it is also as improving as pleasant. It gives such opportunities for cultivating the powers of observation, becoming familiar with the aspects of nature, and learning practically the physical geography, geology, and botany of the districts we visit.

Having a vacant week, therefore, at the beginning of May, I started on the Monday morning with my two boys, one nearly twelve years old, and the other ten years and a half old, for a week's walk in Bollandshire. If my readers will look at their maps, they will see that this is one of the few extensive tracts in England which still remain unpenetrated by railways, and isolated from the great currents of commercial circulation, owing to their mountainous character and the absence of the conditions which attract manufacturers.

There is a circle of railways all round it, connecting Preston, Lancaster, Clapham, Giggleswick, Hellifield, and Blackburn. The best way of penetrating this little-known and little-frequented district is by Whitewell, which may be reached from Clitheroe either by road, or by field and river walks. The road is, of course, less varied and interesting than the latter route; the chief inducement to prefer the road would be to see Browsholme Hall, a fine old house which dates from the reign of Henry VII., and is the seat of the Parkers, who were the hereditary foresters of Bollandshire. For this region of high, desolate moorlands, furrowed by numerous streams and deep woodland valleys, has been from time immemorial famous for the chase, its old name being "Bowland Forest." It was probably called "Forest," like many other districts, not because of its sylvan character, but because it lay "*ad foras*," outside the cultivated lands, left in its primitive state and

to the wild animals that found refuge there. A relic of the severity of the game laws of feudal ages is still kept at Browsholme Hall, namely the "forest strupee." For the game laws, among other rules, provided that "the several tenants, as well leaseholders as feoffarmers, are bound to suffer the deer to go unmolested into their several grounds. They are also fyned, if anie without lysens keep anie dogg bigger than will go through a strupee, to hunt the deer out of the corne."

As we should have another opportunity of seeing Browsholme, however, we chose the other route. After crossing the Ribble, by Edisford Bridge, we left the road about a quarter of a mile farther on for a field walk on the left hand, which conducted us more directly to the Upper Hodder Bridge. As we passed through the fields we stopped an hour at Withgill, an isolated boss of mountain limestone like that about Clitheroe and Chatburn, which protrudes through the overlying Yoredale shales of which the plain hereabouts consists. Here we got a number of large fossils, which could be easily extracted in a good state of preservation, the rock, which had once been quarried, being well weathered. When we arrived at the Upper Hodder Bridge we enjoyed for some time the sweet

quietness of the situation and the lovely views up and down the stream.

From this point we walked all the way to Whitewell by the left (geographically) bank of the river. As well as can be judged from its numerous and extensive windings, I should think that the distance would be about twelve miles, but we took about six hours to do it, for the day was so fine and the scenery so delightful, that we were constrained to stop and look about admiringly every few yards. The Hodder is, indeed, deservedly famous both for its beauty and its fishing. It offers what is one of the greatest, and now, alas! one of the rarest charms of a country walk, namely, the picture of flowing waters perfectly pure, and sweet, and of a crystal clearness.

In this portion of its course which we were now exploring, the stream is one almost unbroken series of picturesque falls, reaches, and windings, and every pleasing feature of river scenery is repeated over and over again. In places the uptilted edge of its rocky bed makes the waters form one long curved line of fall stretching from bank to bank,

"Where the waters bounded
In a full curve rounded
Like a mane of silver bright and clear."

In other places it rushes with manifold struggles and merry din between and over the great blocks of sandstone or limestone scattered irregularly across its course. Here it narrows between approaching hills to a deep, swift current like a millstream; there it spreads itself out over a broad pebbly shallow with numberless twinkling ripples, and manifold murmurings as of countless insect wings or rustling leaves, and

"gurging, kissed his pebbled shore,
O'erhung with wild woods thickening green."

Sometimes with scimitar-like curve it scoops out the base of a hill of Yoredale shales, which shiver themselves away by exposure into steep purple-fronted scree. At other times it cuts a miniature canyon-like gorge through limestone hills, whose craggy faces are clothed and decorated with a luxuriant growth of hanging wood. And, but rarely, the woods and banks receding from the stream, leave it an open course across sequestered basin-like dales, where—

"Lonely slopes the lonely meadow
From the undulating hill."

The valley also wore its brightest spring aspect, for in woods and fields, everywhere, there was an extraordinary profusion and delightful combination of primroses and forget-me-nots, celandines and wood-anemones, purple orchids and cowslips, dog-violets and strawberry blossoms; and about three weeks later, the matted breadths of wood-hyacinths would evidently cover the ground throughout the shady woods as with a veil of blue gauze or of cerulean mist wonderful to behold. When we reached Whitewell we found that the hotel was a roomy, comfortable house, standing in a most picturesque position close to the Hodder, amid rocks, and woods, and encircling hills. Besides the hotel there are only half a dozen cottages and a very small church. Having done our day's walk according to our usual practice, on a lunch of bread-and-butter and water, we greatly enjoyed the excellent hot dinner (ordered beforehand) which was ready for us at half-past five.

The next day's walk, with the aid of maps and books, made the position and surroundings of this part of the Hodder valley which we had now entered upon at Whitewell quite intelligible to us, so it may be as well here to explain it briefly. The general course of the Hodder from its source to the gorge by which it escapes at Whitewell, is through an open basin-like valley, surrounded on all sides by lofty, steep, and bleak fells. The range of hills which separate the Hodder valley from the Ribble valley, with which it runs nearly parallel, are called in various parts by different names, as Browsholme and Birkett Moors, the Easington, Newton, Harrop, Waddington, Grindleton, and Champion fells. The range of hills which shut in the valley on the northern and western sides also form the dividing ridge between the counties and rivers of Lancashire and Yorkshire, for this westward projection of Yorkshire reaches within fifteen miles of Morecambe Bay, and nearly cuts Lancashire in two. Some of the heights on this dividing ridge are of considerable elevation—Fairsnape Fell, 1,701 feet; Hawthornthwaite Fell, 1,568 feet; Whin's Brow, 1,550 feet; Wolf-Hole Crag, 1,731 feet; Bolton Head Fell, 1,784 feet. Our second day's work being to explore some of these fells, we started after breakfast up Tottridge Fell, and a very hard climb it was.

Once on the top, we found that this and all the rest of the range which we afterwards explored are flat-topped hills with sides sloping very abruptly and steeply. These strongly-marked features, geologists tell us, are directly due to their geological formation. For the greater part of their bulk consists of the Yoredale shales, the softness of which causes them, when elevated and exposed, to rapidly disintegrate and crumble away. Thus high and very steep slopes are formed, on which

trees cannot maintain a footing, and only coarse sedges and grass will grow. But overlying the Yoredale shales is a capping of hard millstone grit, which preserves the altitude of the hills, and forms a plateau covered with peat and heather. We walked all round the sharp edge of Tottridge Fell, right to the southern end of the promontory of Porlock Fell, back to Fairsnape Fell, and thence north to Hawthornthwaite Fell. The day was sunny, with a cool wind, and it was very enjoyable walking along the top of these huge hill-terraces at a height of 1,500 to 1,700 feet, inhaling the pure, bracing moorland air, and overlooking the surrounding valleys and plains, and the steep, woody slopes and long, sharp crest of Longridge Fell, which we now saw for the first time on his northern side, and at full length.* We could see the mouths of the Lune and Wyre, but a haze hindered us from seeing the whole expanse of Morecambe Bay and the Lake District mountains.

From Hawthornthwaite Fell we crossed the plateau to reach the head of one of the many streams that rise on the eastern side of the water-ridge, and unite to form the Langden stream. It was well for us that there had been previously a long season of dry weather, for at every few yards we came to a deep grip, down which we had to jump and slide, and then to climb up the opposite bank. After much rain these places must be impassable, as the peaty sides would be too slippery to get a firm footing on, and their boggy bottoms must be soft and yielding as sponges. As it was, the rough walking was most fatiguing, and we were glad when we had scrambled down an almost precipitous rocky slope into the bottom of a deep gorge, down which a brook rushed with hundreds of falls over the boulders in its bed. We walked all down this brook, which was joined by others, until they joined the main valley and stream of the Langden. Both the valley we walked down, and those branch ones which we looked up, were all characterised by remarkably wild, stern scenery, for they are very narrow gorges cut down into the hills, 1,300 to 1,500 feet deep, their trench-like bottoms filled with the roaring, tumbling streams, and their roof-like banks covered either with crumbling rocky scree or with sombre heath and grass. The utter desolateness and wild ruggedness and solitude would be overpowering to some and inspiring to others. From the junction of the Langden with the Sykes and Hareden brooks to its junction with the Hodder, and thence to Whitewell, we found the scenery more open and cheerful.

This day's hard walking of fifteen to seventeen miles would have been too much for the boys had they not been untiring walkers, able to do almost as much as a strong man. It will readily be believed that the yawning gulf which the first cut makes in a shoulder of mutton was considerably enlarged at a six o'clock dinner, after our appetites had had three such effectual whettings as moorland air, a long walk, and bread-and-butter lunch.

Our third day, Wednesday, was a comparatively easy one, being spent on the hill-sides immediately overlooking Whitewell, searching all the quarries, rockfaces, and walls for fossils. For two lines of upheaval traverse the Hodder valley from southwest to north-east, the principal of which brings the mountain limestone to the surface about Whitewell, Newton, and Slaidburn. Encrinites are found here by myriads, some of the walls being vast museums of them. Besides these, we also got the heads of Crinoids, which are rare, Rhynchonellæ, Spiriferæ, Pentremites, Euomphalus, and Productus.

On the fourth day, Thursday, we walked to the Trough of Bolland by way of Dunsop,

* It is an interesting geological puzzle why the Ribble and Hodder do not make their way direct to the sea, *via* Chipping, along the deep troughlike depression between the northern face of Longridge and the southern face of the Bolland Forest fells, instead of running as they do round the eastern end and southern base of Longridge *via* Ribchester.

where there is a pretty little Roman Catholic chapel, with a fine marble figure of an angel, more than human size, in the graveyard. At Sykes, near the Trough, we could see the limestone belonging to the second and parallel upheaval cropping up in the bed of the brook, and we searched the quarries which are traversed by a vein of lead, now worked out. We found a few specimens of lead ore and plenty of calc-spar here. The Trough of Bolland has more fame than it deserves; it is only an ordinary pass over a depression in the watershed, by which the high road from Slaidburn and from Clitheroe to Lancaster is carried. From the Trough to Lancaster the road evidently passes through a wearisome, uninteresting country, not worth the time and trouble of walking. From the head of the Trough we climbed Whin's Brow, which overhangs its northern side, and, following the iron fence which marks the county boundary, passed over a high ridge of wild moorland, from which we had extensive views in every direction, seeing Ingleborough very plainly. We then descended a very steep declivity into the Brennand valley, where the limestone rock and lead veins reappear, and we got some more specimens. Then we climbed up a hill called Midholme, which like a promontory separates the Brennand and Whitendale valleys. We crossed this hill by a depression in its neck, and then descended into the Whitendale valley. We had once thought of going up the Croasdale valley to its very head, and coming down the whole length of the Whitendale valley. But from the top of Whin Brow and Midholme we could see the upper parts of the two valleys as well as if we had visited them, and also Wolf Hole's Crag standing at their heads, with its jagged escarpment of worn millstone grit. The Brennand and Whitendale valleys and streams unite at Footholme, and join the Hodder near Dunsop, by which we again returned to Whitewell. The scenery in both the valleys just named we found to be very wild, as they are entirely shut in by lofty, steep, and rugged moorlands. The streams which chase along their beds are true specimens of mountain brooks, and are formed by many smaller tributaries which come rushing down from the steep moors above. From these streams the Blackburn Corporation has lately provided itself with an additional supply of excellent water, which is conveyed in iron pipes, thirty inches in diameter and two inches thick, over hill and across dale, at a depth of seven feet underground, and for a distance of over twenty miles from its source to Blackburn, where five millions of gallons a day are delivered.

On the fifth day, Friday, we walked from Whitewell, by the side of the Hodder, keeping to its left bank as far as Newton, and to its right bank from there to Slaidburn. The walk is delightfully pleasant and very easy throughout its whole length. Between Whitewell and Newton we passed through a pretty park, Knowlmer, and between Newton and Slaidburn through another, still prettier, called Dunnaw. This latter part of the walk runs between the river and some low, well-wooded limestone crags. We passed through Slaidburn, the capital of Bollandshire, without stopping. It is a quiet little village with a large church, and a humble inn called "Hark to Bounty." From Slaidburn we hope, some day, to follow the Hodder to its fountain-head in the millstone-grit region of Catlow Fells and Bolland Knets, and to climb the latter hill in order to see the view from it, which is said to be the finest in the whole of the Bolland and Craven districts, including, as it does, Ingleboro, Pen-y-Ghent, Whenside, the hills about Kirby Lonsdale, and all the intervening country. On the rocky summit of this hill, also, we should like to see the scratches which have been made by a glacier coming from Ingleboro' direction.

Any one wishing to leave the Hodder valley in that direction can easily reach Clapham

station. We left the valley, however, after lunching at the bridge over the stream, by crossing the Harrop and Grindleton Fells to Chatburn. The walk is uninteresting, excepting for the fine views from the top of the

Fells and from their southern slopes into the Ribble valley.

A night and day at Downham, near Chatburn, and easy strolls among the pleasant field walks about the foot of Pendle, brought

the week to a close, and on the Saturday night we found ourselves comfortably at home, stronger and happier for our excursion, and longing for another as soon as may be permitted.

THE TARTAR HORSE AND THE ROBBERS:

A HOLIDAY ADVENTURE IN THE EAST.

By DAVID KER,

Author of "The Boy Slave of Bokhara," etc.

"A LETTER, Barin" (master), said a Russian servant, coming up to the side of his master's horse just as the impatient man sprang into the saddle, eager to be off to his workmen upon the new railroad ten miles away, and thence to join a few friends on a holiday spin.

"Confound these letters!" growled the Englishman; "they always seem to come just when I'm in a special hurry. However, let's see what it's all about; it may be business. Hallo! what's this?"

"Look well to your safety. There are those who know where you are going to-day, and what you carry with you. If you ride out this morning you will never come back."

"A FRIEND."

Such a warning, even although worded in bad Russian, and clumsily scrawled upon a scrap of coarse paper, made Mr. Archer, brave though he was, feel rather "queer" for a moment. It could hardly be a joke, for there was no one anywhere near him who would have ventured to play such a trick; and if it spoke the truth he was in a very awkward scrape. The district in which he lived—a lonely tract among the hills that rise from the great plain between the Black Sea and the Caspian—was literally swarming with Tartar and Persian robbers, to whom the killing of a man meant no more than the crushing of a mosquito; and the money which he was carrying with him to pay his workmen would have tempted these ruffians to attack him had he had twenty men at his back instead of being quite alone.

But the stout-hearted overseer did not hesitate long. Come what might, it would not do for him to "show the white feather;" and he must not make his workmen wait for their pay just in order to save his own skin. Moreover, in broad daylight there was at least no fear of his being taken by surprise, and if the worst came to the worst, he would have a fight for it. He thrust his hand into his pocket to make sure that his trusty revolver was all ready for use; and then, touching his horse lightly with the whip, darted away across country at full gallop.

But he was soon forced to slacken speed, whether he liked it or not, for beyond the grassy uplands lay a broad belt of cornfields, and here galloping was quite impossible. He had got nearly half way through them, picking his way as best he might, when suddenly

a hoarse, croaking voice, which seemed to issue from the thickest of the waving corn, called out to him,

"Go back, go back! Death lies in front of you!"

Mr. Archer started, and looked keenly around him; but he could see no one. Indeed, the corn was quite tall enough to hide any man who did not stand bolt upright. He raised himself in his stirrups, and called out sharply:

"Kto tam?" (who's there?)

But there was no answer, and when the echo of his shout had died away, all around him was as still as death.

Mr. Archer began to feel very uncomfortable. This second warning, so sudden and so mysterious, coming close upon the heels of the first, was anything but pleasant. That his route was known and watched, and that those who watched it were quite aware of his having a large sum of money with him, was plain enough; and when he remembered that half a dozen robberies and at least one murder had occurred in this very district during the last three months, he could easily guess what was in store for him.

But what was he to do? It would help him little to turn back, for the only other man in the house was his Russian groom, of whom he knew nothing whatever, having only taken him on trial about a week before. He might leave the money at home, but who could tell whether these mysterious warnings might not be a trick of the robbers themselves to frighten him into doing so, that they might have a chance of attacking the house and carrying off the gold in his absence?

"The money's safer in this belt round my waist than anywhere else," said he to himself. "Whoever wants it must pull off my coat to get at it, and they won't do that very easily while my revolver can talk."

Away he went again, leaping yawning trenches, splashing through shallow brooks, rattling and crashing over gravelly ridges. Already four of the ten miles lay behind him—then five—six—seven—eight. A few minutes more, and he would be in safety; but there is "many a slip 'twixt the cup and the lip."

The horse that Mr. Archer rode was of the true Tartar breed, small, rough, wiry, and swift as the wind. On open ground he might laugh at any attack of men on foot; but there was one spot in his road where they

would have him at a disadvantage, and that spot was close in front of him now. Between him and the railway cutting whither he was bound rose a bold rocky ridge thickly covered with bushes, up the side of which zigzagged a narrow bridle path, so steep and broken that no horse could mount it faster than a quick walk. If the robbers really meant to waylay him, this would certainly be the place, where the thickets on either side would hide them till the very moment when they made their rush.

Mr. Archer felt for his revolver, but before he could draw it his horse began to stumble upon the loose stones, and both his hands were needed to keep it from falling outright. Just then came a crash among the bushes and a wild yell, and he found himself in the clutches of four of the ugliest ruffians that he had ever seen in his life.

The sturdy Englishman struggled fiercely with his assailants (who luckily had no firearms), and gave them so much to do in holding him fast that not one of them could spare a hand to draw a knife and stab him. But he knew that the moment his strength began to fail one of those long sharp blades would be buried in his heart.

Suddenly he remembered that the Tartar who had sold him his horse had warned him against touching a white patch on its back just in front of the saddle, which would at once make it rear and kick. Now was the time to try it? With one finger of his left hand, which was pressed down upon the saddle, he just managed to reach the white spot. A furious plunge, a rear, a kick, and one robber lay motionless under the horse's hoofs, with a second writhing and howling beside him. The third, who held the bridle, was dashed to the ground, while Mr. Archer's strong right hand knocked over the fourth like a ninepin; and then horse and rider went scrambling and stumbling up the breakneck path, over the crest of the ridge, and down into the crowd of astonished workmen beyond.

Our hero could never find out who was the author of the two mysterious warnings; but the story of his adventure soon got abroad, and from that day forth he and his horse were greatly revered by all the people of the district, robbers included.

I have only to add that this story is quite true, and was told me in Russia by the sister of its hero.

ROMANCE OF AN ENGLISH LANE.

A SUMMER RAMBLE AT SELBORNE.

"THERE is a Sundew growing near that clump of moss."

"So there is, but I thought *Drosera* was bigger."

"Oh, no. It is never more than six inches high, and the leaves are always under half an inch across. You might as well take that; there are two or three near it."

And so the little insect-eater was torn from its mossy bed.

Not much to look at, but one of the most famous plants that grow. A circle of rounded leaves, slightly cup-shaped, covered with

Fig. 1.

glandular tentacles, whose tips are glistening with syrupy dew. The leaf is green, but the club-shaped hairs that crowd its surface are a curious purple. There is but little root, and the soil around is the boggiest of the boggy and the poorest of the poor, so that nearly all the nourishment the sundew gets must come from what it catches.

"A vegetable, but no vegetarian! How does it feed?"

"That one over there is feeding now. Watch it."

A tiny fly has fluttered on to one of the leaves, attracted by the light. It has been caught in the sticky moisture on a tentacle, and struggles to escape.

"It will never get away. If you were to wait here long enough you would see the tentacles all bend to it. The gland that caught it is secreting more and more of what looks like dew, and all the glands will slowly come into action. The fluid will stifle the life out of the fly, will gradually grow acid and suck the juices from the corpse, and when all the goodness has gone and been digested the tentacles will bend back again and leave only a little dust, which the wind will blow away."

"Does it only feed on insects?"

"In a state of nature, probably yes; but Darwin fed his sundews on chopped meat, and they got on very well, and then he fed them on infusions and they seemed to thrive, but when he tried them with cheese it killed them off with severe indigestion."

"Doesn't it make a mistake sometimes and shut up at a raindrop?"

"No. For it does not care for hard knocks. It wants a gentle tickling such as it gets from an insect's legs. It will act on a pressure of the eighty-thousandth of a grain, but a hard hit such as it must suffer from at times seems not to affect it. The curious thing is the sympathetic action of the tentacles. At first only one feels the pressure, and yet all combine to hurry up to dinner and shed their gastric juice in the good old animal way."

And so we walked off with the sundew, and when I reached home I drew it life-size, as shown in Fig. 1, and, magnifying one of the leaves, I made out the state of affairs much more clearly, as can be readily understood from the giant portrait which the printer has called Fig. 2.

An interesting subject is that of these insect-eating vegetables, as I soon discovered. The names of many of them are now household words—and household words of considerable length! There is *Aldrovanda*, a freely floating rootless water-plant, with broad leaf-stalks growing radially from the stem, each ending in four or six divergent spines with a bristle at each tip; there is *Drosophyllum*, of Portuguese extraction, with a well-furnished battery of tentacles and glands; there is the South African *Roridula*, with its sharp upright hairs in scores; there

hairs at *d*; Fig. 6 shows a section through the leaf, giving the glands at *b* and the hairs on the lower surface at *d*.

The flytrap means business, and is by no means a leisurely carnivore like the sundew. On each leaf are six filaments, three on the upper face of each half. The blade is divided by the midrib, and the halves stand at right angles to each other ready for action. As soon as the fly touches one of the filaments snap goes the leaf like a trap, and if instead of a fly something not worth eating has been caught, the blades spring apart again and let it fall. The spikes interlock but do not quite close, so that small insects can creep out, and the plant has only to begin digestive operations on a good square meal, and not injure its health like some people by injudicious worrying with trifling snacks.

Another meat-eating vegetable is our old friend the Butterwort, the greasy *Pinguicula* which the Lapps use for rennet, turning its pepsin to account in making their reindeer milk into cheese.

Pinguicula is not much of a plant to look at, though it has a pretty violet or yellow bloom. It shows best under the microscope, and we give three slides duly magnified. Fig. 7 gives the surface of the leaf with the glands at *g*, the hairs at *h*, the base of the hairs at *b*, and the stomata at *s*; and Fig. 8 shows a section of the same leaf with the glands at *g*; and in Fig. 9 we have these curious glands and hairs dissected out, *a* and *b* being the top and side views of a gland, and *c* being a stellate hair.

The Butterwort is not a very popular plant in Wales and Scotland; it is said to cause sheep-rot. And this is not improbable, for the greasy hairs from which it gets its name

Fig. 2.

is the Australian *Biblis*, which, like *Drosophyllum*, has both tentacles and unstalked glands; and then there are the Flytraps.

Of the chief of the flytraps, *Dionaea muscipula*, we print four sketches which will make its structure clear. Fig. 3 shows the plant itself as it grows in its North Carolinian home; Fig. 4 is an enlarged lobe of its leaf which can be profitably compared with the enlarged leaf of the sundew in Fig. 2; Fig. 5 gives a portion of the leaf as seen from above, showing the sensitive filaments at *a*, the digestive glands at *b*, and the stellate

catch fast hold of any dead animal matter and absorb its juices. The margins of the leaves curve up and push this matter, whatever it may be, closer and closer to the centre, where the hairs are thickest, and thus the excitement is furnished which brings forth the secretion and ensures the digestion of the stuff. To the same botanical order—the *Lentibulariaceae*—belongs another carnivore, the Bladderwort, the *Utricularia* whose feats in flesh-eating have only lately been recognised, and who seems to think as little of catching and bottling off a tiddler as do

the boys with the worms round our park ponds.

The most graceful of the insect-eaters are the Pitcher plants. Of one of them, *Nepenthes distillatoria*, I have been favoured with a sketch numbered as Fig. 10, and a little

"Oh, no, not at all; don't you know? He, she, or it was an aloe, and some fellow's negro attendant got too near, and the baneful gases, etc., overcame him, and the leaves fell down and clutched him, and he was clasped to its heart, and when his master

gault, and were now toiling up a chalk hill by Prior's Dean to outflank the Hanger.

The hedgerows are aglow with a fringe of

bit of the body wall of this idealical pitcher cut out after it was sketched I magnified, and obtained the glands displayed with pleasant truthfulness in Fig. 11.

But this will never do. I started to describe a walk which with my old Lewes friends I took last year through Gilbert White's territory, and instead of doing so I have plunged into the middle, and, ignoring poor old Scottie, have made a great display of myself—which I hate—and for the last ten minutes have been as prosy as a "Kicklopedaia," which I am assured is the proper pronunciation of that awkward-looking word our

shot the deadly bullet straight to the centre the leaves all dropped off like those of an artichoke, and in the centre was the whitened skeleton of the wretched Ethiopian."

"Oh! ah! That must have been in the reign of Queen Tolderiddleidoruntumididdleina."

"Exactly."

'But you might offend a nation
In such a situation
By mentioning their monarch's name
In a rude abbreviation.'

"Forward! by your left!" broke in our volunteering hero, who on the strength of

Fig. 4.

schoolmates used to clip so conveniently into the "Penny Sike."

"Come along!" said Scottie.

"Did you ever hear of the man-eating tree of Madagascar?" asked Rab.

"Is he any relation to the Infuriated Toothpick of St. Martin's Lane?"

being a full corporal presumed to order us about as if he had been a field officer.

We had left Petersfield in the morning, and were on our way to Selborne, and after toiling northward in the burning sun over the well-wooded greensward had stumbled over our insect-eaters in the flat plain of the

Fig. 5.

bloom, and at every break and in every copse we come across huge foxgloves a couple of yards high drawn up in martial array to form a rear rank, while less lanky beauties guard the front. There in a corner of the hedge stands another floral giant, the great primrose mullein, which, thanks to its own four feet and the hillock it stands on,

Fig. 6.

shines out like a lighthouse far up the path. And there at another break we come upon a clump of purple loosestrife as high as the

hedge itself, and a mass of colour rich as rich can be. We pluck the wild strawberries as we pass, and we give up collecting in despair, for our boxes have long since been

planted him in so congenial a spot, and forced him, whether he would or no, to write the first and most charming natural history book in the language.

they are. Professor Bell used to live here, and here he wrote his books."

"Did he know White?"

"No; but he edited him, as sixteen others have done."

And then we turned up to the church to find the old naturalist's grave, the simple

G. W.

26 June, 1793.

Then we measured the yew, "whose aspect bespeaks it to be of a great age; it seems to have seen several centuries, and is probably coeval with the church, and therefore may be deemed an antiquity. The body is squat, short, and thick, and measures twenty-three feet in the girth, supporting a head of suitable extent to its bulk. This is a male tree, which in the spring sheds clouds of dust, and fills the atmosphere around with its farina. As far as we have been able to observe, the males of this species become much larger than the females, and it has so fallen out that most of the yew-trees in the churchyards of this neighbourhood are males; but this must have been matter of mere accident, since men, when they first planted yews, little dreamed that there were sexes in trees."

I have let White describe his own yew, for it is the same tree. Men may come and men may go, but the yew lives on for ever. It is a couple of feet greater in girth now than in his time, although the size depends very much on where the measurement is taken. I need say nothing about the church, for all its history has been duly given by Gilbert himself, and since his time "nothing has occurred to chronicle."

"Now, my friends, there are three courses open to you. You can go to Alton by the straight road, you can go by the old round-about road, or you can go by an old English road that our forefathers used to tramp along in the days of King Edgar."

"I'll be a forefather," said Rab. "Let us follow the old folks."

"Not in all their ways."

"Well, in this one, then. Where is it?"

We wandered about for some time, but failed at first to strike the track. At last Scottie interrupted an interesting yarn of the youthful warrior's with, "There is a double hedge sort of place over there which ought to be our road."

"Yes," said Rab, "and a Chicago meat-tin to mark the spot."

"Left by one of the Americans, probably!"

"Yes, as a traveller's sample," suggested I.

"Avaunt, thou obelisk of beef!" said the leader, giving the tin a kick.

Fig. 7.

filled. Such a wealth of wild flowers is the boast of no other district in Britain. All sorts of soil are here found side by side in narrow strips, and each of them appears in its barren and its fertile garb. Hill and plain, meadow and woodland, field and garden, follow each other in rapid succession,

He really could not help it! The birds are here in dozens, and each one seems to be the very original of the portrait in the dear old book. Here comes a wood-pigeon sweeping past, not a cricket-pitch away; a lark rises as he sings; a yellowhammer wants "a little bit of bread and no cheese" in the bush near the next tree; away to the left is a wise-looking magpie; and beneath us as we look through the foliage on to the road below three or four swallows come swiftly sailing.

Down the zigzag we go, stopping to fill our pockets with bunches of the sweet-scented woodroof that grows at the corners, and up the straggling street we make for the inn, where a genuine substantial early tea awaits us. For a few minutes we look through the various editions of "The Natural History of Selborne" that are there collected, and then

Fig. 8.

and as we rise across the common and from beneath the beech-trees on the Hanger look down the zigzag to Selborne we chant quite a song of praise at the beauty of the land, and envy old Gilbert White the pleasant fate that

glance through the visitors' book, crowded with the names of Yankees and Canadians, South Africans and Australians, who look upon Selborne as another Stratford, and reverence it as one of the old country's most sacred shrines.

"The meal it was large and the bill it was small, so give the landlady the thanks of us all," said Rab, as we crossed the road to White's old house; "I wonder you are not ashamed to look a hen in the face. You told the girl how many eggs you had, didn't you?"

"Yes; and she said it didn't matter."

"Splendid place, Selborne; commendable habits and customs of the inhabitants. What are those two trees in front of Gilbert's house?"

"Portugal laurels—and capital specimens

Fig. 9.

"These Selborne folks have not yet learned the right use of preserved provisions. You know why canned meats are so economical?"

"No."

"Perhaps because you eat the grub and save the tin," suggested Rab.

Whereat we laughed; and the learned chemist said no more.

Crossing what seemed to be a dusthole we plunged into a gully where the trees and bushes meeting overhead shut out the sunlight and hid us in their shade. This was the old road; rough under foot, narrow, worn deep down into the rock, and strewn and edged with shrubs and flowers, through which we had at times to almost fight our way. It was a hard task, but a delightful one, and we were sorry when it ended.

We did not long remain on the high road, but went off to a path through the cornfields curving round the foot of a wooded hill, where the orchids grew in brilliant patches, and the sun's rays shooting down through the foliage just tipped the spikes and made them gleam like spear-heads among the rich green grass. Then out on to the road we went, and then a sudden turn brought us in front of a small church. Surely there never was a stranger church in these dominions!

It still fulfilled its civic functions. In the

Bible was in the pulpit just as it had been left when the preacher closed it for his last sermon. But the spiders had been busy, and over all the desk hung the cobwebs in thick draperies. Between the joints in the stone floor the grass and nettles were growing, and the mushrooms had forced up the flags. The roof was broken and the light streamed in through the holes. There were the hassocks and cushions left as they had been by the worshippers, but now all burst and rotten with the rain. The cloth still covered the communion table, but it looked like a dirty

The moss and the lichens were eating into the woodwork, the ironwork was a mass of rust, the open doors were dropping from their hinges. But the outer door was securely locked to prevent admission. It was the only part kept in repair!

"Here is the last vicar's grave!" said Scottie, pointing to a neat little headstone.

"What does it all mean?" asked I.

"That is the question. I do not know. This is the mystery of West Worldham."

"Out-of-the-world-ham I should call it," said Rab, and so with another wondering look through the shattered window we bade the mysterious ruin farewell.

"What a scene for a story! No one will believe me when I tell them that such a place exists."

"Tell a good many, then, and enjoy a grievance, and at the same time you may by chance wake up somebody whose business it is to open that locked door."

Soon we are in another gully, down, down for a mile or more with the stream running in and cutting its way deeper into the rock. Overhead we get stray glimpses of sunlight, and look up at the under sides of the leaves

Fig. 10.

Fig. 11.

porch were the usual parish and militia notices, as though the door had been locked and the congregation had left it but yesterday. But the morrow would seem to have been as long in coming as Rip Van Winkle's in the Kaatskills. We thought we ourselves had woken up after a sleep of a dozen years.

The windows were all broken and falling away. But inside these were the hymn-books and prayer-books still in the pews. The

rag all spotted with filth and dust; and the carpet round the altar steps was green with mould. A tree had thrust its bough through one of the broken windows, and the birds were resting among its leaves inside the church and flying in and out as in a disused barn. A duck and her brood were grubbing in one of the aisles. Nettles and thistles had sprung up in the pews, and the weeds grew thickly in patches along the sides.

and petals, which glow like lovely transparencies with the light behind them. The path is barred by the nettles and briars, and the gully is even a greater wilderness than the old English road. But the lane, or the watercourse, whichever it is, comes to an end at last—in a quagmire as it happens. And with a series of reckless leaps on to widely-scattered stepping-stones we are out on the high road to the railway station at Alton.

ANOTHER SUMMER HOLIDAY IN WALES.*

BY BERIAH GWYNFE EVANS,

Author of "My Summer Holiday in Wales," "Bronwen," "Owen Hughes," etc.

HOW JACK PARRY RODE THE HARVEST MARE.

JACK PARRY felt very much disappointed and "down in the mouth," as he called it, when, after alighting at the country station on that pleasant September afternoon, he found no one but the station-master awaiting him.

"I thought Walter would certainly

have been here to meet me," said he to himself. "It will be no joke to have to tramp these seven miles of dusty road with this thing"—this thing being his portmanteau. "And I have only to-morrow to stay."

His reverie was broken upon by a loud whistle, and, turning towards the direction of the sound, he saw his cousin

Walter Rhys driving the dogcart up to the inn, which is the inevitable "next-door neighbour" to country railway stations.

"You thought I had sold you, I suppose?" asked Walter as he grasped his cousin's hand. "But it is harvest-time with us, and as we wanted to finish off to-day I could not get off sooner. Now

* See our last Summer Number.

pitch that bag of yours behind and jump up."

In another minute the cousins and friends were driving along at a rattling pace through the one straggling, sleepy village street, and out into the open country beyond, the fields on each side being now and again dotted with groups of peasant men and women, boys and girls, all busy cutting or stacking the golden grain.

Dolly's nimble hoofs soon covered the first three or four miles of level highway, and then the road branched off into a parish byway, leading to a steep hill, at the foot of which Walter, with his usual thoughtfulness for his pony, jumped down, followed by Jack, the hill being so steep that the pony was sufficiently tried in drawing the empty vehicle without the additional weight of passengers.

Long and steep as the hill was, it did not appear so to the two friends, who had so much to tell and ask each other, and before the top of the acclivity was reached Walter had told of Dolly's prowess at the recent trotting-match, of his own new double-barrelled gun, and a dozen other important items of news, and had received in return a full and circumstantial account of the last great school cricket-match, as one of the results of which Jack now stood with the honours of election to the first eleven thick and fresh upon him.

"And how are those people getting on? Those you know—I attended their Bidding last autumn?" asked Jack.

"Oh! David Williams and his wife? They are doing well. The old people have retired, and have left the farm to the young couple. By-the-way, too, there will be some fun at that place to-morrow, and if you are good for a day of work, an open-air picnic, dinner and tea, and an evening of fun, I don't know that I can do better than let you spend your single holiday to-morrow at Love Lodge."

"I'm your man, then," said Jack; "but what is the programme to be?"

"Well, it is known among us here as 'Riding the Harvest Mare.'"

"Oh! that's all right. But who is to ride her? If she isn't too old to be good for a gallop, or if she isn't remarkably vicious, I should like to have the ride myself if it is possible. I am partial to horse-exercise."

Walter burst out laughing.

"You have been and gone and done it again, Jack, as you did last year when you thought a Welsh Bidding was a sale by public auction. There will be no horse there at all."

"No horse! Oh! I see, you play upon the word mare. Well, a mare is a sort of a horse, anyhow."

"No, that was not what I meant. There will be neither horse, nor mare, nor mountain pony, nor colt, nor any other form of four-footed animal."

"Well, how in the name of conscience can you speak of a harvest mare, without anything like a mare in the business? I hope you won't put me astride upon a broomstick and parade me about."

"Oh no, never fear. The harvest mare is a small sheaf of wheat, the last cut in the last field of the farm. The reapers have a curious ceremony in cutting this last sheaf, as you shall see to-morrow. Then it is a point of honour

with the young men to carry this sheaf and to place it *dry* on the kitchen table. If that is done, the boys have then some special privileges in the subsequent feast and sports."

"But I don't see what difficulty there is in that, if it should not be raining, and even then you could wrap it up or hold an umbrella over it."

"But, my dear fellow, it is equally a point of honour with the girls to prevent its being placed dry on the table. If they can 'Water the Mare,' that is if they can wet the sheaf by any means, fair or foul, before it is placed on the kitchen table, the privileges of the evening belong to *them*, and I can tell you it is no joke to run the gauntlet of a score of girls armed with basins, jugs, and buckets of water."

"Whew!" whistled Jack. "What curious customs you have, to be sure! But it must be awful fun!"

"Ay, it is that! But the old customs are dying out, and you might search all Wales to-day and not find a dozen places where the boys ride and the girls water the harvest mare. But old Morgan Williams is a great stickler for old customs, and the harvest mare is still an institution at Love Lodge."

By this time the top of the hill had been reached, and the two youths again mounted the car, and proceeded rapidly on their way.

"I say, Walter, will there be many people at that place to-morrow?"

"Yes; there will probably be from eighty to a hundred there, not only most young farmers and farm servants, but all the mechanics of the place. John the blacksmith, Evan the carpenter, David the shoemaker, Jonah the shopkeeper, will be there working all day, and the schoolmaster and the minister and the parson will at least give a turn in and help build a mow each."

"Then I suppose the relatives of the farmer and his wife will be all there?"

"Yes; and among them Jeannie Hughes, of Llwynteg—the girl that led you to the ducking last year."

Jack turned away his head that his cousin might not see the tell-tale colour which mounted to his face.

"Well, I'm awfully lucky in getting such a chance for my single holiday."

"Yes, that you are. You might spend a dozen summers in a dozen different places without meeting with this chance. But you are born to luck. However, here we are!" and, with a whoop, Walter drove at full speed up to the house-door, where he drew up sharply.

Jack leaped out to receive his uncle's warm hand-clasp and his aunt's loving kiss on his forehead, and Walter, having left Dolly in the stable-boy's charge, followed the trio into the house and joined his father and mother in their plain-spoken complaints at the short stay Jack was going to make.

The following day dawned bright and clear. Jack appeared at the breakfast-table in a school suit, which he had brought for any contingency which might arise.

Soon after nine o'clock the cousins started, Walter, as a good reaper, being armed with his sickle, while Jack, as a novice at harvest-work, was obliged to be content to act as a super, and so to be unarmed.

The field when they reached it was already a scene of busy life. A score of stalwart country youths had already cut

their way far into the rippling field of golden grain, each reaper attended by a brawny-armed damsel, who with deft movement and nimble hands bound the long straw as soon as cut into sheaves, which were again quickly picked up by a smaller army of boys and girls, or aged supers, and stacked four together, butt-end down, and with the heavy-laden ears intermingling. In the early afternoon these "stackings" would be gathered together and built into "mows," each containing a dozen "stackings," and built so that the stubble ends would be exposed to the weather, while the ears would meet in the centre, and there be protected by a straw cap, neatly fitted on and firmly bound with a straw plait.

Walter at once threw off his coat and rolled up his shirt-sleeves, striking in after the last of the long line of reapers. Before doing so, however, he turned to Jack, whispering, "I told you you were born to luck! Here is Jeannie Hughes, the prettiest girl and the quickest binder on the field, coming in now, and she falls, by the law of the field, to my share as last reaper in. You can follow me with her, and get a lesson in sheaf-binding from a professor in the art."

Jeannie Hughes now tripped up to them. A broad-brimmed straw hat set jauntily on the well-poised head set off the charms of her blue eyes, golden hair, and laughing features; a small square shawl covered the graceful shoulders, and was fastened in front by the regulation blackthorn pin; the skirt of the dress, turned up under the white canvas apron, was fastened in a loose knot behind, showing a portion of the short Welsh flannel petticoat, beneath which peeped as neat and pretty a pair of feet as any in the field, though they were encased in strong laced and nailed shoes.

With unconcealed and unaffected pleasure she approached Jack, holding out her hand in welcome, and saying,

"We are very glad to have you back again, Mr. Parry. Are you disposed for another baptism?"

"No—that is, yes—I mean that I am glad to see you again," blurted out poor Jack, in a sudden access of shyness, at which his cousin laughed.

"The truth is, Miss Hughes, Jack wants a lesson in sheaf-binding, and so I leave him in your care. I think you are my partner, are you not?"

"I suppose so, that is if you can give me anything to do, or else if not there comes Gwynne Vaughan with his sickle, and I can—"

"That is a hint that I am idling, I suppose, but Gwynne happens to be the day after the fair just now," and without more ado Walter struck in in the wake of the long line of reapers.

Jeannie seized the first armful that fell before his keen sickle, and in a moment she threw it, a neat, tightly bound sheaf, at Jack's feet, saying,

"There you are, Mr. Parry, that is your model and your first lesson. Now, sir, learn the lesson and imitate the model."

Jack immediately seized the next armful, but though he was keen enough at cricket and every sort of boy's play, he felt his fingers very clumsy as he tried to tie a knot upon his sheaf. At last he succeeded in forcing the brittle straw into the semblance of a bound sheaf, and looked up expecting to receive the approval he thought he deserved,

* See "At a Welsh Bidding," B. O. P. Summer Number, 1884.

but what was his surprise to find that half a dozen sheaves and a dozen paces now intervened between him and his companion, who greeted his second approach with an inquiring smile.

"Now, Jeannie, that isn't fair," said Walter. "Show my cousin how to do it."

"Well, now then, watch me closely," said she, and, lifting up an armful, she made what appeared to Jack's bewildered gaze to be one or two mystic passes, and then threw the completed sheaf down before he thought she had had time to prepare the binding straw ribbon.

"She is only laughing at you, Jack," said his cousin. "You had better go and join the supers at stacking."

"How can you say so, Walter Rhys!" pouted Jeannie. "Now, Mr. Parry, your cousin has put me on my mettle, and I am determined you shall learn the way to bind before dinner. Notice now how I do it," and with slower motion she went through the mystic passes—the lifting the armful of straw, the arranging it on the left arm, the half-dozen straws seized in the right hand, passed under the burden, seized by the left hand, twisted as the sheaf was placed on the left knee, and the ends pushed in under the binding straw ribbon completing the process.

"Now you take one and I will look on," said she. And Jack tried, she directing his movements and guiding his unpractised hand in sweet unconsciousness, or apparently so, of the thrill which ran through him as her fingers guided his in the process of twisting the sheaf round and pressing the ends of the binder in.

And so the morning passed, Jack making so apt a learner and Jeannie so able a teacher, that before the dinner-hour he could bind a sheaf deftly and firmly, if not quickly, and though his finger-nails ached and the finger ends pricked like a hundred needles from the thistle punctures in them, he thought this was not too high a price to pay for the lesson he had had.

A loud "Ahoy!" from the house served as a dinner-gong, and off they trooped in merry groups to find at Love Lodge long rough tables put up in the yard before the house, with seats ranged each side down the whole length. On the table stood the basins full of ready-filled broth, to which the workpeople all sat down, Jack electing to remain outside at the big table among the men, though invited into the house for a special table. No sooner was the basin of broth disposed of than its place on the table was supplied by a plate of boiled mutton, while immense dishes of potatoes and plates of broken bread were placed at intervals along the centre.

Never had Jack more thoroughly enjoyed a feast than he did this simple, homely meal in the open air amidst the music of laughter and talk and joke.

Dinner over, the whole party trooped back to the field, where the work of the morning was continued, some of the reapers, with their assistants, being told off to convert the now dried stackings into mows. Walter, having volunteered

for this work, took Jeannie and Jack with him as his helpers, and a very pleasant couple of hours did the trio spend at this work before the tea was brought to the field.

And what a tea that was! It supplied Jack with matter for many a yarn among his schoolmates when he returned to his grind. The snow-white linen cloths spread on the stubble, with the five score people arranged in five separate circles, each around its own central cloth, the loose sheaves serving as stools for such as needed any but mother earth. The wheaten bread, the yellow butter, and the revivifying tea served out from the immense tin jugs in basins to each one, seemed to Jack to be an ambrosial feast which the gods might have envied, and was none the less enjoyable from the fact that sweet Jeannie Hughes was the presiding spirit of his circle.

A short hour's work followed tea, and then commenced the sport.

At one corner of the field a handful of growing corn had been left standing. This, made into a threefold plait, was the Harvest Mare.

The reapers, each with his re-sharpened sickle in his hand, stood at a distance of twenty paces, and each was to have his turn at "catching the mare." This was done by throwing the sickle at the plaited corn, and he who could, by so doing, cut it down, was deemed the victor, and could entrust the mare to whomsoever he wished to carry it home to the kitchen table.

Many were the futile attempts, and loud and repeated was the laughter which greeted each successive failure. Jack, of course, must needs try his hand, and, being an adept at all games of strength and skill, thought he would, if not actually catch the mare, come at least very near to doing so. In this, however, he was disappointed, his sickle flying far wide of the mark—throwing the sickle being very different from throwing a cricket-ball.

Gwynne Vaughan came nearest to it in the first round, his sickle grazing it as it whirled past. On the second bout, Walter Rhys, by as much luck, perhaps, as skill, proved to be the victor, the keen edge of the sickle catching the standing corn fairly, and cutting it off as if with a razor.

The girls and women now all left the field to prepare their reception for the men at the house, while the leaders of the youths met in earnest conference to decide who should ride the mare.

Gwynne Vaughan was first favourite, but before making the decision known to the rest, he called Walter aside, and said—

"The girls are safe to suspect that I have the mare, and I am safe for a ducking. Of course, I don't care a brass farthing for the ducking itself as far as I am concerned, but I *do* care for watering the mare. I've been thinking if your cousin were to ride the mare, he, as a stranger, would not be suspected. He is a keen chap, too. I remember how he found the bride for us last year. What do you say, Wat?"

"It is a good plan, and I think Jack will fall in with it."

Jack was summoned, and the plan broached to him.

"All serene," replied he. "I'll do it, and I'm much mistaken if we do not get the better of them between us."

"Don't be too sure," replied his cousin, "some of these girls have keen eyes."

So it was arranged. Gwynne Vaughan was to place a dummy mare in his breast, and to button up his coat as if to protect the precious treasure from the shower which was sure to greet him. He was to run the gauntlet of the girls, safe to be ranged each side of the yard up to the very door of the house, and draw upon himself the fire—or the "water," rather—of the assailants, in the hope that, even if they discovered their error, Jack would have time to reach the house and place the mare dry-shod on the table before a fresh supply of water could be procured.

The plan, as will be seen, was a good one, and deserved to be successful; and the assembled youths who were entrusted with the secret were unanimous in their approval of the stratagem.

Singing a harvest song, the party of youths, at least forty in number, marched together from the field to Love Lodge, Gwynne Vaughan and Walter Rhys heading the procession, being closely followed by Jack Parry and Tom Williams, the others following in a mixed group.

A pause was made for breath a dozen yards from where the girls, some two dozen in number, stood ready in a double line, some armed with basins, others with jugs full of water.

"Now, Gwynne," shouted Walter, and the young man started at a run, clearing the first two or three couples before they recovered sufficiently from their surprise to throw the water at him, and then impotently casting the contents of their vessels after him. The others, however, met him on each side, and, drenched and dripping, having drawn upon him all the water in the lines, he stood at the house door.

"Now, Jack!" whispered Walter, and the boy darted forward, unsuspected of all, until with a shout he reached the doorstep!

But, alas! "there's many a slip," etc. Having reached the doorstep dry, and with his hand already in his breast to draw out the mare, a musical voice said—

"It is with you, then!"

The next moment Jeannie lifted up the heavy bucket of water which she alone had kept in reserve inside the house door, and swashed it fair in his face and breast, causing him to sputter and gasp for breath, and effectually "watering the harvest mare!"

The dismay of the youths and the elation of the girls at this sudden change of fortune may be imagined, and it was with a somewhat sobered air that Jack, after a change of clothes, found himself, in company with all the other boys, obliged to wait at supper upon the girls, who were now treated as respected guests, and who ordered their bondsmen about at their sweet bidding all the rest of the evening.

WATER LILIES

We know the spot where water-lilies lie,
Hid from the world, wide open to the sky ;
Their broad green leaves with gentle motion float
As past their anchorage glides our little boat.

The "Water-lily" is our pet craft's name,
So called the day that Cousin Lilian came
And sailed with us beyond the rushes where
The lilies grew :—herself the fairest there.

EAST by NORTH

OR A NIGHT'S SAIL

A YACHTING REMINISCENCE.

BY
H.F.H.

"THAT'S mate, then," said Frank, as he brought his queen's rook into position; "we're even now—two games each—and the next will show who's conqueror."

I had to own he had fairly beaten me, and proceeded to place the men for a fresh game.

We were sitting in the main cabin of his cutter-yacht the Emetic (christened so by Frank in consequence of the effect it usually had on his lady friends), a splendid little craft of thirty tons, as good a sea-boat as any one need wish for, with plenty of beam and power, and, as he used to proudly remark, fit to take you anywhere.

The cabin, or—as called amongst yachtsmen—the saloon, looked as cosy and comfortable as possible under the combined light and warmth of a powerful argand lamp that swung overhead from the central beam of the skylight, and the flicker from a sea-coal fire, which burnt in a neat little brass stove screwed to the floor at the forward end of the cabin, between two doors, one of which led by a short passage to the forecabin and pantry.

The door on the port side was slightly open, and the lamplight showed up the tigerskin rug thrown across the berth in my friend's sleeping-cabin, comfortable sofas on either side of the saloon, arranged to be turned into sleeping accommodation when necessary, and a recessed bookcase with drawers and cupboards at each

end, well stocked with technical volumes of all kinds. Above, three long but narrow looking-glasses reflected the light, and gave an airiness to the cabin, that would have otherwise

been rather sombre, in consequence of the doors and fittings being of old Spanish mahogany. A heavy swing table of the same wood was secured to the floor in the centre of the apartment. Looking aft, folding doors led to the companion stairs, on one side to a storeroom, and on the starboard side to another sleeping-berth, which was deputed to my use whenever I had any spare time to spend with Frank; and being very enthusiastic, not to say slightly crazed on yachting—and, moreover, Frank being an old school chum of mine—I always took every available opportunity of being with him, and many a pleasant cruise had we been together.

Frank was a sturdy-built young fellow of twenty-five, very active, and a thorough seaman, who took charge of and worked his yacht with the help of one paid hand, who had the cooking and general cleaning up to do.

Now, although this individual's intentions might have been, and I have no doubt were, of the very best, his actions were seldom satisfactory, through his readiness to fall asleep at all hours of the day or night, and which usually happened when he was most wanted.

Mr. Patrick McCarthy, or Pat, as he was generally called, with all his faults (and they were not few) was an honest chap, and so Frank kept him on in his employ, putting up with his shortcomings with pretty good grace, as Pat could (when awake) take his trick at the

helm, or cook a joint regardless of the weather or the motion of the Emetic.

We had anchored for the night off a creek on the east coast. Frank had determined to have some wild-fowl shooting, in spite of the expostulations and grumblings of Pat about the bad weather to be expected. I had joined Frank about a week previously, and although we had experienced the usual strong winds and cold nights to be looked for at that season of the year, we had had also some fairly good sport with our guns, which made up for any slight inconvenience.

"Before we begin this game I'll give a look round on deck," said I; "by the way she plunges the wind is getting up."

"Do," said Frank, "and I'll tell Pat to make some coffee for us."

I ascended the companion stairs, and pushing the slide back, stepped on deck. Just then she gave a lurch that nearly sent me off my legs, but grabbing at the side of the companion, I recovered myself.

It was a black night, the wind had risen considerably since we had brought up, and was bitterly cold and keen, and a nasty fine sleet was falling that made things more unpleasant still.

"Hullo!" said Frank, poking his head up the companion. "What do you think of things in general, especially the weather?"

"Well, I think it looks dirty, and the sooner the topmast's housed the better. The wind has shifted a couple of points since we brought up here this afternoon, and if it gets much more round to the east we shall have the treat of beating off in a hurry."

"Your words are the words of wisdom," said Frank, with mock gravity. "We'll do so at once."

"Shall I call Pat to lend a hand?"

"Never mind," said Frank. "Pat's asleep; at least he was. I went into the forecabin just now and found he had dropped off whilst washing up the plates, and as he had let his fire out I've set him to work at it or we should get no coffee."

"All right, old man; just slack up the

topmast forestay whilst I ease the shrouds. Now then, ready, both together on the heel-rope; that's enough, and down she comes."

We had done it scores of times before, and it was soon finished, although it took longer to do in the dark than usual, or than it does to write about it now.

The burgee halliards had been let go, and the wind blew them away from the yacht's side.

I was stooping down making the ropes fast, when the yacht gave a sudden plunge, and a loud splash alongside made me look up. I missed Frank from the deck at once and rushed to the side in time to see him just coming to the surface, where the light from the riding-lamp caught the top of the waves and glinted on his wet clothes.

I immediately caught up a lifebuoy lying on top of the skylight, and bending on a piece of spar-line, shouted to him to look out for it. Then, taking some coils of the rope in one hand, I threw the buoy as near as I dared to without hitting him. He saw it, and with a few strokes had placed it under his chest and clung on.

The tide and wind had taken him some considerable distance by the time I commenced to haul him in, and I had overhauled about half the line when Pat came on deck to say the coffee was ready on the table.

"Shure and it's a queer night to be a-fishing, sirr?"

"Yes. Just lend a hand on this line," said I.

"Be the powers, it's the guv'nor!" said Pat, as we got Frank on deck. "How on earth did ye fall in the watter, sirr?"

"I'm jolly glad to see you safe on board again," said I. "Get down below now, and change your clothes."

"Thanks, Jack; but I don't feel any th' worse for my ducking; it's much warmer in the water than on deck, though, so I'll just get some dry things on. It was through standing on the edge of the bulwark rail trying to get hold of those burgee halliards, when she gave that lurch which overbalanced me, and my hand slipping at the same time, overboard I went."

"Well, when you've got your dry clothes on we'll finish that game," said I; "and in the meantime Pat and I will just get that punt on deck, or we may lose it during the night."

"Shure now," said Pat, as we were making the boat fast, "that was a lucky shake for the guv'nor, wasn't it, yer honour?"

"Lucky! Well, Frank was certainly lucky to get out, but he was as unlucky to get in. I don't see why you should call it lucky, Pat."

"Well, yer honour, if the guv'nor hadn't got in he'd never had the luck to get out," said Pat, quite satisfied with his logic.

I then went down to my berth for a dry coat, as the fine drizzle had damped me considerably, and heard Pat grumbling to himself about the weather and things in general as he disappeared down the fore-castle hatch, where I expect he dropped off into peaceful slumbers.

When Frank came into the cabin we drew our chairs up to the fire, and it seemed extra cosy below after our recent experience on deck.

"Hot coffee is very acceptable just now," said Frank. "Draw the chess-board a little closer, old man, and go ahead with your first move."

I did so, and we played steadily on for some time, when Frank said, "Did I ever tell you of an adventure that befell me soon after I purchased this craft?"

"No; you've never spoken to me about it. What sort of an adventure was it?"

"Oh, not much; but my involuntary bath this evening put me in mind of it."

"I should like to hear about it."

"Should you? Well, then, here goes.

Once upon a time—all tales begin in that way; it's the regular orthodox thing," said he—"it was about five years ago that the doctor told me I required a thorough change of air and scene, and being, as you know, always fond of the water, I thought I'd get a yacht; and so, after due examination, etc., I invested some money in this one, and a thorough good one she has turned out, as you are aware."

I assented, and he went on.

"Well, it was in January, a few weeks after I had purchased her, I was sitting alone one afternoon at home; all the others had gone to a party at a friend's in the country and would not return for at least a couple of days. Some business had prevented me starting with them, but it had been settled sooner than I had expected, and I was cogitating whether it was worth while to bowl down after them, when I suddenly thought of spending the time on the yacht.

"The idea was no sooner thought of than resolved upon, and, ringing the bell, I told Janet to make the tea at once, whilst I busied myself with packing a few necessities in a hand-bag.

"My preparations were soon complete, and I sat down to the meal in rather good spirits at the notion I had just formed and meant to carry out. Tea was soon finished, and I wrapped myself up in a thick top-coat, and, telling Janet I should not return until the following night, I started for Fenchurch Street Station.

"The Emetic then lay in that part of the Victoria Docks principally used by yachts.

"By eight o'clock the train had taken me away from the bustle of the terminus, and landed me safe at the dock entrance. I had still over a mile to walk before I could reach the yacht. The official at the gates wished me 'good night'—he had got to know me by sight from my previous visits to the boat. Returning his salute, I passed on along by the side of the crowds of huge vessels that had arrived from all parts of the world, and they looked quite spectral in the coating of snow that lay upon everything and hung from their spars in all directions.

"Twice I stumbled over a rope or chain cable that lay hidden in the snow, which was several inches thick upon the ground. A queer, almost eerie sort of feeling came over me as I walked along, quite alone, and I thought of the different scene the place presented in the daytime, with crowds of men busy at work in various ways, and the contrast made it appear almost as if I were in a region of the dead. Not a person had I seen since leaving the gates. The policeman on his beat (as Pat would say) was off it, and the intense stillness was only broken by my own footsteps crunching through the snow, and I don't mind owning to you I began to wish I hadn't come, and on turning the corner of a storehouse stopped to consider whether I would go on or not, when suddenly my attention was arrested by the dim outline of two

men I could faintly see through the still falling snow."

"Plaze, sirr," said Pat, putting his head in at the cabin door, "will you have the supper laid, or can I turn in?"

"You can lay the cloth at that end of the table," said Frank, "and make one of those tins of mutton hot, and whilst it's warming just give a look at the weather."

"Shure and I've just done so, yer honour; and it's blowing harder nor ever and getting more easterly."

"It's likely we shan't have a very quiet night of it," said Frank; "so when you've laid those things, Pat, get the trysail bent ready before you turn in."

"Ay, sirr," said Pat, and we soon heard his heavy tread on deck getting the sail in readiness.

"Well, cut along with the yarn, Frank; you can finish it while we have supper."

"Where did I leave off?" said Frank—"oh, I was speaking about the men, wasn't I?"

"Yes; that's it."

"Well, they were crouching down together in the shadow of a shed a short distance off, and from their attitude evidently did not want to be observed.

"I judged at once they were there for no good—very possibly they intended breaking into one of the adjacent stores.

"I resolved to watch them, and prevent it if possible. So, walking along as if I hadn't seen them, I turned the angle of the next building, and, creeping along at the back of it, passed down a narrow alley between two sheds, which I guessed would bring me close to the men, and where I could watch and not be seen. On reaching the end I stooped down and carefully looked round the corner. The men had risen and walked some distance from their hiding-place, and were evidently arguing as to which way to go. One pointed in the direction I had been walking, and after a short time they started off towards the yachts.

"I at once turned up the alley again, and, walking behind the storehouses, thought I should be able to keep level with them, but on coming to the end of the sheds, where I should be obliged to go into the open, they were not to be seen. I looked in every direction, but they had evidently given me the slip—that is, if they had seen me—so, after waiting some time on the chance of their turning up in an unexpected direction, I gave up the chase and walked on towards the yacht.

"I had to cross two boats before reaching the deck of mine, as she lay outside of them.

"I felt wretchedly cold, and it seemed more lonely than ever in that part of the docks.

"In pulling the key of the hatch from my pocket it dropped on deck, and, stooping to pick it up, I noticed the snow was disturbed round the hatchway, and found on trying to put the key in that the lock had been wrenched off and the hatch only drawn over again. I felt sure the yacht had been broken into, and hesitated about the best course to take.

"My first impulse was to fetch the police; but then, again, I should have a long way to go before I could get one of them.

"Further examination showed that the footprints led off to the other yachts, and then on to the shore, and from the stillness, and the fact of the hatch being

drawn over the companion, I came to the conclusion that the thief, whoever he might be, was not below then, but had left before I got there.

"So, pushing the slide back, I descended the stairs, and felt about in the dark for some matches I remembered having left on the glass rack the last time I was aboard.

"I at last found them, and had just struck a light, when I heard two persons whispering, and a violent blow on the head from behind laid me suddenly on the cabin floor.

"I must have lain there some considerable time, for as my senses gradually returned it seemed to me that I was wet, and, putting my hand down, I found I was lying in about an inch of water, which was over the cabin floor, and as I lay there it seemed to be increasing.

"She was sinking!

"The thought banished all drowsiness in an instant, and, sitting up, I felt myself over to see if I was hurt. A large bump on the back of my head, that ached badly, was the only damage received.

"The water was rising; there was no time to lose; and the excitement made me forget my headache for the time; so, groping for the matches, which I found had fortunately fallen on the table, I lit a candle, and looking in the store cupboard for the pump, I took the iron pump-rod for defence in one hand, and with the light in the other I searched all over her, but found the men had left. I then carefully surveyed the deck and the surrounding boats, but they were not in sight, so rigging the pump, I began working at it steadily.

"After a long time I took a rest, and on going down was very pleased to find the water had sunk below the flooring; that gave me renewed vigour, and after another long spell at the pump I had the pleasure of hearing it suck.

"I immediately descended into the fore-castle, where on my previous descent I had noticed the flooring pulled up, and there I found the water rushing in at a circular hole evidently drilled with a centreat.

"Well, to make a long story short, I cut a mop-handle to fit, and drove it in, effectually stopping the water from entering; and then, feeling thoroughly done up through the blow on the head and the extreme exertions I had undergone at the pump, I lay down on one of the sofas to rest, and almost immediately fell asleep. The winterly sun shining through the skylight awoke me the next morning, and on sitting up I felt much refreshed, and I'm glad to say I've never felt any bad effects of the blow or of sleeping in my damp clothes; and now, old man, that's the end of my adventure."

"But," said I, "didn't you catch the men? Was there no clue to them?"

"Oh, I put it in the hands of the police on the following morning, but the snow had fallen heavily during the night, hiding their footsteps; and, as they had stolen nothing, there was no clue to get hold of.

"My suspicions rested then, and do now, on two men whom I had found out to be dishonest at my father's works, and I had been instrumental in getting them discharged some few days previously; and no doubt they conspired to revenge themselves on me by sinking my yacht, and had I not been there that

night they would have effected their purpose. I have no doubt they were the men I had seen hiding in the dock, and had broken into the yacht while I was waiting for them behind the shed, and they might have added murder to their other sins had my head not been so thick."

"Well, it's fortunate you got out of it as well as you did; but, you know, I always said you were thick-headed."

"Yes," said Frank, laughing. "What's the time, old man?"

"Wants two minutes to eleven," said I. "How quickly the time has gone by!"

"Yes, it's passed too quickly," said Frank, giving a look up on deck. "The wind's dead on shore. Pat ought to have been on the watch and told us before; now we shall have a nice bit of work to get away, I expect. Rouse Pat up at once."

I did so after considerable difficulty, and joined Frank on deck after putting on my oilskins.

He was busy hooking the sheets on to the trysail, which Pat had neglected to do.

The rain was still falling, and, driven by the strong easterly wind, seemed to strike the face like pins. The night was pitch dark; not a star showed; and the only thing to be seen was the curling heads of the seas as they occasionally broke close to us, smothering us with spray.

Pat was now doing his best to make up for his negligence as he became aware of the danger, and I went forward to help him at the winch. We got the storm-jib on her, but it was an uncertainty for some time whether we could get our anchor or have to slip it. At last we managed it, and Frank putting the helm up, her jib filled, and in another minute we were pounding into the head seas out into the black night and making the water froth around us.

Pat was told to look out forward, and I believe he did for once in his life, as even he could not have slept (on deck) that night, and it was well he did, for we had not been away on the port tack much over half an hour when he shouted to Frank to put up the helm.

"Hard over, sirr."

I had just gone below to retrim one of the side lights that was burning rather dimly. Hearing the shout, and without stopping to finish the lamp, I rushed up on deck in time to see a large square-rigged vessel bearing straight down for us out of the thick blackness of the night.

Frank had put the tiller hard over, and we all three shouted at the top of our voices. We could see no lights, and there seemed to be no men aboard her.

Seeing the danger, I began cutting the lashings which held the dingy to the deck with my pocket-knife, but it was too late to be of any use. On she came, towering high above us, when suddenly on the top of a sea she swerved, and in another instant we were alongside of her instead of under her bows, and as she rolled in the swell her mainyard came down on our truck, breaking it close off, but our topmast, being housed, was fortunately saved. The next sea parted us, and we noticed she was a brig, but could not see her name. I thought it very strange that she should have no canvas up and that no one had hailed us.

We all felt thankful to God for having escaped so well, and it was indeed a narrow escape.

"That was a close touch for us," said Frank, laying hold of the tiller again. "That's the second surprise we've had to-night, and I for one don't want any more."

"Don't you think we've been long enough on this tack? Let's go about," said I, putting up the side light.

"Yes," said Frank. "You take the tiller whilst I give a look at the chart below. I think we've made enough offing by now."

I did so; and Frank, after a little time, called out for me to heave-to and go down to him.

Pat helped me in with an extra bit of the trysail-sheets, and then checking the weather jib-sheet, I went down. Frank was bending over the chart which lay on the table.

"What's best to do?" said he. "Heave-to for the night? make for Harwich? or run for the Thames?"

"Do as you like, old man; but I can't help thinking of that brig. There's something wrong aboard her, I'm sure. Didn't you notice that no one answered our shouts? I vote we go in chase."

"If you think that, we'll go. I'm game for a chase; and then, if we find nothing wrong with her, we can run on for the Thames, it'll be all in the course."

"Just so. That's settled, then."

We went on deck at once, and letting go the jib and easing off the trysail-sheets, we were off before the wind, with the waves following up to the taffrail and looking as if they would come aboard, and then, quietly slipping under her counter, they would break in a smother of foam on each side of us.

We steered as near the direction the brig had been going as we could guess, and presently could see her looming ahead. We lowered the trysail, keeping on under the jib, as we wanted time to consider what to do.

"I don't like having to run alongside of her," said Frank, "but what else can we do? We're too short-handed to go aboard in the dingy in this sea and leave the yacht to one."

"Yes," said I. "Let's get the fenders over the side, and stand by to cast a line forward, Pat."

He got ready, and I made a bowline in a piece of line. As we came alongside we hailed her, and, not getting any answer to our repeated shoutings, Pat and I cast our ropes aboard.

We were fortunate, for in the first cast Pat's caught on the fluke of an anchor and mine landed over a bollard-head.

"I'll go aboard," said I, "and see what's the matter."

So I climbed up the side by the rope, and on reaching the deck shouted to any one who might be there, but there was no reply.

I went aft, and, striking a light, looked into the cabin, expecting to see the captain lying ill or dead; but no, the cabin was empty. I then went forward and searched the men's quarters, and found that was in the same condition. There was not a soul aboard except myself.

"What's to be done?" thought I. "Here's a valuable craft drifting about at the mercy of the winds, and she will, in all probability, get ashore on one of the numerous sandbars that lie all about here and become a total wreck. She'd be worth keeping if we could take her in tow. So thinking, I went on deck again and shouted down to Frank,

"There's no one aboard. What's to be done, old man?"

"Yes; by all means. We won't leave her," sung out Frank, not clearly understanding my question.

"Can you send Pat aboard with the trawl-warp?" shouted I again.

"Ay, ay."

"We shall want the mainsail," said he, "to tow that lump of a craft; the trysail wouldn't be any use."

"No, you're right; but with one reef in the mainsail she ought to tow pretty easily. We've given her plenty of line. By-the-bye, have you made your end of the trawl-warp fast?"

like you being alone there. Supposing she was to break adrift?"

"You'll have to sail back and pick me up again; but we've made her well fast, so I don't anticipate it," said I, shinning up the side. "Good night, old man."

I let go the forward spring and stood by the after one, ready, whilst Pat pushed the yacht's head off, and then both of them worked at hoisting the mainsail, and the wind getting into it, I let go, and she was away into the darkness ahead. I then went forward to the brig's bowsprit and watched whether the yacht would have any effect over a so much larger vessel.

After a short time I saw the hawser tighten out, and found on going aft to the wheel she had steerage way.

Hurrah! the prize was ours, unless any accident occurred.

I stuck to the wheel the rest of that night, occasionally eating some biscuits I had in one of my pockets, and I was extremely glad of them, as it seemed extra cold standing at the wheel, after the previous exertions I had been making.

The yacht's binnacle light showed sufficiently for me to steer by, but it seemed a long night all by myself, without a fellow-creature to speak to.

The dawn broke at last, showing up cold and clear, and showing also that we were just off the mouth of the Thames.

As soon as it was light enough to see the yacht clearly I waved my cap and gave a cheer. Pat was steering and went through some pantomimic gestures, and Frank, coming up the companion, saw me and sent back three cheers in return.

We kept on, and with a fair wind passed the Nore light, the men on board having a good look at us, no doubt interested in the unusual sight of a yacht towing a brig.

The weather had cleared considerably since the night, and by the time we were up to Canvey Island it was quite bright, and correspondingly exhilarating to my spirits.

I could see Frank and Pat getting the dingy into the water, and soon Frank got in and dropped down to the brig. I had found the rope accommodation ladder and threw it over the side, and after making the boat fast he came on board.

"Top of the morning to you, old man. How have you enjoyed your night's sail?"

"It's been pretty cold, but we ought to congratulate ourselves on getting her here safely."

"Yes," said Frank. "Where shall we bring up?"

"I think close in shore at Mucking. We shall soon be there, and I want breakfast soon. I assure you I feel quite empty."

"All right, old man, you shall soon have it," said Frank, getting into the boat again.

We were soon close to our destination, and they rounded-to, dropped their anchor, and then taking the end of the warp into the dingy, got it fast to the buoy just in time before the brig swung round to the tide, very fortunately, for if we had not got it fast in time she would have overpowered us and drifted on.

We then went on board, and getting the tow-line round the windlass we shortened it up until we were near enough to the buoy to get a chain cable passed in its place. That done we went

With the Derelict in Tow.

Frank had understood me this time and soon Pat came over the side with a thin line, by which we pulled up the end of the warp.

Pat and I then took it forward outside of everything, and knotted it on to a hawser we found lying by the bitts. We then made the other end of the hawser secure to them, and dropped the bight of the rope overboard all ready for towing. It was hard work and it made us wringing wet with perspiration. We then slid down to the yacht again and found Frank busy taking the trysail off the hanks.

"Yes, that's secure; but I think one of us ought to go aboard of her, she will tow as easily again if there's some one to steer her."

"I'll do that as soon as we are ready here," said I.

We were soon ready, for Frank offered Pat a ten-pound note if we got the brig safe into the Thames, and he accordingly did his level best and jumped about quicker than I had ever seen him do before.

"I think we're ready for the experiment now," said Frank "but I don't half

back to the yacht and rested and had breakfast. Whilst sitting over the meal we arranged to leave Pat in charge of the brig during the time we took the yacht to Gravesend, and went up to London to

three days. After a great deal of knocking about they brought up with a kedge anchor in the Yarmouth Roads, and the master, a Norwegian, determined to land, before going farther, for another hand or

getting there, the brig was well away and beyond their reach when he told them, so the master could only telegraph up to the owners, informing them of the loss, which we were very happy to be able to contradict on the following morning. The salvage, one third of the value of the vessel and cargo, amounting to over six hundred pounds, belonged to Frank, but he very generously insisted on my taking half, as he said I had had half the trouble, so I gave Pat fifty out of it, and Frank did the same from his share, making him

Pat's Cabin.

see the owners of the brig, whom we had discovered from papers in her cabin to have offices in Queen Street.

We did so, and they were very glad to hear of the safety of their vessel, and eventually the salvage which Frank claimed was paid over to him.

It was then that we heard about the first part of the brig's voyage. The Mary Ann had left Stockholm very short-handed, two of the crew being very ill at the start, and had died after being out

two, and leaving a boy in charge he went ashore with his small remaining crew of two.

Soon after five in the afternoon a shackle in the cable parted and she drifted along. The boy got alarmed, and, dropping into a boat that was hanging astern, he rowed off to the shore, leaving the brig to its fate. Being winter, it was quite dark, and no one knew what had occurred to the brig until the boy reached the town, and as it took him a long time

promise he would not spend it all at once.

He gave his ready promise, but I very much doubt if he kept it, as Frank told me that for the rest of the winter he dressed in most extensive long-shore clothes and seemed to have discovered no end of relations, and now he seems as hard up as ever.

But as Pat says, "Shure it was a slice of luck," and I shall always remember that night's sail

A BOY'S HOLIDAY IN SWEDEN: A TRIP UP THE GOTA CANAL TO STOCKHOLM.

BY HENRY FRITH,

Author of "On the Wings of the Wind," "On the War-path at Sandilands," etc., etc.

CHAPTER I.—IN WHICH WE START FOR GÖTEBORG, AND FIND OURSELVES AT TROLLHÄTTA.

"Is this the steamer of Yäteburg, please?" said Alfred.

"The steamer for *which*?" replied the English mariner addressed.

"He means Gothenburg," said Ernest. "I told you, Alfred, that your attempts at Swedish names would bring you to grief. Is this the Swedish boat?"

"No, sir; she's English. The Romeo is her name, and she trades to Sweden," said the mariner, who, having thus corrected Ernest, walked away.

The two boys looked at each other and laughed.

"One apiece for us," said Alfred. "Here is Mr. Basil; now we shall get along. Dick is with him. All serene!"

This little dialogue took place in the very early morning of a summer day a few years ago. Three boys, with an old friend in the capacity of "bear leader," had made up their minds to go somewhere where "no fellows had ever been before!" When the map of the world was consulted it was found that, with the little exception of some hundreds of square miles in the interior of Africa, there was no place so unvisited within reach of a fortnight's trip. Even the centre of Africa was considered too far—and (perhaps) too hot.

So said Mr. Basil, drily, when the remark was repeated to him.

"Of course, I don't mean uninhabited places," replied Alfred; "I mean places where none of *our* fellows have ever been, not travellers."

"Then," remarked Ernest, "you will have small difficulty in deciding. Very few of us have been anywhere except to Ireland and Switzerland, and bits of France or Germany."

"Try the Rhine," said Richard.

"Don't!" said Mr. Basil. "If you are

going to have a holiday under my care, let us see something out of the common track. What do you say to Sweden? Shall we go to Stockholm, and come back through Copenhagen and Hanover? Or back to Hull?"

"Won't it be awfully expensive?" said Dick.

"No; cost about fifteen shillings a day each, all included; or even less. If your parents will give you, say, twelve or thirteen pounds apiece, boys, we can have a fortnight at least if we are economical."

So Richard Selwyn and Alfred and Ernest Middleton, cousins, all school-fellows, petitioned the home authorities, and cheques for fifteen pounds for each lad were respectively forwarded. That sum was deemed sufficient, and, as Dick remarked, with some acumen, if "we telegraph for more when we find we can't come back without it, the governors will stump up!"

"We do not intend to bring forward any supplementary estimates," said Mr. Basil. "We will start on Saturday morning from Hull, and steam direct to Göteborg—which is pronounced very softly, like 'Yäteborg,'" he added.

It was in endeavouring to acquire this indescribable pronunciation that Alfred got "thrown" by the British mariner, as we have already told you.

The start was made under good auspices. The North Sea was fairly smooth. The Romeo, a fine vessel, behaved remarkably well; and though she rolled, as is the manner of screw steamers generally, the majority of the passengers were able to eat and drink at the prescribed times, and some even indulged in luxuries between meals.

"I never could see where the Humber

rises," said Dick Selwyn. "I remember I lost a place about this rubbishy river, though I don't believe it rises at all."

"Oh, don't it!" interrupted a man who was standing by. "You should see the 'ager'—the tidal wave, I mean—you'd say it rose then!"

"I was thinking of the source," said Dick; "but it's a compound of other rivers, I believe."

No one cared to discuss the question. Every one seemed bent upon other topics. So Dick's pedantry met with no response other than Alfred's remark, "I say, Dick, I'm all for holiday-making, so let geography and any other 'ography' alone, please."

In due time the mail steamer approached the Swedish coast, and the sea got rougher.

On Monday morning the Romeo passed quietly up the Götaelf, and took up her moorings off the Skeppsbron at Göteborg.

"So this is Gothenburg," said Alfred, wisely returning to British pronunciation. "It looks rather nice."

"I believe it is a clean and interesting place," said Mr. Basil. "We will inquire concerning the hotel."

But any trouble on that point was saved, for an energetic commissioner who talked English offered to conduct the party to the Hotel Haglund, where accordingly they proceeded in a "fly."

That afternoon was passed quietly. The young tourists walked about a little, but there was not much time—people are early in Gothenburg—so it was not until the Tuesday that the party investigated the town.

"Who is this old swell?" inquired Ernest, as they halted in front of a fine statue in the Gustaf-Adolf's-Torg.

"Surely you can guess that, even if the name of the square did not inform you," said Mr. Basil.

"Oh, Gustavus Adolphus, of course," replied Ernest. "I beg his pardon. He is a fine fellow, I must say! There is the Exchange and there is the Town Hall. I see there is a museum open. Let us go and see it."

There they went, and gazed at the whale, wondering how long the skeleton was, and whether he felt his tail inconvenient. So time passed in admiring the figures of the "Duellists," and gazing at the canals which penetrate into the town. It seemed strange to the lads to walk alongside the ships in the centre of the streets. But they forgot that the same effect can be experienced in old Bristol.

Suddenly Alfred, who was the pioneer of the party, came running up.

"I say, Mr. Basil, are we going up the Gotha Canal?"

"Certainly we are," replied the tutor.

"Why do you ask?"

"Because the steamer leaves to-night."

"To-night! Are you sure?"

"Certain. The bill in the window there says 'Tuesday, Thursday, and Saturday.'"

"Well, we can wait till Thursday, eh?"

"Oh no," said Alfred. "Let us get on. We have only ten days, and I would rather stay in Stockholm than here. Wouldn't you, Dick?"

"I don't know," replied Dick. "I'll wait till I see Stockholm, anyway. But this place seems quiet, and as we know no one—"

"Let us get ahead," said Ernest. "I'm all for the canal. I believe it will be great fun!"

So a reference was made to the hotel people, who thought it impossible that berths could be obtained for that night's boat. There were such a number of people travelling, and so on. But Mr. Basil said he would try.

Being directed to the steamboat office, he found the hotel people were right. All the beds were already engaged, and the boys' faces fell, for, boy-like, they preferred to see new things to wandering about in a strange town in the broiling sun or heavy rain, even though the town were busy, prosperous, pleasing Gothenburg.

"What a bore," said Dick, as they passed out. "These people will be disappointed too," he added, as a lady and gentleman, very English-looking, with their two children, a boy and a girl about the ages of fourteen and sixteen, came into the office.

The English party went out and paused irresolutely, wondering what there was to be seen that evening. The country did not appear very attractive, and they were walking away, when a man from the office came running after them.

He spoke German, and Mr. Basil soon ascertained that the gentleman and his family were unable to proceed that night, and had come to change the tickets if possible. We need hardly say that Mr. Basil was delighted to accept them, and arranged the matter with the gentleman in the office at once.

This lucky hit made them all friends, and the boys looked at the Swedish party and wished they could talk Swedish. Dick said so aloud, and lamented his vile French.

The young lady smiled at Dick's bright open face and seemed to understand.

"I wish you could talk English, mademoiselle," said Dick. "Then I could perhaps amuse you. Stunning pretty girl, Ernest."

The young lady laughed merrily and replied without any boldness yet without shyness.

"I can understand English quite well. You are English, of course?"

"Rather," said Dick. "But how well you speak English. It's wonderful, Ernest, isn't it?"

"Not very," replied the Swedish boy for his sister. "We are English, or rather Scotch."

"English! Living here?"

"Yes," replied the lad. "Father is a merchant, and we live near the town. We were going up to Stockholm, only father has business to detain him."

"We are going to Stockholm too," said Alfred.

"Perhaps we shall see each other again," said the boy. "Come, Mary."

Meanwhile Mr. Basil had been chatting with the lady and gentleman, whose

name was Trevor. (This is not the real name, so any one bearing the same name must not think the writer means to be personal. The kindness of his Gothenburg acquaintance would prevent any such rudeness.)

Mr. and Mrs. Trevor were extremely pleasant, and gave Mr. Basil some hints concerning the transit to Stockholm. Moreover, with true Swedish hospitality, they invited the boys to come to their house to dinner, an invitation, after some demur, accepted. Then Mrs. Trevor took possession of the young people, and Mr. Trevor returned to the hotel with Mr. Basil to see about the bill and the baggage, which was already packed.

This gentleman's good-nature did not stop there. He examined the account and saw it was correct. He had the luggage carried to his house, and gave the young party a capital dinner; and to crown all he drove them to the pier whence the steamer started, and saw them off.

"We shall meet again," he said, "Mr. Basil. Your name is familiar to me. My brother was at Cambridge with a Lucius Basil, and they are still great friends, as of old."

"My cousin's name is Lucius," said Frank Basil, "and I have met his friend Alexander Trevor. Is he your brother? How singular!"

"Yes, indeed. My wife will be pleased to hear this, *Au revoir*. Good-bye, boys."

"Remember me to Miss Mary and Robert," shouted Dick.

"Dick's 'spooney' on Miss Mary," said Ernest. "Poor Dick! you've no chance with Alfred."

"Haven't I?" said Dick. "You'll see."

"Nonsense!" cried Mr. Basil. "If you quarrel concerning this very pretty and ladylike girl I will cut you all out and marry her myself."

"Oh, I say!" muttered Dick. "Let us look for our beds, I vote. It is nearly midnight."

"Nonsense!" cried Ernest. "Why, it's quite light still. It can't be more than ten o'clock."

"The steamer is moving, any way," replied Dick; "and it is timed to leave at 11.30, so it must be near midnight."

"It is five minutes to twelve," said Mr. Basil. "And now, if you boys will take my advice, you will get into your berths, and sleep till we reach the falls in the morning. The Trollhätta Falls are grand, and we shall have more than an hour to view them."

The lads took this advice and made their way down the companion-ladder. At the foot of the stairs, and along the sides of the vessel, were some long pantries, called rooms, which contain two couches, each about five and a half feet long.

These are the cabins. There is a small washing apparatus, and above it a port-hole for air and light shrouded by a curtain. A few pegs and a rack netting as in railway carriages form the available clothing conveniences. A lamp swings from the low ceiling. There are no chairs, and the only table is the flap of the wash-hand stand, which covers the basin. It is impossible for two persons to move about at the same time. One of the occupants must always be absent or in bed before the other gets up or undresses. So we need hardly remark that

only good friends should be placed in these cabins, for disagreeable people would under such circumstances be intensely disagreeable, and there is no escape unless you forfeit your passage or lie on the deck or floor.

"This is a limited company's boat, I expect," said Ernest, as he looked into a cabin; "what a small place!"

A loud growl and some curious language informed him he had made a mistake and awakened some irascible foreigner.

"Which are our berths, I wonder?" he said, retreating.

"Here they are," said Mr. Basil, opening first one door and then another on opposite sides of the lower deck. "Now, boys, be quiet and go to sleep till six o'clock at earliest. Good night."

"Good night," responded the cousins, who retired at once to the starboard side, while Mr. Basil and his young friend Dick Selwyn consoled themselves with the port cabin, and the other voyagers being by this time asleep, the English tourists followed their example. But not for long. At five o'clock Dick Selwyn rose, and of course disturbed Mr. Basil, who blessed him. Dick then, with much consideration, dressed, and stirred up Alfred and Ernest Middleton, who threw things at him from their couches. Two pairs of slippers, some soap, two sponges, some odd volumes of books, and finally a boot and two pillows, were each and all discharged at the youth who stood in the doorway. But with no useful effect. Richard remained, the Middletons were thoroughly awakened, and arose to pick up in succession the pillows, the boot, the books, the sponges, the soap, and the slippers. These articles being recovered, the lads dressed and found themselves within hearing of the grand falls of Trollhätta.

CHAPTER II.—THE GOTA CANAL—THE FALLS—THE LAKES—ARRIVAL AT STOCKHOLM.

WHILE the boys are gazing at the enormous stairs in the form of locks which seem to block up all navigation, but, in truth, assist it, we will in a few lines indicate the course of the celebrated waterway between Gothenburg and the Swedish capital. And do not let our young readers think we are inventing this trip for their amusement. We have done it with boys, and this narrative is one result of our expedition, which is truthfully described.

If you will look at your map of Sweden you will perceive that between Gothenburg, on the south-western coast, and Stockholm, near the eastern seaboard, there are numerous lakes, Wener, Wetter, Roxen, with streams and lakelets. The immense track of country which in Sweden is occupied by lakes can be appreciated by the traveller who journeys by the railway from Malmö on the Baltic to Stockholm. Vast and beautifully wooded lakes succeed each other rapidly, and in the dim light of the Swedish summer night these lakes look weird and romantic indeed.

But to return to our Gota Canal. Early in the sixteenth century it occurred to Swedish engineers to unite the great lakes with the Baltic and the Cattegat, or rather to connect the two latter by

means of the lakes. There were many minor and mining difficulties to be encountered, but the chief obstacle was the

Mr. Basil and his young friends followed a wooded path, dark pines overshadowing the rocky way. They were in

great series of cataracts which the Gota river forms on its way from Lake Wenern to the sea.

The length of the waterway is just 260 miles (English). There are seventy-four locks *en route*. There are, however, only fifty miles of actual canal in the whole distance: the remainder of the navigation is through the lakes, the river, and the sea—the Baltic. We may add that the cuttings have an average depth of ten feet, with ninety feet width. The pace in the canals is slow. The fare is about twenty-five shillings, not including food, which is well served, plentiful, and cheap. The “krone” is the equivalent for our shilling—it is worth 1s. 1d. It is divided into one hundred parts (“öre”), and the British pound sterling is worth eighteen krona. A Swedish mile is nearly equal to seven of our miles. The generic name for female attendants seems to be Lovisa (Louisa), just as Mary or John has been adopted by us for our female or male domestics.

The first real attempt to make the canal was in the beginning of the eighteenth century. But more than a hundred years ago the idea was abandoned till 1800, when eight new locks were made. Telford, our engineer, assisted Baron von Platen; and about 1832 the route was completed, at a cost of five million krona. We will mention the various places of interest on the way, and our readers may find the course upon a good map.

The boys reached the deck as the steamer was advancing towards what appeared a series of enormous steps. The vessel takes two hours to ascend these locks, and “such a getting up stairs we never did see.” The passengers did not, however, wait for the performance, but proceeded to view the falls.

turn followed by itinerant vendors of photographs, some of which were purchased. The roaring of the river increased; louder and louder it rose, until the party came out in view of the rapids and gazed upon the falls.

Some idea of the scene might perhaps be gathered from an engraved illustration, but it could give no complete notion of the grandeur, the massiveness, the rapidity, and majesty with which the river proceeds and with which it is surrounded. Over the rounded, water-worn rocks the current slides with a gruesome, glassy rush which makes one shiver. The cruel coldness of the sweeping power of the river can only be properly estimated when the traveller crosses a frail and dangerous bridge, and stands on the isolated rock above the stupendous cataract. Then the grandeur and might of our servant Water may be estimated. But he is his own master here, and let us know it.

“The falls are not as high as Niagara,” remarked Mr. Basil, smiling. “I am rather disappointed in the altitude, but the grandeur is incontestable. They are a fine sight!”

“Look at those rocks, and how the great waves roll and tumble over them!” said Dick. “One would have no chance of life a hundred yards up stream!”

“Isn’t the water green!” remarked Alfred. “Let us ascend the tower yonder.”

They climbed up, and were rewarded by a beautiful view of the wooded stream, which gradually slackened in its wild race as it turned the corner, panting after its fierce struggle with the rocks and boulders, and apparently endeavouring to arrange itself pending its arrival at quiet, respectable Gothenburg. Its wild leap was over—the maddening rush

of its middle age was past. Henceforth the river will flow peacefully to its ending in the German Ocean.

“Well, it certainly is impressive,” said Ernest. “But there is something more to see. The King’s Grotto is here somewhere.”

This grotto bears in its cavernous recess the names of royal personages who have visited the Falls. Our party did not add their names, as time would not permit. They then heard the legend of the tailor who sat on the rock making his wedding garments, for the cruel maiden had condemned him to that solitary shop-board in mid-stream; on no other condition would she marry him. The task was finished, the clothes were made, the maid was won. But, alas! the overjoyed tailor leaped to his feet too suddenly in his joy. He slipped, and in a moment was engulfed in the Falls of Trollhätta; only his new garments remained to attest to the close of his sartorial existence.

A loud whistle announced that the captain of the steamer was waiting for the passengers, who hurried through the barriers and emerged upon the quay or wharf at which the vessel was lying preparatory to her transit up the Stallbacka Canal, at the extremity of which, and at the southern limit of Lake Wenern, is Wenersborg.

Thence ensued a pleasant run in fine weather across the great lake. In stormy days the transit is dangerous, for the waves are high. The boys enjoyed the passage and ate their dinner, including the national introduction to it, called “smorgasbrod”—a relish consisting of sardines or other such smoked or oiled delicacies, washed down, by those who can stand it, with fiery liquor. Reindeer tongue, ham in slices, anchovies, radishes, and biscuits, form a good free lunch. Then immediately is served the dinner—soup, fish, and fowl and veal, with good öl, or beer, all of which is entered in an account by the young lady who waits on your party. At Stockholm she will bring her book and expect a krone for her attendance, which has been good and unintrusive.

The “regulations” are hung framed in various places on board. Cleanliness and proper behaviour are enforced. If any one is obnoxious, tipsy, or misconducts himself, he is put ashore then and there to find his way to his destination. There is no appeal, off he goes! Lights are supposed to be out at eleven, but there is daylight long after that. It seems odd to stand on deck at midnight and see the lake and the mist above it and the distant shore, and watch for the ruddy glow which announces the sunrise before you retire to your cabin. Time is annihilated! Darkness is not in it!

Across Lake Wenern the steamer made an easterly course, and then entered a shaded and narrow canal cutting, whereon trees nearly met overhead, and where navigation, in view of passing ships, is difficult. Then when the whistling has ceased the silence is great; the swishing of the water and the weeping weeds, which bow to us as we pass, are for a while the only sounds audible. Then comes a grim and rocky passage out of the lock. The vessel turns her nose in and out, never scraping, never touching, but often “shaving” the great porpoise-backed boulders which glint and glisten in the morning light.

Pleasure and Toil.—See page 51.

We have not space at our disposal to tell all the places nor the objects of interest the steamer passes. Töreboda was reached about midnight, and after that the scenery is not very interesting. The steamer transits are wisely arranged both ways, so that the most interesting scenery can be viewed, and the least pleasant passed in darkness. As the ships are independent of tide, this can be managed.

From Vossbacken the scenery is pretty, and in places reminds us of the Thames. Then locks and more locks, which are not the least interesting features of this wonderful canal. Passing the Castle of Carlsborg the vessel enters Lake Wettern, which is beautiful when quiet with its peculiarly clear water. The course is then across to Vadstena, and thence to the half-way station, Motala. Five locks descent now—the others have been all up hill—bring us to Lake Boren, and here and onward the views are very picturesque. The boys in the trip we are writing of made friends with the mate, the captain, and the engineer, sat on the bridge and blew the whistle, read, raced, or otherwise conducted themselves boy-fashion in and out of the steamer. The locks afforded many opportunities for landing and rambles ashore, one of which, at Berg, in Lake Roxen, may be extended, and the interesting Vreta Kloster Kyrka visited. At noon or thereabouts the steamers up and down pass here, and hence to Stockholm the canal presents no particularly novel features.

About twenty miles from Stockholm a pretty place called Södertilje salutes us with a battery of cakes. Boys and girls seem to devote their existence to selling cakes to passengers. Our own experience of these delicacies is not very pleasant.

It is now again six o'clock in the morning, and all are prepared for the approach to the Swedish capital, from which we expect great pleasure. Nor are we disappointed. Lake Mälaren looks its best. The numerous islands, the vessels, the steamers, the distant spires, the great promontory with the "King's Hatt," whence Olaf leaped, all unite in compelling our admiration for the inland sea which bears us to stately Stockholm.

Yes; Stockholm indeed! We are now at nine o'clock actually making fast to the wharf on Riddarholmen, and facing us is the celebrated church in which lie the ashes of the great Gustavus Adolphus.

"We will go there," said Mr. Basil; and so they did.

But first they had to land and persuade a flyman to carry them to the Grand Hotel. The fair Lovisa was paid her account, which amounted to an average of seven shillings a day for each traveller, with a little gratuity besides for herself. These duties performed, the party stepped into the carriage and found apartments at the excellent Grand Hotel opposite the Royal Palace and overlooking the lake.

CHAPTER III.—A LOOK AT STOCKHOLM— RETURN HOME.

"Be it never so humble, there is no place like Stockholm!" sang Richard Selwyn, as he gazed with great delight from the windows of his bedroom in the Grand Hotel that evening. The young party

had been out all the afternoon sight-seeing and had returned rather tired.

Let us try to describe what he saw.

In the first place there was the King's Palace across the water, a fine and extensive building. To his right was a bridge, close to which, beside the sparkling water, was a garden restaurant, with a band playing, lights twinkling, and waiters hurrying to and fro with ices and other refreshments. On the water were numerous little tidy steam launches, looking in the twilight of the summer evening like fire-flies, with white and green and red lamps hung out. These boats darted about bound for all parts of the numerous islands on which Stockholm is built. The flowing water reflected the lights of the gardens and of the boats. The soft air carried the music of the band gently to the ear, the pleasant twilight gave a fairy-like look to the scene, and Dick could scarce believe his ears when he heard the clocks strike midnight. It seemed almost unreal; he felt as if he were in a dream.

But it was all real and true and very beautiful.

"Come in, Dick," said Alfred, "we shall get no sleep."

"Stop," exclaimed Dick, as he half turned to answer, "who wants to sleep on such a night as this? It is fairy-land here!"

"Yet even fairies sleep," said Ernest, for the three boys, for the convenience of "bolstering" and pillow combats preferred to occupy adjoining rooms. "Even fairies sleep, and I am going to bed. I have a room to myself. Good night!"

"It's a shame to shut out the scene," remarked Dick, sorrowfully. "We may never see it so fine again. I believe it rains here!"

"Really?" said Alfred, sleepily, from his bed: "I fancied all rain not British went to Spain!"

Dick made no reply in words. He merely cast a hair-brush at his friend, who in return placed the brush carefully in the water-jug, and lay down again without speaking a word. The lads seemed both perfectly contented, and Richard went to bed. But Alfred snored! Then Dick took the hair-brush from the jug and sprinkled his "chum" with cold water, which amused Alfred vastly when he woke and found himself extremely damp about the head and shoulders.

He immediately guessed what had happened, and the room being dark now, he rose with much caution and crawled across the floor with a damp sponge to Dick's bed. But lo! Dick had crawled out and was in Alfred's bed; whereupon Alfred gave him a *douche* which not only wetted Dick's dress but saturated Alfred's sheets, a fact which the "cold-piger" did not discover till, flushed with victory, he lay down in his own bed, having cried "Pax," to which Dick, who knew what had happened, had consented, chuckling.

So the first portion of the first night that Dick and Alfred spent in Stockholm was passed in a very intellectual and pleasing manner. It is certainly true that English people carry their national traits abroad with them.

In the morning Dick was missing. Whither had he gone? Inquiries were made, and he was eventually found in the yard amusing himself with a pair of bears' cubs which inhabited a small tene-

ment by the laundry. After breakfast, served *à la carte* at separate little tables, the party were conducted to the roof and had an excellent view all over the city. Islands bare and islands wooded, craggy rocks on which little houses are perched in the lake and river and bright sunny city, a quiet, orderly, religious-feeling city, where all the shops are strictly closed on Sunday, where church-going is universal apparently, but where the museums are open after service on Sunday afternoon. No drinking, no police, no howling cads and rough Arrys—quiet, order, respect, and cleanliness are the distinguishing features, with *al fresco* popular amusements, in the capital of Sweden.

There is the museum with the relics of the great Charles XII., and many other most interesting relics and objects of national value. Some good pictures too, and arms and armour. There are the Deer Gardens, and "Hasselbacken," where an excellent band plays during the open-air dinner, which was recalled vividly at the "Healtheries" in Kensington. This free! The Deer Park, or Djurgård, is a beautiful park which is reached by water in a launch, or by a long tram-ride. Cafés, restaurants, concert-hall, and charming walks by the river are all here, and here too our travellers encountered their friends from Gothenburg with the young people. How they met, dined, chatted, and finally left Stockholm by rail together, it would take too much space to describe.

The palace had to be seen, and with great "list" slippers over their boots the young people skated merrily over the polished floors.

"Can we ever properly describe this jolly place?" exclaimed Alfred; "Dick, my boy, you are right. There is no place like Stockholm!"

Oh, that palace and that room, where all the furniture and fittings are Sèvres china! Oh, the White Sea—as the grand ball-room is named! Oh, the "Hall of Mirrors," where you are reflected again and again, until you feel almost beside yourself at having all these reflections cast upon you! The queen's, the princes' apartments are all delightful, and you skim about on polished oak, in slippery slippers, enchanted! Yes, it is all real—all true—all delightful. Dick was right!

Mr. Basil thought so too. He found Miss Mary charming—an intelligent girl with cheery manners and most ladylike demeanour. Oh, that Djurgård, and the launches, and, above all, the Dalecarlian peasants in native dress in the Drottning Gata! There in the curious collection a whole afternoon was passed. Curious groups, looking extremely lifelike, illustrating Swedish manners and customs, may be seen, and two specimens are now in the Alexandra Palace, Wood Green. All kinds of national exhibits are at the Drottning Gata in Stockholm, and the extremely pretty and picturesque Dalecarlian maiden is also quite a pleasing feature of the show.

Tuesday has come. Away! away! Mr. Basil must leave, so must the Trevors, and Mary Trevor is quite sorry. So is Mr. Basil. Then fifteen hours' railway travelling through pretty flattish landscape, and then Göteborg again—with the Trevors—for two days.

Then a run to Malmö, steamer to Copenhagen, and home through Hanover. But upon this journey we must not dilate.

The great trip had been made, the Swedish capital had been visited, and worst (or best) of all, Mr. Basil was in love!

Whether he ever married I will not here relate, but I will tell you something in the strictest confidence. I, the writer—I, *moi que parle*—went that trip with my young friends a few years ago; and listen! My wife's name is Mary! *Verbum sap.*

Such a little trip, and an extremely

interesting one it is, may be easily undertaken by lads with a tutor or guardian. The return ticket from Hull to Gottenburg is only £5 5s., and in Sweden the charges are moderate. If wines be not indulged in, and "Grand" hotels avoided, the prices may, particularly in the former case, be greatly reduced. The best hotel is, however, usually the *cheapest* in the end. Travelling is the chief expense everywhere, but the fares in Sweden are

cheap. The sum per head we have named (£15) will be found ample, we still believe, for all ordinary requirement; and the Swedish capital will well repay a visit.

The return can be made *vid* Copenhagen, Hanover, and Flushing, but this distance will entail much additional expense, and Jutland is uninteresting. Copenhagen and its environs are, however, worth a visit, and may be included in the tour.

Pleasure and Toil.

BY ROBERT RICHARDSON, B.A.

I.

THE yachts that swing at the harbour mouth
Weigh anchor one by one;
A warm moist wind from the merry South
Springs up with the rising sun.
It follows us steady and close behind,
And furrows the foam capped sea—
The Kestrel lays her cheek to the wind
With all her courses free.

The clouds aloft are blue and soft,
Tight as a drum our sail;
Aloft, alow, no colour but blue,
No tempest in the gale.
With tiller in hand our skipper stands,
And lets the Kestrel run;
One wary eye on the Eastern sky,
As we sail into the sun.

II.

THE fisherman rides o'er the harbour bar
With the first grey gleam of morning;
He steers his course by the morning star,
All thought of danger scorning.
He shakes his sail to the freshening gale
As his boat shoots through the foam;
Through midnights drear his heart to cheer
He thinks of those at home.

His smack sails not, like our bonny yacht,
For its master's ease and pleasure;
But he toils all night till dawn of light
To gather the ocean's treasure.
The fisherman's life is a daily strife
With forces wild and grim—
Kind Father above, in Thy great love
Spread sheltering wings o'er him!

AMONG THE ALPS ON A BICYCLE.

By RALPH YATES,

Author of "To Bingen and Back on a Bicycle," etc.

To many boys the title of my paper will suggest a tale of imagination rather than a narrative of actual experiences. Naturally so, for who would think that the land of snow-capped mountains, countless lakes, foaming torrents, precipices, avalanches, and

glaciers was a choice field for a bicycle tour? Yet so it is, as a perusal of my experiences will, I think, show.

Before proceeding with my narrative I wish to give a few practical hints to those readers who may contemplate a similar tour. In the first place, I should not advise any but good and experienced riders to take their bicycles into Switzerland, although the roads, generally speaking, are quite as good as our English roads; but in all bicycle tours of any extent there are times when a skilful hand and a steady nerve are the rider's only hope; and nowhere in Europe is the bicyclist more likely to be suddenly beset by deadly peril than in Switzerland. Still the danger is, I believe, less than in Alpine climbing, and, since all English youths are naturally adventurous, I have no hesitation in strongly commending Switzerland as a grand country for the experienced bicycle tourist.

Taking it for granted, then, that any reader who has made up his mind to go into Switzerland on his bicycle will be in possession of a good strong "roadster," with thick tyre and reliable break, I shall not say more about the steed.

But about the time required for the tour and cost? You could do my tour from London, say, in fourteen days if you were very energetic. I did it in seventeen days, but if you can spare the time, take three weeks. I spent, exclusive of photographs and presents, fifteen guineas, and I do not think any rider could do it for much less; but if you are

very "flush," and go in for the grand hotels at the fashionable places, you may spend fifty per cent. more.

For three months before starting I rubbed up my French and German, read all I could find on the subject of my projected tour, and corresponded with a Genevese bicyclist, whose name and address I obtained from the "Cyclists' Touring Club Gazette." Indeed, so courteous was Monsieur Bruel, that before starting I knew the character of the road even to the minutest details. I began my tour on the 1st of September, and found the weather very agreeable; but if I were going again I should choose the month of June. Then you have longer days, and the prolonged evenings are most enjoyable when spent in the saddle.

The route chosen was that of Newhaven, Dieppe, Rouen, Paris, and Bâle, but it is by no means the only one, although the cheapest. If preferred, the Rhine route could be used, and Switzerland entered at Schaffhausen. But my advice is, save yourself until you get to Bâle, and, if you have already seen Paris, do not be lured into wasting time in the gay French capital. Leaving London Bridge Station at 8 p.m., we arrived at Newhaven in two hours. I have here spoken in the plural, for I must tell you that I was accompanied to Paris by a splendid companion, who, poor fellow, had to abandon the trip through a serious flaw being discovered in his machine.

At Newhaven we had time for a supper,

Zurich Cathedral.

Sport in the Alps.

also to exchange a portion of our money at the little office lying conveniently near the railway station and the quay, which are in immediate juxtaposition. Dieppe was reached by breakfast-time next morning. Awaiting the boat is an express train, which starts as

I cannot resist the temptation to linger a moment in the pretty Rouen valley. My imagination brings it vividly before me now with its long line of factories and tall chimneys, interspersed with villas, orchards, and gardens; or in Rouen city, the ancient capital

chequered and ornamented with rich carving—grotesque heads, flowers, and other fanciful devices.

Of Paris it is superfluous to speak. Suffice it to say, that after lingering two days in the French capital I took a seat in the night express for Bâle, my friend having discovered the flaw in his machine that necessitated his remaining behind. Next morning, ere the sun rose above the dim violet mountains of the Vosges, I crossed the new Franco-German frontier. A numerous body of officials and soldiery, the latter wearing those gleaming Prussian helmets so hateful to the French eyes, awaited our arrival. While a most scrutinising inspection was being made of tickets and luggage, I feasted on the beauties of one of the fairest and most productive plains of Europe. Just discernible from the carriage window a flagstaff was to be seen planted amid cornfields, orchards, and vineyards. It is there to indicate the line of demarkation between France and the newly-acquired territory of the German Empire. How painful the sight of it must be to the great bulk of Alsatians, who, being wholly French at heart, are compelled through force of circumstances to remain subjects of a detested foe.

An all-night railway journey of about 300 miles landed me at Bâle, which place is considered the principal gateway into Switzerland. This quaint old town, the abode of many of the Swiss aristocracy, possesses numerous battlemented buildings, watch-towers, and other feudal fortifications, in a perfect state of preservation, which, coupled with its situation in an angle on the frontiers of Germany and Switzerland, constitute it a town of strategic importance. Leaving Bâle I rode over the colossal bridge which spans the Rhine, and over which Napoleon III. thought of sending troops from Belfort to Southern Baden during the Franco-German war of 1870, had not the whole of that grand federal army of the Swiss Republic instantly prepared to defend her soil from again being used as a battle-ground, as had often been the case in the wars between France, Germany, and Italy.

In spite of a weary night's railway journey I rode ninety kilometres, or fifty-six English miles, on the first day. Although the morning opened beautifully fine I was caught in a drenching rain before Brügg was reached, which town was a most important settlement of the Romans in Helvetia, and still contains many monuments and relics of Roman conquests, feudal tyranny, and monkish superstition.

Tell's Chapel, Lake of Lucerne.

soon as the passengers have partaken breakfast and escaped the vigilant scrutiny of the *douaniers*, Paris being reached about noon. Leaving Paris, Station L'Ouest, at 8.40 in the evening, I arrived at Bâle at six o'clock next morning.

On the French railways bicycles are treated as common luggage, and as they are within the allowed weight, you simply pay for the booking of same, which is something like threepence from Dieppe to Bâle. The charges on Swiss railways are similar to our own. On arrival at the French port, make it clear to the custom-house authorities that your machine is not new, or they will attempt to impose duty upon you.

Just a word about the luggage, and then to my story without further preface. I still find the M. I. P. bag to answer very well. My luggage, which consisted in a couple of merino guernseys, ditto of flannel shirts, change of stockings, pair of light knickers, and a nightgown, weighed just nine pounds. Murray I carried by a strap across my shoulder, and my macintosh strapped to the handles of my machine.

The fishing port of Dieppe is situated between two high ranges of chalk cliffs, similar to those which fringe our southern shores, and which are doubtless indicative of a time far remote when our seagirt isle formed a part of the mainland of the continent of Europe. The staple trade of Dieppe is principally carried on by fisherwomen. Arriving on a market day, we saw to advantage the most interesting spectacle of the city. Seated in high-backed chairs, placed in rows behind the stalls, these *marchandes de poisson* vociferate in a most unladylike fashion, a strange contrast to the mellifluous accents of their national tongue, yet scarcely more marked than the incongruity of their bronzed masculine faces when seen adorned with the high snow-white caps peculiar to the province of Normandy.

of Normandy. It has been designated the French Manchester, although the atmosphere which envelopes it is not thickened with such dense smoke as we see daily hovering over the great Cottonopolis of England. Rouen, like Antwerp, is a place wherein the antiquary, or even the architect, must love to revel. Some relic of antiquity meets the eye at every turn, either in the form of a painted arch or the mutilated statue of some saint. Even the doorposts, window-frames, and woodwork of almost every building are

Monument to the Swiss Guards.

Baths at Lenkerbad.

There is a peculiar yet awful grandeur in a rapidly gathering storm among the mighty mountains of Switzerland. With startling rapidity the valleys where the Rivers Reuss, Limmat, and Aar meet were enshrouded in black lowering clouds, not an accessible chalet was to be seen, and, with no place of shelter at hand, I rode at a break-neck pace down the winding valley. Being drenched to the skin, and oppressed with feelings of hunger and fatigue, the din of swollen torrents meeting with an angry roar in my ears, I felt quite overwhelmed and ready to drop from my steed. It was at a small wayside inn in Frick that I stayed for dinner, and as it may be worth your while to note the cheapness of living in Switzerland, I give you the *menu* of that first day's meal, which consisted of soup, beefsteak, bacon, eggs, vegetables, plain bread, and a bottle of wine, for which, including a couple of cigars, I paid eighteen-pence.

It has been said that the French tongue is understood almost everywhere on the Continent, but at any rate the bicycle tourist finds it inadequate for all the nooks and by-ways of Switzerland. You will be amused when I tell you that nearly the whole business with the innkeeper was done by gesticulation. Save a very few words I am ignorant of German, and my host, who by the way was farmer and butcher as well as innkeeper, understood not a word of French or English. And, while on the subject of language, I would just incidentally quote the following figures as showing the predominance of the German language, which is spoken more or less in every canton, and which is taught in every public school. Families speaking German, 384,000; French, 134,000; Italian, 30,000; Romansch, 8,000.

In an hour's time I was in the saddle again. What a transformation scene! The heat of the sun at its meridian was intense, almost

drying the macadamised road instantaneously. Having attained the rocky heights above the Swiss Baden, I experienced a great and dazzling change in the character of the scenery. It seemed as if summer and winter had united to produce that grand panoramic display of natural phenomena. By the roadside, geraniums, roses, and other flowers hung in great profusion from the window-ledges of every cot, fruit-trees and vineries being in rich harvest, richer last year I was told than the Swiss peasantry have experienced for many years past. In the far distance, perhaps sixty or seventy miles off, in the direction of Canton Schwytz,

"Hills over hills and Alps on Alps arose,"

the snow-capped summits of which reflected the burning sun's rays with all the fire and brilliance of a myriad of diamonds. Nature has been cruelly hard with the Swiss agriculturist. With a wife and half a dozen children dependent on him for their coarse sustenance, how can he go into raptures like us tourists at the beauty and sublimity of the cold, heartless mountains? But the Swiss, unlike the Irish, do not repine at their lot. Without unremitting industry their small plots of land would not support them, and if these poor toilers had not a great deal more forethought and frugality than the average English workman their valleys would speedily become depopulated, and the ibex and chamois would soon return to them.

"Still even here content can spread a charm."

Most countries in Europe have within their borders some city which lays claim to the title of a modern Athens. That of Switzerland is Zurich. Since, however, it is nowhere recorded in history that Athens was intersected by tramways or that she carried on a brisk and thriving trade in cotton and silk

goods, nor boasted of large iron foundries, it is necessary to split the Swiss Athens into two portions, which the pure crystalline and rapid River Limmat may be said to divide. It is the lake portion of the city which is the centre of a Switzer's intellectual life, and which possesses academies of art and music, institutes of science, public libraries, an Alpine club, societies of commerce and agriculture, and a hundred colleges and schools. If the scenery of England may be regarded as a reproduction of the scenery of the Continent I should call the lake of Zurich the Swiss Coniston. Resting on the summit of the Ober-Albis, which rises 2,887 ft. above the sea, I spent some time viewing the grand panorama spread like a map at my feet. A calm bright-green lake, some twenty-six miles broad at the widest part, teems with populous hamlets, built on its gently sloping banks, engaged in the manufacture of cotton and silk goods. From the soil of those lake villages many objects have been unearthed which reveal habits, arts, conditions of life, and internal history of the time when Central Europe had not attained to a knowledge of metals, but was using implements of bone and stone for war, hunting, and domestic purposes. These relics of a remote past are now treasured in a public museum, and serve to show the rapid advances which the proud city has made in her commerce. Those tall factory chimneys emitting black smoke reveal a gradual development in the cotton and silk industries which has been going on for generations, and the power-looms and spindles of Zurich are now supplying not only home requirements, but are keenly competing with Lancashire manufactories in the markets of Germany and Italy.

Putting on the break very tightly, I rode carefully down the steep circuitous mountain path to Zug. Throughout the small canton of Zurich I heard at every turn the song of

life and work—the woodman felling trees, the milkmaid bringing home her pail, the cobbler stitching at his stall, the miller grinding at his wheel, and the secret of all

business to an exact science, evidently did not see the beauties of nature as I did, and in their judgment that incomparable moonlight spectacle required improving by fire-

dirty towns to be found in the same canton, but that Saturday evening it was brilliant. In addition to the fireworks, splendid reed and vocal music was given to a gay and fashionable company assembled on the shores of the lake. The most characteristic features of the city are two curious old bridges which cross the Reuss, a river which rushes from the lake with great velocity and force. These bridges are partially roofed, and their sides are adorned with rude paintings of Old and New Testament narratives and famous events in Swiss history.

In the environs of Lucerne is a most interesting monument of the Swiss Guards who fell while defending the royal family of France in one of the bloody massacres of the first French Revolution. It represents a lion of colossal size wounded to death with a spear in his side, yet endeavouring in his last gasp to protect from injury a shield bearing the *fleur-de-lys* of the Bourbons, which he holds in his paws. Of course I spent some time on the Lake of the Four Forest Cantons and along its classic shores, on which occurred those memorable events which gave freedom to Switzerland, and where the first Swiss Confederacy was formed. It is also the land of Tell.

A little beyond Brunnen, a port commanding fine views of two reaches of the lake, and famous as the spot where the alliance between the Forest Cantons was formed in 1315, stands Tell's chapel. Here, according to tradition, Tell sprang on shore from the boat in which Gessler was carrying him a prisoner to Küssnacht, when a sudden storm on the lake had compelled him to remove Tell's fetters in order to avail himself of his skill as steersman. The chapel, an open arcade lined with rude and faded paintings representing the events of the delivery of Switzerland, was erected by Canton Uri in 1388, and in the firm belief of the country-people to the memory of the brave archer. But there have been fierce disputes as to the truth of the story of Tell. It is not mentioned by narrators of the events of the Revolution, nor for two centuries after their occurrence. It is pretty clear, however, that a Swiss named William Tell existed, and

Swiss Cowherd.

this harmony is that the canton is composed of a brave, industrious, and law-abiding people, governed by a purely democratic constitution, in which every man feels that he is a living, active force. It was necessary to pass through Zug on my way to Lucerne. The town has a deserted look in spite of the vineries, cornfields, and orchards which are planted along the shores of the lake bearing the same name. Mention might just be made of one of its churches, which, like many others in the Roman Catholic cantons, has a bonehouse attached to it, containing many hundred skulls. It is the custom for relations to cause the skulls of the dead to be taken up, cleaned, labelled with their names and date of birth and death, and then placed in the bonehouse.

Wherever I have roamed on the bicycle I have been pestered by assaults from dogs, but nowhere so frequently as in Switzerland. Throughout that country my appearance excited a great amount of curiosity and astonishment among the people, but the dogs of Helvetia, which are mainly large St. Bernards, universally regarded me as an innovator, and just before reaching Lucerne at dusk on a Saturday evening I had a narrow escape of being thrown violently to the ground by an attack of one of those splendid creatures of the canine race.

Lucerne by moonlight is one of the grandest sights in the world. The wild grandeur of the scenery of the Lake of the Four Cantons, apart from its legends and historical associations, is greatly enhanced in its effect on the mind when seen bathed in the mellow light of a full clear moon. Under such favourable conditions I saw it. The silver peaks of old Pilatus and the famous Rigi were distinctly visible, while the snowy Alps of Oberland, Unterwalden, and the Uri formed a vivid and spectral background. But the proprietors of these large white palatial hotels, who pride themselves that they have reduced their

works, which for nearly two hours added conflicting illumination to the city and lake. The city is naturally cheerful and bright, and is in every respect a contrast to the dull and

Fruit-seller and Horn-blower.

The Wellhorn and Wetterhorn.

Bridge of Lucerne.

that he was held in honour by his countrymen, but there is nothing to prove his connection with the history of the Confederation. Among English schoolboys the fame of Tell is associated with the tradition of the shooting of an apple from his son's head. I went through Altdorf, the capital of Canton Uri, where it is said this incident occurred. It is a dull village without trade or manufactures, and still exhibiting signs of the conflagration which nearly reduced the village to ashes in 1779. Over the spot where Tell is said to have stood and taken aim is a stupendous plaster statue of the famous marksman, which has been erected by the riflemen of Zurich. Having spent the week in the manner described, and the following Monday's weather being unpropitious, I was obliged to leave Lucerne without making the ascent of the Rigi, whose summit affords a magnificent panoramic view of Central Switzerland extending over a circumference of three hundred miles.

From Lucerne I proceeded by the lake through Alpnach, where a crowd of fashionable English tourists were busy booking seats in the diligence, bound for Interlaken, lying some forty miles to the south-west. Rotzberg Castle was soon passed. This castle, by-the-way, situated on one of the Alpine passes over which Suvarof led the Russian troops in the war of the Austrians and Russians against the French in 1799, is remarkable as the first stronghold of the Austrians, of which the Swiss Confederates gained possession on New Year's Day, 1808. The valley of Sarnen, bounded by gently sloping hills, has nothing Alpine in its scenery. Those of you who have driven over Kirkstone Pass and along the vale of Brothers Water, will have a good idea of the character of the twenty miles of country lying between Alpnach and Brünig Pass, save that the whole is on a greater scale and is rendered more im-

posing by countless waterfalls leaping down gloomy precipices and bare mountains of rock.

The ascent of the famous Brünig I began at noon. Having decided to reach Brienz if possible before taking lunch, I imposed upon myself a forced march up the cruel mountain pass. Never did British trooper with his fifty-six pounds kit on his back feel more inclined to grumble, than I over that horrible grind of three miles up the delusive Serpentine Road; yet it is a lovely forest path, and although the season was too advanced to see the Alp rose and other Alpine flora and fruits in all their Sicilian wealth, there was a sombre beauty in the variegated tints of foliage of the oleander, fig, walnut, fir, and larch-trees. Having attained an altitude of 3,648 feet above the sea level, or 500 feet higher than Scaw Fell, I was able to mount my bicycle and ride some distance before commencing the descent to Brienz.

At this point I just escaped a terrible accident. A diligence containing a lady and gentleman came dashing along, and owing to the zigzag nature of the road were upon me before I could dismount. The horses, more restive than those I had previously met, shied towards an awful precipice some thousand feet in depth, and which was only bounded by stone boulders placed at intervals sufficient to allow the diligence to fall through. To ensure confidence in the spirited animals I ran my machine against the rocks on the opposite side. For a few seconds which seemed an age we all stood in deadly peril, but the young driver, with admirable courage and coolness of head, maintained his position, and by sheer strength of arm wheeled the horses round while their fore legs dangled in the air. I shall never forget the expression of despair depicted on the face of the lady inmate as she stood up in the vehicle and threw up her arms to Heaven for help.

Nothing could be grander than the view which the summit of the pass affords. There below lay the rich valley of Sarnen backed by Pilatus with the Lungern See in the foreground, and beyond the still finer view of the valley of Hasli and the snow-white crests of the Wellhorn, Wetterhorn, Eiger, and other Bernese Alps.

Descending the pass I was espied by a young waitress looking through a window of the Brünig Hotel, who rushed out and in alarming tones entreated me to stop. In breathless broken English she related how a young bicyclist from my own country was a short time ago killed in attempting the perilous descent of the Brünig Pass. The result was that she secured an extra customer for table d'hôte, while perhaps she also saved my neck.

Brienz, and the small villages clustered round the shores of the lake bearing the same name, are as attractive as the mountains, lakes, waterfalls, and luxuriant verdure which surround them. Through the open doors of neat and artistically-carved pine-wood chalets, built on the steep but easily-accessible wooded banks of Alpine pasture lands, I heard the "rickle-tick" of the handloom, and this too in a country where, in proportion to its population, cotton and silk are manufactured to a larger extent than any other country in the world. These Switzers are an interesting study. Their industry, coarse living, the simplicity of their wants, remind us of the race which has now become almost extinct in our own cotton districts. But in other respects they occupy a unique position. Next to that strong feeling of independence which every Switzer naturally inherits, the love of country and the love of education are dearest to his heart. Each man is a trained soldier, ever able and ready to defend his home and his country, and when his rifle is not required he can do something more. Not only is he able to read and write, but he is master of two languages. Education comes to him in his cradle, and it clings to him through life. He could not cast that love of learning away from him if he would, and he would not cast it away from him if he could. In this Brienz valley, a very hive of industry, not only in weaving, but in wood-carving, cheese-making, and hotel-keeping, situated on the high-road between two of the most noted centres of the Swiss lakes, the 150,000 tourists

who annually visit Interlaken must needs pass that way, and few out of this number fail to carry home some specimens of these Switzers' skill in the craft of wood-carving.

Of Interlaken I need scarcely speak. Does not our magazine literature teem with stories of Interlaken and the Jungfrau? It will be sufficient to say that it is a town of hotels and *pensions*, possessing a good main street lined with lofty walnut-trees, from which is obtained an excellent view of the mighty Jungfrau. Within easy reach of Interlaken is situated Giesbach, one of the prettiest of waterfalls. During the season this waterfall is illuminated at night with a beautiful rose-coloured light. The Steamboat Company of Lake Brienz have surrounded the spot with every comfort and luxury, and the scene altogether is quite romantic and dazzling. Very pretty maidens dressed in the costume of their native valleys flit to and fro among fashionable loungers, serving *café au lait* or anything else they please. That little ride up the Lauterbrunnen Valley would have repaid me for all the trouble and cost of reaching it.

A splendid macadamised road winds by the side of a foaming torrent of glacier water for a distance of nearly twenty miles. Approaching Staubbach, which Wordsworth describes as a "sky-born waterfall," the scenery increases in magnificence. The valley becomes narrower, the rocks higher, and there is greater rushing and roaring of glacier waters down the dark valley. Here I met a Yankee whose acquaintance I had previously made at Lucerne. He was standing at the foot of that "wonderful and indescribable waterfall," which, notwithstanding his own words to the contrary, Byron finely describes in "Manfred." The Yankee was a stern, practical man of business, but even he stood in hushed reverence under the appalling influence of that grand panorama of glacier, avalanche, rock, and snow. Indeed, the man is to be pitied who could stand in the midst of such overwhelming displays of nature's power as I saw in the majestic solitudes around Lauterbrunnen and Grindelwald and not feel to a distressing degree how infinitesimally small he is as a unit in God's Universe.

Leaving Interlaken at noon the following day, I set out for Berne, a distance of sixty kilometres. It was grand bowling along Lake Thun. The Swiss understand road-making, and they bestow great care and expense in avoiding hills. There I was in the very heart of the glorious Bernese Oberland, where Byron repeopled his mind from nature. Thun is one of those pretty smiling lakes which are neither tame nor awfully grand. Like its neighbour Brienz, it is a blue-green expanse of water, stretching peacefully below the mountains. On its fertile banks are numerous ancient castles and picturesque chalets, and at the west end of the lake stands the ancient and quaintly-built town of Thun, than which there is scarcely a prettier spot in all Switzerland. It has been a thing of regret to me since that I did not give the place more than a passing call, but it would

have been unwise to have yielded to the temptation to linger.

Even in Switzerland the weather is not always fine; indeed, it has a very varying climate, and, in relation to its latitude, is comparatively a moist country. At Thun it began to rain, and my only safety lay in action. I therefore donned my macintosh, leaned well over the handles, and rode at racing speed the twenty-eight kilometres to Berne. Berne, which is the Federal capital, is not only a very notable city, but is considered one of the most handsome cities in Europe, being built on a lofty sandstone promontory some 1,700 feet above the sea. The appearance of the town from the Thun road, along which I travelled in approaching the Swiss capital, is certainly very imposing. Almost all the houses rest on arcades, which form covered walks lined with shops and stalls like the Rows in Chester. In the centre of the main street, which is very wide, an open sluice runs, quite a mountain rill in the force of its current. Its use is to do the scavenging work of the town and neighbourhood.

The citizens of Berne have shown gratitude to its founder, Berchthold, who, being once nearly destroyed by a bear, made a vow that he would build a town on the spot to commemorate the event. So to-day we find bear-dorm signalised throughout the city. Not only is his effigy on signposts, fountains, and public buildings, but for several hundred years a few live bears have been kept, at the expense of the State, in a public bear-pit outside the town. Another object in Berne characteristic of the place is a town clock, similar to the famous Strasbourg clock. A few minutes before the hour a wooden cock crows and flaps his wings. In another minute a procession of bears passes round a seated figure of a bearded old man. The cock then crows again. The hour is struck on a bell by a harlequin with a hammer, while it is counted by the bearded figure, who turns an egg-glass, raises his sceptre, and opens his mouth, a bear inclining his head at the same time. The cock then crows again in conclusion, while a life-size figure of Berchthold on the top of the tower strikes the hour loudly with a large hammer. Berne also possesses a minster, built about the fifteenth century. There is nothing striking about it in any way except its loud florid Gothic front, which reminds one strongly of Rouen Cathedral. From the promenade built on the fortifications of the city a glorious view is obtained of the whole range of the Bernese Oberland, which

Humboldt considers among the very finest in Europe.

From Berne I took the nearest route to Lausanne, through Canton Fribourg, which has nothing in the way of scenery such as that which has made Switzerland the playground of Europe. It is, however, interesting historically. Fribourg is in itself a dirty town of about ten thousand inhabitants; but, looked at from a distance, its quaint houses, feudal watch-towers, and romantic gorge give it a picturesque appearance. "Mon lac est le premier" are the words in which Voltaire vaunted of Lake Lemane. Still, as a whole, it cannot be compared to Lucerne or Thun for sublime grandeur. But it is perhaps the most interesting and attractive lake in Switzerland, on account of its combination of soft beauty in scenery, historical interest, and famous names indissolubly associated with its shores. On the evening of my arrival on its shores there was a lovely sunset. In company of a young student from Heidelberg, I stood on the heights above Clarens, drinking in the beautiful picture presented by the Dent du Midi, Vevay, Clarens, and Montreux, all situated at the very base of the Alps.

Very early next morning I rode down to Chillon Castle, situated at the eastern extremity of the lake. I rode my bicycle over an old drawbridge, and right up to the very doors of the castle itself. Finding it converted into a powder magazine, a little of the romance was at once knocked out of that unromantic-looking whitewashed building, whose origin we are told is buried in the darkness of the Middle Ages. Nor was the keeper one of those long-grey-bearded old men whom we sometimes meet in similar situations in our own country, and who detail the histories of our own castles with great reverence and solemnity. He was a young soldier, and at that early hour his presence impressed me with the idea that he had had early fellowship with another kind of barrel other than the Government had confided to his care. The interior of Chillon is singularly like the representations often found in Byron's poems. You are shown the pillar in the dungeon to which Bonnivard was chained, and the stone floor at its base, worn

Castle of Chillon.

by his pacing to and fro; also the state-room, torture-chamber, and chapel. The walls of the interior are literally crowded with names of different languages—German, French, Italian, and English—among which there are three illustrious Englishmen—viz., Byron, Shelley, and Dickens.

The journey from Chillon to Geneva, embracing the whole extent of the crescent-shaped north bank of the lake, was my last day's ride. It was real enjoyment cycling along the water's edge for a distance of sixty-two miles, gazing on the glassy expanse of water, so full of life, beautiful white birds flitting hither and thither, gaily-painted rowing-boats with little Union Jacks, trim yachts, and fine steamers; young men and young ladies in sociable tricycles on its shores; lawn-tennis and music and much fashionable society. Lausanne, once the famous Protestant canton of Vaud, is beautifully situated on a gently rising eminence three miles from the lake. Although its streets are narrow, crooked, and in some places roughly paved, and its houses are dingy-looking, there is an air of calm repose about the town, and it would appear that its inhabitants were in easy circumstances. Its environs are dotted over with delightful residences, surrounded by sunny woods and a succession of vineyards. Here Voltaire held his court of wit, here Byron wrote his "Prisoner of Chillon," and here Gibbon completed his twenty-three years' work of the "Decline and Fall of the Roman Empire." I passed over the spot on which the last sentence was written, and concerning which Gibbon has left particulars which will cause Lausanne to be regarded as classical ground as long as his great historical work is read.

Geneva is a handsome town, gracefully

laid out on the shores of the lake. On the day of my departure Mont Blanc and the whole chain of the Savoy Alps were quite visible, though some fifty miles distant. The trade of Geneva, which consists in watchmaking, shopkeeping, and hotel-keeping, is largely supported by English money. The watch manufactories at Geneva, where girls and women are very largely employed, are particularly interesting. So also is the school life of Geneva. I was told that boys and girls of tender age often devote thirteen hours per diem to school-work, drill, and home-work. Lying close to Savoy, the streets of Geneva are a little infested by the tramps and beggars who come from that province, but as a rule the inhabitants are a refined, polite, and well-dressed people. The young Genevese have good tastes. Their education and training have been received in the very cradle of that society which has long attracted many of the greatest minds in Europe.

From Geneva I had intended making a detour to Chamounix, lying at the foot of Mont Blanc, and fifty miles distant, but time would not permit me to do so. The members of the Geneva Velo Club assured me that the road, although rather hilly, was a good one.

My stay in Geneva was very enjoyable, greatly owing to the kindness shown to me by the members of the Geneva Velocipede Club. Leaving Geneva exactly at twelve midday on a Saturday, I travelled by express trains to Dieppe, which port was reached on a Sunday evening, and London early the next day.

I was away from home just seventeen days, and although I was alone nearly the whole time I never felt lonely. In spite of

the violent exercise which such a long bicycle ride entails, I returned home with increased energy and vigour as well as a mind improved and freshened by the thousand and one sights, scenes, and incidents which I saw and experienced in my wanderings.

TABLE OF ROADS, THEIR CHARACTER AND DISTANCES.

Bâle to Brugg, 53 kilometres.	Undulating, but good.
Brugg to Zurich, 32 kilometres.	Rather hilly near Brugg, improves near Baden, indifferent nearing Zurich.
Zurich to Zug, 38 kilometres.	Very good road, although the Albis has to be crossed.
Zug to Lucerne, 28 kilometres.	Fair near Zug, very good approaching Lucerne.
Lucerne to Altdorf, return by boat from Fluellen, 41 kilometres.	Good road close to Lake of Lucerne, and almost level.
By boat to Alpnacht.	
Alpnacht to Brünig Pass, 40 kilometres.	Very good road, 1½ hours' walking up Brünig Pass.
Brünig to Brienz, 10 kilometres.	Capital road, sloping gently along Lake Brienz.
Brienz to Interlaken, 17 kilometres.	Level, capital surface.
Interlaken to Lauterbrunnen and back, 32 kilometres each way.	Considering the nature of the country, very good road, rises gradually from Interlaken.
Interlaken to Thun, 26 kilometres.	Splendid surface road along the edge of Lake Thun.
Thun to Berne, 28 kilometres.	Ditto, almost level.
Berne to Fribourg, 32 kilometres.	Good road, no difficult hills, scenery comparatively tame.
Fribourg to Lausanne, 63 kilometres.	Ditto.
Lausanne to Chillon, 30 kilometres.	Very good macadamised road, close to the shores of the lake nearly the whole distance.
Chillon to Geneva, 99 kilometres.	

Total, 534 kilometres, or 334 English miles.

Home again.

PIERRE AND PAULINE:

A HOLIDAY STORY.

LAST summer, while enjoying a quiet fortnight's rest and change on the Continent away from the beaten tracks of tourists, I learnt the details which I will now narrate.

Pierre Daudet was in a difficulty—not for the first time in his life. He was a young fisherman, living in the village of Marny-sur-Bois, on the west coast of France, and a far from pleasant village he found it.

He had discovered some years ago that, though fishing was the ostensible occupation of most of his fellow-villagers, their more lucrative profession was one of a less innocent kind. They were wreckers. Now Pierre was an honest man, and had refused all invitations to join his companions in their nefarious deeds.

Naturally he was the object of their aversion. This was not pleasant for him, for he was of a sociable nature, and hated to find men avoiding him and giving him black looks. More than that, they often succeeded in spoiling his fishing for him. Pierre wished heartily enough that he could leave Marny for ever and settle down at some pleasanter village—say Vercamps, where the fishing was better, and where wrecks were almost unknown.

But there were two things which kept him at Marny-sur-Bois. The first was lack of money. He had inherited from a deceased uncle a tumbledown cottage, which was just good enough to live in, and a share in a boat. His fishing brought him in a living, but not much more. He had scraped and pinched to save money to purchase a boat of his own, which would enable him to live where he pleased, but had only succeeded in putting by half the required sum. And he had been saving for four years!

The other reason why he remained at Marny was Pauline. She was the only daughter of a small farmer who lived two miles inland. Pauline was pretty, and had half the fishermen of the neighbourhood for her admirers; but she had promised to marry Pierre, who was thoroughly devoted to her. She was a very charming girl in many respects, though Pierre found, to his cost, that she was rather apt to be jealous, and to let him see that she had done him a favour in accepting him.

But Pierre knew that she was good at heart, and if only he could marry her and take her away from her old friends he had no doubt but that she would make him as happy as he hoped to make her.

The particular difficulty with which Pierre was struggling on this occasion was this. He had promised to meet Pauline at dusk and take her for a walk along the cliffs, and then home by the wood. Unfortunately he would be unable to keep his promise.

"What shall I tell her?" he thought. "I hope she won't be angry. She would not if I could tell her the real reason."

He was wandering along the sands, thinking over his dilemma, when he heard some one calling to him from the

cliff. He recognised the voice in a moment. It was Pauline's.

In a few seconds he had clambered up the steep path and reached her side.

"I've come down early," she said; "but as you have returned from fishing, let us set off now. It is almost dusk."

"I'm very sorry, Pauline," he said, sorrowfully, "but I can't come with you to-night."

"Not come with me? Then where are you going?"

"I have to meet some men," he replied.

She looked annoyed. He began to try and make arrangements for meeting her the next day, but she interrupted him.

"Who are you going to be with to-night?" she asked.

Pierre looked uncomfortable, and hesitated. She saw his hesitation, and insisted. After some beating about the bush he was obliged to tell her plainly that he had promised to keep it a secret.

Pauline was in a temper. She began to accuse her lover of wanting to go off with another girl—of trying to deceive her. In vain Pierre protested; she met all his protestations with the question, "Where are you going to-night?"

To this he could give no answer.

At last he grew weary of repeating that he had promised to tell no one, and, finding it hopeless to induce her to listen to reason, he said good-bye, and prepared to descend to the village.

"Good-bye," retorted Pauline; "and I do not mind if it is good-bye for ever! I do not care to have a lover who is ashamed to tell me where he is going!"

"You will be sorry for this to-morrow," said Pierre, cheerily, "when you shall know all."

"So will you," she cried back, "when you see me on the arm of Jacques!"

Pierre would listen no longer. He ran down to the beach, and then home.

He had the best of reasons for silence, though he wished he could have told them to Pauline. The dangerous state of the coast had been brought under the notice of the Government, who had sent down a small surveying party to take measures for ensuring the safety of vessels. It was well known that the cause of the wrecks was a rock about a mile from the shore, standing only a few feet above the water, too small to erect a lighthouse on, and quite invisible in a storm. The surveying party, headed by Captain Dubois, had come to the conclusion that this rock must be blown up.

But it was not so easy to accomplish this. The coast was intricate and the currents dangerous. It was not advisable to try to reach the rock without a pilot. Captain Dubois had hired a fisherman, but he had nearly wrecked the whole party, and would have done so quite had he dared, for he was peculiarly interested in keeping the rock as it was.

The captain soon discovered that it was not easy to find a man who was willing to aid him. More than that, he had heard well-grounded rumours that

when the attempt was made to demolish the obstruction the wreckers had determined to do their best to frustrate it.

Now Captain Dubois was not a man to be intimidated. He was not going to neglect his duty because of the threats of a parcel of scoundrels. He discovered that Pierre was a man to be trusted, so he took him aside and made him an offer.

"Two hundred francs to you, my friend, if you will take me out to the rock to-night and bring me safe back again."

Two hundred francs! Added to what he had already saved, that would be enough to enable him to purchase a boat. Then he could leave Marny for ever and marry Pauline.

He did not hesitate long. It was not till after he had accepted the offer that he recollected he had promised to meet Pauline that evening.

"Mind now, not a word to a living soul," said the captain. "Meet me just after dark two miles west of the village; my boats will be there. One night's hard work ought to do the job."

Pierre promised to keep his tongue still and be there sharp to time. He spent the next hour in wondering how he should explain his absence to Pauline. As may be imagined from the result of his interview, he did not come to a very satisfactory solution of the problem.

It was a dark night, but fairly calm. Pierre found the captain waiting for him. There were two well-appointed boats and seven men. Pierre steered the first boat and the other followed close in her wake.

There was no moon, so that the chance of their being observed from shore was small. Captain Dubois had taken every precaution to make their departure as secret as possible. After the first half-mile the dangers from currents and shoals were over and the men could give way freely.

Pierre was the first on the rock, which was now some two feet out of the water. He was astonished at the discipline and energy of the crew. Everything had been foreseen. The captain had learnt the formation of the rock, and knew exactly where to work. There was a deep rift in the very centre, open at the side facing the sea. This rift was closed on the open side with a mass of rubbish and cement, and the water baled out in a few minutes, leaving a hole which ran far below the level of the sea.

Down this hole the machinery was fixed, and the men set to work with a will, three at a time, to bore.

The captain encouraged them by word and deed; Pierre was lost in admiration at the skill and rapidity with which the boring proceeded. In four hours there was a very respectable hole, in five they had gone deep enough. At the very bottom the orifice was made larger, so that the explosive might not explode harmlessly upwards. Then a vast charge of gun-cotton was carefully placed in position: it was in a case from which ran a

wire connected with an electric apparatus in the boat.

"That's all right," said the captain. "We've no time to lose."

He was quite right. The sea had risen considerably; there were signs of an approaching storm. Pierre had given warning of it, but every one was too excited to think of leaving the work when it was on the eve of completion. But now that it was over the men leapt into the boats and pulled off to a safe distance.

They had barely left the rock when a wave submerged it. Pierre gave a cry of dismay, thinking all their labour had been in vain. But the explosive was in a water-tight case, and could come to no harm.

The captain gave the word to cease rowing. He had his hand on the button to fire the charge, when Pierre gave a shout.

"Stop!" he cried.

But it was too late. There was a swift line of flame, a terrific explosion, and the rock rent in a hundred directions; masses of stone flying into the air and falling with heavy splashes into the sea. One fragment of considerable weight fell near the boats but did no harm. The sea heaved convulsively, rocking the boats as if with a mighty swell. There was a loud shriek and then came silence.

When Pauline found herself left alone on the cliff she was in a great rage. She would teach Master Pierre she was not to be treated in this way; she would show him that if he chose to neglect her there were plenty of others as good as he who would be only too glad of the chance of a walk home with her and a draught of her father's cider afterwards.

As if to give her an opportunity of carrying her threats to Pierre into effect, who should come into sight but Jacques Fromont, the most dangerous of Pierre's would-be rivals. In five minutes they were talking together, and Jacques had promised that when he had just fastened up his boat for the night he would come back to her and see her home.

He was as good as his word. Farmer Barbe welcomed him with effusion; the reason being that he wanted some assistance in fixing up a slab of stone as a gate-post, and meant to make use of Jacques. In the dark the job was no easy one, and by the time Jacques had finished he was heartily tired of it, and wished he had not had the luck to supplant Pierre. However, Pauline was sitting up when they returned to the house, and gave him a draught of cider with her own hands.

As he wandered home he thought over what Pauline had been telling him about Pierre. What was Pierre doing?

He did not at first connect his absence

with the proposed destruction of the rock, for the wily captain had given out that he had abandoned all intention of carrying out his design. But it now suddenly struck Jacques that Pierre was piloting the captain through the shoals, and for all he could tell the rock was on the point of being blown up.

Tired as he was, Jacques ran to the cottage of Garnier, a congenial companion of his, and knocked him up. In less than an hour later two boats were being swiftly pulled towards the rock.

"If they haven't done it we shall be in time," said Jacques in a whisper. "A storm's rising; the rock will be under water in half an hour."

"Pull, and don't chatter," replied Garnier.

The men gave way bravely. Suddenly they perceived a light on the rock. So carefully had Captain Dubois taken his measures for concealment that the light by which the work was done had been invisible, but at the end concealment was unnecessary.

So excited were the captain and his crew that they did not hear the approach of the other boats. It was only Pierre's practised ear that in the moment of silence before the explosion had distinguished the sound of oars.

His cry to the captain had come too late. The explosion sent a mass of rock on to the leading boat, and instantly swamped it.

In a moment the captain ordered the boats forward, and every effort was made to rescue the men. The wreckers' second boat turned round and made for shore. It was time for their safety, for the storm was on them earlier than anticipated.

Four men were dragged from the water after considerable search, but one was still missing—Jacques.

There was no chance of finding him now. Every effort was required to keep the boats afloat. Pierre pronounced it impossible to reach the harbour; the only chance of safety was to make for the bay round the point where the shoals were less numerous. To reach even this seemed impossible; the waves rose higher and higher.

"All is lost!" cried Garnier; "we shall never make land!"

And, indeed, even Captain Dubois was for once in his life frightened.

The village was startled at early morn by a report that some boats had been out all night, and that one had not returned. In a short time half the population were on the beach, asking what had happened and who was missing.

One of the men on Farmer Barbe's farm had been early at the village, and brought back word that a boat had been

lost in the storm. Pauline had spent a miserable night, thinking over the unkind way in which she had treated her lover and blaming herself for her want of confidence. When she heard of the catastrophe a terrible fear rose in her heart, and she could scarcely ask who was missing.

The old man hesitated before he told her that Pierre was, it was feared, lost.

In a frenzy of despair Pauline ran to the beach. She saw in the distance a group of men and women standing around something; what, she could not see.

She ran swiftly along the wet sands, from which the sea had just retired.

"Who is it?" she gasped, as she neared the group.

"Poor Jacques Fromont," replied an old woman. "This will be a lesson to young fellows not to go out at night when they've no business."

Pauline's heart was relieved for a moment; but, after all, where was Pierre?

No one had seen him? They told her as much as was known, which was confined to the report of those in the wreckers' second boat, which had reached land safely. It seemed probable that not only Jacques, but Pierre and the whole of the captain's crew had perished, as well as the occupants of Garnier's boat.

Pauline set out on a pilgrimage along the coast. If Pierre's body were cast up by the cruel sea she would be the first to find it and weep over it. Oh, if she could only recall those unkind words of hers!

Suddenly she heard a shout above her. She looked up, and could scarcely believe her eyes. It was Pierre! He clambered down to her, and it was not long before the estrangement was over.

The boats had been driven on shore four miles from the village, and Pierre had started the first to bring the tidings of their safety. Later on the others arrived, and Captain Dubois was loud in his praise of Pierre. More than that, he added fifty francs out of his own pocket to the promised sum, and Pierre was able to buy his boat and marry Pauline. Not long after they left Marly-sur-Bois for Veramps, and found the change a pleasant one.

Garnier and his fellows were allowed to escape punishment; indeed, it would have been difficult to prove anything against them. The rock destroyed, their principal means of livelihood was gone; the best of them turned their attention to honest work, the rest became vagabonds, and of their ultimate fate the best said perhaps the better.

H. M. P.

Our Camp.

Ah! now is the time for a week on the river!

O'er meadows and roads you can see the heat quiver,

But here you can lie in a cool, shady nook,
Refreshing your mind with a not-too-deep book

Till warmed by a growing sensation of cramp

You push off your boat and pull to the Camp.

There comes up the Swan, with four good fellows in her,

All eager for work and more eager for dinner:

Jones has promised a salad; he pulls out his knife

And slices up lettuce and egg for his life;

Smith is cooking to-day, so we hope for a treat,

For Smith as a cook isn't easy to beat.

Now dinner is over, so put on the kettle,
(Hot water is best to take grease off the metal;)

A final cold plunge, next a row to the lock,
Then back before ten by the old village clock.

One glee round the fire and then out with the lamp,

A hearty good night; then all's still in Our Camp.

Our Camp.—See p. 63.

"BOY'S OWN" GORDON MEMORIAL FUND.

THE readers of the B. O. P. are now engaged in raising a Boys' Memorial to General Gordon, a project in which we hope all the readers of this Summer Number will assist.

From the moment of Gordon's death being reported in England, quite a number of letters reached us from various parts of the country, and from writers of all ages and conditions in life, urging that we should open such a Boys' Gordon Memorial Fund in our columns.

To so many earnest appeals we felt we could hardly turn a deaf ear, even if our own sympathies had been less warmly identified with the object espoused; and we resolved, therefore, at once to start a Boys' Fund, the proceeds to be wholly applied in accordance with Gordon's known wishes—that is, *for the benefit of poor boys*. A *Working Boys' Home of Rest, at the Seaside*, is included in the scheme, should the funds received enable it to be carried out in its entirety. We have received many congratulations on having taken this Memorial in hand. In a sympathetic message from her home at Southampton, Miss Gordon herself says:—

"She hopes very much that the Boys' Memorial will succeed: it has her best wishes. A Home for poor boys is what would be most in accordance with General Gordon's desires."

Ours is essentially a *Boys' Memorial to one whose memory English-speaking boys the world over may well delight to unite to honour*. Our Fund is intended to be thoroughly representative of British boyhood—a memorial raised by boys for boys, in fond memory of a noble boy-lover. We hope that boys of all ages and conditions of life will take it up heartily and make it their very own.

Collecting Cards will be furnished to all who, in applying for them, enclose a properly addressed and stamped envelope, accompanied by a letter of recommendation from head master, clergyman, employer, or other responsible person. The necessity for this must be obvious. *All cards thus sent out will be duly numbered, and registered with the names and addresses of the applicants, and thus the chances of any cards getting into the wrong hands will be guarded against.*

Donations may be sent at once, and all amounts received will be acknowledged in the columns of the "BOY'S OWN PAPER." Cheques should be crossed, and P.O.O. made payable to H. WILLIAMS, BOY'S OWN PAPER Office, 56, Paternoster Row, London.

THE LAST OF HIS TRIBE.

(Drawn for the "Boy's Own Paper," by F. W. Burton.)

Breaking Up.

Time, 6.30 a.m.

THE school-bell sounds and young Potts, yawning, stretches his arms and, half-awake, says:

Oh, bother that bell! and my Euclid's not done,—

But stay—why, of course—yes, it's breaking-up day,

And I dreamt of work I'd not finished—what fun!

When really I haven't a lesson to say.

(*Getting up.*) Well, now for a wash—ugh! the water is cold,

My brushes are packed, so my hair must go rough,

I've no time my rug and my great-coat to fold,

My nightshirt I'll try in my hatbox to stuff.

My breakfast's a farce, I'm too happy to eat;

A "second" to Langton; look sharp, if you please.

I wonder if Pater and Mater will meet

Me. Here, boy! a paper. My word! it *does* freeze!

At last we are off, and look there, there's some ice.

The pond will soon bear if this lasts. Where's my wrap?

The nuisance! I've left it behind; this is nice:

No matter, they're sure to bring one in the trap.

I *should* like to know if my box is all right;

I put an address on—I think so, at least;

I don't think I *can* have forgotten it quite—

I hope Mater 'll give us a rare Christmas feast.

I can't read the paper, we soon shall be there;

Oh, yes, there's Great Dolby, so now we're not far;

I fancy that must be the carriage and pair,

And Pater and Mater. It is! *There they are!*

SOMERVILLE GIBNEY.

AN ACTING PROVERB.

BY PAUL BLAKE,

Author of "Birchington Academy," "Christmas at Halehurst," etc., etc.

THOSE readers who bought the last Christmas number of the BOY'S OWN PAPER will probably recollect the Acting Proverb which formed a part of the festivities at Halehurst. This year we present them with another, specially adapted for boys to perform, as there are only male parts, and of these but one is that of a grown man.

Not that a boy need have any difficulty in making himself up to resemble one of his elders. A pair of false whiskers (not too

large), a line or two carefully drawn with a sable pencil under the eyes, and a pair of spectacles, are usually quite enough to make a youngster "pass" as a man.

In previous Christmas numbers we have given instructions as regards the preparation of similar pieces, and these apply equally well to the present one. But certain advice cannot be too often repeated. First in importance is the necessity for efficient management. Learn to obey your stage manager. It

is impossible for you to judge of the general effect as you are acting. Do not shirk work. You have no right to present an entertainment to your audience which will not entertain them. Have plenty of rehearsals and come to the very first of them letter-perfect. Speak very distinctly; it is no good to say a funny line if it is not heard!

Be careful and painstaking in the "business" of your part. For example, Snell has to climb out of the window twice. Let the

action in one case be different from that in the other, and let each be made as effective as possible. When the auction scene is on, Robinson has a fine chance for comic acting, but the others present must not neglect their parts, though they may not have a word to say. Let each boy determine what demeanour he will adopt, whether that of an eager bidder or a cautious one, and let his by-play be in accordance with his conception. All of which may sound to you like insisting on unnecessary detail, but these apparent trifles make all the difference between a spirited performance and a tame one.

Besides, there is so much more enjoyment for the actors, both at rehearsals and performance, if everything "goes" well. Rehearsals are dismal in the extreme when parts are not known and points missed and the manager gets out of temper.

Let there be some lively music as an overture, and let the curtain rise and fall at the proper moment. You must let the curtain have a rehearsal; it often wants it badly.

Perhaps you would like a prologue to your performance. If so it should be spoken in front of the curtain. The following is suited to the occasion:—

PROLOGUE.

The custom 'twas, I'm told, in former days,
To speak a prologue before all our plays,
In which apology was made for those
Who faced the critics in their serried rows.
How much more, then, should I indulgence ask

For those who now essay the pleasing task
Of pleasing you? No veteran actors these;
Their only merit is their wish to please.
Although they've learnt their words and cues by heart,

Each trembles lest he may forget his part.
Each separate he shakes in his separate shoes

For fear that he will miss his well-conned cues;

Whilst the stage manager, o'erwhelmed with cares,

By turns beseeches, scolds, implores, despairs.

Still, all will do their very best; in fact,
Succeed they will, or perish in the Act.
My speech is done—you will not grieve, I'm sure;

The band will now perform the overture!

ACTING PROVERB.

"SECOND THOUGHTS ARE BEST!"

Characters:

Tom Snell. George Purkiss.
Charlie Crawley. Mr. Scott.
William Robinson. Boys *ad lib*.

Scene—A Classroom. Door on left, window on right to open. Forms, high desk.

Properties—Bat, telescope, books, money, purse.

Enter Snell, hands in his pockets, head down, looking very miserable.

Snell.—What a brute that Scott is! Who's he, I should like to know? He's always down on me. Suppose I were a master and he were a boy, how would he like it? I've got a jolly good mind to tell him what I think of him, only I suppose I should get another swishing.

Enter Crawley.

Crawley.—Hullo, Snell! I thought I saw you come in here. Why do you want to waste your time up in this dismal hole when they're just going to start a scratch match?

Snell.—It's going to rain, so they won't play long; that's one comfort.

Crawley.—Why, my sweet child, what's the matter? You don't seem in the best of tempers. Bolted a bullseye?

Snell.—Don't you give me any of your cheek, now, or I'll soon stop you. I'm in the mood for taking it out of somebody.

Crawley.—Oh, bosh! old man. I didn't mean anything. What's the shine about? Has Scott been down on you?

Snell.—Yes, he has.

Crawley.—What's the latest?

Snell.—It's all a swindle. He saw me in the old conservatory.

Crawley.—Well, but, Tommy, you know that's out of bounds, now. He's growing mushrooms there, or beetroot, or some sort of fruit or other.

Snell.—I didn't know it was out of bounds; we used to go there.

Crawley.—But he gave it out after school that we must take our pleasures elsewhere.

Snell.—I wasn't there; I was away one day last week. It must have been then—Wednesday.

Crawley.—'Twas Wednesday. Well, that is too bad! What's he given you?

Snell.—Told me to go to the Doctor after prayers.

Crawley.—You know what that means; a swishing.

Snell.—Yes, I know; the first this half; I'm as savage as I can be; I should like to kick him. And I've been trying hard to keep out of rows. (*Goes to window and looks out, half crying.*)

Crawley (*aside*).—If he gets into Scott's black books there'll be a chance of my pulling off the Euclid prize after all.

Snell.—'Pon my word I've got a good mind to run away. I know my pater wouldn't let me be treated like this.

Crawley.—Of course not. (*Aside.*) Now, if he were to run away I'm safe for the prize, and I should be pretty sure to get elected into the second eleven. I wonder if I could persuade him to hook it?

Snell (*coming down*).—It's begun to rain. I thought it would.

Crawley.—I say, Tommy, do you remember when Hawkins ran away? He was a plucky chap!

Snell.—I remember.

Crawley.—I know I'd never stand getting a lathering for a thing I didn't know about.

Snell.—Would you run away if you were me?

Crawley.—I should think so! Here's Robinson; you ask him.

Enter Robinson.

Robinson.—What's the row, you fellows?

Crawley.—Keep it dark; Snell's going to run away.

Robinson.—Is he? He's a lucky beggar. I wish I had the chance! I should have been off a dozen times, only my father lives in India, and that's too far to run, and the passage-money is a little too stiff.

Snell.—I'll go; I will. I'm sick of this place. (*Jumping up and holding out his hands.*) Good-bye, you fellows, I'm off now.

Robinson (*going to door and shutting it carefully*).—Don't be in a hurry, my boy. It's easy to see you're new at this kind of thing. How are you going?

Snell.—By train, of course; the station's close.

Robinson.—Do you know the time of the train?

Snell.—There's one about this time, I think.

Crawley.—I can find that out from one of the day-boys. But I say, Snell, have you got enough money for your fare?

Snell.—I'm afraid not. (*Feels in pockets.*)

Robinson.—How much have you got?

Snell.—Tenpence.

Robinson.—And your fare is—?

Snell.—Seven-and-sixpence.

Robinson.—Seven-and-sixpence into tenpence—won't go and nothing over. You're up a tree, Tommy.

Crawley.—I can lend you a shilling. You'll be sure to let me have it back?

Snell.—Thanks, awfully; I'll be sure to send it you.

Robinson.—I'm sorry, Tommy, but I've only half-a-crown in the world, and I owe fifteen shillings; however, you may as well have a shilling of it.

Snell.—You're a brick, Rob., a tender-hearted brick. That makes two-and-ten.

Crawley.—Couldn't you bribe the guard to let you go in his van?

Snell.—I don't think so.

Robinson.—How are you going to do it, then? You can't walk ninety miles.

Snell.—I must give it up unless I can borrow some money, and fellows know I'm always hard up, so I don't expect they'll lend me anything.

Crawley.—It's an awful nuisance. Just as we'd arranged everything!

Snell.—Yes.

Crawley (*suddenly*).—I've got it! Eureka! Hold an auction!

Robinson.—Good for you, Crawley. You won't want your things any more, you see, Tommy, when you've left.

Snell.—No, of course not. I'll go and get my things out.

Robinson.—We'll hold the sale in here. I'll be auctioneer; I'll make 'em bid.

Crawley.—I'll go and see the time of the train. (*Exit Crawley.*)

Snell.—I'm afraid my things won't fetch much. And I say, Rob., don't let the fellows know I'm going to cut, or they'll be sure to let it out somehow.

Robinson.—All right, Tommy; you get your things out. I'll tell the fellows what's going to happen.

Exit Snell. Robinson drags form to door, mounts it, and shouts to room beyond.

Robinson.—Ladies and gentlemen! I have the honour to announce to you that, acting under advice, Mr. Thomas Snell has resolved to hold a sale of the whole of his valuable property, without reserve and considerably under cost price. (*Shouts in the schoolroom.*) The sale will be held immediately in this classroom. Tickets of admission gratis; children in arms not admitted; dogs must be led by a string and accompanied by their owners, who must be responsible for their good behaviour. (*Shouts, and boys come tumbling in.*)

Boys (*all speaking at once*).—I say, Rob., what's the excitement?—I'll bid half-a-crown—Bring forth the fiery untamed stock—Going, going, gone!—etc., etc.

Robinson (*mounts desk*).—Order, gentlemen, please! Tommy is at present engaged in cataloguing his possessions.

Purkiss.—Is he going to leave?

Robinson.—Never you mind, Purky; it's none of your business.

Purkiss.—It's as much mine as yours.

Robinson.—I'll come and punch your head if you cheek me. Come along, Tommy.

Enter Tommy, laden with bat, books, telescope, etc. Robinson puts them behind him.

Enter Crawley.

Crawley (*aside to Robinson and Snell*).—Plenty of time; the train doesn't start for half an hour.

Snell (*to Robinson*).—Do you think these things will fetch enough?

Robinson (*surveying them*).—I doubt it, Tommy, but we'll see. (*Aloud.*) Now, gentlemen, the first lot is an excellent cane-handled match-bat, presented to our worthy young friend on his attaining the age of fourteen. Who bids ten shillings?

Purkiss.—Why, it's sprung!

The Auction.

Robinson.—Sprung? Of course it is. What would the world be without a spring? A watch wouldn't go if it hadn't a spring, and you complain that the bat's sprung!

Boy 1.—I'll go sixpence.

Boy 2.—Sevenpence.

Robinson.—Bosh! Why, I'll bid a shilling, though I haven't got the money. Come, some of you!

Boy 1.—Ninepence.

Robinson.—That's better. Purkiss, you want a bat, I know.

Purkiss.—I'd sooner have a broomstick than that one.

Snell.—It's a better one than you've ever had, anyhow!

Robinson.—Come, gentlemen, we've no time for foolery. Any more bids? Going, going, gone! (*Knocks the table.*) Jordan, that's yours; hand over the money. (*Jordan pays Snell.*)

Robinson.—The next article on the programme is an excellent Latin dictionary, very little used owing to the fact that its possessor has a rooted objection to the language. It's a dead language, and he is of opinion that it shouldn't be disturbed. How much shall I say for this excellent dictionary?

Boy 3.—Is his name written in it?

Robinson.—Yes; which renders it all the more valuable.

Boy 4.—Fourpence.

Boy 5.—Fourpence-halfpenny.

Robinson.—Come, gentlemen, wake up! This book's worth five shillings.

Boy 2.—Never mind the dic., Rob.; put up the telescope.

Crawley.—You shut up, young un.

Boy 2.—Do it yourself. (*Scuffle.*)

Robinson.—Order, gentlemen! Fivepence bid, sixpence, sixpence-halfpenny, sevenpence; any more? Going, going, gone! Simpson, yours. Pay up and look pleasant.

Simpson searches every pocket and at last makes up the sum, the boys jeering.

Snell (to Robinson).—Put up the telescope next.

Crawley (to Robinson).—You needn't tell them one of the lenses is gone.

Robinson.—Now, gentlemen, comes the lot of the sale, a fine double-jointed, extra-polished brass telescope, through which Jupiter's satellites are distinctly visible and the time can be told by a church clock twenty yards distant. Who says a pound?

Purkiss.—A shilling.

Boy 1.—Eightpence.

Boy 2.—Two shillings. (*Snell rubs his hands.*)

Boy 3.—Two-and-two.

Boy 1.—Two-and-six.

Boy 2 (wildly).—Five shillings! (*Boys cheer.*)

Robinson.—Five shillings is bid. Any one say six? (*Pause.*) No one? (*Knocks it down.*) Yours, Turnbull.

Boy 2.—Hand it over, please.

Snell.—Where's the money first?

Boy 2.—I can't pay you now; I can give you sixpence now and the rest next half.

Robinson.—You little idiot! Why didn't you say so before? If Snell could wait till next half he wouldn't be selling-off. Up it goes again, gentlemen. A shilling—eighteen-

pence—no one going higher than eighteenpence?

Crawley (aside).—Money down makes all the difference.

Robinson.—Sold at eighteenpence! Only two more lots, gentlemen; schoolbooks, various. How much?

Boys (quickly).—Twopence, threepence (*up to ninepence, when it is knocked down.*)

Robinson.—Last lot! A purse for which the owner has no further use. A nice present for a mother as a hint you want it filled.

Purkiss.—A penny.

Robinson.—Any one bid higher? (*Pause.*) Yours, Purkiss. There's a hole in it and the catch is broken, but what can you expect for a penny?

Crawley.—Now clear out, you fellows.

Boy.—It's stopped raining. Come along. (*All rush out but Snell, Robinson, and Crawley.*)

Crawley.—What have you got now?

Snell.—All but a shilling.

Crawley.—Oh, here you are. I'll stand it for an old chum. It's getting on time to start. How are you going?

Robinson.—You mustn't let the fellows see you.

Snell.—I might drop out of this window.

Crawley.—Yes, and over the low wall by the fowl-house. No one can see you there.

Snell.—All right. Good-bye, you two. Don't let the fellows think I ran away because I was afraid of a caning.

Crawley.—We won't. Look sharp, or you won't have time to take your ticket. (*Opens window.*)

Robinson.—Mind the drop; it's pretty high.

Snell climbs out of window. (*N.B.—If there is no practicable window he must go through the door, and the dialogue must be slightly altered.*)

Crawley.—He's down. I hope he won't get caught.

Robinson.—I half hope he will, for some things. I shall be sorry to lose him after all.

Crawley.—Oh, yes, of course; so shall I.
Robinson.—How many minutes has he?
(*Looks at watch.*)
Crawley.—Eight minutes, and he can do it in three.

Robinson.—I think we'd better move out of this or we shall get mixed up in this business. I'm off.

Crawley.—So am I. Come along. (*They run against Snell as they approach the door.*)

Robinson.—Tommy! what's up?

Snell (*out of breath*).—Lost some of my money; not enough left. Look for it, quick!

Robinson.—Where?

Snell.—Here; must have dropped it getting out of the window, or got a hole in my pocket. (*All hunt everywhere.*)

Crawley.—How much is it?

Snell.—A shilling.

Crawley (*aside*).—Bother it all! he'll miss his train as sure as eggs.

Robinson.—How did you get back? (*They still search.*)

Snell.—Over the front gate; nobody was looking.

Robinson.—Did you damage yourself? You're limping.

Snell.—No; I've got a stone in my shoe; can't stop to take it out.

Crawley.—Tommy, quick! take off your shoe.

Snell.—What for? (*Takes it off.*) Why, here it is!

Robinson.—Of course; dropped out of that hole in your pocket. Now off you go again if you are going.

Crawley.—You must run like mad if you're going to do it. (*Gives him a leg up.*)

Snell.—I'm off. (*Jumps out of window again.*)

Robinson (*watching him*).—He'll never catch it.

Crawley.—Let's hope the train won't be punctual.

Robinson.—Anyhow we'd better cut. (*Crawley goes to door.*)

Crawley.—Wait half a second; there's Scott.

Robinson.—What's he want?

Crawley.—Look out, he's coming here.

Robinson.—Shut the window, quick! (*Crawley shuts it.*)

Enter Mr. Scott.

Mr. Scott.—Is Snell in here?

Both.—No, sir.

Mr. Scott.—When you see him tell him I want to speak to him.

Both.—Yes, sir. (*Exit Mr. Scott.*)

Crawley.—He'll have to wait a long time, I'm afraid.

Robinson.—Unless Tommy misses his train. (*Looks out of window.*) He has! There he is in the yard. He's coming up.

Crawley.—What a little ass? Will he never get clear off?

Enter Snell.

Snell.—Missed it by about four seconds. What ghastly luck!

Robinson.—Haven't you seen Scott? He wants you.

Snell.—Does he?

Crawley.—Why didn't you stay at the station?

Snell.—Because calling-over comes before the next train, and they'd be sure to send there for me. After all, I don't know whether I won't stay here and take my swishing.

Enter Mr. Scott.

Mr. Scott.—Ah, here you are, Snell. Wilkinson told me he saw you coming up here.

Snell (*frightened*).—Yes, sir.

Mr. Scott.—I find that you were away on the day that the school was told that the conservatory was to be closed in future, so in the circumstances I remit the punishment I intended inflicting on you.

Snell.—Thank you, sir.

Mr. Scott.—Mind, though, I don't find you there again.

Snell.—No, sir, thank you, sir. (*Exit Mr. Scott.*)

Robinson.—Bravo! Tommy; we shan't lose you after all.

Crawley (*aside*).—And I shan't get the Euclid prize nor get into the second eleven!

Snell.—And I shan't run away or get whacked either. That's best after all!

CURTAIN.

A MIDNIGHT VISITOR.

BY EDMUND MITCHELL, M.A.

I AM a medical man, settled in a suburb of London. The story I am about to relate carries me back to my early student days. Indeed, at the time the incident occurred I had not begun my regular medical studies, but previous to doing so, and for the purpose of acquiring a practical knowledge of drugs, was spending a year in the shop of an uncle, who was a chemist in one of our large provincial towns.

My uncle was a man of strictly business habits, and insisted that, notwithstanding our relationship, I should occupy the same position as the other young men in his employment, sharing in all the hard work and extra duties.

In common with other large businesses of the kind, provision had to be made for the sale of medicines in the night time. There were four assistants in the shop, and each of us in rotation took a week of night duty. A very comfortable truckle bed, that during the day was pushed under a side counter, served as our couch. The door bolted on the inside, and but a peep of gas was left burning in the shop. It might be—though this rarely happened—that from the hour of turning-in till morning not a single summons was sounded by the night-bell.

Well, I had been about six months with my uncle, and had got quite accustomed to this part of my duties. I could fall asleep as readily on the truckle bed behind the counter as in my comfortable

room in my uncle's house. I had also acquired the habit of turning out at a moment's notice, attending to a customer, and getting to sleep again almost without the consciousness of having had my rest disturbed. So, everything considered, I did not dislike my spell, one week each month, of night duty, as it broke the even tenor of my life, and, moreover, gave me extra off-time during the day.

On the night which at the present moment specially recurs to my memory I, as usual, bolted the shop-door from the inside at nine o'clock. I then repaired to my little recess behind the side counter and whiled away a couple of hours in perusing some chapters of a recently published medical work. Beginning to feel drowsy about eleven o'clock, I, according to wont, divested myself of my upper garments, and, putting out the gas by which I had been reading, so that there was left only one faint peep at the centre of the chief counter, got under the blankets; and then, with a long overcoat and a pair of slippers near me, in case of being called, I composed myself for slumber. My head had not been many minutes on the pillow when I was sound asleep.

I had no distinct idea of how long I had been sleeping, though I knew it must have been several hours, when the sharp "Ting, ting, ting!" of the night-bell close to where I lay, roused me to a consciousness of my surroundings. To spring

from my couch, pull on my slippers, and get into my long top-coat was the work of a minute. I then at once sallied from the sleeping recess, screwed up the gas at the central counter, and unbolted the door. The sleet and rain were beating down pitilessly, and the cold gust that entered by the door held ajar chilled me to the marrow.

I found outside a woman, of slight size, and closely muffled up in a black shawl. She slipped in, and I at once reclosed the door, without, however, bolting it.

"I want some laudanum," she said, partly withdrawing the shawl from her face.

I saw it was that of a lady—white and pinched, indeed, but bearing the distinct traces of former beauty. There was a strange gleam about her eyes, and she seemed to drop them the moment I looked her in the face.

"What quantity?" I asked, getting behind the counter.

"Sixpennyworth," was the answer.

"That is a pretty large supply," I said. "Of course you are aware that laudanum is a poison, and that a very few drops constitute an ordinary dose?"

"Yes, yes," she replied. "I know all that; I have got the same quantity here before. I buy it for outward application to remove a pain here;" and she placed her thin white hand on the side of her face where *tic douloureux* usually makes itself felt.

On reference to the books I found this was so, and while I was selecting a phial in which to place the drug I was conscious that the woman's restless eyes were roaming over the place. Then, as I turned my back slightly towards her, in the act of measuring out the proper quantity in a graduated glass, I heard her move away from the counter, and the cold gust of air and the momentarily louder sough of the wind told me the door was open. I as quickly as possible completed the operation of filling up the measure, and then turned to her rather sharply, to find her in the act of closing the door and coming back to the counter.

"You should not have needlessly opened the door," I said; "it is very cold."

"Yes," she replied; "I never thought of that. I wished to see if it was still raining."

Thinking no more of the incident, I filled the phial, affixed the label marked "Poison" in big letters, and wrapped the whole in paper, tipping the ends with sealing-wax in the usual way. The woman handed me a florin, from which I deducted sixpence and the usual extra night charge. I then accompanied her to the door, and, without another word, she slipped out into the cold night air. I immediately bolted the door, screwed down the gas again to a peep, kicked off my slippers and whipped off my big coat, and in a trice was once again snug under the blankets.

Contrary to custom, I did not get to sleep at once; the woman's face, and especially the gleam of her eyes, seemed to haunt me. Again and again I dismissed the absurd phantasy from my mind, but again and again it returned. At last I became drowsy, and was in that blissful stage, just conscious that sleep was stealing o'er my senses, when—

I shall never forget how my heart gave a great bump, and then seemed to stand still, while my blood trickled coldly down my back. I felt—I *knew*—I was not alone in the shop. There, as I lay breathless, straining my ears, I could hear a soft stockinged foot on the tessellated floor on the other side of the counter. The incident of the woman having returned to the door while my attention was engaged recurred to my mind like a lightning flash, and I at once took in the whole situation. She had admitted an accom-

plise—some one bent on robbery, perhaps on murder. While my mind was thus active I felt incapable of moving a single muscle. I tried to reason with myself that it was all a fancy—an imaginative creation. But no! hark! Pat, pat, pat went the soft footfall, and I almost fancied I heard the breathing of a human tiger on the other side of the counter. The sound receded from where I lay, then crash! down came a bottle, and thereafter all was still. At the sound of the shattering glass my heart once more gave a great jump, then sank within me. There could be no longer any doubt. The woman with the gleaming eyes had come on a mere pretext for the purpose of admitting an accomplice on blood or booty bent.

He evidently realised that the fall of the bottle might have awakened me, for I heard no further movement. I lay, bathed in a cold perspiration, absolutely incapable of moving even my little finger, far less of springing from my couch and making for the door. Besides, I felt that before I could get to it and unbolt it I would be overpowered—stabbed or garrotted, perhaps.

So I lay, breathless, nerveless, almost lifeless, each tick of the clock seeming to mark the passage of an hour. I thought of my past life; how my mother and sisters would weep when they came to learn in what manner its youthful promise had been cut short; and I felt that I should have liked one more kiss from my darling Ethel, when "Ting, ting, ting!" went the night-bell above my head. But I could not move. The thought flashed through my mind that this might be another of the gang, and I lay still, frozen with fear. After a minute, "Ting, ting, ting!" again went the bell, but still I felt powerless to respond. "Ting, ting, ting!" this time with more force. Yet I lay, paralysed and motionless. Then I heard, slowly coming along the pavement outside, the measured heavy footfall of the night policeman, and for the first time a glimmer of hope entered my heart. Tread, tread, tread, and the steps paused outside the door. Then came some muttered words, followed by one loud, long ring of the night-bell that made it quiver in its socket. This time I felt that it was the policeman himself that had rung it, and with a vague, uncontrollable desire to be

near and gain the attention of the guardian of the law, I threw off the nightmare bonds that tied me to my couch, sprang to the floor, and, unmindful of slippers, top-coat, or anything else, rushed to the door, and, with terror-stricken face, looking over my shoulder all the while in the expectancy of seeing my would-be murderer dart after me, I convulsively undid the bolt and staggered out into the street.

The policeman and a young boy, who had evidently first rung the bell, started back at the strange apparition—for I was without coat, trousers, or boots. I gasped out the words "Robber—murderer!" pointing into the shop. The policeman at once closed the door, and blew his whistle several times. Before many minutes—all the while there was no sound from within—two other constables joined us. In a few hurried words I explained the state of matters—how the lurking assassin was within. The policemen spoke among themselves, and then threw open the door. Two of them entered, and I followed. The bull's-eyes were flashed all round the shop, but no intruder was to be seen. Then I whispered to one of them, "Under the counter!" The policeman advanced, stooped down, and flashed his light into the dark recess, and there sprang forth, with a fiendish, blood-curdling yell, a lean, hungry, rain-bedraggled tom-cat, that with one bound darted through between our legs and out of the door and away into the darkness of the night. The policeman, I believe, got a greater fright than if it had been a real live burglar, for his face turned pale and his lantern dropped from his paralysed fingers.

As for myself, I saw it all in a moment. I without delay got in the boy and the third policeman outside, supplied the former with the blue-pill required, and then, tipping each of the stalwart guardians of the law, asked them to say nothing about the matter. As for myself, I lit up half a dozen jets of gas and got off my wet underclothing, for the few minutes' exposure had soaked me to the skin. Then I tried to begin again on my medical book, but it was no use. I alternately felt chilled with fear and then convulsed with laughter, and even to this day the mere recollection of that night similarly affects me.

The First Day of the Season.

Now get out your skates, boys, the ice is all ready,

As firm as a rock, with a surface like glass;

You'll have to look out or your legs will get "spread-y."

In that case you know what will *next* come to pass.

A click, and a snap, and secure is each "Aeme;"

Now gently at first, till you get your ice feet;

Look there at young Smith, I half think he could whack me

At cutting an "eight," he's so plucky and neat.

But stay, my young friend, till I try. What a cropper!

The ice is much harder, I find, than my head;

But just for that trifle I'm not going to stop, or

Give up; no, I'll practise the figure instead.

There, that is much better, "a three" is as *nought* now

To me, for you see my old form's coming back,

The figures and dodges last year I was taught, now

Seem easy to do, for I've got in the knack.

"The grape-vine" and "scissors" I glide through securely,

Perform the "spread-eagle" and "flower-pot" too;

The "rocking turn" stumps me completely, but surely

It is to be done, though it's managed by few.

I *will* not be beaten, success lies in trying

Again and again; I'll go at it until

I conquer the figure, I'll take no denying—

That's better already, I had not one spill!

SOMERVILLE GIBNEY.

THE DERELICT BRIG:

A TALE OF THE NORTH COUNTRY.

BY DR. GORDON STABLES, C.M., R.N.,

Author of "Stanley O'Grahame," "The Cruise of the Snowbird," etc.

IT is just five years come Christmas, 1884, since I heard the strange story that I am now about to relate to you—heard it from the lips of honest Farmer Deane himself, as he sat by the fireside of his own comfortable red-papered parlour, his wife in the easy-chair beside him knitting, and the younger children sound asleep upstairs.

For some months previous to my acquaintance with Mr. Deane I had been living in a romantic little village in the East Riding of York, and close to the sea. I had had the misfortune to sprain my ankle by getting spilled from my iron horse when turning a corner at too great a rate of speed. But I was determined that no number of sprained ankles should prevent me from taking exercise in the fresh air, so I looked about for a conveyance.

"There is Tommy," said my landlady—"Tommy, of the Mower's Rest. A nice little pony, and a handsome bit of a trap."

To the Mower's Rest I went—a queer, old-fashioned inn, with a wooden dais and table in front of it, besides two immense great shells of trees, for they were quite hollow in the centre, and any number of boys could have crept into them, curled up, and gone to sleep.

"Certainly, sir," said the burly host; "you can have Tommy as often as you please."

So I concluded a bargain forthwith.

It was all through Tommy I got acquainted with Farmer Deane. Tommy was a character in his way, and probably still remains so. A dark chestnut, about twelve hands high, a hog mane, a smallish head, and a very wise face, which always assumed a double amount of wisdom when, after being "put in," he took an inquiring glance over his shoulder at the trap, to see who was going to drive him.

"Oh, it is you, is it?" he would seem to say, when he saw me, whip in hand, ready to mount.

"Yes, Tommy," I would reply; "and, mind you, I'm not going to stand any nonsense, so I tell you."

"All right, measter," Tommy seemed to answer, with a saucy whisk of his tail.

So off we would start. But from time immemorial Tommy had been in the habit of taking out little pleasure-parties, generally of fisher folks or farm people, bent on a day's enjoyment.

A thirsty lot they must have been as a rule, and I'll tell you how I know. I never could get Tommy to pass a public-house without considerable difficulty.

I'm afraid that before I got back that day Tommy must have come to the conclusion that I was a strange customer, for not even the Jolly Tapsters had charms for me, nor the Sow and Magpie, nor the Bull and Bottle, nor the Huntsman's Delight. We returned as we had gone forth, only Tommy had some water and a dog-biscuit that I had taken in my pocket specially for him.

But this old pony and I became thorough friends in less than a week. If he did need the stimulus of the whip sometimes when first starting, he went well afterwards, and at any time when his nose was turned homewards Tommy went like a bird.

One nasty trick which Tommy had was that of hooking the rein under his tail. This necessitated a stop, and that was precisely what Tommy wanted.

Thus one day, when right opposite a fine old farm-steading, while admiring it I let the reins get slack. Tommy hooked the off one at once, and I used the whip.

The next thing I remembered was crawling out of the ditch into which Tommy had backed the trap. The old rascal took good care not to fall himself, though.

The splashboard was broken, the wheel-guard split, and an axle bent.

"I can put ye all right in a brace o' shakes," said a manly and cheerful voice beside me. I looked up, and there was Farmer Deane.

"Come in, sir, and rest ye," he added.

What a pleasant little wife he had! What darling children! and what a rambling, rumbling dear old house and farm it was altogether! The "brace o' shakes" got extended to two hours somehow, and then he made me stop to dinner, and it was ten o'clock and bright moonlight when I drove into the inn yard with Tommy again.

This was only the first of many and many a happy evening I spent at Greenleas, as Mr. Deane's farm was called. It lay about twelve miles inland from the village where I lived. The road took us across a rolling kind of a country, without a very great abundance of trees, but very beautiful for all that; and the lanes were often high-banked and shady, their sides carpeted with a wealth of wild flowers, with energetic-looking sturdy Yorkshire bees doing business among them, and butterflies of every hue, pretty enough to make the heart of any young naturalist beat high with pleasure.

Yes, the lanes were lovely; and so quiet and lonely, too, for sometimes for miles on miles you would hardly see a house or hut. The lanes led you up to nearly the tops of the broad, breezy uplands, then left you to wonder, as you went onwards, at the acres—nay, but the square miles of rich green wheat, waving in the wind, so that the sunshine, in long lines of glittering white, seemed for ever travelling across it. There were patches here and there where the wheat was not so tall, and in June and July these were all ablaze with crimson poppies; while, far beyond, the woods and hills on the horizon would be bathed in the purple mist of distance.

Winter came on early that year, but Tommy and I might have been met on the uplands all the same, months after all the grain was cut and carted and stacked, and the hills white with snow. For I was always welcome at Greenleas, and I spent that Christmas there.

As I said, the young children had all gone to bed, for it was wearing late; only the oldest boy, a bright, bold lad of twelve, leant over his mother's chair, and little Winnie sat on a footstool close to her father's knee.

"Hark!" said Farmer Deane, holding up his finger; "listen to the wind! How it roars aroon' the chimneys, and dindles the window-sash! Stir the fire, wife. Eh, lad, you and your Tommy pony are as well at Greenleas to-night. It's a fearful night. Puts one in mind o' being at sea."

"You've been to sea, then?" I said.

"Once," he said, "only once, really at sea. It was enough. It was the making o' me, though; but I shouldn't like to have another such experience. No, lad, no!"

Then bit by bit I wormed his story out of Farmer Deane, and tell it you now in my own words. Perhaps you will like it none the less when I assure you it is a true one.

Many, many years ago, then, about a mile along the coast to the nor'ard, and right on the top of one of the tallest cliffs, though some distance back from its actual brink, there stood a fisherman's cottage. Its ruins are still visible enough, though nearly grown over with gravel and wholly covered with weeds. There was attached to the cottage a good garden, that grew plenty of vegetables, and flowers were never scarce within it, with land enough besides for a cow's keep.

Having no family except one boy, who was about fifteen years of age at the time our story opens, the fisherman's wife could easily afford the time to look after cow, garden, land, and house as well, for Edward the boy was nearly always at sea with his father—that is, out in a boat fishing. Dangerous enough is this kind of life too, although it does not entitle the person engaged in it to call himself a sailor. But I believe little Neddie could steer the boat and shift the mainsail sheet before he was five years of age.

When the winds blew very high and the sea was rough and stormy, the old fisherman did not venture forth, but stayed at home with his boy and mended nets, or looked after the grass land, and helped to dig the garden. Yet many an evening the boat left the little cove near the sandy beach at the cliff-foot in weather that promised both fair and fine, and yet before midnight starless darkness would settle down upon the ocean, the clouds would gather close around the little boat, and the gale would break before they could run for their harbour, driving them mayhap out to sea, to slave all night cold and wet and wretched—baling, baling, baling to keep themselves afloat. Sad and terrible nights of suspense these for the wife, the mother, who sat at home alone in the cottage, the bright lamp burning in the gable window that looked seaward; or rising oft to go anxiously out to the cliff-

"Catch me if you can!"

top, and gaze away into the storm and mist, trying to catch a glimpse of the longed-for light in the boat that held the only two beings she loved on earth.

On nights like these the roaring of the wind about the cot on the cliff, or the noise of the waves breaking on the rocks beneath, or chafing and tumbling down in the bay with a sound so sullen, so merciless, used to make the heart of this fisherman's wife feel cold with fear. She had but one consolation—she could pray. Ah! there was a Friend on high to whom she could always appeal, and who never deserted her in her loneliness.

Teddie Deane was a strong, hardy, wiry lad. No extra fat or superfluous flesh about Teddy. He could hold his own with far bigger boys than himself at the village school, which he attended every forenoon of week days. He had a bright, open face, and such an abundance of fair soft ringlets waving round brow and neck, that his *confrères* usually called him "Curly."

Teddie's constant companion at school, and out of doors as well, was Willie Brown—a simple name enough, yet Willie was not a simple lad for all that, but daring—not to say audacious—in the extreme. He was not so tall as Ted, but more strongly built, and even more firmly knit together. He was well named Brown, for his eyes were brown, his hair was brown, and his skin, from constant exposure to the sun and salt sea-spray, was brown also.

The cliffs were very high along the seashore; inland the trees were very tall. Great birds built in both; the seagull or kittiwake in the rocks, the hawk and hooded crow in the lofty branches of the waving pines. But gull nor crow never yet found a place to build its nest out of the reach of Willie Brown. He could "speel" the highest larch-tree, and hang in mid-air to the side of a rock, one hand grasping a shrub-root, with the beach and its breaking waters far, far beneath him, and the wide ocean spread out before him like a picture, dotted with many a boat and many a sail.

"I feel like a bird," he would tell Teddie, "when high up there. And oh, Curly, if I were to die I shouldn't mind being a seagull! No, I wouldn't mind it a bit!"

Willie's father had a boat, in which the two lads used often to go out fishing on their own account on school holidays and Saturday afternoons, when they were not wanted at home.

The "harvest play," as it was called, was always a joyful time with these lads. Willie's father owned no more land than Teddie's did, and so, while other farmer-boys had to work in the fields during this school recess, these two spent most of the day afloat, or in the woods or among the rocks.

One day Willie appeared at the fisherman's cottage carrying under his arm a little mysterious parcel.

"Curly, are you ready for a sail?" he said.

"All ready!" was the reply. "But what have you got there? Gingerbread?"

"Gingerbread? No!" said Willie. "Don't ask till we are fairly afloat."

So down the cliff they went by the little zigzag path that led to the beach, where Willie's boat was moored; and once they had hoisted their morsel of sail, and put about a quarter of a mile between

them and the shore, Willie unfolded his parcel, and also his plans.

The former was a chart of the coast that he had found in an old closet in his father's house.

"Now look you here," said Willie. "Well, that is Holy Island, and on it is a monastery, mind you. And there are monks in the monastery—this little old book will tell us all about it. Jolly old monks, Curly, that live like fighting-cocks, but hardly ever see any one. And won't they be glad when we call on them!"

"But do you mean we are to go there now?"

"Certainly I do! I've made it all right, Curly—don't stare so! In under the seat there are lots o' water and prog, and I've given a little girl a halfpenny to go and tell your dad and mine that we've gone to the island. So all is correct, you see. This bit o' wind will run us down to the island before sunset. We'll stop and dine with the monks, if they'll let us—oh, it will be fun!—then come home tack and half-tack in the moonlight."

"Well," said Teddie, "I'm not afraid; and as you've made it all right at home, here is for off—"

"That's a man! Now shake out that bit o' reef, we'll fill and start; then we'll have something to eat."

Willie had laid up quite a store of things—biscuit and meat and cheese and bread and milk, and nuts and fruit besides. So the two boys were as happy as happy could be.

It was a glorious day; the sun shone bright above them, and his silvery beams were reflected from every wavelet that danced and rippled around them. A delightful breeze was blowing them straight on their course—a breeze that the boat could feel and seemed to rejoice in as she went skimming over the blue sea—a breeze the very gulls appeared to revel in as they whirled and whooped and screamed in air or dipped their snowy pinions in the sea.

No wonder the boys were happy!

The breeze increased, and the boat positively flew across the water and along the rock-girt shore. Willie was wonderfully good at telling Old-World stories that he had read in books found in his father's attic, and Teddie kept him at it all day during the intervals of conversation.

As the sun began to decline behind the distant hills the boys dined—and dined right royally; then they both began to sing.

"But I say," said Teddie, presently, "shouldn't we be nearly there now? Isn't the sun about setting? and isn't the wind getting up and the sea getting a bit rough?"

"That's nothing," said Willie, laughing; "give us another song."

But even Willie Brown awakened at last to the peril of the situation, when the sun went down among lurid, threatening clouds, when the seas began to dash inboard, and the ever-increasing wind threatened every moment to tear the mast out of their boat, and the island with the monastery on it which they had come to seek seemed as far away as ever—seemed only a myth, in fact.

Land on that iron-bound coast they dared not; return they could not. There was nothing for it but to fly on. Perhaps some ship might pick them up.

Night fell at last; then the round

moon rose, but was almost immediately afterwards swallowed up in the storm-clouds that came sweeping across from the west.

So darkness was all around them—darkness and danger. They had close-reefed their little sail, and so before the wind—nearly dead before it—they scudded, the great waves racing up behind them and threatening each moment to poop and swamp the boat.

I believe that at midnight, when the storm was at its very worst, and the sea a wild chaos of foaming water, poor Ted thought more of the misery his mother must be enduring than of his own danger.

"Willie," cried Teddie, at last, "hadn't we better pray?"

"Yes, Curly; but I've got a hold o' the tiller. Just kneel down beside me, yet keep your hand on the sheet."

Teddie's prayer was a very simple one, but very much from the heart.

"Curly," said Willie, about an hour after this, "the wind is getting higher; I don't think that mast can stand long. Now just do as I tell you. Are you ready?"

"Yes."

"Well, tie the oars tightly together with a bit o' rope you'll find there. No granny knots now! our lives depend upon their security. Done, you say? Now tie the oars to the painter, by the middle. Leave about a yard and a half of rope between the boat's bow and the tied oars. Done again? Right! And now stand by to heave the oars over the bows to windward when I shout, and let go the sail. All clear? Stand by, then! Heave!"

Down went the sail and over went the oars. A sea broke on board the frail craft that filled her to the gun'les, but she swung round all the same, and rode in the teeth of the gale to the oars that Teddie had so neatly lashed and so cleverly thrown overboard.

The mast was unstepped and the water baled out, the boys having to use their hats for the purpose.

The danger now, though not quite so extreme, was still very great. And oh! it was a long and bitter night they spent; and with what joy they hailed the first glimpse of the grey dawn only those who have been in a similar situation can fully understand.

No land in sight anywhere, only the great, tumbling, froth-crested waves, and the wind still raged and blew with all the force of a gale. But see down to leeward of them! Each time they rise on the top of a mountain billow a tall-masted brig is in sight. They are being wafted right upon her. Yet a strange craft she looks. Deep in the water, her topmasts and bowsprit gone, and never a rag of sail upon her.

"We'll get in those oars," cried Willie, "and up sail, and rush straight for her. We must board at the weather side; so stand by to grapple for your very life!"

Only fisher-boys—and British fisher-boys at that—could have managed a boat in that sea as Willie and Ted now did. But they managed it so well that in five minutes more they both stood safely on the deck of the brig.

The first thing that met their gaze, to their horror, was the body of a man, then another, and still a third; and from the appearance of the bodies, the torn clothes, and the blood about, which the

breaking waves had not sufficed to wash away entirely, it was evident enough that murder had been done—murder on the high seas.

There was no evidence, on a hurried glance around, that anything else alive was on board, but ropes dangling from the davits showed that a boat must have been lowered and left the ship.

From his dress one of the dead men appeared to have been the captain, another probably the mate.

Hardly knowing what they did, Ted and Willie drew the three bodies close together and covered them up with a tarpaulin. Then, hand-in-hand, stepping silently and fearfully, they took their way aft, and with much hesitation descended the companion-ladder and peeped into the saloon. Not a soul in it, but the things in the adjoining state-room all tumbled and confused—drawers broken open and their contents scattered about the deck. By degrees the boys examined every corner of the ship. It was all deserted, no one was there to tell the story of this doomed ship, or of the fearful tragedy that must have been enacted on her deck.

The wind and sea went down, and, working all the afternoon, towards evening the lads were able to clap a little sail on the brig, and, water-logged though she was, steer away for the southward

and west. Nothing occurred all that night, and the breeze, blowing steadily, seemed to waft them homewards. They saw several ships next day, but none came near enough to speak. About ten o'clock on the second night, as Teddie and Willie stood together at the wheel, they started and clutched each other in sudden fear, for forward there in the moonlight, close to the spot where lay the dead, stood a female figure robed in white! It bent low to the deck. Then a corner of the tarpaulin was lifted, and a shriek rang through the ship—a cry of terror, anguish, grief.

It was no ghost, then. Teddie ran forward at once, and soon afterwards carried below to the saloon the fragile form of a beautiful young girl of some thirteen summers old.

Pitiful indeed was the tale she had to tell, in her broken English—she was a Spaniard—too pitiful, indeed, to repeat in detail. The brig had been bound for Norway from a foreign port, laden with mahogany and specie. Her father was captain and owner, and her only earthly relation. All went well till the storm came on, when the brig was reported sinking. The captain and mates refused to leave her; mutiny was the result, and a fearful fight on deck. Then the crew came below and ransacked and robbed the ship, while poor Rosie hid for her life.

Teddie and Willie did all they could to comfort the unhappy child, but, alas! what consolation is there for sorrow such as hers?

Let me finish this over true tale in the language of Farmer Deane himself.

"Dear heart," he said to me, "I was the fisherman's boy Teddie, and here sits by my side the poor lass we (Brown and I) found on the derelict."

"You see, my mother adopted her. For the matter o' that, she could well afford it, for the price o' the brig went all into the bank to be saved for Rosie. But, bless you, sir! how I did come to love the wee lass! and I was never so happy as when sailing in the bay with Rosie by my side."

"But I was sent away for four years to a distant school, only I found time to say something to Rosie the night before I started."

"I love ye, lass!" I said; 'and when I come back I'm going to ask you to marry me, and if you don't I'll just go off to sea.'

"Well, sir, I didn't have to run off to sea. Heigho! how time flies! Stir the fire, sir. Listen to the wind! Isn't it fearful?"

I had never spent a quieter Christmas than that one, but it was none the less a very happy one, and the memory of it even now is pleasant.

A MIDNIGHT SWIM.

By ROBERT RICHARDSON, B.A.,

Author of "Christmas in the Bush," etc.

THE very good ship Cawarra, homeward bound from Sydney, was sailing through a phosphorescent sea under starlit skies. We had crossed the line a few days previously, the brave trade winds had followed us as faithfully as the albatross followed the ship of the Ancient Mariner, and had not yet deserted us.

Willie Baggart and I were seated in the lee of the skylights, I watching the masts slowly rocking among the stars. All the other passengers had gone below. The night was very still. Nothing broke the soft hush save the creaking of the cordage, the chief officer's occasional voice from the quarter-deck as he gave some orders, and two voices coming up through the open skylight from the saloon below, where the captain and the doctor were chatting.

"Tell us that yarn, Willie, you had just begun the other day when something interrupted you," I said.

Baggart and I had become close chums during the voyage. He was going to England for a year's visit. A fair blue-eyed fellow, tanned brick-brown, not above the middle height, but of a conspicuously well-knit and supple frame, clear fearless eyes, and a clean-cut firm chin, looking altogether the sort of man you do not easily score off.

"All right." And Willie began without more ado.

* * * * *

It was early in the seventies—seventy-two, I think—that I was at Waneroo, the Driscolls' Run. Squatters had not yet recovered from the "black years," and economy and thrift were the order of the hour. Waneroo is an out-of-the-way place, as you perhaps know, and the Messrs. Driscoll had been a good deal bothered by the blacks. Soon after I went on to the station they again became troublesome, several times attacking the sheep at an out-station at one of the remotest

parts of the run, and killing and carrying off a considerable number. This was a thing not to be tolerated at any time, but especially not in hard times.

There were two men in charge of this out-station, but one was an old fellow, a shepherd, and it was thought expedient to replace him by a younger and more active man. I, therefore, who was at this time doing almost everything by turn on the station, was told off for this post.

My companion was a man named Furlong, a good-natured, easy-going Irishman, who had been many years in the colonies, and we got on very well together. It is necessary that I should try and make you understand here, old man, how our hut was situated. It was the rudest possible little shanty of a place, built of unbarked logs after the most approved and elementary bush fashion. It stood back a few yards only from the river. This stream led with many a bend and circuit from our hut through bush and scrub and plain land right past the home station. Its breadth and volume made Waneroo one of the best-watered runs in northern Queensland, and compensated largely for its remoteness and inaccessibility.

Dan Furlong and I kept a sharp look-out for our black neighbours, but we ceased almost altogether to be troubled by any of their neighbourly attentions. We made a nightly patrol of the vicinity, but never caught even a glimpse of a black shadow among the gums. We began to hope that the natives, either satisfied with the quarry they had already secured, or warned off by the increased vigilance of our watch, had decamped altogether from the neighbourhood.

The summer had been a long one, but at last the winter rains had begun. We were not sorry for that, for we were beginning to want them. The rain fell steadily for three

days without pause or break, a perpendicular rushing downpour, such as those only who have lived in tropical or semi-tropical lands can conceive. On the second day Dan Furlong said at breakfast,

"Do you know, old man, the tea's nearly out? Hardly enough to last us another twenty-four hours." To most Australian bushmen short commons in tea is an infliction indeed.

"What'll we do? A ride to the head station in rain like this isn't a very lively business," I said.

"We'll wait a bit longer to see if it lightens at all. To-morrow morning I'll make for headquarters and get a fresh store, though it should pour bandicoots and bunyips."

And so it was settled. About noon on the following day the rain was falling less threateningly, and Dan mounted horse and set out. But by nightfall it was coming down as heavily as ever, with a dull heavy thud on the earth like the roar of a distant cataract, and a swishing lashing beat on the roof of the hut like a hail of leaden bullets. I expected Dan back by midnight, but midnight came and past and there was no sign of my mate. I concluded that he had found himself too comfortable at headquarters to desire to face a night ride through that bleak cold hail of water; and I could not find it in my heart to blame him.

By this time the river was almost level with its banks. Looking out from the door of the hut was to look across a vast area of flooded country, a cheerless and melancholy prospect in any case, but trebly so when it was remembered that a little further continuation of the flood meant the destruction of thousands and thousands of sheep upon our own and adjoining runs. Rain we had wanted, but floods were a worse extreme.

I did not wait longer than an hour for Dan, for I felt pretty sure that he had stayed over the night at the head station. I had had a

long and dull day in the hut, and the unceasing sound of the beating rain outside had at last produced a dull, blank, vacant feeling in my mind. In such circumstances bed seems the one thing left in the world. I lay down in my Crimean and trousers, kicking my boots into the corner of the hut with a slightly vicious feeling, as though kicking against the fate that had left me stranded in a wretched little hut in the middle of a flood, without a companion. But at least I could sleep; and to sleep I went in less than five minutes, in spite of the unceasing rataplan of the rain overhead.

I could not have been asleep more than two hours, when I was awakened by a chill feeling in my extremities. For a moment I thought that I had merely kicked off my blanket, and was feeling the cold air on my feet. I sat up with the idea of readjusting my blanket, stretched out my hand to the foot of the bed, and touched something cold. It was water! I could scarcely believe it, and for an instant thought I was hardly yet fully awake. I reached my hand out to the side of the bed—water! The next moment a cold tide flowed in over me; I sprang to my feet and found myself standing above my knees in water on the floor of the hut.

You may believe I was thoroughly awake now, yet it took me a minute or two to gather my senses together. It was clear enough what had happened. The river had risen during the last few hours far more rapidly than I had counted on, had burst its banks, rushed up the low slope on which the hut stood, and in a little more would probably wash it clean away. There was no time to be lost if I wished to avoid being involved in the wreck of the falling hut.

It was pitch dark, but in a moment or two I had reached the door. Outside thick darkness rose up before me like a solid black wall; black impenetrable night and a wild roaring of waters all around. It was a moment to daunt the boldest heart, and a deathly cold shaft struck suddenly home to mine.

With a strong effort I pulled my courage together, tried to keep my head, and prepared to face the peril. I waded out into the black night before me and the blacker flood beneath. Half a dozen steps took me above the waist, half a dozen more up to the armpits, and presently I was swimming. I made for the river. My idea was to trust myself to its current, wild as that was, and to let it drift me on eastward in the direction of the head station.

But what a desperate and forlorn hope it was, to think that I could possibly last—keep breath and warmth in my body, till I reached the home station. And even should I succeed in doing this, how should I be able to judge in this black darkness when I had reached the station? In very truth it seemed like hoping for a miracle. But at least it was better than trusting myself vaguely to the blind pathless flood of waters that stretched around me on all sides; and the instinct of self-preservation bade me fight my fight to the last and banish despair.

I was soon in the current of the river, and being borne along upon its wild torrent. I have been a good swimmer from my earliest boyhood, and it was now much in my favour that I had not to waste my strength and breath in actual swimming. What I had chiefly to do—and it was task enough—was to keep myself well above the rough and broken water, and not allow it to beat and buffet the breath out of me. A great deal of the time I was treading water, and the current was carrying me along in an almost upright position. This, of course, was not so much exertion as if I had had to swim. Had I been obliged to stem such a current, practised swimmer as I was, I could not have lasted half an hour.

On and on I was borne on the mad eddying flood, the black night continually opening its weird arms to receive me, closing again

as swiftly behind me. My difficulty chiefly was not to make progress, but to prevent myself being borne too swiftly and rudely along. Another danger was from uprooted and floating trees which were being swept headlong down the raging river, more than once striking me sidelong in their rapid passage.

The water was not so cold as you might suppose. The cold of a flood like this in northern lands would have soon become unendurable, but in our latitudes the water seldom reaches that death-chill temperature. Moreover, the very swiftness of the flow—its state of angry commotion like a vast churn—made it less cold; just as you have observed at the seaside that the water seems warmer on rough days than when it is quite smooth and waveless. I thought I could last some time yet, as far as insensibility to cold went. But I could not be sure. I was still comparatively fresh. Exhaustion might come upon me suddenly and swiftly at any moment. It was all uncertain how long I could actually last.

It took me all I knew, I assure you, keeping up my heart. The roar of waters in my ears was deafening and terrible, striking awe and horror to the heart; while the sensation of being swept on through black space, never seeing two yards before you, always with a vague terror of I know not what before you, was like being hurried into the pit of death itself.

All this time my mind was neither altogether vacant, nor, curious as it may seem, entirely absorbed in my situation. All sorts of strange thoughts went flitting and drifting through my brain in a mingled and confused progression. Scenes and places and people and fancies came back to me that I had not thought upon for years, just as they so often do in dreams, and with just as little apparent reason or connection. But every few moments I was brought up again, so to speak, to the reality and awful danger of my situation; and thus my mind oscillated in a strange way between memories of the past that I had thought were dead and buried for ever and my present and instant peril.

And now, perhaps, the strangest part of an eventful night happened. I had been, I should say, nearly an hour in the water when I was struck on the back by some heavy bulk. I caught instinctively at the object as it swept past me, and grasped the trunk of a large tree, much larger than any that had been drifted near me hitherto. The moment I seized the tree I saw that something else had hold of it too. A dark form was grasping it on the other side a little nearer the trunk.

In a moment or two more I had made out the figure. To my amazement it was a black man. We were so close that there was no possibility of mistake; so close that even in the thick darkness I saw his wild eyes gleam red and savagely, it seemed to me with mingled hate and rage. I had usurped his property, perhaps his hope of safety, and he was at once prepared to resent it.

It was easy to guess at the black man's position. He had in some way been surprised by the flood like myself; and though the Australian aborigines are splendid swimmers, the man had perhaps been maimed or incapacitated for some reason from swimming, and was trusting for safety to the trunk.

The tree was a large one, and would have proved a most helpful buoy and support to me also; but still I think I should have left my new acquaintance in undisturbed possession of his raft if he had allowed me. But he did not. Thinking probably that my intention was to oust him from his position and seize the tree for myself, he slipped along the trunk until he was right opposite me, and before I was well aware of his intention, grasped me by the head and shoulders, and endeavoured to force me under the water. There was nothing for it now but to shake

off my new-found foe. I raised myself upon the tree almost half out of the water and seized the black man in turn.

And now began a strange and deadly struggle. We wrestled and strove in the grim darkness across the trunk that rolled and swayed and turned beneath us, like two wild water creatures. Now we were on top of the trunk, now underneath and struggling and striving in the foaming water, both grasping the tree with our legs twisted about it, while each endeavoured to thrust the other off with arms and shoulders. Had it been a hand-to-hand encounter on dry land I feel sure that by some trip or ruse in wrestling I could soon have mastered my swarthy foe-man; but under the present circumstances we were more evenly matched. He fought like a wild beast; but I, too, was fighting with the strength of despair, and at last I effected what from the first I had been aiming at. I got my hands clasped about the savage's throat, and he was in my power.

But even at that moment, when my blood was up, and all the worst passions in one's heart were supreme, I did not wish to kill him, even though in self-preservation. A little more pressure upon his throat and he was a dead man; but I refrained. Putting all my remaining strength into the effort, I flung him from the tree, and in a moment he vanished from my sight in the darkness. It was my only alternative. He had still the same chance for his life as I had previously, for the strength he had displayed in his struggle with me had convinced me that he was still able to make some fight for his life against the river.

The force I had used in dislodging my foe from the tree sent me nearly off also, spinning the trunk round, and plunging me backwards in the water. But I now changed my position in regard to the tree, resting my arms across as one does with a life-preserver, and allowing my body to float as upright as possible in the water.

I was much exhausted by my recent struggle, faint and breathless, and all I could now do was to keep fast hold of the tree and allow myself to be carried along with it. A most uneasy sort of progression it was, for the trunk rolled and lurched and twisted in the tumbling waters, and it was the utmost that I could do sometimes to prevent its being swept from under me.

Thus things went with me for some time, when I became aware, with a dread sinking of the heart, that my last remaining strength was going from me. The cold of the water, the beating and buffeting of the mad current, the struggle with my black foe—was it any wonder that I was spent? My own marvel was that I had lasted so long. I could not be mistaken. I felt sure that I was at the end of my physical resources. A numbness was creeping alike over body and mind. Now and then I lost entire consciousness for a moment or two, awaking again from the brief stupor with a sudden painful start.

These periods of unconsciousness were becoming of longer and longer duration. I was grasping the tree almost mechanically, my sense of touch having become nearly extinct; the deadness of feeling was spreading all through my frame, and clutching it seemed at my very heart. The wild black world about me was growing even blacker and blacker, when suddenly I was roused to new feeling by striking my head sharply against a hard substance. I was jerked at the same moment from my trunk. I raised my arms and caught at the branch of a tree bent low over the river, full consciousness again returned to me for a few moments, and with the last remaining remnant of strength I lifted myself out of the water, scrambled into the branches of the tree, and settled in a cleft. At that instant consciousness finally deserted me, and I knew no more.

I awoke to life and feeling with a sensation as of some warm liquid trickling slowly through my veins. All my limbs were numb,

stiff, dead. It was only that creeping warmth about my heart that told me that I was still alive. Then I looked up and beheld the sun shining out strong and brilliant from a clear blue sky. It was that that had waked me to thought and sensation again; it was the kind vivifying warmth of the great life-source that was penetrating my faint and frozen frame, and reviving it.

I looked around me, and lo! at a distance of not more than three or four hundred yards were the huts, houses, fences, and paddocks of the home station, standing still well out of the reach of the flooded river on the grassy rise. Between me and the station rolled a yellow, turbid, foaming flood, which now, however, under the vivid beams of the sun, looked a very different thing from the terrific torrent in the wild darkness of the night.

My object was now to signal in some way to my comrades, for it was almost impossible that, without looking directly towards me, they should discover me hidden amid the boughs of my she-oak-tree. I stripped myself of my Crimean shirt, climbed with considerable difficulty as high as I could up the tree, and fastened the shirt like a flag to a bough. The morning breeze caught and filled it, and it floated wide in the wind.

I had not long to wait. In a few minutes a number of figures had gathered in front of the overseer's house, and presently the boat, which was always kept at the head station for use on the river, was launched upon the flooded waters. Two men jumped in and rowed towards me. My perils were over at last.

I was taken to the superintendent's own

house, given some hot drink—I knew not what—and at once put to bed in heated blankets, when I immediately fell asleep again and slept on till past midday. It was probably the best that could have happened to me, better than food or drink. I awoke feeling much better, warmer, stronger, with a less vacant, dazed, and dreamlike feeling in my brain, and able to take food. I was nursed and tended during the next few days like a child, but it was many weeks before I quite got over the effects of that night's adventures; indeed occasional slight twinges of ague that I am liable to to this day I attribute to that midnight swim.

* * * * *

"And now, old man, everybody below there's gone to roost, it's going eight bells, and I think you and I'll turn in too."

THE MIDDY'S PLUM PUDDING;

OR, A CHRISTMAS DINNER ON BOARD A SLAVER.

"To-morrow will be Christmas Day," remarked Lieutenant Hill to Harold Browne, the midshipman of his watch, as the latter made his appearance on the quarterdeck of her Majesty's ship Foam, to report to his superior officer that he had gone the rounds, and found the look-out men on the forecabin on the alert and doing their duty.

"Yes, sir," replied Mr. Browne, with a smile, "and I hope it's the last we shall spend on the West Coast of Africa."

"How is your mess looking up for Christmas fare?" inquired the lieutenant; "better off, I trust, than we are in the ward room?"

"I don't know, sir, but I expect it'll be a case of 'salt horse' at one end of the table and salt pork at the other; you know what an 'empty belly' station this is."

"Yes, it's pretty bad that way, Browne, but I should have thought that your caterer might have laid in a stock of fresh provisions when we anchored off Jella Coffee the other day."

"Nothing to be got there," replied the midshipman, "but a few 'Jella Coffee runners' (the name given to African fowls), and we finished the last of 'em yesterday, old and tough as they were."

"Well, I'm afraid you are worse off than we are; however, the purser has plenty of flour and raisins in the hold, so at any rate there'll be the orthodox plum pudding to fall back on, my boy."

"Sail on the weather bow, sir," hailed the "look-out" in the foretop.

It was a lovely night, such a one as is only met with in the tropics. In the bright moonlight the long low line of the African coast down which the Foam was running was plainly visible on the beam, and the dull roar of the heavy surf breaking on the white sands might be heard from time to time above the wash of the sea and moaning of the wind through the ship's cordage.

The good ship was spanking along under "all plain sail," every stitch of canvas drawing. For over three years had she ploughed her way up and down the coast of the Dark Continent assisting to keep down the infamous slave trade; but the Foam's had been very unfortunate in comparison with the crews of other vessels forming the African squadron; as yet they had never succeeded in making a capture, and consequently they were very anxious to retrieve their fortunes before the termination of the commission.

So when the cry of "Sail on the weather bow" was heard it had an electrical effect on the lieutenant and the youngster.

The former jumped quickly into the hammock netting, and with his night glass carefully scanned the horizon, and said in excited tones,

"Young'un, if this turns out to be the craft we are in search of, I congratulate you on the Christmas box you'll get."

"What does she look like, sir?" exclaimed the mid, scrambling up to the side of the lieutenant.

"Long black hull, schooner rigged, and—upon my word, I believe we're in luck at last. Boatswain's mate!"

"Ay, ay, sir."

"Hands make sail; call the skipper, Browne."

"Tumble up there, lads, tumble up, men," roared the boatswain's mate, as he stood at the top of the fore hatch.

Up they came in response to the shrill pipe, and quickly flew to their stations.

As they busied themselves making sail Captain Harris, the commander of the Foam, appeared on deck.

"Hullo, Hill, what's up now?" were his first words.

"Schooner right ahead, sir, crossing our bows, and if I'm not mistaken it's the Raven."

"You don't say so," rejoined the cap-

tain, rubbing his hands with glee, and, mounting a gun-carriage, he took the lieutenant's glass and looked in the direction indicated by that officer.

"I believe you're right, Hill, but I'll very soon know. Mr. Courtney," addressing the first lieutenant, "is the bow gun loaded?"

"Yes, sir."

"Then fire across her bows at once, and if that doesn't make her heave-to we shall understand each other. Stand by forward there to fire the bow gun."

"Ay, ay, sir."

"Fire!"

Bang! The flash lit up the rigging of the Foam, making all the ropes and shrouds look as if they were traced in fire; while a wreath of white smoke rolled across the moonlit waters, and as the breeze carried it far away officers and men strained their eyes to see the effect on the schooner.

"That doesn't look like heaving-to," said Mr. Hill to the captain; "they're clapping on more canvas—why, she goes like a witch."

"She does indeed; we must give her another shot, but don't fire low—aim for her foremast. I don't want to hurt any of the poor wretches that may be stowed away below."

Once more the gun sent its iron missile hurtling through the air, but the shot fell short, and it was evident to all on board the Foam that the Raven was fast showing the man-of-war a pair of clean heels.

"This will never do, Hill," said the captain, casting his eyes aloft. "Has she got all the sail on she can carry?"

"Yes, sir."

"Foretop there."

"Ay, ay, sir."

"Keep a sharp look-out on that schooner."

"I think, Captain Harris," said Mr. Rowe, the master, who for the past ten minutes had been as attentively watching the horizon to windward as his shipmates had been regarding the movements of the supposed slaver to leeward, "we must shorten and furl."

"Why, Rowe?" answered the captain, and there was a slight shade of annoyance in the tone of his voice.

"There's a tornado brewing over the land," replied the master, pointing to the coast.

"Yes, you are quite right. Hands shorten sail!"

On the African coast the atmospherical changes are rapid and frequent. At one moment the sky may be perfectly clear, and the sea as smooth as a millpond; a few moments later a dark cloud in the form of an arch is seen rising quickly over the land towards the zenith. The temperature, which has been unbearably hot and stifling, falls fast, as cold currents of air laden with the scent of earth and perfume of flowers are wafted seaward. At last the arched cloud, on attaining its highest elevation, suddenly bursts asunder, and with a wild, whistling, screeching sound the wind comes roaring furiously across the waters, tearing them into sheets of foam and whirling the white crests before its path.

Woe betide the ship caught unprepared in the track of the tempest.

But, fierce as it is, the storm is of short duration. It appears quickly to exhaust itself, and frequently in a quarter of an hour it has blown itself out, and is succeeded by a deluge of rain, to be followed by the bright sunlight and gentle breeze.

The ship's company of the Foam very soon stripped their ship of her white pinions, and presently, when the tornado bore down upon her, it found little more than bare poles to wreak its wrath on; so it raged and roared round the ship in impotent fury, in concert with the artillery of heaven; while high above in the black vault the lurid flashes of lightning darted here and there discovering the frightened clouds that were scurrying madly across the sky, and lighting up the dark billows that heaved and tossed as if in agony below.

When the tornado was over the Foam's men were not at all pleased at finding that the chase was no longer in sight. Eager looks were directed to the quarter in which she had last been observed, but nothing was visible on the now calm waters, which were rising and falling in long gentle undulations.

The bluejackets, who were drenched to the skin by the heavy downpour, were quickly aloft, and once more the vessel was arrayed in all the glory of her white wings, but the wind had fallen so light that she made little headway.

It was now close upon eight bells (midnight), so the hands were piped down and the middle watch mustered.

Lieutenant Hill and Mr. Midshipman Browne having been duly relieved by their "opposite numbers," upon whom they impressed the necessity of keeping a sharp look-out for the schooner, wished each other a "merry Christmas," which both appeared to think a good joke as they shook hands together and smiled at the "drowned-rat"-like appearance they presented. After this ceremony they disappeared below, the one to his cabin, the other to his hammock.

* * * * *

"Now then, Browne, out you shoot; show a leg, there, show a leg, you sleepy head," shouted a chorus of noisy young mids as they stood round Mr. Browne's hammock at five a.m., and at last succeeded by jerking the lanyard in precipitating the midshipman of the first watch to the deck, where he lay for a few seconds under a pile of pillows which his lively messmates in the exuberance of their spirits shied at his head.

"Come along, you duffer; here's the

schooner that you lost last night in sight again, and old Fizzle the gunner is going to give her a slight touch of the 'Excellent.' Look sharp, or you'll lose the sight."

Away scampered the noisy lot to the fore-castle, and Browne, having got inside his jacket and trousers, followed in a high state of excitement.

He arrived just in time to form another unit in an anxious group of spectators who were watching Mr. Fizzle, as that good gentleman, bursting with professional ardour and standing in the approved attitude behind the bow gun, was taking a careful sight along the metal at the schooner that was seen through the bow port scudding gaily over the blue waters.

"Aim for the foremast, Mr. Fizzle," called out the captain, who was watching the schooner from the mizen shrouds.

"All right, sir. Hélevate."

"I say, Charley," said a saucy-looking mid to another, "is 'hélevate' in the gunnery book?"

"What's that you remarked, sir?" exclaimed Mr. Fizzle, who overheard the question.

"Oh, nothing particular, Mr. Fizzle; I didn't know 'hélevate' was in the gunnery book, that's all."

"Certainly it is, sir," seriously answered that worthy. "Hélevate, my man. Hélevate! Well!"

A dead silence followed the gunner's "Well!" as that officer, placing his left hand on his hip and holding the lanyard loosely in his right, stepped quickly aside, jerking the trigger sharply and—

The gun missed fire!

"Shiver my tarry top-lights," roared Mr. Fizzle to one of the gun's crew; "you rascal, you forgot to prick the cartridge."

"Axin' yer pardon, sir—"

"What's the matter there, Mr. Fizzle, with that gun?" sang out the captain.

"Why, sir," spluttered the gunner, "this—"

The remainder of the sentence was lost in the roar that followed.

"Well done, gunner."

A cheer went up from the crew of the Foam as they saw the shot strike the main gaff of the schooner, bringing it down and causing considerable confusion. Before the damage could be repaired by the slaver's crew the man-of-war was alongside her, and the master of the Raven (for it was that vessel), seeing that resistance was useless.

In a few minutes the boats of the Foam were manned, and the slaver was boarded, the master and his villainous-looking crew were secured, and the hatches thrown open to liberate the poor negroes from their stifling dungeon.

Over two hundred of the wretched creatures were brought up, many of them in a dying state, only just released in time to save them from the fate of a dozen of their less fortunate companions in misery, who were found dead at the bottom of the hold.

As soon as the negroes were transferred to the Foam the slaver was taken in tow, and a guard of marines left on board her until Captain Harris could make up his mind as to whether he would proceed with her to Sierra Leone or despatch her to St. Helena.

Eventually he decided on conveying the negroes to Sierra Leone in the Foam, and sending the Raven in charge of Lieutenant Hill to St. Helena.

"You need not leave till the afternoon, Hill," said the captain to the lieutenant, "as the half-dozen hands I shall send with you to navigate the schooner may as well enjoy their Christmas dinner with their messmates before starting."

As soon as all the necessary arrangements had been made as regards the schooner, the Foam's crew settled down to the usual Christmas Day routine, delighted with the prospect of a good lump of prize money and at the good morning's work they had accomplished.

Christmas Day was accordingly kept in accordance with the time-honoured custom that prevails in her Majesty's ships, whether they be sailing under the burning sun of the tropics or ice-bound in the frozen regions of the north.

After breakfast, and directly the crew had had the regulated time to clean, all hands "fell in" at divisions on deck arrayed in their best clothes, looking as neat and trim as possible. And after being inspected by the captain and dismissed, church was "rigged." A curious expression perhaps to any but nautical personages, but the meaning of it is that a certain number of fire buckets or buckets of any description are arranged along the quarter-deck from the mainmast aft, which support the capstan bars that are placed across them, and on these bars the men sit; a reading desk is then improvised out of a couple of conning stools placed one above the other; over these a flag is thrown, and the arrangements for "Divine Service" are complete, or in other words "Church is rigged."

The ship's bell now tolls for a few minutes, and as soon as the officers and men are seated the first lieutenant informs the captain, who emerges from his cabin, and, taking his place behind the desk, commences with the prayers that are enjoined by the articles of war to be read daily; the proper lessons follow, and in some vessels hymns are sung, and well sung too, by the bluejackets.

On board the Foam this Christmas morning, as the ship under easy sail drifted along the African coast, the Christmas Hymn was joined in heartily; and depend upon it that many a weather-beaten old sailor, as he raised his voice in the chorus of praise, thought of the days long past when in some pretty village church in the dear old country as a youngster he had sung the self-same words.

The negroes who were gathered together in the waist looked on with wonder as the service proceeded, and although they did not quite comprehend what was going on, their faces beamed with pleasure when they heard the ringing music "Hark, the Herald Angels" proceeding from the three hundred throats.

The service concluded, the order was given to "pipe down," and then Captain Harris and his officers, at the invitation of the petty officers and seamen, walked round the lower deck to inspect the men's dinners.

The lower deck was tastefully decorated fore and aft with palm leaves and bunting, while each table was groaning under the weight of enormous plum puddings, pasties, and eatables of various descriptions, among which I am sorry to say "salt junk" was very conspicuous.

At the head of the tables stood the cooks of the messes, holding plates overflowing with huge slices of plum pudding, of which the captain and officers were

begged to partake. As the gallant officer had to pass a great number of these mess tables in his passage round the decks, and would scarcely like to hurt the feelings of his men by refusing the proffered "duff," he had some difficulty in stowing away the dainty. Not so the young middies who followed in his train but well in the rear; they had a fine time of it, and the only wonder is how they managed to get through their own dinner which took place later in the day.

Having visited all the messes the captain addressed a few kind words to the crew, wishing them a "Merry Christmas," and expressing a hope, which was joined in by every one on board, that the next would be spent in England.

Then he retired to his cabin and wrote out the "sailing orders" for Lieutenant Hill.

About three o'clock Captain Harris sent for his lieutenant, gave him his orders, saying, "I have picked out six of the steadiest of the crew to accompany you, and in addition to these men you had better take Duncan, the quartermaster, and one of the young gentlemen to keep watch."

Lieutenant Hill selected Mr. Midshipman Browne, and as soon as that "sucking Nelson" was informed his delight was unbounded, notwithstanding the pretended commiseration of his messmates.

"Poor fellow!" exclaimed one; "you'll get no pudding aboard that filthy old tub! How I pity you!" but he knew his pity was thrown away.

"Who's that as will get no pudding?" exclaimed Jenkins, the gun-room steward, from his pantry. "Don't be quite so fast, Mr. Crofton. You didn't think, Mr. Browne, that I was a-going to let you go aboard the slaver without your Christmas dinner? No, sir! You'll find in the cutter as big a duff as your brother officers will see on their table to-night."

"Thank you very much, Jenkins," replied the youngster. "Good-bye, you fellows! Hill's singing out for me. Here, help me up with my traps, or I shall lose my passage!"

On reaching the quarter-deck Mr. Browne found the lieutenant ready and waiting to shove off. Captain Harris saw them over the side into the cutter, and gave a parting word of advice to Lieutenant Hill to keep a good look-out on the master and crew of the slaver. "Don't like the look of the skipper at all, Hill," were his last words. "Keep your eye on him!"

Lieutenant Hill's first care on reaching the Raven was to see that her late crew and the master, a swarthy Spaniard, were properly secured in the slave-hold, where Captain Harris had directed them to be kept during the passage; and, being satisfied on this head, he sent the marine guard back to the Foam, and while his own men, under the direction of the quartermaster, were splicing a few ropes that had been cut away by Mr. Fizzle's lucky shot, he made a careful survey of the ship, finally bringing up in the master's cabin.

"This will be our den," remarked Lieutenant Hill to the middy; "and a filthy place it is at present. Faugh! look at the cockroaches! The ship swarms with them!"

The master's cabin was indeed a con-

trast to the neat ward-room of the Foam. It was fitted up as a sleeping-cabin, having two bunks on either side, with not even a curtain to screen them. The only furniture it contained was a couple of chairs, a table, and a greasy oil-lamp, suspended by rusty chains from a brass rod under the small skylight. There were lockers at the after end, but they were fastened, and the keys were not visible. Beneath the table there was a small square hatch, and, lifting the cover, the lieutenant desired the mid to jump down and see what there was below.

"It's only an empty store-room," reported Mr. Browne. "There are a few old bottles down there, and any number of rats!"

"All right, my boy! Now tell Duncan to order one of our people to light the galley-fire; and as soon as we get under weigh we must see what can be done towards getting something cooked for dinner."

Mr. Hill repaired to the upper deck, and, finding that everything was ready, hailed the Foam, and asked that the hawser which bound the schooner to her captor might be cast off. This was done. Sails were hoisted, and in a few minutes the Raven was gliding quietly along in the opposite direction from the course of the man-of-war. The lieutenant and his subordinate paced the deck of the schooner together until dark, and as the lights of the Foam were just fading away in the distance across the wide stretch of waters, he remarked that it was nearly time that they should think about getting something to eat.

"We shall have a very quiet Christmas dinner together, Browne—not quite such a lively party as they'll have on board the Foam to-night."

"Never mind, sir, we shan't do badly; Jenkins sent such a whopper of a pudding on board!"

"I'm glad to hear it, for there's precious little of anything else, I fear, except a few pots of preserved meat and pickles."

"Dinner's ready, sir," said the blue-jacket who was doing duty as steward, cook, and valet.

"All right! Duncan, take charge for an hour while I go below. Keep her head due south for the present."

Lieutenant Hill and Mr. Browne once more retired to the master's cabin, and found that Tom Snell, the bluejacket, who combined in his own person the three functions above mentioned, had laid the table to the best of his ability.

The midshipman's pudding occupied the centre, and was supported at one side by a box of sardines, on the other by a pot of lobster, while at the foremost end of the table reposed a four-pound piece of salt pork, faced at the after end by an eight-pound piece of salt beef.

But when the two officers entered the cabin they observed a few delicacies that Tom Snell had not provided. The cloth was literally swarming with huge cockroaches, and not until these unpleasant and uninvited guests had been disposed of did Lieutenant Hill and young Browne commence the attack.

"I expect, Browne, that this is about the slowest Christmas dinner-party you ever sat down to," remarked Mr. Hill as he looked into the depths of the sardine-box and brought to light one of their uninvited guests.

"After that, I think we had better

commence on the lobster. Pass your plate this way."

"You can remove the fish, Snell," said the lieutenant. "We'll try the next course."

"Shall I give you some beef, sir?" said Mr. Browne.

"Thank you, no, Browne; I'll help myself. Salt horse I never could tackle, even in my young days, and my teeth were pretty good too."

After the two officers had played with their salt fare for a few minutes, they looked up at each other and burst out laughing.

"What are you laughing at, young un?"

"Oh, I was only thinking whether we shall manage to get through that piece of junk before we reach St. Helena."

"Was that all? Come now, let's try the duff."

Mr. Jenkins's Christmas pudding was found to be excellent; at any rate, the midshipman thoroughly appreciated it.

"Now, Browne," said the lieutenant, "fill your glass; here's some good claret which our dear old skipper gave me, and now I must ask you to drink the same toast that our shipmates no doubt are drinking—

"Absent friends."

The middy duly honoured the toast, and then the lieutenant requested Tom Snell to remove the banquet.

"The what, sir?" said the astonished A.B., looking around.

"The banquet, you donkey! Well, the grub, then."

"Ay, ay, sir; but where shall I put it?"

"Isn't there a safe in the schooner?"

"No, sir."

"Well, put it in one of the lockers."

"They're all locked, sir."

"Oh, well, put it on top of one of the upper bunks till the morning; and look here, Snell, throw the tablecloth over all, or the cockroaches will walk off with the lot before the morning."

Tom Snell did as he was ordered, and when he had completed his job returned to the upper deck.

"Just look at the way that fellow has arranged the gear," said the lieutenant to Mr. Browne, pointing to the bunk.

"I see," said the middy; "looks exactly as if some fellow was asleep under the cloth."

"Yes," laughed the lieutenant; "the pudding at one end makes a capital head and the lobster-pots at the other you might with a very small stretch of imagination suppose to be the gentleman's trotters. Shall we go on deck?"

All was quiet on deck. Duncan, the quartermaster, was steering the schooner, and two others of the crew were looking-out forward, while the remainder of the men were lying down on the fore-castle asleep.

It was a lovely night, almost as bright as day. The schooner was riding with an easy motion over the silver-crested waves with a nice steady breeze on her quarter, leaving in her wake a sparkling track of phosphorescent water.

Mr. Hill looked aloft at the white sails, and then turning to the quartermaster asked him if the slaver's crew had been at all noisy in the hold.

"They was gettin' rayther obstreperous about half an hour ago, sir," replied Duncan, "singing out for water. That

Spanish skipper was swearin' 'orrid, but I told 'em all if they didn't hold their jaw I'd shy a bucketful on their heads, and they've bin quiet enough ever since."

"But mind you let them have sufficient, Duncan."

"Why, bless you, sir, they've got plenty below, and it's a jolly sight more than they deserve."

"I think," said the lieutenant, "I shall go below now and turn in till eight bells. You can take charge of the watch till then, Browne; it's all plain sailing. Call me if the wind shifts, and, mind, on no account take off the main-hatch without first apprising me."

The lieutenant went below, and Mr. Browne, feeling proud of his responsible position as officer of the watch, strutted to and fro on the little quarter-deck of the schooner, occasionally stopping for a few minutes in his walk at the main-hatch to listen and ascertain whether the prisoners were quiet.

Once or twice he heard a few sounds as if some slight altercation was being carried on, but as the hours passed all was quiet as death; only the rippling of the sea against the schooner's bows broke the silence of the night.

Just about seven bells, as his watch was drawing to a close, he noticed through the little glass skylight over the cabin that the oil-lamp was burning very low, and as he stooped down and peered into the cabin he caught sight of the covered-up remains of his Christmas dinner, and was forcibly struck with the really strong resemblance it bore to a human being stretched out in the bunk; more so than ever now in the dim light.

He smiled to himself and was on the point of getting up and telling one of the crew to go down and trim the lamp, when something that he saw below riveted him to the spot with horror. There beneath him he saw stealthily crawling out from beneath the table a man, and as the fellow rose to his feet he saw in the man's hand a hatchet or axe. The swarthy face and red sash showed him at once that it was the master of the slaver, and it flashed across the boy's mind immediately that he must have obtained admittance into the cabin through the hatch.

"He'll murder Hill," muttered the middy; but before the youngster could raise his voice the Spaniard swung the axe round his head and brought it down with a terrific crash on the pudding. At the same moment the stalwart form of the lieutenant leaped across from the opposite side, and, clutching the would-be murderer by the throat, dragged him backwards across the table.

"Take that, you cowardly skunk," exclaimed the lieutenant, giving the astonished Spaniard a blow with his clenched fist across the face. "Quick, Browne; jump down here and secure the hatch, I hear the whole lot of them below!"

In a minute the midshipman was beside the lieutenant, and, crawling under the table, he was just in time to slip the bolt, and prevented the raising of the hatch.

The cry of the lieutenant had brought all the Foam's crew to the rescue. In very short time the master of the slaver was heavily manacled with some of the

irons used for the slaves; and, this done, Hill, taking a revolver in his hand, and followed by Duncan and Browne, went to the main-hatch and directed the slaver's crew to come up singly, saying as he stood over the aperture that the first man who attempted to make a rush he would shoot. One by one they appeared, and each in turn was placed in irons.

Mr. Hill, then taking a lantern, went below, and on examining the hold ascertained that one of the planks forming the bulkhead that separated the store-room from the other part of the ship had been carefully removed, thus affording a means of ingress to the cabin.

I have little to add to the story beyond stating that during the remainder of the voyage Lieutenant Hill took particular care that neither the captain nor the crew should have another opportunity of making use of the formidable axe which Mr. Browne declared was just the thing they required for chopping up their "salt horse."

The Raven reached St. Helena in due time, and the slaver and her captain having been safely handed over to the authorities, and the latter well punished for his baffled attempt on the life of the lieutenant, Mr. Hill and his party proceeded in the mail steamer to Ascension, where they rejoined the Foam, and shortly afterwards sailed in her for England, where we hope they may have spent their next Christmas Day, and enjoyed a better Christmas dinner than they had to put up with on board the slaver.

CHRISTMAS MATIN SONG.

Music by ARTHUR HUDSON.

VOICE. *Majestic and sustained.*

PIANO. *mf*

Come, bre - thren, all who feel full

fain To raise a - loft a joy - ous strain, For

f

1st, 2nd, & 3rd times. Last time.

Christ - mas - tide is come a - gain! gain!

Ope wide your sleepy, sluggard eyes,
With heartfelt joy from couch arise,
Though night still shrouds the midnight skies.

Sing not as if ye sang for hire,
But e'en on this cold earth aspire
To emulate the heavenly quire.

Chant loudly! Let your holy mirth
Attest your gladness for His birth
Whose coming brought goodwill to earth.

FINDINGS NOT KEEPINGS: A CHRISTMAS STORY.

By F. L. ROWTON.

CHAPTER I.

"CHRISTMAS time! 'Tain't much of a Christmas time to me, anyway. Great folks may manage to keep themselves warm, I can't."

He was a poor ragged boy standing at the corner of a London street where crossings joined, and he had been plying his broom diligently, sweeping away the thick snow which had fallen to the depth of quite a foot.

He had only earned one penny that day, and his cheeks looked pinched with hunger and the biting cold, while his dark hollow eyes eagerly scanned every face that passed by. But scarcely a glance fell upon him in return; people seemed in too great a hurry and too much interested in their own affairs to bestow a thought upon him just now.

"'Tain't so much for me," he said to himself, as he wiped away a tear that stole down his grimy cheek, "as for little Ben. I *would* have liked to take him something home. 'Twould make believe Christmas." And a sob caught his breath.

"I wonder if people ever think how hungry poor folks is! There's a gent crossing along the road where I've swept! I'll foller him. 'Please, sir, I'll be very thankful for a copper, I've only—' He's gone! and never so much as looked at me. It *is* hard."

Tears filled the boy's eyes; he thought of last Christmas, when their hard-working mother, though she had been unable to help them keep Christmas as others do, had at least been with them, and they had been far happier.

Joe's father was no help to his boys; his drunken habits had brought them where they were.

His wife died in the spring of low fever, induced by cold and bad living; and while the husband seemed almost indifferent to her loss, the two boys mourned her sadly. Many were the tears that ran down the wasted cheeks of little Ben and stained his miserable ragged pillow, when he was left lonely and sick all day in the garret where they lodged, and many a sob heaved in the breast of Joe as he swept his crossing. He was thinking of her now, as he stood dreamily gazing around him. How she had contrived, out of her poor scanty store, to give them a few little pleasures to make believe Christmas!

"And I wish, I do just wish she hadn't gone away and left us," sobbed Joe, "or if she'd took us with her! Hallo! somebody's dropped summat. What is it? A purse!"

A purse it was sure enough, of tarnished leather, and the "somebody" who had dropped it was far on ahead, even if Joe could have seen through the fog, which he could not.

But just as he noticed the purse he had caught a glimpse of a cotton gown disappearing into the gloom of the gathering blackness, so he fancied that might have been the person who had lost it, and that it was a woman. His first thought was one of great delight. Here was something for him after all! and he eagerly opened it to see what money might be inside.

Two half-crowns and three penny-pieces! It seemed a fortune to Joe.

"Now we can have some dinner to-morrow!" he cried, in great glee, "and Ben can have some o' them oranges!"

As he shut the purse again he paused, and looked doubtfully at it, while a shade crossed his eager face.

The purse was not his. He had no right to take the money.

Poor Joe! it *was* hard; and as that little reminding thought assailed his conscience, he tried to shake it off, to put it away from him, and to think only of little Ben having a good dinner. But no, it would not do; the purse was not his, and he must not touch the money!

And in all that crowd of careless, bustling people around him, not one knew the bitter temptation that had come to him. He felt as if he *must* have the money—and once even, holding, almost crushing, the purse in his trembling hand, he was proceeding towards the shops—but a sudden remembrance swept across his mind and stayed his progress.

It was only a little text of four words, but his mother had taught it to him not long before she died, and had bidden him *never* forget it when she should be no longer by to remind him. And it came to him now as though her own living voice had spoken it—"Thou God seest me."

He stopped abruptly, put his hands before his face, and burst into tears. It was the hardest struggle of his young life.

With one voiceless sob the hungry boy whispered a broken prayer, but it came straight from his heart.

The air, foggy and heavy as it actually was, somehow felt lighter now to the poor exhausted boy than before; he could look quite easily at the purse, and he felt that it possessed no power to harm him now. He did not know how great a Christmas offering his conquered temptation had been in the sight of God. He only knew he had done right, and *therefore* felt happier.

But he was not to be left quite desolate. A thought suddenly struck him. He *might* spend one or two of the *coppers*, because *those* he would be able to earn, and could therefore repay. He *had* earned one penny that day, and the half-crowns he would hide somewhere until some one claimed them.

His father must not find them. At any rate, little Ben could have an orange or two, to "make believe" Christmas, and he would replace the coppers with all the speed he could.

Drying his eyes, he took out two of the pennies, carefully shutting up the silver in the purse and putting it safely into his pocket, picked up his broom, and walked quickly towards the fruiterer's.

He walked into the shop and up to the counter, where were displayed those juicy apples and pears and golden oranges that he had so longed to be able to take to his little brother.

The shopkeeper, a ruddy-faced, pleasant-looking man, put up three large oranges in a paper bag for him—which Joe thought were beauties—and, taking up two or three rosy apples, slipped them in too, saying, "There, my boy, that's a Christmas-box for luck!"

Before the boy could recover sufficiently to thank him he turned to speak to an old gentleman who, unseen by Joe, had been making a good many purchases at the other end of the shop, and now came forward, bearing a heavy, well-filled bag, in addition to several brown-paper parcels, which he carried under his arms.

"It isn't very far," he was saying to a man who had been serving him; "but I can't carry it, my arm is quite stiff and cramped now."

"Want your bag carried, sir?" briskly asked the shopkeeper. "Here's a boy who will be glad of a job, I'm sure;" for he knew Joe by sight, his crossing being nearly opposite his shop; and, having noticed the boy's sad face all that day, felt sure he was safe in what he said.

Joe looked radiant. "I'll carry it, sir! I'll carry it!" he cried, delighted, and stuffing his own paper bag into his worn pocket. "Where to, sir?"

"Stop a bit, my lad," said the old gentleman, releasing his arm carefully from the heavy bag and giving it a gentle shake. "There, that's better. Take care of it. To the railway station—over yonder."

Joe took the load, and, turning a grateful look to the kind shopman, set off with it. It was very foggy, and he had to keep close to the gentleman for fear he might lose him.

The distance was not great, but it was made longer on account of the fog, which rendered their progress more slow and tedious than it would otherwise have been, and the jostling crowd, too, which every now and then ran into them.

But the station, with its row of lamps gleaming dully through the murky blackness, was reached at last, and Joe set the bag safely down on the platform, receiving as a reward for his services a bright silver coin.

Sixpence! Hurrah! there would be some dinner after all for little Ben!

Holding it tightly in his hand, he rushed back again, made his way in the direction of the cross roads, and, after some careful deliberation, purchased a small loaf, a rasher of bacon, and a couple of eggs—Ben was fond of eggs.

Then he set off home as fast as he could, holding his treasures tightly as a miser does his gold, never stopping until he reached the wretched back street where he lived, lit by one dim lamp that faintly glimmered, struggling with the fog.

The poor boy was tired, hungry, and wet, for it was snowing again fast; but he hurried on. He could not see much, but there was no fear of his losing his way, he knew it too well for that.

It was the last house up a little court, on the right-hand side, and he reached it at last. It was all dark at first, but as he opened the door the woman of the house came out with a candle guttering in her hand and her apron flung over her head.

"Snowing again!" she muttered, as Joe by the light of the flaring candle groped his way up the narrow flight of broken stairs to the top of the house to the garret where he and his brother lived. Turning the handle softly, he entered the room.

It was dreary enough, being lighted

only by a window or skylight in the roof, and now the snow had lodged on it thickly, dripping here and there through the cracked panes on to the floor below. How scantily it was furnished! Two chairs, a truckle-bed, and a table were all it contained. There was a cupboard in one corner, and that held all their necessities—a few plates, cups, and an old teapot—and a small supply of firing. This was all; but, desolate as the place looked, it was "home" to poor tired Joe, and he gave a sigh of relief as he put down his armful of things on the table, and then turned to the bed whereon his brother lay.

"Is that you, Joe?" said a faint, weary voice. "Oh, I thought you was never comin'; it's all so dark and cold!"

You could hear from the trembling tones that Ben was near crying.

"Never mind, Bennie," Joe replied, cheerily; "I'll soon get a light, and I've got summat here for you. Just wait a minit; you can't see yet; three oranges! Think of that, and all for you!"

"Oranges!" said the child, raising himself in his bed, with eager, longing eyes. "Oh, Joe, how *did* you get them?"

"Ah, I'll tell you all about it," said Joe, who was busy raking in the grate and putting some sticks in to boil the kettle. "And the man at the shop he giv' me four apples, he did, for a Christmas-box; and an old gent as wanted his bag carried to the station giv' me a sixpence; and I've got two eggs here for you. There, that's better," as the wood began to crackle. "Now for the kettle; that's it." So saying, Joe placed the kettle firmly on the embers, and then began to unpack his treasures, displaying them before the admiring eyes of his brother. "There they are, ye see," holding up the eggs, one in each hand, "and all whole. I was afeard they'd break, what with the loaf and broom and all, but they ain't. Now you shall have a tea presently. Here's this 'ere rasher too."

"But, Joe, hadn't we better save that for to-morrow?" put in little Ben, looking at it, nevertheless, with hungry eyes.

Poor child! Sad experience had taught him to be careful, so careful of their meagre food, and he knew that Joe would probably not earn anything on the morrow, being Christmas Day.

"Pr'aps we'd better," agreed Joe, eyeing it with loving glances, but he put it on a plate and set it on the shelf in the cupboard. "No one's been, I s'pose, Ben?"

"No; oh, no; nobody comes to see *me*," said the sick child, with tears in his eyes, and yet a faint smile struggling on his pallid lips.

Joe shook his rough head sorrowfully as he coaxed up the fire under the kettle, which was beginning to give a faint yet significant little hum.

While it was progressing Joe caught up his ragged cap and sped away again to fetch some milk with his last penny. He was soon back, and knelt down to watch the now nearly boiling kettle.

"How's the pain been to-day, Bennie?"

"Oh, very bad, Joe—sometimes. I feel my limbs all twisted with it. And my head aches too now," added the poor little fellow, lying down again upon his torn pillow with a weary sigh. The tone went to his brother's heart, but he said, as cheerfully as he could,

"Never mind, Ben, you shall have some tea; it will be better after that. You're tired and hungry, that's what 'tis. Now, this is just a-goin' to boil."

It would have done any one's heart good to see Joe in the midst of his preparations, putting a pinch of tea (it was all they had) in the teapot, filling up with boiling water, and standing it on the rusty hob, cutting slices of bread off the loaf, and setting on the egg that was to be Ben's dinner as well as tea, in a little tin pot to boil. The sick child lay back and watched him with a look of wistful affection in his large hollow blue eyes. He had evidently been a pretty-looking child, about eight years of age, with delicate features and fair hair, pretty curling locks, which his poor mother used to praise; but now his face had a pinched, careworn expression, the result of suffering, for a very lingering disease arising from exposure to cold and damp had almost crippled his limbs, and he was unable to move from his bed.

His father paid little heed to him, and had it not been for Joe the poor child would have been badly off indeed, but all the warm affection of Joe's heart was poured out on this helpless little brother. He would not have minded a bit going without food himself if only he could have got Ben what was needful. But Joe's means were so small. To-night, however, seemed to be quite a jubilee to the two boys.

"Now," said Joe, as he carefully drew off the pot and took out the egg, "he's done. Ain't he prime? You shall have a reglar tea, Ben. Here you are—there, now!" bringing it to the bedside, "what do you say to that?"

"It's beautiful, Joe!" said the child, eagerly. "Oh, how good you are!"

"Well, eat it up, Bennie, it'll do you heaps of good; and here's a cup of hot tea."

The child-boy pressed his hand with a sigh of gratitude and obeyed swiftly, eating the egg, and drinking the tea with the feverish zest of one half famished.

"That's right," said Joe, as he saw the faint colour come to the pallid cheeks; "and while we're eating, Ben, I've got summat to tell you."

Then sitting down with his own tea close beside his brother, Joe gave an account of how he had found the purse, and what it contained, adding,

"Oh, Ben, I was very near taking it, and spending it, and I don't know but what I should ha' done it too if it hadn't been for—mother," he added, in a choked voice.

"Oh, Joe, I'm so glad. I knew you wouldn't, but it must have been hard." And Ben raised his eyes to his brother's face in tearful admiration.

The little expression of sympathy did Joe good; he felt that his brother understood him, and he returned to his tea with greater relish than before.

"But," said Ben, with a face of anxious thought worthy of an older person, "we mustn't let father know. We must hide it, Joe; and where? I don't know of any safe place, do you?"

Joe reflected as he munched his slice of bread.

"We might hide it under your pillow, Ben. I can't think of no other place as safe. He wouldn't look there."

So it was finally agreed, and the purse was transferred thither at once from

Joe's pokcet, little Ben seeming greatly delighted with having the charge of it.

"Father ain't been in, I s'pose, Ben?"

"No," replied Ben, shaking his head; "pr'aps he'll be away to-morrow till the day arter. He had some money, I know."

"Pr'aps he will," said Joe, beginning to busy himself in putting away what was left of their frugal meal. He washed up the cups, and made up the little fire with some odds and ends of wood, and then came and sat down beside his brother again.

After a time he was called out. He was gone some little while, and returned in high glee.

"Look'ee here, Ben. Mrs. Clapp downstairs 'as had a sack o' coals giv' to her as a Christmas-box, and she 'ave given me this 'ere basket full. See them lumps! Ain't that glorious?"

Ben admired as Joe held and displayed the lumps of coal to the best advantage.

"It's a snowin' awful," said Joe, "and it's nearly nine o'clock."

"Father won't come," said Ben; "hadn't you better read, Joe? Mother's Bible is there on the shelf."

"Father's gone to the Stag's Head, Mrs. Clapp heard him say so," said Joe, as he sat down and reached off the shelf the worn and tattered volume, doubly sacred to them on account of being mother's Bible.

"I think, Ben, I'd better read about Christmas time and Jesus a-comin'," suggested Joe, thoughtfully; and, Ben agreeing, he turned over the leaves to St. Luke's Gospel, and read the second chapter to the twentieth verse.

CHAPTER II.

THE snow was falling thick and fast on Christmas morning when Joe got up and found Bennie still fast asleep.

"He won't hear me a-lightin' this 'ere fire," said Joe to himself as he proceeded to wash his face and don his ragged clothes. It'll be real easy to light it with them jolly lumps o' coal."

It proved so, for he soon had a cheerful fire burning in the rusty grate, and the kettle on before Ben showed signs of waking up.

When he did, however, he seemed feverish and complained of his head and limbs aching terribly. Joe was dismayed.

"I thought you'd a been better for that bit o' fire yesterday, Ben, and the egg—and there's another a-waitin' for you in the cupboard. And then there's them beautiful oranges, too! Well, maybe they'll do you good." Joe got the scanty meal ready, talking as cheerfully as he could all the while.

"It ain't snowin' much arter all now; pr'aps I'll get to church, if you don't want me and if you can sleep. I think mother would like one of us to go, and you can't. It's Christmas Day, you know, Ben."

Poor little Ben could not eat much breakfast, and Joe looked sorrowfully at his pale face and weary wistful eyes.

"Now I'll tell ye what, Ben," he said, as he put away the breakfast things and made up the fire. "I think you'll go to sleep, cos you look half asleep a'ready. So I'm a-goin' to church. Hark how the bells are ringing! And I'll get Mrs. Clapp to come up and look arter you and the fire, so I'll be able for to cook that 'ere

rasher when I get back, and we'll have them apples and oranges arter dinner as dessert, like the grand folks do." Ben smiled faintly at the idea, and Joe added, "But I'll leave one o' them oranges to keep by you, cos you eat nothin' hardly, and you might like it presently." And Joe cut one with infinite care and put it ready.

Then he brushed his hair, and put on his Sunday jacket, as he called it; but, alas! poor boy, it was hardly a bit better than his everyday one, worn and shabby to the last degree, but he fancied it was more respectable; and it was his mother who had carefully patched it thus. Then with a very clean face he prepared to go forth.

"Good-bye, Ben; ha' you got that purse safe?"

"Yes, Joe," and Ben put his hand under his pillow and drew it forth. "Look."

"That's all right; put it back, Bennie, and mind you go to sleep, cos the time won't seem so long till I get back."

Left alone, Ben lay quietly watching the flames as they leaped and sparkled in the sooty chimney. How silent the place seemed, as if there were no one in the house besides himself; and he wondered if they had all gone to church, or out to spend the festive day. He had not been long alone, however, before the door opened, and Mrs. Clapp, with her cap awry, came bustling in.

"I thought I'd jist mak' up yer bit o' fire afore I begins to see arter the dinner," she observed, vigorously poking at the flaring coals. Having carefully banked it up, and poured a little cold water on the top, "just to make it last longer, and not burn away so soon," she affirmed, she came up and looked not unkindly at the boy's flushed face. "Poor creeter, ye don't feel up to much," she said, with rough sympathy. "Hasn't yer father been in?"

"No," sighed Ben, shaking his head, "not since yesterday mornin'."

"Hum! a nice father indeed to leave his childer ill and starvin'! Ugh! but ye're better without him, I'm thinking, arter all." With this expression of condolence the good woman departed.

Left alone again, Ben fell into a heavy doze, which lasted some time, and from which he was awakened by the sound of footsteps in the room. He opened his eyes, thinking Joe had returned, and saw—his father; and, oh horror! gazing with half-tipsy delight upon—the *purse*! Yes, in turning over, Ben had dislodged it from its hiding-place,

and it had slipped to the floor, where it caught the avaricious eye of his father, who had seized it with avidity and counted its contents. Ben gave a cry of dismay.

"Oh, father, don't take it!" he pleaded.

"You're a nice child, to hide money and leave your parent to starve or beg!" growled Davids with an oath that made the child shiver. He covered his face with his wasted hands and burst into tears.

"It isn't ours," he sobbed. "Joe found it in the street, and he gave it to me to keep until he could find the person it belongs to. Oh, *do* give it me back."

His father replied by a brutal laugh.

"You think I believe all that rubbish? A pack of lies! Joe tells you that story to keep it from me; it belongs to me by rights, and I mean to have it."

"No, no; it *is* true!" cried Ben; "he did find it last night, and he wanted so to spend the money; but he thought of mother, and wouldn't touch it, and he—gave it me to keep safe."

"Hold your tongue, you!" shouted his father, clenching his hand as though he would have struck him, while a livid look passed over his face at the boy's words. For an instant he hesitated, holding the money at arm's length, as though it burned his fingers; then the sight of the glittering silver hardened his heart again, his momentary remorse van-

ished, and, putting the money in his pocket, he flung the purse on the bed with a hoarse laugh. "There, that'll do you as much good as the money!" and he rushed from the room, with his eyes averted from his child's anguished face and terrified look, but they nevertheless haunted him for many a long day.

CHAPTER III.

"WHY, Bennie, wot's the matter?" said Joe, as he entered the room half an hour later, and found his brother weeping hysterically and sobbing as if his heart would break. At his voice the child looked up.

"Oh, Joe, the purse—father has got it, and he has taken the money!" he gasped.

Joe stood thunderstruck.

"Where did he find it?" he said at length.

"Oh, Joe, it must have tumbled on to the floor when I was asleep. I woke up and saw him with it. Oh, what shall we do?" and he fell to sobbing again.

"I say, Ben, don't 'take on' so," said Joe, putting his arm round him; "it ain't your fault, we can't help it; but it do seem a pity, it do, that I should ha' let it alone jist for him to take it arter all! But don't cry, Ben, you'll be so bad presently; he's left the empty purse," taking it up with a rueful shake of his

head, "but that ain't no use to us. I'd better keep it, p'raps; maybe we might get the money ag'in one o' these days."

Exhausted with crying, Ben let Joe place him comfortably on his pillow, and lay there quietly watching his brother, who busied himself (but with a very brave face) in the scanty preparations for dinner. But though Joe cooked the 'rasher' with his best skill, poor Ben could not eat a morsel.

"I can't, Joe dear; you must eat it," he said, sorrowfully.

"Tain't more'n enough for you," said Joe, looking very dissatisfied, "and you eat nothin' at breakfast; it won't do, ye know, Ben, but p'raps you'd like another o' them oranges?" To this the child consented, and Joe prepared one nicely for him. "And I'll bring out them apples, and we'll bring up the table nearer to you, and have a rare dessert."

The poor rickety table was easily moved up to the bedside, and Joe put on a plate and a broken knife and the brown-paper bag with the rosy apples.

"Ain't it a spread, Bennie! That 'ere greengrocer have given me four beauties. Look'ee!" and Joe cut one of the apples with care, "ain't he prime?"

CHRISTMAS CAROL.

God rest you Merry Gentlemen

God rest you merry gentlemen, Let nothing you dismay; Remember Christ our Sa-vi-our
Was born on Christmas Day; To save us all from Satan's power When we were gone a-stray.
Chorus O ri-ding, of com-fort and joy O ri-ding, of com-fort and joy.

In Bethlehem in Jewry,
This blessed Babe was born,
And laid within a manger;
Upon this blessed Morn;
The which His Mother Mary,
Did nothing take in scorn.

The Shepherds at those ri-dings,
Rejoiced much in mind;
And left their flocks a-feeding,
In tempest storm and wind;
And went to Bethlehem straightway,
The Son of God to find.

From God our Heavenly Father,
A blessed Angel came;
And unto certain Shepherds
Brought tidings of the game:
Now that in Bethlehem was born,
The Son of God by Name.

Now to the Lord sing praise,
All you within this place;
And with true love and brotherhood,
Each other now embrace;
This holy tide of Christmas
All other doth deface.

Yet the feast was somehow a failure. The loss of the purse was on his mind, and Ben guessed as much from his face as he sat silent, now and then giving a heavy sigh.

And all that afternoon and evening, which was spent by his two poor, half-starving boys in that miserable garret, with no comfort but in their warm love for each other, William Davids had spent at the ale-house, whither he had staggered, with the two half-crowns in his pocket.

In the taproom of the Stag's Head he remained with several boon companions, drinking and smoking; but though he tried hard to drown the remembrance in liquor, and to shout and jest with the others, the thought of Ben's agonised face would rise up and haunt him. He could not get away from it, and it made him more angry. He had a horrible idea, too, that the boy had told him the truth about the money, and the child's mention of his mother had stricken him like the sword of an avenging angel. He tried to stifle his conscience, and drank on until a late hour; but he had still enough remorse not to dare to return home and face his innocent children—Joe, who had proved himself so honest and strong in the hour of temptation, he felt he could not meet. And Ben's face! No! Clenching his hand, the wretched man staggered away down the street—away he knew not whither.

CHAPTER IV.

THE week after Christmas set in snowy and bitterly cold. Joe earned a few pence by sweeping the snow from people's doorways, but that was scarcely sufficient to buy them bread, and for want of warmth and proper food Ben grew daily worse. He tried to be cheerful not to distress his brother; but at last it became impossible to hide what he felt, and Joe saw how very ill he really was.

Added to this, since Christmas Day their father had not been home; no one knew anything of him; he had not been seen at the Stag's Head, and they supposed some accident had befallen him, but they could do nothing. Now therefore Joe had to bear the weight of their whole support. Sometimes—how long ago it seemed!—Davids had brought home a trifle towards paying the rent, but now Joe had to do it all, and each day the task grew harder.

The last week in January came, and Ben was so ill that the landlady, of her own accord, fetched the parish doctor to him. He was a kind, humane man, and it grieved him to see the mute anguish depicted on Joe's face as he read what the doctor's opinion was of his little brother.

"He ought to be in the infirmary; there is a chance for him there, he will have good nursing—and that, my poor boy, you cannot give him," the doctor said, when he had finished his examination of the sick child.

"But, sir, would he be sure to get well—there?" asked Joe, stifling a sob.

The doctor hesitated. "That is in higher Hands than ours," he said. "I dare not say that he would; but he cannot get well, or even better, here. In the hospital every chance will be given him. He ought to go without delay."

Joe's heart sank. "But, sir, should I be let to see him? We's allers been to-

gether, and I—can't bear—to let him go."

Joe fairly broke down now, and sobbed aloud.

"My good boy, you can see him every day if you like," said the doctor, laying a kind hand on his shoulder. "I will give you a 'pass'-letter, and you can go any time."

Joe raised his head and dashed his tears away. "Then, sir, I'll let him go, and glad; I know as I ought to. When shall he go, sir?"

"As soon as he can be got ready—in a couple of hours," said the doctor, briskly. "I will take him in a cab. I must see that a bed is got ready for him. Cheer up! you are doing the very best thing you can, under the circumstances," with a smile at Ben's white face.

He had lain quite still and silent during the interview, except to answer the questions put to him by the doctor. He seemed to feel no anxiety about himself, and though he grieved at being parted from his brother, yet he made no objection; he felt too ill to care what they did with him.

True to his word, the doctor came that afternoon, and Ben was well wrapped up and carried down to the cab, and as the hospital was quite near they soon reached it.

The parting between the brothers made the kind-hearted doctor sigh as he thought how soon another parting would come.

He had persuaded Joe not to accompany them then, as he could pay Bennie a long visit the following day, when the child would be comfortably settled, and Joe passively acquiesced. But when he heard the cab drive away with all he loved on earth, he flung himself on Ben's empty bed, and sobbed as if his heart would break.

The next afternoon Joe washed his face and dressed himself with great care in his Sunday jacket, and set off for the infirmary. When he reached it the porter showed him which way to go, and without much difficulty he found the ward where Ben was.

A pleasant-faced nurse, with clean cotton gown, apron and cap, came forward as Joe stood hesitating in the doorway.

"This is the way," she said, beckoning to him as if she had been expecting him; "you will find him at the other end of the ward—No. 27." She walked along beside Joe as he advanced up the long room. "He has been sleeping nicely, and asked for you a few minutes ago," Joe thanked her, and she went away to another patient, and he walked slowly along the ward to find his brother.

How fresh and clean it all looked, with its white scrubbed floors and the long windows letting in plenty of light, and the rows of beds with their blue-and-white check curtains. There were illuminated texts and pretty pictures on the whitewashed walls, and a large fire burned in the wide grate at the end. It was not the usual visitors' day, so it was all very quiet and orderly; only a nurse or two moved noiselessly about attending to some of the patients, and several convalescents were seated on a bench beside the cheerful fire. Joe thought how comfortable it all looked as he went on, looking up at the card above each bed for No. 27. At last he found it, and sprang forward to meet Ben's eager face and smile of welcome.

"Oh, Joe, dear, I am so happy here! they are all so kind to me. Isn't it a nice place?" said Ben, holding Joe's hand as he sat beside his bed.

"Why, you're lodged like a prince, Ben; I am glad, I am, that you're here, 'cos it's so good for you, and maybe you'll soon be better, and then it'll be jolly, though there's only the garret that we can call home for you to come to."

Ben smiled and stroked his brother's hand, but he did not reply directly.

"Is it very dull at home, Joe dear?" he asked presently.

Poor Joe! It was hard to answer; he did not want to make Ben unhappy, and it was so lonely!

"Never mind that, Benny dear," he said, bravely. "I'm out, you see, pretty nigh all day, so 'tain't so long."

Ah! but Ben knew all that the brave heart wanted to conceal. That little husky tone of voice told him so well Joe's real feelings that he turned his head quickly away to hide the tears that sprang to his eyes.

But both boys struggled with themselves, and tried each of them not to cloud their meeting by sorrow or depression.

While they were thus sitting, the tinkle of a bell was heard, and the nurses began to move about briskly preparing the patients' tea. The same nurse who had spoken to Joe approached them now with two large cups of tea and a plate of thick bread-and-butter. "There is some tea for you," she said to Joe, with a kind smile, for she had noticed his pinched face; "you would like to have it with your brother, wouldn't you?"

Joe was so astonished and touched that he could only look at her pleasant face in speechless gratitude, but she understood him, and nodded as if in reply. "There," she said; "mind the tea doesn't upset on to the sheet," and then went off, leaving them in a state of great delight.

"Now, ain't that kind!" ejaculated Joe, as he took a bite out of one of the slices with great relish. "I didn't expect it."

"I'm so glad," said Ben; "she is so kind; every one of us likes her. She is Nurse Emily."

The boys enjoyed their tea, especially Joe, for Ben could take but very little, yet he liked to see his brother have a good meal, and as they finished, Nurse Emily came to take away the tray.

"You can always have your tea with him when you come in the afternoon," she said to Joe, as she saw how the hot tea and substantial bread-and-butter had brought a faint colour to his thin cheeks.

Joe thanked her warmly and gratefully both by word and look, and after shaking up Ben's pillow she went away.

Then after a little more talking it grew to be time for Joe to go.

"I'm real sorry, Ben, I couldn't bring you nothin', but you don't want it, and I hadn't anything."

"Oh, Joe dear, don't say that!" said Ben, eagerly; "you want it all. You haven't heard anything of father, I s'pose?" lowering his voice.

Joe shook his head. "Not a sign. Well, good-bye, Bennie; I'll come ag'in soon."

One of the most frequent visitors at the hospital was the Rev. Charles Maitland, the clergyman of the church where Joe had gone on Christmas Day. He was greatly beloved there by the poor

patients of the different wards, and much esteemed for his upright and pious life by all the authorities of the hospital.

It was not long, you may be sure, before he found out Ben Davids, and was deeply interested in the poor child's case and the simple details of his pitiful history, which were told him in broken accents by the poor little fellow himself.

The boys became quite friendly with some of the other patients in the ward, especially those whose beds lay on either side of Ben's, and they were pleased all of them to see Joe whenever he came.

One day, it was the visitors' day, some people came to see the woman who was in No. 26; one was an elderly woman (sister to the one who lay on the bed suffering from a bad foot which was tightly bandaged), and they began talking together earnestly. Joe and Ben tried not to seem to overhear their conversation, yet a word or two now and then caught their attention, and one sentence made Joe stop short in what he was saying to Ben and look across with an arrested gaze.

"Yes," the elder woman observed, "I dropped it on Christmas Eve, the first thing I've ever lost. It had two half-crowns and some coppers, and I could ill afford to lose it, Lizzie, I can tell you. I haven't heard anything of it; of course some dishonest person picked it up and kept the money."

Could it be possible? Was this the person who had owned the purse! Joe stared, and Ben, who had also heard the words, touched his hand.

"Joe, dear, did you hear? the purse was *hers*. Oh, if we only had the money you might give it back to her."

"I must tell her about it," said Joe, with a sudden determination, "and let her know as it wasn't a dishonest person as picked it up."

He rose and came a few paces forward towards the woman, who looked hard at him as he approached. Joe stood a minute, looking himself rather uncomfortable as to how he should broach the subject; he fidgeted uneasily with his cap, and the sick woman turned her head slightly towards her sister.

"What does he want?" she said to her, half aloud.

Joe caught the words and came a step nearer.

"I heard you say just now as how you'd lost a purse, didn't you?" he said, rather awkwardly and colouring.

"Well, what then?" asked the woman, sharply. "What if I did? Can't I speak a word to my own sister without you a-listening?"

Poor Joe hung his head a little at the sharp tone, but he contrived to go on with what he had to say.

"I didn't mean to listen, but I found it."

The woman started and her face flushed angrily.

"Found it! Ah, I daresay; you picked my pocket of it, I'll warrant you, you young rascal!"

"That I didn't," said Joe, warmly, roused by the accusation; "you dropped it just by my crossin' where I sweep, and I'd have given it back to yer an' welcome only you got clear off in the fog."

"A likely story!" said the woman, scornfully; "boys in the street like you ain't so honest as all that comes to."

"But I am," said Joe, scarcely able to restrain his tears; for it was hard, cruelly

hard, after the sacrifice it had been to him to give up the money and the temptation he had so nobly conquered, to be accused of being a thief.

"Well, if you found it, as you say, where is it?" asked the sick woman, who seemed a little softened at the boy's evident distress.

"Ay, where is it," added the other; "'tis hard for a poor creature to lose her bit of earnings."

Joe struggled with himself, but it must be told.

"My brother an' I we kep' it safe, but—but—an accident happen'd an' it's gone." That was all he could say, he could not tell of his father, and he fairly burst into tears when he had finished speaking.

"Gone! yes, of course, you stole it and spent it; I knows the like of yer!" cried the woman, in a passion.

"I never stole it or spent it!" cried Joe, "an' I mean to work to get it paid back to yer."

She burst out laughing.

"It's likely, ain't it?" she said. "A long day it'll be before you earn it, or try to, you young thief. If I had my will I'd have yer put into the hands of the police!"

"Stop!" said a voice close by, and Dr. Evans, the head physician of the hospital, stepped forward from behind a screen which had been drawn round the bed of one of the patients whom he had been attending to—"stop!" and he laid his hand upon Joe's shoulder. "I know all this story of the lost purse," addressing the woman, who looked rather uncomfortable, "and I know this boy, and I will not have him abused in this way. I will tell you the whole affair." And, still keeping his hand on the boy's shoulder, and pressing it kindly when he came to the mention, which Joe had omitted, of his father, the physician recounted the history of the finding of the money—how bravely Joe had resisted the temptation of keeping it; how it had been safely secreted by himself and his little brother in the hope of one day returning it to its owner, and how, through his father, it had been lost to them.

Joe's tears glistened on his flushed cheeks and in his grateful eyes as he looked up thankfully into the good man's face.

"Thank ye, sir—thank ye," he said, brokenly, "for rightin' of me; indeed, I wouldn't never have took it."

"I know it, my lad, I know it; and to end the matter I will pay the money to you," addressing the woman, who looked heartily ashamed of herself; and taking five shillings from his own purse, Dr. Evans gave them to her.

"Indeed, sir, I ask pardon; but I didn't know—" she began. "You see—"

"Enough; yes, I *do* see," he returned, gravely, "that there is very little charity in the world. But this poor boy has shown an example of truth and honesty that ought not to be forgotten, and I shall make it my business to remember it."

"Oh, sir!" cried Joe; and in his gratitude he caught the physician's hand and kissed it with joy; "but I did borrow them two coppers, sir, to get Ben some oranges; and I thought I could earn them again. Oh, sir, you are so good!"

"Well, well, my boy, that part of the debt I leave you to pay," said Dr. Evans, smiling.

Here the woman interposed to the effect that she did not want the coppers; she would rather not have them; and begged Joe's pardon.

But Joe resolved, as he returned to the bedside of his brother, that he would bring and pay those pennies at the very first opportunity.

* * * * *

Ben grew hourly worse; and, knowing that the end was near, Joe scarcely ever left his side. The child was patient to the last; he never complained, but even strove to cheer his stricken brother, and had the same sweet grateful smile and look for all who attended on him. Even when the dreaded time actually came the boy did not look worse. Joe could not see much change in the little white face, but to professional eyes it was too evident that the child would not live another hour. Dr. Evans, seeing the state of the case, remained in the ward, but he could do nothing for Ben; and Nurse Emily devoted herself to the dying child and to the weeping Joe.

The little boy's eyes were closed, and he was lying very still and motionless, but his face was calm and peaceful. Joe's tears were running fast, and as Dr. Evans drew near, he sobbed out,

"Oh, sir, don't you really think he might live a bit longer? I can't a'bear to let him go."

"My boy," said the physician, a little huskily, "there is *no* hope—he is dying fast."

"But, sir, you don't think he is in any pain?" Joe bent over his little brother as he spoke, his tears falling on the placid face.

"No, he is in no pain; he does not suffer," was Dr. Evans's answer, as he laid his hand kindly on Joe's shoulder.

"Thank God—for that!" said Joe, brokenly. "Oh, Bennie, *do* speak to me!"

The sound of his voice roused the child. He opened his eyes and put his arms feebly round his brother's neck. "Oh, Joe, dear—don't cry—I am so happy—I am going to Jesus—and I shall see—mother—and tell—her—how—good—you—have been—to me—and you—will come—too—" His voice died away into a faint whisper.

"Oh, Ben!" sobbed Joe, holding him fast; "I can't get along without you! I know I'll never get to heaven all alone!" He could say no more.

With a last dying effort the child put up his cold lips and kissed Joe's wet cheek. "Yes—dear, you will—come—we shall—wait—for—you."

The child sank back on his pillow; then, suddenly opening his eyes, while a radiant smile beamed over his face, said, "Oh—Joe—there is *mother*!" and, holding out his arms, he fell back, his eyes closed, and poor little Ben was dead, the happy smile still lingering on his lips.

CHAPTER V.

AFTER Ben's burial Joe was placed by Mr. Maitland at a good school a little way in the country, not far from the spot where his brother was buried, and he often went to visit the grave, and kept the little grassy mound fresh and in order, sometimes taking a few flowers to lay reverently upon it—Ben used to be so fond of flowers.

He was at school three years, and at the end of that time the physician took

him into his own house, and Joe served his kind employer and his family well, fully deserving all the trust they placed in him.

One evening in summer Joe was standing beside Ben's resting-place, his eyes fixed thoughtfully upon the rays of the setting sun, as they seemed to fall lovingly upon the little grave, when a hand placed upon his shoulder made him look up.

A man in decent clothes, with a hale-looking face, stood beside him, but Joe did not recognise him, and gave him a glance of wonder as he saw that his eyes were full of tears.

"Joe, don't you remember me?" said the man, in a choking voice, as he held out his hands almost deprecatingly.

Joe gazed as if he were in a dream. "Father!" he said, in a half whisper; "is it you?"

"Oh, Joe, my boy, forgive me! I can hardly expect it after—"

But Joe had his arms round him, and the pent-up feelings of the last few years gave way in a burst of tears.

"We thought you were dead," he said at last, wiping his eyes.

"Ay, I did not dare to come back to you after—" He paused and looked down at the grave at their feet.

"Yes, he is there; you knew he was dead?" said Joe, in a low voice.

"They told me about him," said the father, putting his hand across his eyes. "Oh, Joe! can you ever forgive me for this?" and he fairly sobbed aloud.

"Ben is happy now, father; he would not want to remember it," said Joe, softly.

"Joe, my boy," said Davids, after a few minutes, "I am in a good berth now; will you come to me and share the home I can give to you, my son, now

Joe looked up with a troubled face, which his father saw with a pang of self-reproach.

"Joe, my lad, I don't wonder that you doubt me; but hear my story first, and don't judge me hastily. It was all your doing; that money I took—God forgive me! though I knew his account of it was true—" He looked reverently towards the grave as he spoke of the dead child. Then he continued, "I drank it all away, but I could not forget that look on his face, and your honesty shamed me. Joe, I was haunted by it! it drove me nearly mad! I dared not come home; I felt I could not even stay near you. I determined to go abroad, and I worked my way out to New Zealand. I began life there anew, but it was a better one, Joe. I made a friend there, who proved a good one to me, and by degrees I got on, and now I have a little farm out there, and it works well. I determined to atone (God helping me) to my poor boys, and came back to fetch them."

He paused, his voice trembled, then he said,

"Will you not come, Joe? Cannot you forgive me?"

"Oh, father, don't talk so," said the boy; "it isn't that; but Dr. Evans has been so good to me!"

"Ah, Joe, more than your father has been," said Davids, sadly; "but God will reward him. I'll perhaps see this gentleman and explain matters;" and that very evening he saw the doctor, and the doctor, finding him sincere, decided to part with Joe.

Some three weeks later Joe was sailing from the shores of England, and as he stood on deck looking longingly after the good doctor on shore, he was happy with a happiness almost akin to pain. His

eyes were moist as he thought of the little grave also left behind.

"I shall meet them in heaven," he whispered reverently to himself, as he turned towards his father, "and now I'll try and think of that, and how to make father happy. It must make mother glad indeed to see him now, and Bennie too! and all through that purse, after all! How much good it did. It taught me to be true and honest, it gave me two of the kindest and best friends I can ever know; and more than that," he added, softly, "it brought father back to God."

Joe and his father prospered well out in New Zealand. They owned a thriving sheep farm and some valuable land. They made many friends in the colony; but none, to Joe's affectionate heart, were to him like the kind friends of his youth, to whom he felt he owed a debt of gratitude that he could never repay.

Four years after he had left England he was able to pay a brief visit back to the shores he loved.

He visited Ben's little grave, and the hospital, to see the nurse who had been so good to his brother. Nurse Emily was delighted to see him again, and they talked lovingly of the child who had died there seven years before, but whom she still remembered. Joe paid a visit too to the house where he and Ben had spent the greater part of their young lives. In that wretched garret, Joe looked around, and thought as he did so how all the sorrows they had there endured had been changed by the loving hand of God, which had taken his little brother to His rest, and had crowned the lives of his father and himself "with His loving-kindness and tender mercies!"

WINTER SPORTS IN CANADA.

October and the early part of November, and by the middle of the latter month it comes down prepared to stay, and stay it does until the middle or end of April. Then it begins to go in good earnest, and in the course of a very few days all traces of the snow are lost.

In the country the average depth of the snow is from three to five feet; in many places drifts of ten times that depth are frequently met with. All out-of-door farming pursuits are of course suspended. Everywhere, in city and country, the wheeled vehicles are stored away, and sleighs and sledges, from the light one-horse "cutter" to the big "family carry-all," take their place. Even the omnibuses and tramcars have their wheels removed and runners substituted. In every street and road is heard the merry tinkle of the sleigh-bells as the horses fly rapidly past, the runners noiselessly gliding over the frozen snow.

Winter is the Canadian boy's favourite season. The summer has its joys and pleasures, but even the "average schoolboy" tires of games when the thermometer registers ninety-five to a hundred in the shade. The winter is equally extreme in temperature, but then it is easy for a boy to warm himself in cold weather, while it is often very difficult for him to cool himself in a Canadian summer. Most distinctively Canadian sports, too, are solely practicable in the winter, depending upon the snow and ice for their very existence; so altogether winter is the boy's halcyon time.

In the hope that boys in England may be interested in hearing something of the games

and sports of their Canadian brothers, I will try and describe some of the more common and enjoyable of the many practised in the Dominion.

Foremost in popularity comes "Tobogganing," or as a modified form of it in the States is called, "Coasting." For tobogganing all that is required is a toboggan and a snow-covered hill, the longer the better. The toboggan, or sled, is made of a strip of birch-bark. It varies in size, but the most usual dimensions are about seven feet in length and twenty inches in width. At the front end the bark is curved up and back, the section resembling the old-fashioned curved skate-iron. The bark is strengthened by three or four longitudinal strips of white wood, and along each side runs a light rail of the same material raised an inch or so from the surface. The whole toboggan only weighs a very few pounds.

In using it the toboggan is dragged to the top of the hill, and the crew embark. They sit one behind the other, knees drawn up to the chin, and grasping the side rails with their hands. The captain kneels at the stern on one knee, the other leg being allowed to hang behind and acting as a rudder. Then, when all are on board, the captain gives a good push, and down the hill flies the toboggan, leaping over obstacles, curling in and out, obedient to the steering foot of an accomplished captain.

The speed and duration of the journey depend, of course, entirely on the length and incline of the hill, but even on moderate slopes the rate attained is marvellous. As the riders sit the air rushes past them with

THE Canadian year really consists of but two seasons—summer and winter. True, there are two periods dignified with the names of spring and autumn, or "fall," but they are so short in duration, summer gliding so rapidly into winter, and winter into summer, that the time of transition is hardly worthy of the name of season.

In the principal province, Ontario, snow usually falls throughout the last half of

WINTER SPORTS & PASTIMES IN CANADA.

1. Moose Hunting.

2. Sleighing by Moonlight.

3. Snow-Shoe Tramp by Torchlight.

4. A Moose Hunter's Camp.

the speed of a whirlwind; objects seem to appear and disappear like flashes of lightning, and it is not until the toboggan, shooting out far over the level at the foot of the hill, begins to slacken its pace, that an ordinary deep breath can be drawn.

Accidents of course occur, even sometimes under the most skilful steering. At the tremendous speed attained, the least bit of careless management may upset the toboggan, and its occupants are flung far and wide. But the snow is soft and powdery, and the sensible garments worn by both sexes render any accident of a serious nature very improbable.

As well as being sensible, the tobogganing costume is very picturesque. The men wear long tunics of white blanket, confined by a brilliant-hued scarf at the waist. Stout flannel knickerbockers and two or three pairs of bright-coloured stockings worn one above the other, and deerskin moccasins, cover the lower extremities, whilst the head is protected by a red or blue woollen "tuque," which resembles nothing so much as the old-fashioned nightcaps worn by our grandfathers. The ladies wear similar tuques, tunics, and moccasins, and two or three stout woollen skirts reaching half way below the knee.

In many places, where natural facilities do not exist for the sport, artificial slides are erected. At Rideau Hall, near Ottawa, the seat of the Governor-General of the Dominion, there are two very fine artificial slides. High wooden stagings are erected, and a sloping wooden way of some two hundred yards in length leads to the top of a slight natural declivity, so that the toboggan has a clear descent of some seven or eight hundred yards.

During the winter tobogganing parties are frequent at Rideau, and occasionally torch-light *fêtes* are held, when the slides are illuminated with coloured lanterns, and the effect as toboggan after toboggan glides swiftly down the slope, each carrying one or more torch-bearers, is picturesque and weird in the extreme. The gay dresses, the variegated lights, the flashing torches, accompanied by the music of a good band, and the cheery laughter of the sliders, form a scene not easily to be forgotten.

Somewhat similar to tobogganing is the more American sport of "coasting." But whereas in Canada nobody ever seems to grow too old to enjoy a toboggan slide, in the States coasting is almost entirely confined to the young folk.

For coasting, a sled proper is used—that is, a framework consisting of two runners and a platform. The boy drags his sled to the top of the hill, and then, running a few yards with it, precipitates himself upon it, and flies to the bottom. In some cases a sled called a "double runner" is used. These are usually gorgeous affairs, consisting of two short sleds connected by a long bench gay with cushions and brightly painted. The hindmost of the sets of runners works on a pivot, and is steered by a horizontal wheel above the bench. A double runner is doubt-

less a more comfortable vehicle than a toboggan to travel on as long as all goes on well, but in case of an upset the heavy wood and iron work is apt to cause a considerable amount of injury to the riders, whilst the light and frail toboggan bounds over its late occupants like a soap-bubble.

Toboggans, too, can travel over any path where snow lies, even if it be soft and powdery, whilst the iron runners of a sled require a firm icy surface if any speed is to be attained.

Next to tobogganing, in popular estimation, comes snow-shoeing. Perhaps this can hardly be termed a sport, as in the country snow-shoes are a part of the everyday winter equipment. Without them it is impossible to make any way through the lanes and fields where there is not constant traffic. Still, in the cities, where snow-shoes are not articles of necessity, many clubs exist whose members are of both sexes and all ages, devoted to the practice of snow-shoeing. And there are many ways of spending a fine clear moonlight evening less agreeably than in a tramp across country—to the expert that is, for the neophyte should beware of attempting cross-country work until he is thoroughly at home on his shoes. Probably the mass of my readers are familiar with the general appearance of the snow-shoe, but for the benefit of the less well-informed I may briefly describe it.

Imagine a huge lawn-tennis racket, very closely strung, and with about two inches of handle; about three feet long and a foot or fifteen inches wide at the broadest part; the front rounded, and very slightly turned up; behind tapering to a point.

In walking in snow-shoes, the foot, encased in a soft deerskin moccasin instead of a boot, is placed on the shoe, the toe being a little bit forward of the broadest part. A long deerskin thong is passed through the gut and bound around the toes, and then carried up round the ankle. The foot is only attached to the shoe in front of the ball of the great toe, so that in walking the sole of the foot can be easily raised without lifting the shoe. Supposing then the shoes on, and the neophyte starting. In all probability he will find his shoes catching in each other and himself sprawling in a deep drift, whence it will be almost impossible for him to extricate himself without assistance.

Care must be taken at every stride to lift foot and shoe clear of its fellow, and to take long strides, then with a little practice all will be well.

The costume worn by snow-shoers resembles that of the tobogganers, and a pretty sight it is to see a long string of boys and girls, men and women, winding in and out, across fields, over hedges, along streams, up hill and down dale. And more especially striking is it to meet such a procession on a calm clear night, bearing torches and carolling some old Canadian lyric with a good old-fashioned chorus which wakes the echoes far and near.

Skating, of course, has no claim to be considered a purely Canadian sport, but the

facilities for practice afforded by the long winters have rendered "Kanucks" the finest skaters in the world. Every village has its rink, kept clear by regular and constant work, and every village has its one or more skating festivals or fancy dress carnivals. A fancy dress ball is a pretty sight, but not for a moment comparable to the scene at a skating carnival. The grace of the skaters, their daring and wonderful evolutions, seem marvellous, and the speed of their motions, with the consequent rapid and constant changes of the pictures presented, resembles rather the changes of the kaleidoscope. At one instant Sir Walter Raleigh is seen beside Queen Elizabeth; before the eye can follow him almost he is gliding along with a Galatea or a Marie Antoinette. A Clown is waltzing round Night, only to find her place usurped in a second by a Cavalier or "Jumbo."

Skating races, too, are frequent, and some of the records attained are remarkable. Hockey and lacrosse on the ice are common amusements, but the most exciting ice sport by far is that known as "Ice-boating."*

A huge frame, varying from twelve or fifteen to forty feet long, is built in the form of a T. At each of the three extremities a runner is placed, that at the tail of the T being moveable and attached to a tiller like a boat's rudder. At the junction of the cross-pieces a mast is stepped, rigged with sails of any pattern the builder approves. In front of the rudder a sort of tub or box is contrived, capable of holding from two to ten people. Ballast is attached to the arms of the T to keep the runners down on the ice, but frequently in a stiff breeze this is found insufficient, and it is then the duty of the crew to perch themselves on the arm to windward and keep it down by their united weight.

The speed attained by these vessels is enormous. A rate of one hundred miles an hour is sometimes reached, and fifty and sixty miles per hour are common. The sport is very exciting and demands great nerve and coolness, but accidents are frequent, and many fatal ones occur. The tremendous speed at which the boats travel renders a collision with one another, or with some fixed object, a certain disaster. The occupants are flung for yards along the hard ice, and in all probability dashed against the frames of their own or another boat. Still ice-boating has many votaries, and ice-boat regattas are regularly held wherever a sufficiently large sheet of water is available.

These, then, are a few of the principal winter sports of Canada. Of course there are countless others, but the above are the more distinctively Canadian.

In future papers I may tell you of some of their summer sports and camping-out adventures, feeling assured that English boys will take as deep an interest in their transatlantic brothers as Canadian boys do in the Boy's OWN PAPER.

C. M.

* See the last Christmas Number for full details, with sections, of the ice-boats.

CHRISTMAS IN A TREE-STUMP.

BY THEODORE WOOD,

Author of "Our Insect Allies," "Legs and Wings," etc.

A CURIOUS place in which to spend Christmas, perhaps, and yet one which is evidently considered by insects and many allied beings as all that can possibly be required in the way of a winter habitation. It is really wonderful to see the quantities of creatures which sometimes take up their abode in a decaying tree-stump during the colder months of the year, and which yield

to the mild persuasion of the jack-knife or the chisel when the entomologist is taking his walks abroad, and casts the fatal glance upon their place of concealment which dooms many of them to premature death, and all to a somewhat rude awakening from their slumbers. Specimen after specimen is disclosed to view as the work of demolition goes on, and ere the stump is reduced to frag-

ments the collecting-bottle is generally filled with a more or less excited batch of captives, which, aroused from their torpor by the warmth of the pocket, diligently scour their prison in search of a means of escape, and sometimes, sad to say, beguile the monotony of the journey homewards by dining upon their companions in misfortune. More than once did we lose valuable insects in this way,

until bitter experience taught us to place some crumpled paper in the bottle, when laurel leaves were not obtainable, in order to serve as a foothold, and also to relegate the more predaceous species, such as ground beetles, etc., to solitary confinement in pill-boxes, where their cannibalistic propensities could not be exercised upon their weaker brethren.

Many a decaying tree-stump have we pulled to pieces in the winter months, and seldom have we been unrewarded by the capture of more or less desirable specimens. Some stumps, of course, are more productive than others, but there are very few which yield absolutely nothing, and these, generally, are not sufficiently decayed to afford the required protection to creatures in search of a winter home.

Some insects are almost always present. It is the exception, and not the rule, for instance, to find a stump in which that brown, sluggish beetle scientifically known as *Helops striatus* is not to be seen in more or less abundance, either resting beneath the bark, or embedded in the wood itself. I do not know a more irritating insect than this, for it is always turning up at every possible opportunity, in every conceivable situation. If one works with the sweep-net, *Helops striatus* is sure to be one of the first inmates. If the umbrella or the beating-sheet is used, *Helops striatus* will probably fall at the first blow of the stick. If one pulls the bark off a tree, there is *Helops* again, clinging to the wood, and, if a tuft of grass is shaken, two or three specimens are tolerably sure to tumble out from among the roots. After dark it swarms at sugar, and is, generally speaking, such a nuisance that the entomologist is often tempted to wish that its total extermination could be brought about, and he be no more troubled by incessantly finding it foremost among his captures.

Then there will probably be a wire-worm or two, generally in company with the perfect insect, the long, black, down-covered *Melanotus rufipes* being, perhaps, the species most commonly found. This, unlike many of its kin, is decidedly a useful insect, helping to clear away any rotten wood which encumbers the earth, and so to leave the soil clear for the growth of fresh vegetation.

In the bark itself, or lying just beneath it, one is almost sure to find some of the smaller wood-boring beetles, whose little tunnels radiate in all directions from the large central passage in which the parent insect laid her eggs. Perhaps only the grubs will be found, fat, sluggish, white objects, perfectly helpless when removed from their burrows, and seeming hardly capable of eating their way through the hard wood with the tiny jaws which are their only tools. The dead body of the mother, however, is nearly invariably present, for she has seldom sufficient strength

remaining after her eggs are deposited to make her way back into the outer world, and generally dies in the entrance to her burrow, her body blocking up the way, and preventing the various enemies of her offspring from obtaining admission.

Almost certain to be found, too, are some of the *Dromii*, those flat, delicate beetles which live in the chinks of or beneath the bark, and which prey upon the various minute creatures inhabiting the same situation. Many of these are prettily spotted with yellow, and, in spite of their small size, are very conspicuous objects, even when resting motionless among the *débris* always to be found in decaying wood.

If the stump is that of a pine-tree, we shall very possibly meet with some of the handsome *Rhagium* beetles, belonging to the group of the Longicorns, as they are lying huddled up in their curious cocoons, from which, although perfect insects, they have not yet emerged. These are the best specimens which can be obtained for the collection, for, as they have not been knocking about in the world, they retain all their natural beauty, and have suffered none of the losses of antennæ or legs which are not uncommon in examples found roaming at large. It is rather curious that they should emerge from the pupal shell so long before leaving their retreat, but this peculiarity is shared by many other beetles, notably the cockchafer and the stag-beetle, which become perfect insects in mid-winter, although they do not appear on the wing until May or June.

If the stump be covered with fungoid growth, certain other beetles are almost sure to be present, most conspicuous among them being perhaps the very handsome *Scaphidium quadrimaculatum*, a polished black insect of rather singular shape, with long, slender limbs, and with wing-cases diversified by four large crimson spots. This, although not a very common species, is generally tolerably plentiful in the localities which it inhabits, so that when one is found others should always be looked for.

So much for the beetles. Now for the other orders of insects.

PUPÆ of various moths are not at all uncommon, either in decaying stumps or in logs lying upon the ground. As a general rule, they will be found resting just beneath the bark, but sometimes a caterpillar, wishing to "make assurance doubly sure," will penetrate to some little depth in the rotten fibres before feeling contented with its choice of the abode in which its pupal existence is to be passed. Some of these may be seen lying fully exposed when the bark is removed; others form a cocoon of silk, fragments of wood, etc.; and a common plan is to hide themselves in some chink or cranny, and to

cover the entrance so neatly that a sharp eye is necessary to detect it.

Hymenoptera, in the shape of ants, ichneumon flies, etc., turn up frequently, and it is by no means unusual to find a humble bee or a queen wasp lying huddled up in some snug corner, and perfectly torpid from the effects of the cold. Sometimes, but more rarely, a dipterous insect or two may be discovered, and hemiptera, or, as they are less politely termed, bugs, are usually common enough. These will generally be found to possess the flattened bodies and short limbs which at once point them out as destined for an existence beneath the bark, and show that they have not resorted thither in search of a winter retreat alone.

Earwigs, of course, are a certainty, and sometimes tumble out almost by the pailful when the bark is stripped away. These are generally more lively than is usually the case with hibernating insects, and seldom waste much time in hunting up another retreat. Woodlice are often even more abundant still, and when all the living specimens have made good their retreat a number of bleached corpses will mostly be seen, showing that the mortality during the winter months has been tolerably high. Then there will be a centipede or two, winding their scaly length slowly along as they awake from their slumber, and insinuating themselves into the first crevice which they can find, while spiders, hastily unpacking their long legs, which have been compactly tucked up beneath their bodies, rush hurriedly away as soon as they realise what has happened to their abode. Probably a web or two, plentifully stocked with wings, legs, etc., will bear testimony to the doings of these gentlemen while the weather was warm enough to allow of active work.

THESE, as will be quickly found by any one who cares to experiment for himself, are but a very few of the living creatures which resort to decaying stumps for protection during the winter months, and which are well worth examination by the collector of almost all orders of insects. Great rarities sometimes turn up in unexpected situations, and reward one for a lot of hard work in discovering their habitat. Only last January, for instance, I found beneath the bark of a rotten pine-stump a beetle which had never been taken before, and there are few entomologists who cannot point to a number of good things as being among their winter captures from logs, etc., given over to decay. The necessary apparatus is simple and limited, the work interesting, and the results tolerably sure, so that the collector can safely be recommended to take advantage of a spare hour or two, and at the first opportunity to discover for himself something of what Christmas is like in the tree-stump.

FASCINATED BY A FAKIR.

BY JAMES COX, R.N.,

Author of "How I Saved my Aunt's Diamonds," "Nearly Garrotted," etc.

WE are slowly steaming through the Suez Canal en route to Bombay, in her Majesty's ship *Crocodile*. On board the great white trooper are a number of military officers, representing various branches of the Service—dragoons, hussars, dapper little riflemen, heavy artillerymen, and smart linesmen.

Many of them are on their way East for the first time, while others have spent the best of their days there in the service of their country, and are now returning after leave of absence to add fresh laurels

to those already won under the burning sun of her Majesty's Indian Empire.

Among the latter there is a handsome grey-haired old colonel. At the present moment he is the centre of a group of young subalterns, sitting in listless attitudes on the quarter-deck under the sun-awning listening to the experiences of the old soldier.

"Curious-looking object that squatting on the bank there," lisped one of the youngsters named Devenish, pointing to a solemn-looking Arab who was sitting

on the Canal bank intently watching the passing vessel.

"Yes," assented the colonel; "but not half so queer-looking as some of the fakirs you'll see in India. Did I ever tell you, by the way, a little adventure of mine with one of those gentry? No? Ah, well, it happened many years ago—at a time when you were cutting your teeth, I expect, Devenish," and the colonel smiled a grim little smile. "I think most of you know," he continued, "that before I entered the army I belonged to the sister

service, and served under the gallant Peel at Lucknow in the Shannon's naval brigade. It was owing to our being landed and thrown so much together with the soldiers that I became smitten with a longing to exchange my blue jacket for a red coat. However, I must tell you that after we had thrashed the sepoy, and once more settled down to a quiet life on board the frigate, I found the midshipman's berth very monotonous, and made up my mind when I got home to get into the army.

"But my story is connected with my naval life. I was rather a green young midgy, notwithstanding that I had seen a little hard service before I was sixteen. It was just after we had returned to Calcutta, and had gone through a heavy course of festivities which the good people there insisted upon honouring us with, that while pacing the deck of the Pearl, then anchored in the Hoogly, off Garden Reach, the quartermaster of the watch brought me a letter from a gentleman whose acquaintance I had made at a dinner-party, inviting me to come and spend a couple of days with him at his bungalow a few miles out in the country and eat my Christmas dinner there.

"Having succeeded in obtaining leave, I packed up a few articles of clothing in my portmanteau, and the same evening transferred myself and effects to a native boat, and soon found myself at one of the numerous landing-places in the 'City of Palaces,' where I understood my friend, a Mr. Vernon, would meet me with his carriage 'at six o'clock precisely.'

"I was punctual as to time, but I saw no signs of Mr. Vernon, and after kicking my heels about for a quarter of an hour I decided to wait no longer, but to hire a gharry and drive out to his place.

"Looking round for some one to carry my traps, I saw, crouching in one of the angles of the ghat, a hungry-looking native, and, having a slight knowledge of Hindoostani, I told him to take up the portmanteau and conduct me to a part of the town where I should be most likely to find a conveyance.

"This way, sahib," said the fellow, trotting along a few paces in advance as he led the way along the river's bank through a long, badly-lit street; and he was about to plunge into what I knew to be the native quarter of the city, when I bade him halt—or, as I probably then expressed myself in nautical language, to 'heave-to.'

"Why do you go in this direction?" I asked.

"Pardon, sahib," was the reply. "Your servant's brother has one of the best horses in Calcutta; his humble abode is close at hand, if the sahib will condescend to come this way."

"Oh, very well," I answered. "If that's the case, go ahead!" and so I followed him through the bazaar and up a tortuous labyrinth of narrow, ill-smelling lanes,

where it was so dark, owing to the scarcity of lamps and the overhanging eaves of the squalid buildings, that the dusky natives who were seated on their haunches at the open doors, enjoying the cool night air, looked like the shadowy forms of ghosts in their white garments.

"This part of the town was as silent as a city of the dead, save for the occasional deep boom of a tom-tom, beaten by some musical Hindoo who may have been entertaining a small party of friends in a back-yard.

"After stumbling over a few of the

The Fakir.

ghosts, my guide presently pulled up before a hut, and, after lowering my gear from its resting-place on his head, tapped at the door, and informed me that we had reached the 'humble abode.'

"The brother, however, appeared to be in no immediate hurry to admit us, so to accelerate his movements I hammered away heartily with my stick on the bamboo framework of the house, when suddenly out popped a head and shoulders from a hole at the side of the door which did duty for a window.

"The sahib wants you to drive him to—," said my guide.

"And look sharp about it," I added.

"What will the sahib give his servant?"

"One rupee."

"The head began to shake from side to side in a deprecatory fashion.

"Well, two, then," I said. "But come along; don't keep me waiting."

"The head and shoulders disappeared for a few seconds, and presently the door was opened and out came an ancient Hindoo, very much run to seed about the lower extremities. He made a profound salaam, and then hastened off to the rear of the premises to put his nag into harness.

"While waiting for his return several natives gathered round my guide and entered into conversation with him. I caught a few words here and there, and comprehended from their talk that they were curious to know who I was, where I came from, and whither I was going—in fact, they wanted to know all about my business.

"One particularly dirty individual, ornamented with a string of beads, from which hung a gourd and brass dish—a tall, lean, cadaverous-looking fellow, with long, attenuated arms and legs, and a shock of tangled black hair that fell some distance over his shoulders, and whose eyes glittered and gleamed like those of a wild cat—seemed really most anxious to find out where I was bound to, and plied my companion with questions on the subject.

"The light from the open door fell full on his features, which were hideous, and I observed that his naked body down to the waist was coated with a quantity of mud or clay. In my innocence I concluded from this that he had recently taken a mud bath in the river, and had omitted to scrape the dirt off. At the time his appearance puzzled me not a little, but I afterwards learned that a certain class of religious devotees in the East are addicted to smearing their bodies with the mud of the Ganges, a custom that, as may be imagined, does not add to their personal beauty, though it has certain advantages, inasmuch as it protects them from mosquito-bites, keeps the cold out, and is a very economical description of clothing.

"Why this mud-beplastered personage should take so much interest in me I could not imagine. At last, apparently satisfied with the information he had elicited, he leaned on his staff and gazed earnestly, and, as I considered, impertinently, at me. I was relieved when the guide's brother at last arrived with his horse and gharry, for I felt that the fixed stare of the fellow was beginning to exercise a kind of magnetic influence over me.

"Jumping into the gharry—a ramshackle affair, a compound of a bath-chair and bathing-machine—I threw a few annas to the guide, and we drove off in the presence of the admiring crowd.

"I was very glad when we emerged from the narrow streets, with their un-

savoury smells, and reached the open country.

"Our road lay for some time parallel with the river, and after proceeding along its bank for some considerable distance I thought it probable that we might be in the vicinity of my friend's bungalow, so I interrogated the driver on the subject.

"Very near now," was the answer. "The sahib will be able to get a boat at the next village."

"Get a boat! What on earth do you mean?" I exclaimed.

"The bungalow of the Sahib Vernon is on the other side."

"Oh, then, that accounts for my missing him!" I muttered to myself. "What a donkey I am!"

"Plenty boats, sahib," said the Hindoo, in a cheerful tone, meant to relieve my apprehension.

"We were now approaching a cluster of native houses, and were welcomed by a number of half-wild dogs that rushed forth from their lairs and greeted us with yelps and howls. A crack of the driver's whip sent them flying into the background, and as they disappeared a couple of natives came forward and inquired what was wanted.

"After a great deal of talking and haggling the two men agreed to row me across the water and carry my traps up to Mr. Vernon's house, which they said was only a short distance from the landing-place.

"This being settled, I jumped out of the gharry, and was rather taken aback at seeing, just behind the wheel, the figure of the dirty native who had taken so much interest in my movements!

"Yes, there he was, in the road, leaning on his staff regarding me with the same look I had noticed when we drove away from the city.

"How ever did you get here?" I asked, in some surprise.

"No reply; only a prolonged stare from the fierce eyes.

"Come, speak out, man!" I continued, feeling unaccountably irritated at the presence of the filthy object; "and don't stand staring at me in that way!"

"Still no reply, and so I turned to the coachman and asked him if he could tell me where the Hindoo had so suddenly sprung from.

"Cannot say, sahib," he answered, and there was a startled expression on his face as he gathered up the reins and drove off in the direction of Calcutta, leaving me alone with the boatmen and the object of my disgust.

"I felt almost inclined to shout to the driver of the gharry to return and take me back to the city, but on second thoughts decided to proceed on my journey. So, telling the men to lead the way to the boat, I followed, looking back once or twice at the gaunt figure in the road, who remained standing there in the same position watching our movements.

"Don't you know how that man got here?" I asked the boatmen.

"He must have come behind the sahib's carriage," said one of them, with a laugh.

"But what does he want? and who is he?"

"One of the holy men, sahib."

"A fakir, I suppose?"

"Yes, sahib."

"We had now reached the boat—a large roomy craft, partly housed over

with matting stretched over a light framework of bamboo, which formed a kind of upper-deck cabin, entered from either end. A small oil-lamp suspended from a batten illuminated the interior.

"The boatmen having deposited my portmanteau in this place, I sat down and proceeded to unstrap it in order to get out my pipe, as I thought a little tobacco smoke would keep off the swarms of mosquitos and sand-flies, whose attentions were anything but pleasant.

"While thus engaged, the boatmen commenced to unmoor their craft, and presently I heard the splash of their oars in the water and felt the boat gliding across the stream.

"Having re-strapped the portmanteau and lit my pipe, I went to the after end of the cabin, intending to go out into the fresh air. As I drew back the curtain of matting you may imagine my surprise at seeing, perched up in the stern-sheets, the hideous fakir!

"There he sat, glaring at me with the same fierce expression in his eyes that I had observed on the two former occasions!

"For a moment I stood returning his stare, with the corner of the curtain in my hand; then, dropping it to shut out the unpleasant sight, I walked towards the opposite end of the boat, intending to find out what the boatmen meant by permitting him to come on board. But I had scarcely taken three paces across the deck when my attention was arrested by the sound of a stealthy footstep behind, and the clattering of the fakir's brass dish against his beads. Turning quickly round, I saw my gentleman quietly perched on the top of the portmanteau, and as the flickering rays from the lamp played over his disgusting features, his eyes met mine, and I seemed suddenly fascinated by his gaze, just as the bird is said to be fascinated by a cobra.

"The shout of anger that I was about to raise died on my lips, my legs seemed to be weighted with lead, I could neither advance nor retreat, a sense of utter helplessness stole over me, and my mind appeared to be benumbed.

"I endeavoured once by a desperate effort to withdraw my eyes from those of the fakir, but found, to my horror, that I was powerless to do so.

"I could, however, distinctly hear the measured dip of the oars in the water, and the gurgling of the rushing tide against the sides of the boat, and would have given all I was possessed of to be able to cry out to the men in the bows for assistance, but my tongue refused to give utterance to speech, and every moment my mind became more and more concentrated on the object before me, and oblivious to everything else.

"There before me sat the image, silent, immovable, like an image carved in stone.

"Yet the eyes of the old fakir were full of life and energy, all his vitality seemed to be centred in them. At one moment they grew to an enormous size, then the great luminous orbs would dwindle into two fiery sparks, scintillate for a few seconds, and gradually enlarge again.

"Presently he stretched one of his long skinny arms towards me, and, pointing with a finger that resembled the claw of a vulture to a stool at his feet, motioned me to seat myself.

"I felt compelled to obey. Then, unfastening the dish from the string of beads, he placed it on the deck between us, and, holding the gourd above it, shook out a small quantity of white powder. This done, he touched the powder with the end of his staff, and instantly a tiny spiral column of smoke commenced to ascend from the dish, which, on attaining a height of about three feet, expanded and filled the cabin with a strong, pungent, though not altogether unpleasant odour. Very soon a veil of smoke hid the form of the fakir, but through the veil I saw the eyes glaring as fiercely as before—in fact, they appeared more luminous than ever. I began to feel extremely drowsy, and slightly alarmed as I noticed that the eyes were slowly but surely approaching my own. At last I actually thought, I could feel them scorching my face, and then I became unconscious.

* * * *

"When I came to myself I was lying alone on a mat in the cabin, and it was broad daylight.

"I struggled to my feet and endeavoured to collect my thoughts. Was it possible that I had fallen asleep and had been suffering from nightmare! My first impulse was to rush out of the cabin and call the boatmen.

"I did so, and, glancing towards the bows, expecting to see them there, I was amazed to find that although the boat was speeding swiftly through the water, there was no sign of them! I looked, then, towards the stern, and was completely bewildered at the sight of the old fakir, who was perched up on the gunwale sculling the boat with his long staff. As my eyes met his he greeted me with a mocking smile.

"What does it all mean?" I exclaimed, as I turned my back on him with a feeling of disgust, and now noticed for the first time that we were no longer on the broad bosom of the Ganges.

"We appeared to be flying along the surface of a narrow stream through the middle of a dense forest. On either bank, growing close down to the water's edge, were colossal trees, whose enormous branches stretched right across, and, interlacing each with the other, formed a roof of foliage some hundreds of feet overhead.

"Never before had I seen or believed that there were such monsters in existence.

"While lost in amazement, the boat's bows suddenly inclined towards the embouchure of a creek, and, entering where it was only just wide enough to admit the boat, we continued until all further progress was arrested by the creek terminating at the foot of an avenue of magnificent palms, that stretched far away until lost to sight in the distance.

"The fakir now left his seat at the stern, and, without noticing me, at once stepped on shore. No sooner had he landed than he threw himself flat on his face, and, after remaining in that position a short time, rose to his feet, and, turning towards me, fixed me with his eyes and beckoned me to follow, which I felt impelled to do.

"Immediately after I had landed, the fakir strode off up the centre of the avenue, and I could not resist following him.

"I was again struck with awe and wonder at the size of the trees and vege-

tation, and the beauty of the flora. The forest appeared to be full of life; I could actually see the tall palms and the broad-bladed grass that fringed our path *growing*; the circulation of the sap in the great leaves and petals of the gorgeous flowers was plainly visible through the network of veins. I cannot pretend to describe the surpassing beauty or the brilliant hues of the birds and insects that flitted to and fro; the plumage of the former was different from anything I had ever beheld, while the bodies of the latter glittered with scales of gold, and their eyes sparkled like precious stones.

"There was apparently no end to this long arcade and its marvels. For hours we sped rapidly through it, and, strange to say, that, notwithstanding the pace, I felt no sense of fatigue. On the contrary, as we proceeded I thought my body was getting lighter, and that, with very little effort, I could skim over the surface of the ground like the winged forms that hovered about us.

"At last the sun, like a globe of fire, was visible at the end of the vista, and as it slowly sank below the horizon, and the twilight commenced to darken into night, a mysterious change came over everything. The hues of the lovely flowers faded, and the sweet perfume gave place to a nauseous odour; the leaves of the palms no longer spread their plumes in graceful curves to the breeze, but hung flat and dank against their shafts, while the foliage of other varieties of trees shrivelled and fell in showers to the earth, and on reaching it became metamorphosed into noisome beetles and huge squat toads, that scurried off into black stagnant pools.

"The beautiful feathered denizens of the forest also changed into abominable forms, some taking the shape of enormous vampire-bats, others horned owls and flying monstrosities resembling nothing that I had ever conceived possible.

"The leafless branches of the trees now swarmed with monstrous apes and creatures of the monkey tribe, that chattered as they leaped from bough to bough, and gnashed with their teeth, while they paused in their exercise to shake their long arms at us in a threatening manner. In the deep recesses of the woods I heard the crash and fall of great trees as if mighty brutes were tearing paths for themselves through the forest, and at intervals above the buzz of insects, croaking of toads, and the growling of many animals, a terrific roar would shake the air, and reverberate through the tall columns. None of these sights or sounds made the slightest impression on the fakir, who strode steadily along in silence.

"Presently the moon appeared and threw a long silvery beam of light along the road, disclosing immediately ahead of us a dark square building of great size. Approaching it I observed that it looked like a block of black marble standing on the top of a flight of seven white stone steps forming a kind of pyramid, and that it was approached on three sides by avenues of palms similar to the one we had just traversed.

"Ascending the steps the fakir touched the face of the building with his staff, and instantly an opening seven feet square disclosed itself. He entered and I followed. On gaining the interior I saw nothing for a few moments, for all was dark as Erebus, but by-and-by I

perceived a faint light in the centre of the building, which gradually became brighter, until an intense white light illuminated the place, which appeared to emanate from a crystal globe that revolved in the air apparently without support of any kind. I now saw that the walls, ceiling, and floor of the building were of highly polished black marble, similar to the exterior, and that at equal distances round the walls were four black marble cubes placed on white marble steps, models in fact of the building itself, while in the centre exactly under the globe was another but somewhat larger. They looked very much like tombs.

"The fakir advanced to the central tomb, and, springing up the steps, leaped on the top of it and sat there cross-legged. I was about to follow him, but found that immediately my feet touched the first step I was unable to move.

"The crystal globe now revolved more rapidly than ever on its axis, and the white light began to fade, and was succeeded by a deep red glow; after this the crystal exhibited in succession all the primary colours, then came an interval of total darkness.

"Afterwards a faint white light appeared once more, and as it grew in intensity what was my astonishment to behold perched on the other tombs four fakirs, the very image of my dirty acquaintance!

"I started at the sight, and my astonishment increased at hearing one of the fakirs shout in a loud voice,

"What news, great Mahabārata, dost thou bring from the north?" But there was no reply to this question from the old fellow.

"A fakir at the opposite side now called out,

"What from the south?" No reply.

"Number three then roared in a voice that shook the building,

"What from the east?" Still no reply.

"The fourth now howled in a voice of thunder,

"From the west?" This stirred up the fakir; he sprang to his feet and exclaimed,

"Brothers. Woe, woe, woe! to the children of the sun; the spears of the warriors of Ind have been broken, and the chieftains swept before the winds like the dust, by the lightnings of the Feringees. A simultaneous groan from the fakirs.

"My brothers," continued the fakir, "do not the Vedas tell us that the children of the Empress of the West shall conquer the Orient? Already like a torrent that nought can stem they have rushed over the four quarters. Behold, my brothers, one of the race of the mighty conqueror."

"All eyes were now levelled at me, and fierce expressions of hate gleamed on the faces of the fakirs.

"Come, my friends," I remarked, feeling that something was expected from me, "I'm naturally of a retiring disposition, and—"

"My speech was cut short by the fakirs suddenly jumping off their tombs and advancing towards me in a menacing manner. In another minute they had seized me by the arms and legs and laid me flat on my back on top of the central tomb, and to my horror I found the old fakir who had brought me, flourishing a bright broad-bladed knife in the region of my throat.

"With a violent effort I disengaged my arm from the clutches of one of the wretches, and, doubling my fist, struck out and hit the 'dirty one' fairly between the eyes.

"At this moment there was a sudden crash, the crystal globe fell to the ground and was shattered to pieces on the marble floor, leaving us in total darkness, while the building appeared to commence swaying and heaving as if rocked by an earthquake.

* * * * *

"I staggered to my feet, and was bewildered to find myself once more in the river boat with the oil lamp lying broken on the deck. The boat was rocking to and fro as if in a heavy sea, and the voice of one of the boatmen reached me, shouting in excited tones,

"Quick, sahib! quick! The steamer has run us down."

"The next moment I was struggling for dear life in the cold dark water of the river. I caught a glimpse of the bright stars shining calmly above me and felt that I was being dragged under as the boat sank. My feet were entangled in a rope.

"I gave myself up for lost, but in another minute (which seemed an age), I rose to the surface, and being a good swimmer struck out for the bank, which was close at hand.

"As I scrambled up I found the two boatmen already at the top, wringing their hands and bewailing in Eastern fashion the loss of their boat, while the cause of it, a large paddle-wheel steamer, was clearly visible heading up the river at full speed.

"As soon as I could make myself heard I asked anxiously what had become of the fakir.

"Both men looked astonished at the question.

"The fakir, sahib? What does the sahib mean?" they exclaimed, almost simultaneously.

"Mean?" I answered; "the fakir who embarked with us from the other side?"

"The boatmen evidently thought that the accident must have demented me, and stared at each other.

"Do you mean to say," I continued, "that that dirty old chap who turned up so suddenly at the village never entered the boat?"

"Never, sahib," they both exclaimed, with a look of alarm.

"But, as if to give the lie to their assertion, there suddenly appeared on the surface of the river, apparently clinging to a piece of wreckage, the dark body of the fakir himself. As the swift tide bore his lifeless form along, the boatmen sprang into the water and dragged it to the land. It was the fakir, and he was dead; there was no mistake about that. One of the paddle-wheels of the steamer must have struck him on the head, for there was an ugly mark across his face.

"The boatmen were evidently surprised, and appeared somewhat startled when they recognised him, but they still persisted that he had never entered their boat.

"I could not stop on the bank arguing with them all night in my wet clothes, so desired one to go to the nearest village for help to remove the body, and requested the other to take me at once to Mr. Vernon's bungalow.

"The house was close at hand, and in less than a quarter of an hour I was

under the hospitable roof of my friend, who was considerably astonished at my appearance and plight.

"His first words to me were, 'Why, Seymour, my boy, I had almost given you up; what on earth have you been doing to yourself?'

"I was about to explain, but he insisted on my first changing my dripping garments for some dry clothing which he procured for me, and while I dressed I heard one of the boatmen telling my host about the accident in voluble language, and Mr. Vernon directing him to go to the village to find his companion; so when I entered the dining-room my friend congratulated me on my narrow escape, and was very indignant at the conduct of the captain of the steamer in proceeding up the river and leaving us to our fate; but while he rattled on my own thoughts were not so much engaged on that subject as on the extraordinary and mysterious journey I had taken with the fakir.

"Seeing how preoccupied I was, Mr. Vernon asked me if I felt all right, hoped my ducking had not done me any harm, etc., and proposed that we should have dinner at once.

"I am expecting a very old friend directly," he added, "Mr. Bell, one of the judges; he promised he would come here this evening; but we won't wait, as he is an uncertain bird."

"However, we had hardly seated ourselves at the table when a servant announced the judge, and a very pleasant and agreeable addition to our party he proved.

"But notwithstanding the amusing conversation of the new arrival, my mind *would* revert to the fakir, and I kept puzzling my brain in trying to account for his appearance in the boat. At last I told the whole story to Mr. Vernon, who listened with an amused smile on his face to my description of the journey through the forest. When I had concluded he laughingly asked me whether I was addicted to smoking opium.

"On my replying in the negative, he said,

"Well, the only explanation I can give is that you must have fallen asleep and dreamt it all."

"No," I said, "that won't do, for there's no doubt that I saw the fakir in the stern sheets of the boat after we left the village, and if you like you can see his body yourself after dinner. I must confess that I feel extremely puzzled," and added that I should like to be able to explain the mystery.

"Perhaps," said the judge, who had been listening attentively to my story, "I may be able to throw some light on it."

"I wish you would, then," I rejoined.

"In the first place," he responded, "it is evident that the fakir *did* get into the boat, although the boatmen may not have been aware of it, and in the second place you saw him.

"Now you know, Vernon, that the Orientals are supposed to be acquainted with all sorts of magical arts; whether they are or no is of course a matter of opinion; at any rate, they pretend they

can do many marvellous things. That they are very clever jugglers cannot be denied, and it is well known that they are able to exercise a species of fascination over serpents and animals. We Westerns are inclined to look upon these fellows as impostors; but we are unable to offer a satisfactory explanation of the most common and interesting of their performances. This man may have been a fakir who was an adept in the art of fascination. In my opinion he was anxious to ascertain whether your young friend's portmanteau contained anything worth walking off with, and in order to satisfy himself first commenced operations by mesmerising him, but his performance was brought to an abrupt conclusion by the steamer running the boat down."

* * * * *

"That, gentlemen," said the colonel, "was the judge's theory, and I'm inclined to believe he was right. Whenever I meet any of the fascinating gentry now I always look the other way. By Christmas morning I had quite recovered my spirits, and hope I was not the least merry of a very merry party."

"Very curious story," drawled Lieutenant Devenish, as he screwed his eyeglass into its usual place and regarded the colonel with interest.

"Come, Devenish," said the colonel, as a smile played over his rugged features, "none of that; don't you try it on. Once in a lifetime is quite sufficient to have been 'fascinated by a fakir.'"

ROUND THE CHRISTMAS FIRE.

ROMAN PUZZLES.

1.

Take nought from eleven and leave nine.

Eleven = XI.

Nine = IX.

or

Eleven = I I I I I I I I I

Nine = NINE.

2.

From the following figure

to take three away and then complete the figure as before by putting only two back.

Take three away and you get

Put two—these two—back and you get

3.

Take six from nine and leave nineteen.

Nine = NINE.

Take six away and five (I I I I I) are left, which arranged thus X|X give nineteen.

4.

To prove that seven is the half of two.

Two = II

Halve it = II

Make seven VII

5.

To prove that twelve is equal to a thousand.

Twelve = XII

One thousand = M

6.

To make ten out of four without adding or subtracting anything.

Four = IIII

Ten = X

7.

To prove that four is equal to five thousand.

Four = IV

Five thousand = V

8.

To make ten thousand out of three.

Three = III

Ten thousand = X

9.

To convert ten into fifty thousand.

Ten = I I I I I I I I I

Fifty thousand = I K K K

10.

To prove that $4^2 + 3^2 = 1884$.

1884 = MDCCCLXXXIV

Or 28 strokes, which arrange

"Var da Vaigher"

(GUIDE THE
WANDERER).

[* * The foreign words are old Shetlandic, spell phonetically, and still used in the Shetland Isles.]

PALE and passion-moved a woman
Cowers beneath the rocky wall
Where the wild and fitful glimmers
Of the "northern streamers" fall;
Round her roar the tempest-voices,
At her feet the billows rave,
And a Marool* rides triumphant
On each phosphorescent wave.
Upward then her hands beseeching,
And her auber† glances rise,
"Var da Vaigher! Var da Vaigher!"
To the Polar Star she cries.

Wild around her native Norland
Rolls the cradle of her race.
Wherefore should a sea-king's daughter
Fear the ocean's wrathful face?
Ah! upon those vexed waters
Rocks a lonely barque the while,
Bearing—rude and fragile refuge—
Him, the darling of the Isle.
This is why her pale lips murmur,
As she bends a trembling knee,
"Var da Vaigher! Var da Vaigher!"
Lead my sailor-on-the-sea!"

* Marool—Sea-fiend.

† Auber—Eager; longing to obtain something.

Var da Vaigher! Var da Vaigher!
Long and weary are the days
Since his vessel, drifting seaward,
Vanished from her lauger* gaze.
Long and weary are her vigils,
Oft and wistfully her eyes
Turn, with love's beseeching language,
To their magnet in the skies.
Constantly her prayers are carried
Further than the furthest star:
"Var da Vaigher! Var da Vaigher!"
Guide the soul that wanders far!"

On the tjordon†-haunted ocean,
On its islands wrapt in night,
Through the curtains of the cloud-land
Shone the Pole Star's holy light.
On the ship, and on the woman,
Whose strong hope no storms could kill,
On the voyager, whose glances
Seek that faithful beacon still,
Did the symbol of God's guidance
Beam: and o'er that trackless foam,
Vard da vaigher—led the wanderer,
Brought the sailor safely home.

* Lauger—painfully intense.

† Tjordon—thunder.

JESSIE M. E. SAXBY.

Home for the Holidays.

YES! home for the holidays! Pack up
your box,
What matters its bursting if only it locks?
Purchase your ticket and jump in the train,
Rattle away to the country again.
There is old Tim with his worm-eaten fly
(One of those things that will never say
die);

Ask him to just let *you* handle the reins,
Nothing can happen in these country lanes;
Mother and father and sister and all,
There they stand waiting you inside the hall.

How the time passes! here's Christmas Day
come;

Jack Frost is at work and your fingers are
numb;
Off down the pond for a skate, and you'll
find
Your extremities soon leave their numbness
behind.
If *that* wont do try a snowball or two,
It's wonderful what a good pelting will do.

Then homewards for dinner, with tales round
the fire,
Snapdragon and all that your heart can
desire.

Don't gourmandise, though, or when lying in
bed,

When the fire has sunk down to a dim dusky
red,
The fiend Indigestion will make his at-
tack,
And gallop you off on a nightmare's broad
back.
Never mind, there is nothing that always can
last,
If that night is too long the next day goes
too fast,
So enjoy it, and we will in pity refrain
From hinting that schooldays must soon
come again!

BILK'S FORTUNE.

A GHOST STORY.

By T. B. REED,

Author of "My Friend Smith," "The Fifth Form at St. Dominic's," etc.

CHAPTER I.—SUPERSTITION.

WE had a fellow at Holmhurst School who rejoiced in the name of Alexander Magnus Bilk. But, as sometimes happens, our Alexander the Great did not in all respects resemble the hero to whom he was indebted for his name. Alexander the Great, so the schoolbooks say, was small in stature and mighty in mind. Bilk was small in mind and lanky in stature. They called him "Lamp-post" as a pet name, and as regarded his height, his girth, and the lightness of his head, the term conveyed a very fair idea of our hero's chief characteristics. In short, Bilk had very few brains, and such as he had he occupied by no means to the best advantage. He read trashy novels, and believed every word of them, and, like poor Don Quixote of old, he let any one who liked make a fool of him if he only took the trouble to get at his weak side.

I need hardly say the fellows at Holmhurst were not long in discovering that weak side and getting plenty of fun out of Alexander Magnus. He could be gammoned to almost any extent, so much so that after a term or two his persecutors had run through all the tricks they knew, and the unhappy youth was left alone for sheer want of an idea.

But one winter, when things seemed at their worst and it really appeared likely that Bilk would have to be given up as a bad job, his tormentors suddenly conceived an idea and proceeded to put it into practice in the manner I am about to relate in this most veracious history.

The neighbourhood of Holmhurst had for some weeks past been honoured by

the presence of a gang of gipsies, who during the period of their sojourn had rendered themselves conspicuous by their diligence in their triple business of chair-mending, fowl-house-robbing, and fortune-telling. In the last of these three departments they perhaps succeeded best in winning the confidence of their temporary neighbours, and the private seances they held with housemaids, tradesmen's boys, and schoolgirls had been particularly gratifying both as to attendance and pecuniary result.

It had at length been deemed to be for the general welfare that these interesting itinerants should seek a change of air in "fresh fields and pastures new," and the police had accordingly hinted as much to the authorities of the camp, and given them two hours to pack up.

More than ever convinced that gratitude is hopeless to seek in human nature, the gipsies had shaken the dust of Holmhurst from the soles of their not very tidy feet, and had moved off, no one knew whither.

These proceedings had, among other persons, interested Alexander Magnus Bilk not a little, and no one mourned the rapid departure of the gipsies more than he. For Bilk had for some days past secretly hugged the idea of presenting himself to the oracle of these wise ones and having his fortune told. He had in fact gone so far as to make a secret observation of their quarters one afternoon, and had resolved to devote the next half-holiday to the particular pursuit of knowledge they offered, when, lo! cruel fate snatched the cup from his lips and swept the promised fruit from his reach. In other words, the gipsies had gone, and, like his great namesake, Alexander, Magnus mourned.

Among those who noticed his dejection and guessed the cause of it were two of his particular persecutors. Morgan and Dell had for some months been suffering affliction for lack of any notion how to get a rise out of their victim. But they now suddenly cheered up as they felt the force of a mighty idea moving them once more to action.

"Old chap," said Morgan, "I've got it at last!"

"What have you got?" asked the "old chap;" "your back tooth, or measles, or what?"

"I've got a dodge for scoring off the Lamp-post."

"Have you, though? You are a clever chap, I say! What is it?"

What it was Morgan disclosed in such a very low whisper to his ally that the reader will have to guess. Suffice it to say, the two dear lads put their heads together for some time, and were extremely busy in the privacy of their own study all that evening.

Bilk, little dreaming of the compassion and interest he was evoking in the hearts

of his schoolfellows, retired early to his sorrowful couch, and mourned his departed gipsies till slumber gently stepped in and soothed his troubled mind. But returning day laid bare the old wound, and Alexander girded himself listlessly to the duties of the hour, with a heart far away.

He was wandering across the playground after dinner, disinclined alike for work and play, when Dell accosted him. Bilk might have known Dell by this time, but his memory was short and his mind preoccupied, and he smelt no rat, as the Irish would say, in his companion's salutation.

"Hullo! where are you off to, Lamp-post? How jolly blue you look!"

"I'm only taking a walk."

"Well, you don't seem to be enjoying it, by the looks of you. I've just been taking a trot over the common."

"I suppose the gipsies have all gone?" inquired Bilk, as unconcerned as he could.

"Yes, I suppose so," answered Dell, offhand. "Anyhow, they've cleared off the common."

"But I was told," said Bilk, rather nervously, "they'd gone quite away."

"Not all of them, anyhow," said Dell. "But of course they can't now show up the way they used to."

"Where are they, then?" asked Magnus, with a new hope breaking in upon him.

"How can I tell? All I know is there are some hanging about still, and I shouldn't wonder if they weren't far from here."

"Really, I say! I wonder where?"

"I'd as good as bet you'd come across one or two of them after dark in Deadman's Lane, or up at the cross roads, any evening for a week yet. They don't clear out as fast as fellows think. But I must be off now, as I've a lot of work to do. Ta, ta!"

Alexander stood where the other left him, in deep meditation. Those few casual observations of his schoolfellow had kindled anew the fire that burned within him. Little could Dell guess how interesting his news was! After dark! The afternoon was getting on already. The school clock had struck half-past four nearly a quarter of an hour ago, and by five it would be quite dark. Tea was at a quarter-past five, and for half an hour after tea boys could do as they liked. Yes, it would be foolish to throw away such a chance. At any rate, he would take the air after tea in Deadman's Lane, and if there he should meet—Oh! how he wondered what his fortune would be!

Tea was a feverish meal for Bilk that evening. He spoke to no one, and ate very little; and as the hand of the clock worked round to a quarter to six he began to feel distinctly that a crisis in

his life was approaching. He was glad neither Dell nor Morgan, whose studies probably kept them in their study, were at tea. They were such fellows for worrying him, and just now he wanted to be in peace.

The meal was over at last, and the boys rushed off to enjoy their short liberty before the hour of preparation. Bilk, who had taken the precaution to put both a sixpence and a cricket-cap in his pocket, silently and unobserved slid out into the deserted playground, and in another minute stood beyond the precincts of Hohnhurst.

Deadman's Lane was scarcely three minutes distant, and thither, with nervous steps, he wended his way, fumbling the sixpence in his pocket, and straining his eyes in the darkness for any sign of the gipsies. Alas! it seemed to be a vain quest. The lane was deserted, and the cross roads he knew were too far distant to get there and back in half-an-hour. He was just thinking of giving it up and turning back, when a sound behind one of the hedges close to him startled him and sent his heart to his mouth. He stood still to listen, and heard a gruff voice say—or rather intone—the following mysterious couplet—

Ramsdam pammydiddle larrybonny-
wigtail
Wigtaillarrybonny keimo.

This could be no other than an incantation, and Bilk stood rooted to the spot, unable to advance or retreat. He heard a rustling in the hedge and the incantation suddenly ceased. Then a figure like that of an old man bent with age and clad in a ragged coat which nearly touched the ground advanced slowly, saying in croaking accent as he did so,

"Ah, young gentleman, we've waited for ye. We couldn't go till we'd seen ye; for we've something to tell ye. Come quietly this way, and say not a word or the spell's broken—come, young gentleman; come, young gentleman;" and the old man went on crooning the words to himself as he led the way with tottering steps round the hedge and discovered a sort of tent in which sat, with her face half shrouded in a shawl, an old woman who wagged her head incessantly and chattered to herself in a language of her own. She took no notice of Bilk as he drew near tremblingly, and it was not until the old man had nudged her vehemently, and both had indulged in a long fit of coughing, that she at last growled, without even lifting her head,

"I see nothing unless for silver."

It said a great deal for Bilk's quickness of apprehension that he at once guessed this vague observation to refer to the sixpence he had not yet offered. He drew it out and handed it to the old woman, and was about to offer an apology at the same time, when the man put his hand to his mouth and snarled,

"Not a word."

The old woman took the coin in her trembling hand, and bent her head over it in silence. Bilk began to get uneasy. The time was passing and he would have to start back in a very few moments. Could it be possible these gipsies, now they had his sixpence, were going to refuse to tell him the fortune for which he had longed and risked so much?

No! After a long pause the old

woman lifted up her hand and said something in gibberish to her partner. It was a long time coming, for they both coughed and groaned violently during the recital. At length, however, the old man turned to Bilk and said, gruffly,

"Kneel."

The boy obeyed, and the old man proceeded.

"She says a great danger threatens you this night. If you escape it you will live to be a baronet, or member of parliament, and perhaps you will marry a duke's daughter; but she can't be certain of that. If you don't escape it you will be in a lunatic asylum next week, and never come out. Not a word," added he, as Bilk once more showed signs of breaking silence. "Wait till she speaks again."

Another long pause, and then another long recital in gibberish by the old woman, broken by the same coughing and groaning as before. Then the man said,

"Stand up and hold your hands above your head."

Bilk obeyed.

"You want to know how to escape the peril?" said the man.

Bilk, with his hands still up, nodded.

"To-night at nine o'clock you will hear a bell."

Again Bilk nodded. Fancy the gipsies knowing that!

"You will go up to a small room with a chair and a bed in it, and undress."

A pause, and another nod from the astonished Bilk.

"You will put on a long white robe coming down to your ankles. At half-past nine the place will be dark—as black as pitch."

Bilk shuddered a little at the prospect.

"Then will be the time to escape your peril or else to fall a victim. To escape it you must go quietly down the stairs and out of the house. The Being who rules your life will be away for this one evening, and you will escape through his room by the window, which is close to the ground."

Bilk started once more. He knew the doctor was to be out that evening, but what sort of supernatural vision could tell the gipsies of it?

"You must escape in the long white robe, and run past here on to the cross roads. No one will see you. At the cross roads there is a post with four arms. You must climb it and sit on the arm pointing this way until the clock strikes twelve. The peril will then be past, and your fortune will be made. Not a word. Go, and beware, Alexander Magnus Bilk!"

The legs of the scared Alexander could scarcely uphold him as he obeyed this last order, and sped trembling towards the school. The gipsies sat motionless as his footsteps echoed down the lane and died slowly away into silence.

Then they rose to go also; but as they did so other footsteps suddenly sounded, approaching them. With an alacrity astonishing in persons of their advanced age they darted back to their place of retreat, but too late. The footsteps came on quickly, and followed them to their very hiding-place, and next moment the light of two bullseyes turned full upon them, and the aged couple were in the hands of the police.

CHAPTER II.—SCIENCE.

DR. PRUDHOM did not often allow himself the luxury of an evening out during term time. But on this particular evening he was pledged to fulfil a long-standing engagement with an old crony and fellow-bachelor, residing about two miles from the school. By some mysterious means the worthy Dominie's intentions had oozed out, and Bilk was by no means the only boy who had heard of it. Mice seem to find out by instinct when the cat is away, and fix their own diversions accordingly.

I merely mention this to explain that as far as Alexander Magnus was concerned no night could have been more favourable for carrying out the intricate series of instructions laid down by the gipsy for the making of his fortune. With this reflection he consoled himself somewhat as he ran back to the school.

The doctor had already started for his evening's dissipation, if dining with Professor Hammerhead could be thus described. This eccentric old gentleman combined in one the avocations of a bachelor, a man of science, and a justice of the peace. He rarely took his walks abroad, preferring the solitude of his library and the occasional company of some old comrade with whom to talk over old times, and unburden his mind of the scientific problems which encumbered it. On the present occasion he had lit upon a congenial spirit in worthy Dr. Prudhom, and the two spent a very snug evening together over the dessert, raking up memories of the good old days when they lived on the same staircase at Brasenose; and plunging deep into abstruse questions of natural and physical science which even the sherry could not prevent from being dry.

The professor's present craze was what is commonly termed ethnology—anything connected with the history and vicissitudes of the primitive races of mankind excited his enthusiasm, and he was never tired of inquiring into the languages, the manners, the customs, the dress, the ceremonies, and the movements generally of various branches of the human family, of whom the most obscure were sure to be in his eyes the most interesting.

It was only natural therefore that when Dr. Prudhom made some casual reference to the recent incursion of gipsies, his host should seize the occasion to expatiate on the history of that extraordinary race; tracing them from the Egyptians downwards, and waxing eloquent on their tribal instincts which no civilisation or even persecution could eradicate or domesticate.

"Fact is," said he, with a chuckle, "they had me to thank that they were allowed here so long. Police came to me end of first week and said they were a nuisance. I told the police when I wanted their opinion I'd ask it. End of second week police came again and said all the farmyards round had been robbed. I said must inquire into it. He! he! All the time I was making glorious observations, my boy, a note-book full, I declare. End of third week inspector of police came and said he should have to apply at headquarters for instructions if I wouldn't give them. Not a place was secure as long as the vagabonds stayed. Had to cave in then, and issue a warrant or so and get rid of them. Sorry for it."

Much to learn yet about them, and the few specimens brought before me weren't good ones. Young gipsies, you know, Prudhom, aren't up to the mark. You only get the true aboriginal ring about the old people. Yes, I'm afraid they're breaking up, you know. Sorry for it."

Dr. Prudhom concurred, and mentioned as a somewhat significant fact that very few old gipsies had accompanied the late visitation, which consisted almost altogether of the young and possibly degenerate members of the tribe.

The discussion had reached this stage, and the professor was about to adduce evidence from history of a similar period of depression in the race, when there came a ring at the front bell, followed by a shuffling of feet in the hall, which was presently explained by the appearance of the servant, who announced that there were two constables below who wished to see his worship.

Now his worship was anything but pleased to be interrupted in the midst of his interesting discussion by a matter of such secondary importance as an interview with the police.

"Can't see them now," said he to the servant; "tell them to call in the morning."

The servant retired.

"Strange thing," observed the justice of the peace, "you can shut up your school at five o'clock every night, and every cheesemonger and tinker in the place can do the same; but we've got no time we can call our own. Pull your chair up to the fire, old fellow. Let's see, what were we saying?"

The servant appeared again at this point and said,

"Please, sir, they've got a couple of the gipsies, and want—"

"Eh, what!" exclaimed the professor, jumping up. "Why didn't you say so before? Gipsies! Why, Prudhom, my boy, could anything be more opportune! Show them into the library and set a chair for the doctor, do you hear? How fortunate this is! Now while I'm examining them, watch closely and see if you do not observe the peculiar curve of the nostril I was speaking to you about as characterising the septentrional species of the tribe. Come away, doctor!"

And off trotted the man of science to his library, closely followed by the scarcely less eager Dominie.

At the far end of the dimly lighted room stood the constables, on either side of an aged couple of vagabonds. The old man was arrayed in a long coat which nearly reached the ground, leaving only a glimpse of a stained and weather-beaten pair of pantaloons and striped parti-coloured stockings beneath. The old woman wore a shawl, gipsy fashion over her head and reaching to her feet, which were shod in unusually large and heavy hob-nailed boots. The faces and hands of both were black with dirt and bronzed with heat, and as they stood there trembling in the grasp of the law, with chattering teeth and tottering knees, they looked a veritable picture of outcast humanity.

"Prudhom, my boy," whispered the magistrate to his guest, with a most unjudicial nudge to emphasise his remarks, "they're old ones. Was ever such luck! Knowing ones too, I guess: they'll try to trick us with their gammon, you see;

he! he! Now, constable, what have you got here?"

For the first time the elderly couple lifted their heads and looked towards the Bench. As they did so they uttered an incoherent ejaculation and attempted to spring forward. But the active and intelligent servants of the law checked them by a vigorous grip of their arms, and crying "Silence!" in their most majestic and menacing tones, reduced them at last to order.

"See that?" whispered the professor to the doctor; "most characteristic. Simulation is of the very essence of their race. Oh, this is beautiful! Did you catch what they said just then? It was an expression in the Mæso-Shemitic dialect, still to be found in the south of Spain and on the old Moorish coast of Africa. I know it well. Well, constable?"

"If you please, your honour, I was passing near the school about half-past five this afternoon along with my brother officer when I observe the defendants crawling along beside the wall. I keeps my eye on them, and observe them going in the direction of Deadman's Lane. I follows unobserved, and observes them crawl behind a hedge. I waits to observe what follows, and presently I observe a young gentleman walking down the lane. As I expects, the male defendant comes out and offers to tell him his fortune, and I observes the young gentleman give the parties money. I waits till he leaves, and then with my brother officer we arrest the parties. That's all, your worship. Stand still, you vagabone you, do you hear?"

This last observation was addressed not to his worship, but to the female prisoner, who once more made an effort to step forward and speak. The grip of the constable kept her where she was, but, heedless of his threatening gesture, she cried out, in a shrill, trembling voice,

"Please, sir—please, doctor, we're two of your boys."

The doctor, who had been intently looking out for the curved nostril alluded to by his host, started as if he had been shot.

"Eh, what?" he gasped; "what was that I heard?"

"Why," said the professor, in ecstasy, "it's just as I told you. Dissimulation is second nature to the tribe. No lie is too big for them. The old lady says she and the other rogue are your children. Doctor, there's a notion for you!—an old bachelor like you, too! He! he!"

"We are, indeed!" cried the old man, echoing the shrill tones of his helpmeet. "I'm Morgan, Dr. Prudhom, and he's Dell. Indeed, we're speaking the truth. We only did it—"

"There, you see," once more observed the delighted professor; "it's the very thing I knew would happen. They know you are a schoolmaster, and they want you to believe— Oh, this is really most interesting."

The doctor seemed to find it interesting. He changed colour several times, and looked hard at the two reprobates before him. But their weather and dust-beaten countenances conveyed no information to his mind. Their voices certainly did startle him with something like a familiar sound, but might not this be part of the deep dissimulation dwelt

upon with so much emphasis by his learned friend?

"I wouldn't have missed this for twenty pounds," said the magistrate, beaming on his guest; "my theories are confirmed to the letter."

"We only did it for a lark, sir, and we're awfully sorry," cried the old man. "We really are, aren't we, Dell?"

"Yes, sir," cried the old lady; "please let us off this time."

"Upon my word," said the doctor, getting up and advancing towards the prisoners. "I don't know—"

"Don't be a fool, Prudhom; I know them of old. Sit down, man. Constable, I shall commit the prisoners. Where are my papers?"

"Oh, doctor, please save us!" cried the old lady again. "We are speaking the truth. Let us wash our faces and take off our cloaks, and you'll see we are. Oh, we'll never do it again!"

And before the doctor could reply, or the scandalised constables could prevent it, the two gipsies cast off their outer garments, and presented themselves to the bewildered spectators in the mud-stained jerseys and knickerbockers of the Holmhurst football club!

I draw a veil over the explanations, the lectures, and the appeals which followed, as also I forbear to dwell upon the consternation of the man of science, and the cruel disorganisation of all his cherished theories. It is only fair to say that the professor bore no malice when once he discovered how the matter stood, and used his magisterial influence with the doctor to procure at any rate a mitigated punishment for the culprits.

The delinquents were ordered off to the lavatory, and left there with a can of hot water and a cube of soap, to remove the wrinkles and sunburn from their crestfallen countenances. Which done, they humbly presented themselves in the library, where the doctor, looking very stern, stood already accounted for the journey home. The leavetaking between the two old gentlemen was subdued and solemn, and then in grim silence Dr. Prudhom stalked forth into the night, followed at a respectful distance by his trembling disciples.

Till that moment the thought of Bilk had never once crossed the minds of the agitated amateur gipsies, but it flashed across them now as the doctor strode straight for the cross roads. What if the miserable Alexander Magnus should have swallowed the absurd bait laid for him, and be in the act of making his fortune on the very spot they were to pass!

They held a hurried consultation in whisper on this terrible possibility.

"We shall be expelled if it comes out," groaned Dell.

"Yes; we may as well tell him at once," said Morgan.

"He may not be there, you know; perhaps we'd better wait and see, in case."

So they went on in the doctor's wake, nearer and nearer to the fatal cross-roads at every step.

Suddenly, as they came within a hundred yards of the sign-post, the doctor stood still and uttered an exclamation, the meaning of which they were able to guess only too readily. Straining their eyes in the direction indicated, they could discern a white shadowy form hovering in the road before them.

"What's that?" exclaimed the doctor, in a whisper.

Dell was conscious of a secret nudge as Morgan gasped,

"Oh, it looks like a ghost! Oh, doctor!" and the two boys clung wildly to the doctor's arm, trembling and gasping with well-feigned terror.

Dr. Prudhom trembled too, but his agitation was unfeigned. The three stood still breathless, and watched the dim figure as it hovered across their path and then vanished into the darkness.

"What can it be?" said the doctor, bracing himself up with an effort, and preparing to walk on.

"Oh, please, sir," cried the boys, "don't go on! do let us turn back! Oh dear! oh dear!"

"Foolish boys!" said the doctor; "haven't you sense enough to know that no such thing as—ah! there it is again!"

Yes, there it was again. A faint beam of the moon broke through the clouds and lit up the white figure once more where it stood close to the signpost. And as they watched it seemed to grow, rising higher and higher till its head nearly touched the cross-bars. Then suddenly, and with a groan, it seemed to drop into the earth, and all was darkness once more.

The boys clung one on each side to the

doctor, who trembled hardly less than themselves. No one dared move or speak or utter a sound.

Again the moon sent forth a beam as the figure once more appeared and slowly rose higher and higher. For a moment it seemed as if it would soar into the air, but again, with a dull crash, it descended and vanished.

"Boys," said the doctor, hoarsely, "I confess I—I am puzzled!"

"I—I wonder," said Dell, "if I ever dare go and see what it is. I say, M-m-organ, would you g-g-go with me—for the d-d-doctor's sake?"

"Oh, Dell! I'm afraid. But—yes, I'll try."

"Brave boys!" said the doctor, never taking his eyes off the spot where the ghost last vanished.

The two boys stole forward on tiptoe, holding one another's arms; then suddenly they broke into a rush straight for the signpost.

There was a loud shriek as the white figure rose up to meet them.

"Bilk, you idiot, cut back for your life! here's the doctor! We were only having a lark with you. Do cut your sticks, and slip in quietly, and it'll be all right. Look alive, or we're all three done for!"

The ill-starred Bilk needed no further

invitation. He started to run as fast as his long legs would carry him, his night-gown flapping in the evening breeze, and his two persecutors following him with cries of "Booh!" "Scat!" "Shoo!" and other formulæ for exorcising evil spirits.

After a hundred yards or so the two heroes gave up the chase and returned to the slowly-reviving doctor.

"Come along, sir," said Dell, "there's nothing there; it vanished as soon as we got to it. Let us be quick, sir, in case it comes back."

The remainder of the walk home that evening, I need hardly observe, was brisk, but it was not so brisk as the same journey accomplished by Alexander Magnus Bilk, who had reached the school a full quarter of an hour before his pursuers, and was safe between his blankets by the time that they peeped into his room on their way to bed and whispered, consolingly, "It's all up with the duke's daughter now, old man!"

The doctor may have had some dim suspicion of the real state of affairs; but if so, he gave no sign, and the boys, happy in their escape from what might have proved a grave matter, were content to forego all further practical jokes of the kind for the rest of the session.

(THE END.)

Homeward Bound for Christmas.

CHROMATROPE AND PAPER FIREWORKS.

IN the October part of the *BOY'S OWN PAPER* for 1883 there is an article on revolving slides for the magic lantern, from which we take the following diagram. It shows very clearly the principle on which such slides are constructed. (Fig. 1.)

Fig. 1.

Round the slide runs a wooden border half an inch wide and three-eighths of an inch thick. The right-hand part of the slide is wood, the left glass, and the moving part showing towards us is also of glass, and fits into a circular wooden ring that is kept in position as it turns by the two tiny buttons on each side of it. One of these buttons works on the frame, the other is fastened to a piece of wood glued on to the wooden part of the slide. Farther to the right is a small silk reel, into which a handle is fixed, and an endless band from the reel round the circle in the buttons completes the machinery. All this is simple enough, and as it has already been described need not be gone into in detail.

The question with us now is how to apply this contrivance to the working of a chromatrope. A chromatrope is a lantern slide consisting of two or more pieces so painted as to give the effect on the screen of a set piece of fireworks. It is the easiest of all slides to paint, as it is purely geometrical, and the colours used require no mixing, but can be put on at once as they are got from the shop. And, best of all, the effects produced are far and away more brilliant than anything else in lantern practice.

The essentials are a fixed slide of some bold design—star-shaped, circular, octagonal, or what not—and a moving shade that is of spiral pattern. The spiral pattern is the

Fig. 2.

secret of the whole thing. Let the above be spun behind a star, so as to be only visible through its rays, and the star will seem to be alive. Turn it one way the waves flow outwards; turn it the other the waves flow inwards. The standing pattern must have a centre, and the spiral must be worked on the same centre. That done, all is well. Sometimes a double spiral is desirable, and then the pattern in Fig. 3 is adopted. By it the outer part of the pattern will seem to flow in a different direction from the inner. Paint the spirals any colours you please providing that they are bright and you get the results. Let reverse spirals appear in your fixed pattern and you improve the effect. Have two revolving rings worked by the same wheel, one

over the other, and the whole device will glow with life and brilliancy.

To begin modestly, take some simple design, such as that of the fountain in Fig. 4. Paint it on your slide, and stop it out all round with asphaltum or any dense black. Then fix

to it a simple spiral disk, such as that given in Fig. 2, and the instant the spiral spins the water will begin to flow.

In all designs remember that the fixed slide must be broken up with black and colour so as not to show the whole of the spiral at once. The waves should as it were sweep over the windows. For front designs nothing is superior to a good knighthood star

Fig. 3.

such as those in the coloured plates of the *BOY'S OWN PAPER* for May and October, 1882.

The colours for slide-painting can either be bought ready prepared, or ground down on plate glass and mixed by Canada balsam or mastic varnish. Should the balsam be too thick, use a little turpentine. The clearest colours are lampblack, burnt umber, burnt sienna, raw sienna, gamboge, Prussian blue, verdigris, and scarlet lake, and these are put on in the ordinary way. Before you begin clean the glass carefully with a little water and ammonia. Copy the design through the glass, and it would be as well not to forget that unless you can draw properly on paper you are not likely to do so on a lantern slide,

where in the intense light and enlargement every mistake and shakiness of line is exaggerated for the benefit of the spectators. For those who cannot draw, figures of men and animals can be cut out with scissors and pasted on the slide so as to give a shadow entertainment as a change from the bought slides. Others can buy transparencies and stick them on for themselves, but the result will never equal hand-painting. One more caution before leaving hand-painting, and that is, do not be in a hurry, and give your slides at least a fortnight to dry.

If the spaces of the chromatrope are too narrow or the design is worked too fast you will only produce a fog, just as you do when you spin a toothed wheel. If, however, the teeth of the two wheels be fixed on the slant

Fig. 4.

and the wheels turned in opposite directions the teeth will be visible—upright if the teeth slant the way the wheel turns, slanting if they follow the course of the wheel. The principle holds good with the chromatrope; the spiral is but a toothed wheel.

The chromatrope was invented by Mr. W. Allen. He called it the pyreidotrope. It was improved, and soon became known as Chinese fireworks. From it the paper fireworks still popular in some circles were derived.

Paper fireworks are merely large chromatropes painted on oiled paper instead of on glass, and lighted by candles instead of a lantern. The wheels and stars and plumes and pyramids are just the same as we have been describing, only much larger. The transparent portions are got by perforations. The machinery is the same, but of a rougher pattern, and the moving parts, instead of reels and bobbins, are barrel-hoops and butter-tubs. From what has been said above, their construction is sufficiently obvious, and we conclude with a design that may serve for either purpose.

Fig. 5.

A RACE FOR A CHRISTMAS CUP;

OR, THE ICE-YACHTSMAN'S DREAM.

By W. J. GORDON,

Author of "The Thrones of the Ice King," etc.

CHRISTMAS EVE, 1883, I spent at home at Brickbury. I had sat myself down and rang the bell for tea, when I saw among the papers on the table a large-sized magazine, folded back so as to display an illustrated page, headed, "The Playground of Ice." I carelessly glanced at the cuts; then I picked up the magazine, became at first interested, and then absorbed in what I was reading.

Whether it was the fire or not I cannot say, but I fell asleep; and when I awoke the snow was on the ground, King Frost was undisputed monarch of the weather, and all promised well for a glorious ice-time. I made the most of it; I was out every day for a week, and then, behold! with my morning letters a telegram from Dick:—

"Come to Upton at once River right Ripplet out Race for the B I Y C Cup tomorrow at eleven."

I was off by the next train south, caught the night mail, reached Coughester at four in the morning, had an hour or two's sound sleep, and, chartering a trap, was at Upton by ten.

"Master's down the river on the Ripplet, sir," said the servant when I arrived.

"Then I'll go to him as soon as I have changed my coat."

And in a few minutes I had donned my sea togs, well lined with duffel, and made my way to the boat-yard.

"Here you are, old man!" said Dick, as he came round from the other side of the ice-yacht and cordially shook hands. "Glad you've come. Had your breakfast? Thought I should have been back before to meet you, but I have been having a look at the starboard runner and easing it a bit. The craft is all right now."

And she looked a beauty! Many a pleasant day had I had on her, but where and when I did not for the moment remember; I was too excited to tax my memory closely then.

A graceful sloop was the Ripplet—four-and-twenty feet over all, with light, broad arms of about two-thirds of her length, that seemed to clutch the runners in their outstretched hands and bear the boat upwards on their shoulders. Beyond us was the ice-sheet—silent and still except for the faint ringing of a distant sledge-bell and the fleecy cloud of finely-powdered snow that floated through the Ripplet's rigging as her slender, tapering mast towered some twenty feet above us.

"Yes, she is all right now. Want you to be my crew. We can start at once."

And we did start. The foresail was run up, the sheet hauled in, we swung the stern round, set the mainsail, the canvas filled, and the Ripplet was off down stream. Dick, in fur-lined cap, barnacles, and respirator, was at the tiller; I, as crew, took up my position on the weather outrigger, which had begun to lift to the breeze.

"Splendid fun this!" said Dick.

"Yes; but it doesn't seem to have been invented very long."

"Well, perhaps it doesn't. But don't you know—"

I don't know, for just at that moment the outrigger gave me a sudden hoist in the air. We flew past quite a fleet of sloops, sailing about in all directions, and narrowly escaped demolishing a sledge that was doing duty as a ferry-boat. Down sank the runner for an instant, to rise before another gust, which swept us through a group of lads skating about to the trimmers they were fishing with in the ice-holes. Although we were going so fast, we could see everything as clearly as if we were in a train. After passing the fishing-people we hauled the mainsheet just a trifle closer, and as the bay opened round the headland we caught sight of a strong party of ladies and gentlemen figure-skating near the bank of the stream. Beyond them were nine or ten yachts drawn up in line.

"There they are," said Dick; "all down but us. Stand by, and look alive when I tell you."

Look alive! We seemed to fly at the boats!

"Hold on!"

The helm shot over light as a straw, the sloop snicked round like a whiplash, and we were side by side with the others in our proper station.

"Not a bad run that!" said I.

"So-so! Six miles in ten minutes will never do for racing, though. We shall wake up a bit if the breeze freshens, and then we shall do our sixty knots."

"Sixty knots! Why, that's faster than a typhoon!"

"Well, and of course we can always go faster than the wind!"

"And why?"

"Easy enough. She makes no leeway, and the running friction is on the sharp outside edge of the lee skate, and she is so light you can tow her with a piece of clothes-line. The consequence is, she sails the hypotenuse of a triangle in the same time as the wind travels the base. Here"—and he chalked a triangle on the tiller-cap—"A is the wind; B C, parallel to it, the base of a triangle; B D the course, and D C the perpendicular. The yacht offers no resistance, and spills no wind, and is carried from B to D in the same time as the air travels from B to C. Her speed, therefore, is to that of the wind as B D is to B C, or as many times as great as the perpendicular is to the base. That's lucid enough, isn't it?"

"Well. Yes. It—er—sounds plausible. It—"

"You'll understand it better when you see it done. But now let us give a parting look round and see that we are all 'right and tight and aisy oh!'"

And carefully did we examine every rope, and block, and nut, and screw. Then casting off the foresheet to prevent her taking a cruise on her own account, we left the Ripplet and strolled down to greet and chat with our coming antagonists.

A pleasant set of fellows they seemed, and up to the eyes in skate-yacht lore. Of it the stock was inexhaustible. In vain I endeavoured to recollect when the B I Y C was started. I felt sure it was in my time, but I could not remember the year, and I did not like to ask Dick for fear of showing my ignorance in a way that I thought might vex him.

Here was Leader, who piloted the Haze in her famous match with the Breeze, when the twenty miles were completed in the fifteen minutes. By his side was Davids, who took the short cut down the Jubilee backwater and actually ran the Marikie for two miles over a sheet of ice that was nowhere more than an inch thick. And with them were many more whose achievements will probably fill a portly volume "in the coming by-and-by."

But time was getting on, and the preparation signal was given. The yachts were all in position, head to wind, and just far enough apart to allow each other room to swing. As the word was given to go, the Phantom, as outside vessel, swung round her stem till the sails filled, and she glided off on the port tack. As she finished her swing we followed, and left the line but a few seconds after her. And thus did all the yachts get under way, streaking across the ice in a long echelon, each beginning to swing as soon as the canvas of the vessel on her lee had ceased to shake. I have no doubt it was a very pretty sight, that brisk right-about-face and sudden flashing of the white wings in the cold rays of the sun that were just struggling through the clouds overhead, but I was too excited to attend to it. The wind was blowing strong from the northward, and the clouds breaking up around told us of a coming storm.

The Ripplet was soon in trim, running before the quartering wind with the sheets rather tight aft, and hence "luffing up as she beat to leeward"—to use the rather curious lingo of the ice track—and needing all Dick's skill with the twiddling stick to keep her on her course.

Oh, the glorious excitement of that race! As the wind rose the weather runner rose. As I steadied myself by the shrouds my whole frame thrilled responsive to the wail of the breeze as it sang through the rigging and the hum of the runner as it shot its glittering streak along the ice. Swaying up and down with every modulation of the gale, it seemed as though I was circling through the air on the pinion of some giant petrel. Past the headlands, over the thicker ice we sped, yawing from side to side of the river valley, as at every touch of the sensitive helm the Ripplet writhed back into her

course. At times as we skimmed over the clear new ice we could see the water foaming and flowing beneath it; at times above the storm-song we could hear a sharp crick-crack as the ice sheet stretched and grew again in the piercing cold.

Side by side with us raced three of the sloops who seemed to follow our every motion. One, the blue-starred Phantom, was just a trifle ahead—the trifle she had gained at the start. The Reverie had crept up to our crossbeam, the Crystal was about a length behind. The rest were nowhere; the winding of the river had brought us round to the wind, and at the last headland an unlucky slant had caught the stragglers and sent them a-board to the bad. We flew from side to side of the river as if bewitched.

"Ready about!" and for an instant the foresheet hung to the cleat by only its last turn.

"Let her draw!" and I was over like a shot, the lee sheet was home, and the Ripplet swooped away on the other tack like a swallow over a forest pool. And tack by tack we were answered by the three. At times the Phantom would seem to come back to us, then the gust would lull, the angle of the runner lessen, and all we had gained we would lose. There was no bungling on either ship, board after board we hung together, and about we went as true and sure as if vessels and crews were one piece of machinery.

Again the river curved and we had the wind on the quarter. The speed was terrific, the runner rose till it was at half a right angle from the track, the breeze had increased to half a hurricane, and we flew through a shower of crushed ice that sprinkled up from the skate-iron fine as the spindrift from the sea. Ahead of us we could see the snow falling; in a second or two we were in the thick of the storm, and our three antagonists were hid in the falling flakes. On we went alone. Suddenly as we passed where one of the cross valleys should have opened on to the stream, the Ripplet luffed up and headed on to a piece of hummocky ice. I seemed to be shot off into space. My legs flew from under me, and I swung out like an acrobat, holding on to the shroud like grim death. The lee runner had mounted a hummock, and the yacht had whipped round on one foot like a gate on a pivot. With a quick turn of the tiller Dick brought her back as soon as the rudder touched the ground, and with a leap and a jump or two we slid off into safety.

Soon we were through the snow and out into the sunshine. Our mishap on the hummocks had lost us quite half a mile, and there, away ahead, streaked our three competitors, while the others were closing up behind. Never before did I travel at such a speed as then. The Ripplet seemed to know what was expected of her, and barely touched the ice as she swayed away in pursuit of the leaders. One was soon out of the race. In endeavouring to round a headland the Crystal cut matters too fine, got on to rough ice, swung round as we did, and found herself only able to escape by running under the lee of the hill, where she was stopped by a huge crack that she was being lifted across as we passed. The Phantom and the Reverie held on, and the Reverie was in front.

And so we passed St. Agarics, where the ice was crowded with people, who cheered us as we went by. Who heard the cheers intended for us I know not; so fast were we going that we came in for the applause that greeted the leading boats. For an instant my blood seemed to freeze with horror. We were running rather close to the shore, and as we neared the point opposite to the church a man skated out right in our road! He saw us, and seemed bewildered. Down on him we swooped like an eagle, but as we passed he had the presence of mind to jump upwards, and the lee runner passed under him in safety.

A Race for a Christmas Cup.—See p. 39.

The express was steaming along the river-bank; we overlapped carriage after carriage, and when we curved apart the train was hopelessly beaten. A skating-race was in progress down one of the reaches; we flew by the skaters as if they were standing still. In another reach a spritsail yacht was giving some skaters a tow; we literally leapt past them in our wild pursuit!

The river had widened, and the leaders were no longer close together. Which was in front we could not tell, but the *Reverie* seemed to have kept her advantage. The gale had become more gusty, and in the gusts more powerful. At times the runner rose so that I had to stoop down and bend outwards to give all the extra leverage I could to keep the yacht from capsizing; for there was now no thought of reducing sail, we must either carry on or lose all chance of the prize. And as long as we could stagger I knew that Dick would not give in.

As it was with us so it was with those ahead. Every now and then they heeled over as if going on their beam-ends. The *Phantom* had two men in her weather outrigger, and her mast was bending like a whip.

On we drove, and we seemed to be closing up. A bend in the river brought the wind on

the other quarter, and as we wore my attention was called off for a moment from the chase. When I looked again the *Reverie* had capsized, and her sails were just vanishing!

I shouted to Dick; a puzzled look stole over his face. Again I turned. The *Phantom* was in difficulties, and yawing about in the strangest manner. What did it mean? We were soon to know. There was a loud crackling all round us. The track split into fragments! The *Reverie* had sunk in the river, and we and the *Phantom* were racing to our doom on floating islands of ice!

To stop was impossible! To go about was impossible! The only thing we could do was to drive on and steer for the bank! Down went the helm, the Ripplet luffed up a bit, and then—the rudder caught in a crack, and the tiller broke off short like a piece of glass. At the same moment we passed the cape where the gorge opens and the shores trended away on each side of us, putting safety farther than ever from our grasp.

The rudder being useless, Dick seized the mainsheet and I the fore, and we set to work to steer by the sails. Frightful work it was among the breaking ice, whose fragments got smaller and smaller as we went! On we

leapt from one to the other, expecting each instant to be our last. The wind came down in furious slammers; and I had to keep my position on the outrigger for fear of an overturn. The gaps between the floating bergs grew wider and wider, and every chasm leapt seemed hopeless.

"Jack!"

"Dick!"

"Look!"

There in front of us was the bank! And there was the *Phantom* barring the way on a sheet of unbroken ice!

We were on the only island left, but between us and the shore-strip was a lane of water that looked a foot across. To jump it meant to dash at full speed into the *Phantom*.

The Ripplet was in full career; to stop or turn her was now beyond our powers. The ghost caught her. We leapt.

There was a crash, and all was over!

Susan had accidentally tripped up over Rover, and shot tea-tray, teacups, and teapot flying under the table, and I woke to pick up from the broken crockery the "Playground of Ice" that had dropped from my hand when I fell asleep in my elbow-chair.

PICTURE PLAITING.

AMONG the many amusements for winter evenings picture plaiting is not unworthy of attention. Take three pictures. Suppose we call them for the nonce A, B, and C, and cut them into strips, pasting the strips down on a sheet of paper side by side in the following order:—

Fig. 1.

And so on. The effect is remarkable, and to those who have not seen it before somewhat bewildering. Take the paper, however, and fold it properly, and the picture is formed as it appeared before it was cut. The folding in this case—a very simple one, but sufficient to show the principle—is as follows:—

Fig. 2.

Each of the pictures can be formed in a similar manner, and as the back of the slip can be also decorated, and there is no limit to the number of subjects, a somewhat complicated puzzle can be built up with very little trouble.

This is rather folding a picture than plaiting

it, plaiting proper consisting of slips interwoven on a chess-board arrangement made by cutting the sheet into squares and pasting these alternately on strips. The principle employed is most clearly shown by cutting the slips of paper first, plaiting them into a mat, and then affixing the squares of the dissected picture.

Fig. 3.

Here is the mat as prepared before pasting on the small squares, and below is the strip marked as it appears when taken away from the group,

Fig. 4.

the shaded portion representing that covered by the picture. The picture having been satisfactorily accounted for, the mat is again built up so as to only show the blanks on the strips, and as these view the second is placed. Then on the reverse side two pictures are similarly pasted, and the puzzle is complete, the difficulty in solving it increasing with the number of strips of which it consists.

It was probably this picture plaiting which suggested the idea of "triplicate views." Here three pictures identical in size are taken and cut into vertical strips. The width of the strips matters but little, though an inch is a very fair dimension. On the last occasion we tried the experiment we had chromo-lithographs of the lugger, the land-

scape, and the hussar, shown on the next page. Having cut the pictures into strips and carefully numbered them on the back, we proceeded to paste down No. 1 of the lugger on a sheet of cartridge paper. By the side of it we pasted No. 1 of the landscape; and by the side of that came No. 1 of the hussar.

Fig. 5.

Having exhausted the three first strips, we treated the three second strips in the same order in the same way, and the result was that shown in Fig. 5, when A does duty for the lugger, B for the landscape, and C for the hussar.

Fig. 6.

The strange medley thus obtained was of course three times the length of one of the originals, and the same height. When it was dry we proceeded to fold it up in the concertina bellows fashion as sketched in Fig. 6, where the folding is shown as only half completed. We, however, pressed the edges

close up together until they stood out at right angles from the landscape, and then having blacked the edges slightly to hide the glaring white line at the joins, we achieved the effect shown in Fig 7.

Fig. 7.

This was satisfactory, and so moving our chair to the left we shut out the landscape and beheld the hussar looking none the worse for having been cut into slices.

Fig. 8.

Another move of the chair gave us another view of our "tria juncta in uno," and behold! the lugger breasting the waves as gallantly on thirteen uprights as she did on the single flat.

Fig. 9.

FOLLOW MY LEADER!

BY THE AUTHOR OF "JOE SIEG," ETC.

THIS cold weather reminds me of a little affair that took place many years ago, when I was very different, but boys were much the same. It was in this wise.

There were two schools in our village, both of them day schools. One was for the more respectable boys—that is, for us—the other for the villagers. We were constantly in a state of armed neutrality during the summer with the cads, as we called them, which always culminated in winter, as a snowball-fight enabled us to try our prowess in a regular set-to.

On the day in question we had our usual encounter, in which we had decidedly the best of it. Not content with our victory, we turned it into a rout, and, chasing the fellows down the street, brought them to bay in a yard belonging to a stonemason, the father of the village ringleader. With a reckless disregard of

consequences, we stormed the yard, drove our enemies helter-skelter out of it, and finished by destroying a magnificent snow-man, which the youngsters had spent a couple of days in erecting.

By that time the stonemason, Mr. Higgs, appeared on the scene with a thick stick and a couple of apprentices, seeing which and whom we beat a hasty retreat. Not so hasty, however, but that we heard Mr. Higgs administering summary chastisement to his son Jim, who did not find his punishment lessened by our derisive shouts.

"I'll pay you out for this to-morrow!" he yelled at us from over the wall when his chastisement was over.

"How did you like it?" we shouted back. "Give our love to Mr. Higgs and say we'll call again to-morrow!"

With this parting shot we scuttled to our various homes through the twilight.

At the back of the school premises ran a fence which bordered a narrow ditch, dividing the school-grounds from the adjoining meadow. The ditch was a shallow one, and was the first water frozen. By all rights, human and divine, this ditch was the property of our school—at least, that was our opinion—and as a rule the village boys did not venture to trespass on it. Skating was out of the question, but the smooth ice made a splendid place for sliding, and every play-hour saw most of us flying along the whole length (some eighty feet), till we were pulled up short by the termination of the ditch in a small round pond used for watering cattle. It was the one drawback to our sport that just when we had a good pace on we "stubbed" our toes against the end bank and toppled over ignominiously on our hands and faces.

The morning after the snowball-fight

we all hastened to the ditch directly after breakfast to have a good turn before school. It was completely deserted. We had had several days of ordinary sliding the whole length of the ice, so this morning we began by some fancy sliding. Putting two bricks about six inches apart, we endeavoured to slide between them on one foot without touching them, occasionally varying the performance by attempting the "cobbler's knock," which is done by tapping the ice with one foot whilst sliding on the other. All were not equally successful, and I remember that more than once I polished my waistcoat buttons against the slippery surface.

"Time's going on!" cried Lewis, one of our biggest boys. "Let's have one good turn right up to the top to finish with. No crowding now; all come one after the other, steadily."

We formed ourselves in line, ready to follow him. We were anxious to do our best, for we noticed Higgs and several others of the cads seated on the fence at a little distance watching us.

"Ready?" asked Lewis. "Go!"

He took a sharp run down the bank and shot quickly forward on to the ice, feet not too wide apart, body upright; everything in first-rate style. The rest of us followed him at about a yard apart; those who had not sufficient impetus were caught up by the more rapid, and then the unwilling friends travelled along together. The pond was reached; another moment and Lewis would execute the usual half-somersault as he fetched up on the bank. Suddenly a fearful yell was heard, there was a tremendous crash, and one after the other of us fell through the ice upon the unfortunate leader.

Six of us went through before the procession could be stopped—I know this because I was the sixth. Then those who had escaped began to pull out their unfortunate companions. Lewis was soaked through, and was choking with mud and water; the rest of us had not fared so badly, for the pond was only about eighteen inches deep. However, we all had our boots and trousers wet, at least, and that was far from comfort-

able with the thermometer at 21° Fahrenheit. The village boys departed as we crawled out, and it was not till the afternoon that we discovered the connection between their presence and our accident. Higgs, it appears, galled by his defeat and chastisement, had paid a visit to our pond late on the previous evening and broken a big hole in the ice. It froze sufficiently hard during the night to cover the hole with a thin coating of ice, which at a distance looked just like the rest, which it was not. Hence the untoward mishap of which we were the victims.

We might have taken a deep revenge, but the next night came a tremendous thaw. That put a stop to snowballing, and consequently to open hostilities, for we determined to wait till more snow came, and then—

But the winter was a mild one, and no snow fell worth speaking of. So nature acted the peacemaker, and before next winter our animosity had happily died out.

H. M. P.

A SNOWSKATE RACE IN LAPLAND.

IN Nordenskjöld's last expedition to Greenland two Laplanders were employed, and when the sledge-party had made their way as far as was deemed advisable across the inland ice-sheet, these two men were sent forward to explore farther on their snow-

skates. Their adventures were unique. As some doubt has been cast on the distance they claimed to have traversed, and as snowskating generally was somewhat of a mystery to a good many scientific celebrities, it was resolved by Mr. Oscar Dickson and the

baron to arrange a "ski" race early in the year, as a test of speed and endurance. The course was marked out, timekeepers were appointed under the command of Colonel Bergman, the Rev. C. Laestadius was told off to umpire at the turning-point, and much

trouble was taken to make the trial as conclusive as possible.

The meeting took place on the third of last April, and, after some delay in waiting for a favourable surface of snow, the men were dispatched about six in the evening on the first long-distance snowskate race on record. The course was from Lake Purkijaur in Lule Lappmark, Swedish Lapland, to Krutholmen and back, crossing several lakes on the journey. This had to be twice traversed, and as the distance out and home measured sixty-eight miles, the full run was one hundred and thirty-six. There were sixteen competitors, but of these six fell out during the race.

The times for the first half of the race, sixty-eight miles, were as follows:—Pava Lars Tuorda, a Laplander, 10h. 10m.; Per Olof Ländta, Laplander, 10h. 10m.; Apmut Andersson Arrhman, Laplander, 10h. 10m. 20s.; Nils Petter Nilsson Tuorda, Laplander, 10h. 10m. 40s.; Johan Gustafsson, colonist, 10h. 41m. 45s.; Anders Katison, Laplander, 10h. 10m. 50s.; Amma Ammasson Ländta,

Paulus Larsson, also a colonist, 11h. 45m. Of the ten in the race it will be noticed that three were colonists and seven Laplanders. Of these latter the two Tuordas belonged to the Tuorpen tribe, whose migrations centre about Lilla Lulevatten, and extends from Quickjork forestwards; the two Ländtas, Arrhman, and Katison, belonged to the Sirkas tribe, who haunt the lower mountains on the south side of Stora Lulevatten as their spring and autumn grazing-ground, and have the reputation of being rather more civilised than their fellows. The other Laplander, Nila Ribbjä, represented the Jockmocks, who dwell on the watershed that divides the Perl and Pite. Some of the men had come in on their skidor the night before from distances of forty miles and over.

No difference took place in the position of the men after the half distance, and the race was won by P. L. Tuorda in 21h. 22m., P. O. Ländta coming in a good second in 21h. 22m. 5s. The last man, Larsson, accomplished the journey in 26h. 34m. One of the com-

The winner, Tuorda, had been on the Nordenskjöld expedition; his time—21h. 22m.—includes an hour and a half for rest and refreshments, so that he skated the hundred and thirty-six miles in 19h. 52m., or at the rate of nearly seven miles an hour. One of the chief objects of the meeting was to demonstrate the advantages of the ski for polar exploration, and this it is considered to have established. Of course, as mentioned in our Christmas part last year, where a description was given of the annual snow-skate sports before the King and Royal Family, the use of the ski is well known, and the novelty of the race herein noted consisted in its being the first long-distance competition and the first properly-timed trial.

In wolf-hunting and other sports snowskates are constantly used; and in our illustration we have shown a couple of sportsmen returning from capercailzie-shooting in full swing down one of the snow-slides in which they delight. A not altogether inappropriate title for the sketch would be "The Descent of Skidor!" For directions how to

Homeward Bound.

petitors, A. A. Ländta, was a man of over fifty years of age; his time was 23h. 38m. 5s.

make a pair of these wooden skates see BOY'S OWN PAPER monthly part for May, 1883.

MIRROR MAGIC.

A PIECE of looking-glass is a famous toy. Even when reflecting the sun in Jack-o'-lantern fashion, giving impromptu flashing-signals across the street, or used in grim earnest as an aid to warfare, there is always something pleasant about it. It does not, however, require a looking-glass to reflect, plain glass will do that at a pinch. Witness the "drawing instrument" sold for a shilling, which consists of a piece of common window pane, at right angles to a drawing-board, with the copy on one side of it and the paper on the other; and the reflection of the copy appearing on the paper, its tracing is thereby reduced to child's play. When light passes from one medium to another a portion of it is always turned back or reflected.

Next to a Jack-o'-lantern, perhaps the simplest optical toy is a Magic Gallery. Take a long box or trough and place a piece of ordinary looking-glass at each of its ends. At one end bore a hole to look through, and rub the silvering off the back of the glass that stands against it. Now fill up the length of the box with grooves, and have a few card trees jutting out for an inch or two from each side, at intervals of two or three inches apart. On the spot on the mirror where the reflection of the spy-hole comes arrange a tree or curtain, so as to hide it. On looking through the spy-hole an endless gallery will be revealed—an avenue of untold length, in which a few tin soldiers or dolls judiciously placed will be repeated till they form an army. A most effective peep-show can be devised on this principle, more especially if the pictures are brilliantly lighted from above, for in all optical experiments it is worth remembering that a good deal of the success depends on having the objects well illuminated and the eyes well shaded.

Having made a Magic Gallery with two mirrors, try one with four. Here the reflections and cross-reflections will be even more startling, and as you advance to six, eight, or a greater number of sides, you will find the results increase in geometrical proportion. There is no better or pleasanter way of commencing the study of optics than that of trying the effect of these combinations of the simple mirror. The cost is trifling, odd pieces of looking-glass being obtainable for a few pence. At first it is best to try with common thin glass, as with the thicker varieties there may be some trouble with the multiple images caused by the reflections from the upper and under surfaces. It is owing to these confusing multiple images that scientific instruments are fitted with metal instead of glass reflectors; and in trying over the experiments of the ancients, with whom mirror manipulation was a fine art, the qualified success is not seldom due to the imperfections of the tools used. For the mirrors of old were costly specimens of perfectly polished silver or steel, or copper and tin mixed, whose reflections were peculiarly sharp and true.

The fundamental law explaining the enlargements and multiplications due to the mirror is the very simple one that the angle of incidence is equal to the angle of reflection. We may as well prove this before we go any further, and we can hardly do so in a simpler manner than that described by Professor Tyndall:—

"Fill a basin with water to the brim, the water being blackened by a little ink. Let a small plummet—a small lead bullet, for example—suspended by a thread, hang into the water. The water is to be our horizontal mirror, and the plumb-line our perpendicular. Let the plummet hang from the centre of a horizontal scale, with inches marked upon it right and left from the point of suspension,

which is to be the zero of the scale. A lighted candle is to be placed on one side of the plumb-line, the observer's eye being at the other.

"The question to be solved is this: How is the ray which strikes the liquid surface at the foot of the plumb-line reflected? Moving the candle along the scale, so that the tip of its flame shall stand opposite different numbers, it is found that to see the reflected tip of the flame in the direction of the foot of the plumb-line, the line of vision must cut the scale as far on the one side of that line as the candle is on the other. In other words, the ray reflected from the foot of the perpendicular cuts the scale accurately at the candle's distance on the other side of the perpendicular. From this it immediately follows that the angle of incidence is equal to the angle of reflection."

Now this is a very simple experiment, easily done and never forgotten, and should be tried by every lad who desires to be anything of a mirror magician. It is the key to nearly all the illusions.

Take the decapitated head, for instance, as given in our last Christmas number, or in its latest form as here shown. The head looks quite isolated. It is really thrust through a mirror inclined at half a right angle as shown along the sides, the hole in the glass being hidden by the frill round the neck.

Having settled with the galleries and the boxes, the next thing to try should be the hinged mirrors. Two pieces of looking-glass are hinged together with a strip of tape glued to one of each of their sides. They are then opened at various angles on any brightly coloured objects, such as flowers or fabrics, so as to disclose the most charming geometrical designs.

One of the most beautiful objects to place between the hinged mirrors, or indeed anywhere, is an ordinary soap bubble shielded by a tumbler from the air. The changing colours of the lessening film baffle all description.

The effect is improved if the mirrors are enclosed in a box and gazed at through a sight-hole as in the gallery. The principle is the same as that of the kaleidoscope, whose construction we have fully described on p. 63, and some of the prettiest patterns produced are those from the reflection of old nails and buttons and scraps of cotton dresses. For suggestions for chromatropic and firework designing the hinged mirrors have no superior. If the sight-hole is fitted with a multiplying-glass, a lens cut in facets like a jewel, the wealth of form and colour is immensely increased; the patterns are the same, but their multiplication seems to refine and improve them.

After thus digressing into ornament the

Fig. 1.—The Maiden's Portrait.

On this system nearly all the physiological impossibilities are worked by our conjurers. Talking heads, living busts, quarter lengths and half lengths, whole heads, half heads, two heads, and three heads, all owe their origin to the angle of reflection. And even in cases, as at the Egyptian Hall, where the doctor cuts off the patient's head, and the disconnected head and body keep time together in threatening gesture, the "forty-five mirror" is the responsible agent. If ever a saint did nurse his head on his knees we may rest assured it was "through the looking-glass."

A few experiments with slanting mirrors should be tried, and the various appearances they give rise to in a partially closed box carefully studied, as more likely than anything else to lead to new developments. You will end by hardly believing your own eyes. There is no more heartless deceiver than a looking-glass.

experimenter may next try his hand at a little mischief, and though he may not equal Archimedes he may certainly succeed à la Buffon.

That Archimedes burnt the ships of Marcellus is generally admitted, but it is by no means clear how he did it. Did he use a lens or a combination of plane mirrors?

When Kircher went to Syracuse with Scheiner, he came to the conclusion that the ships could not have been farther than one hundred and fifty feet from Archimedes at the time the attempt was made, and that a combination of plane mirrors was quite equal to the task.

To prove that the achievement was not impossible, Buffon took one hundred and sixty-eight pieces of looking-glass, each six inches by eight, and connected them so as to throw the light on to one spot. With twenty-one of these mirrors he burnt a beech plank at a distance of twenty feet; with forty-five he

melted a six-pound pewter flask; with one hundred and seventeen he melted thin pieces of silver; and with two hundred and twenty-four mirrors he melted plate silver at forty feet. On the strength of these experiments a Mr. Peyrard, during the long French war, proposed to unite the beams from five hundred and ninety mirrors, and from the distance of a mile and a half destroy the British fleet.

Buffon, it may be mentioned before we leave this burning question, also experimented with lenses. He it was who discovered that the longer the focal length the better. A lens of thirty-two inches in diameter and six inches in focal length, with a diameter of focus of eight lines, melted copper in less than a minute.

This sounds rather sharp work for a burning-glass, but is nothing to what Parker, the Fleet Street optician, achieved. He made out of a mass of flint-glass a lens a yard in diameter, weighing two hundred and twelve pounds. It was three inches and a quarter thick at the centre, and had a focus of six feet eight inches, and the diameter of the focus was one inch. The rays refracted by the lens were received on a second lens, weighing twenty-one pounds, in whose focus the objects for fusion were placed. The diameter of the smaller lens was thirteen inches, and its central thickness an inch and five-eighths, giving a length of focus of twenty-nine inches and a diameter of three-eighths of an inch. The combined focal length of the two glasses was five feet three inches, and the diameter of the focal image half an inch. This was the most powerful burning-glass ever built. Nothing could resist it. Platinum, gold, silver, copper, tin, quartz, agate, jasper, flint, topaz, garnet, and asbestos, were all liquefied in a few seconds. Its "focus" was indeed the hearth that the name implies. Hearths, however, need not necessarily be hot. Witness the damp blotting-paper slope down which sodium globules are run, bursting into flame as they feel the moisture!

And now let us take our flat mirror and bend it into a cylinder, or, what is the same thing, let us silver the inside of an ordinary glass tube, such as is procurable from any druggist's shop. But before we do so we may as well try an experiment with a tumbler and a plate, and turn a shilling into three-and-sixpence.

Rather more than half fill the tumbler with water. Drop the shilling into it tail side upwards. Place the plate on the top, and briskly and steadily turn tumbler and plate upside down so that the shilling drops head upwards on the plate. On placing it on the table the shilling will be seen at the top of the water, and on the plate there will appear a magnified image as large as a half-crown. Refraction has lifted up the shilling, reflection has magnified it.

There is no danger of making a mess. Some years ago a few members of a scientific society visited a certain well-known seaside resort, and one of the party, feeling dissatisfied at the entertainment at the inn, amused himself by filling the tumblers with water to the brim, and by holding a sheet of paper on the top, turning them upside down upon the table. There they were left, seemingly empty, to be removed by the unsuspecting waiter, who doubtless found his task rather a difficult one. To turn them over is easy enough, but to turn them back again under such circumstances—?

Having bent round our mirror, and thus obtained a large segment of a circle, or, what is better, become possessed of a piece of silvered tube such as is sold for gasfittings purposes, stand it upright on a picture. The result will be to pinch up the image and distort it out of all recognition. Why? Let us alter the drawing so as to get a proper representation of it, and we shall see. Divide the sketch into squares, as in Fig. 3. Then take a line the

Fig. 3.

length of one of the sides of the square, and from its centre let fall a perpendicular equal to the focal length of the mirror. From its end draw another line at right angles to it, half the length of the bisected line, and then join the lines so as to form the triangles in

Fig. 2.—Coin Growing.

the annexed figure. Now divide the base of your triangle in the same way as you have divided the sides of your square, and run the divisions down to the apex. Where they are cut by the cross-line draw the parallels which answer to the parallels on your picture, and cut the triangle up into trapeziums, as in Fig. 4. Now place your mirror on the apex of the triangle, and you will find that these trapeziums will appear as the squares from which you constructed your distorted design. This is quite enough to show the principle of anamorphosis, as it is called. With a little thought about our old angular friends of incidence and reflection the mystery of the image in the glass will soon vanish. The appearance of the two sketches when finished is as in Figs. 5 and 6, and of course

landscapes and figure-subjects are prepared in the same way. And now we must hasten on. Still more wonderful distortions are effected by conical mirrors, but the drawings

Fig. 4.

have to be arranged on a rather more elaborate system.

All boys are familiar with the distortions effected by convex mirrors, such as are familiar to them in the teapots and spoons. Cylindrical mirrors are used but as curiosities. Like unto them are spherical mirrors and

Fig. 5.

Fig. 6.

convex mirrors generally. With concave mirrors it is very different. They are the true magic mirrors. It is with them that all the triumphs of the charlatanism of old and the science of to-day have been achieved.

All the wonderful appearances of the gods in the ancient temples can be explained by referring them to the concave mirror. At Tyre there was a temple to Hercules in which, according to Pliny, there was a con-

separated seat from which the gods arose. At Tarsus was a temple where Æsculapius appeared to his worshippers. At Enguinum, in Sicily, was a temple in which nearly all the recognised goddesses could be shown at will. And in each case, given the right distance between the audience and the mirror focus—marked by the magic figure or ring of skulls in which the necromancers placed their dupes—and the supernatural manifestation becomes an ordinary optical experiment.

Hang up a concave mirror and try for yourself, and raise your own phantom by advancing or retiring till you hit the exact spot in which it appears between you and the glass. In fact, repeat the experience of Theodore Santabaren, who was applied to by the Emperor Basil to show him his son but for an instant. The emperor, inconsolable at the boy's death, applied to the miracle-working pontiff for one glimpse of his child in his present state, and the story recounts how Basil beheld his son's image, beautifully dressed, rush into his arms and disappear—out of focus! Or, even better, try your hand at the wonder of the mysteries, when, according to Damasius, "in a manifestation that should not be talked about, there appeared on the temple wall a mass of light, at first seeming very remote, and then transformed as it came nearer into a face divine and supernatural, of severe aspect, but mixed with gentleness, and extremely beautiful."

In the Christmas parts of the *BOY'S OWN PAPER* for the last and previous years are the diagrams showing the way in which these ghostly illusions are most easily worked, and to them reference should be made by all who are unable to discover the secret for themselves. The most startling illusion is that in which smoke comes into play and serves the purpose of a lantern-screen. Jamblichus tells us how the gods often appeared among the vapours, the most suitable of which for the purpose is got by boiling side by side, in separate flasks, solutions of ammonia and hydrochloric acid. And we read how one

Maximus, the sorcerer, eclipsed all predecessors by making the statue of Hecate laugh in the smoke of the burning incense. If Maximus had only had a magic lantern what wonders would he not have effected? Had he only placed a prism in the beam, he could not only have made the statue laugh, but cut off its head into the bargain! And had he used a trough slide, by colouring the water he could have raised round the laughing head additional clouds of any form and colour that he pleased. And a trough slide is so easy to make! Two pieces of glass, with an eighth of an inch between them, so arranged as to be water-tight. Filled with clear water, the trough is invisible; but let but a drop of ink or dye fall into it, and over the picture on the screen the volumes of cloud will ascend.

He need not have used the ordinary lantern, the opaque one described in the January part of the *B. O. P.* for this year would have done as well, and it would have served his turn as well as it did the lawyer's in the will case, where the enlarged images of the real signature and the forged signature were thrown on the court wall from the documents themselves, and the patchings and scratchings of the forgery revealed to all, to the dire confusion of the ingenious gentleman in the dock. An opaque lantern Maximus doubtless did have, but it was of considerable size, and consisted merely of a bright light, whose rays were concentrated on the living figure by a concave mirror, and from the figure reflected on to the other silver mirror, from whence the phantom was floated on the smoke.

These things are very wonderful, though we can "explain" them. Our ancestors may not have been acquainted with quite as many laws of nature as we are, but some of them were keen students of phenomena. One great difference there is, however, between their ways of thinking and ours. Our discoveries we think it best to trumpet abroad, so that all may share in the wonder and win other victories over matter. Theirs they deemed it wisest to keep secret amongst a certain class, as too sacred for popular know-

ledge, and employed them only as a means of mystification.

Mirror magic is strange enough, but the sorcerers are run very close by the professed jugglers. Of the feats of sleight-of-hand recorded in the past, and even in more modern days, some are just as hard of belief until the explanation is forthcoming. We read of just as many curious appearances and disappearances with which the eye was deceived, only as a rule the juggler avowedly produced them for the sake of the amusement, unlike the sorcerer, who carried on his little entertainment for the sake of the dread.

We have in the course of our short paper alluded to many strange things, but none of them are more surprising than the twenty-eight tricks of the Bengalee jugglers, which the Emperor Jehangir in his autobiography says were performed before him. Among these were the basket-trick, the cutting of a man in pieces and then producing him all safe and sound, the putting of seeds into the ground and growing them immediately to the height of a foot or so, and, most extraordinary of all, a masterpiece that the Emperor of Hindostan shall relate in his own words.

Says his Imperial Majesty, "They produced a chain fifty cubits in length, and, in my presence, threw one end of it towards the sky, where it remained as if fastened to something in the air. A dog was then brought forward, and, being placed at the lower end of the chain, ran up, and reaching the other end disappeared in the air. In the same manner a hog, a panther, a lion, and a tiger were sent up, and all equally disappeared at the upper end of the chain. At last they took down the chain and put it into a bag, no one ever discerning in what way the different animals were made to vanish into the air in the mysterious manner above described. This, I may venture to affirm, was beyond measure strange and surprising."

And so say all of us. Though we think it a pity that the jugglers did not themselves climb the chain, draw it up after them, and "equally disappear."

Please to Remember the Hungry Birds.

Our Christmas Penny Readings.

IN THE SIGNAL-BOX: A STATIONMASTER'S STORY.

By G. R. SIMS.

YES, it's a quiet station, but it suits me well enough; I want a bit of the smooth now, for I've had my share o' rough. This berth that the company gave me, they gave as the work was light; I was never fit for the signals after one awful night. I'd been in the box from a youngster, and I never felt the strain. Of the lives at my right hand's mercy in every passing train. One day there was something happened, and it made my nerves go queer, And it's all through that as you find me the stationmaster here.

I was on at the box down yonder—that's where we turn the mails, And specials, and fast expresses, on to the centre rails; The side's for the other traffic—the luggage and local slows. It was rare hard work at Christmas, when double the traffic grows. I've been in the box down yonder nigh sixteen hours a day, Till my eyes grew dim and heavy, and my thoughts went all astray; But I've worked the points half-sleeping—and once I slept outright, Till the roar of the Limited woke me, and I nearly died with fright.

Then I thought of the lives in peril, and what might have been their fate Had I sprung to the points that evening a tenth of a tick too late; And a cold and ghastly shiver ran icily through my frame As I fancied the public clamour, the trial, and bitter shame. I could see the bloody wreckage—I could see the mangled slain— And the picture was seared for ever, blood-red, on my heated brain. That moment my nerve was shattered, for I couldn't shut out the thought Of the lives I held in my keeping, and the ruin that might be wrought.

That night in our little cottage, as I kissed our sleeping child, My wife looked up from her sewing, and told me, as she smiled, That Johnny had made his mind up—he'd be a pointsman too. "He says when he's big like daddy, he'll work in the box with you." I frowned, for my heart was heavy, and my wife she saw the look; Why, bless you, my little Alice could read me like a book. I'd to tell her of what had happened, and I said that I must leave, For a pointsman's arm ain't trusty when terror lurks in his sleeve.

But she cheered me up in a minute, and that night, ere we went to sleep, She made me give her a promise, which I vowed that I'd always keep— It was ever to do my duty. "Do that, and then, come what will, You'll have no worry," said Alice, "if things go well or ill. There's something that always tells us the thing that we ought to do"— My wife was a bit religious, and in with the chapel crew; But I knew she was talking reason, and I said to myself, says I, "I won't give in like a coward—it's a scare that'll soon go by."

Now, the very next day the missus had to go to the market town; She'd the Christmas things to see to, and she wanted to buy a gown. She'd be gone for a spell, for the parly didn't come back till eight, And I knew, on a Christmas Eve, too, the trains would be extra late. So she settled to leave me Johnny, and then she could turn the key— For she'd have some parcels to carry, and the boy would be safe with me. He was five was our little Johnny, and quiet, and nice, and good— He was mad to go with daddy, and I'd often promised he should.

[It

It was noon when the missus started—her train went by my box ;
 She could see, as she passed my window, her darling's curly locks.
 I lifted him up to mammy, and he kissed his little hand,
 Then sat, like a mouse, in the corner, and thought it was fairyland.
 But somehow I fell a-thinking of a scene that would not fade,
 Of how I had slept on duty, until I grew afraid ;
 For the thought would weigh upon me, one day I might come to lie
 In a felon's cell for the slaughter of those I had doomed to die.

The fit that had come upon me, like a hideous nightmare seemed,
 Till I rubbed my eyes and started like a sleeper who had dreamed.
 For a time the box had vanished—I'd worked like a mere machine—
 My mind had been on the wander, and I'd neither heard nor seen.
 With a start I thought of Johnny, and I turned the boy to seek,
 Then I uttered a groan of anguish, for my lips refused to speak ;
 There had flashed such a scene of horror swift on my startled sight
 That it curdled my blood in terror and sent my red lips white.

It was all in one awful moment—I saw that the boy was lost :
 He had gone for a toy, I fancied, some child from a train had tossed ;
 The local was easing slowly to stop at the station here,
 And the Limited Mail was coming, and I had the line to clear.
 I could hear the roar of the engine, I could almost feel its breath,
 And right on the centre metals stood my boy in the jaws of death ;
 On came the fierce fiend, tearing straight for the centre line,
 And the hand that must wreck or save it, O merciful God, was mine !

'Twas a hundred lives or Johnny's. 'Twas that ! what could I do ?
 Up to God's ear that moment a wild, fierce question flew—
 "What shall I do, O Heaven?" and sudden and loud and clear
 On the wind came the words, "Your duty," borne to my listening ear.
 Then I set my teeth, and my breathing was fierce and short and quick.
 "My boy !" I cried, but he heard not ; and then I went blind and sick ;
 The hot black smoke of the engine came with a rush before,
 I turned the mail to the centre, and by it flew with a roar.

Then I sank on my knees in horror, and hid my ashen face—
 I had given my child to Heaven ; his life was a hundred's grace.
 Had I held my hand a moment, I had hurled the flying mail
 To shatter the creeping local that stood on the other rail !

Where is my boy, my darling ? My boy ! let me hide my eyes.
 How can I look—his father—on that which there mangled lies ?
 That voice !—O merciful Heaven !—'tis the child's, and he calls my name !
 I hear, but I cannot see him, for my eyes are filled with flame.

I knew no more that night, sir, for I fell, as I heard the boy ;
 The place reeled round, and I fainted—swooned with the sudden joy.
 But I heard on the Christmas morning, when I woke in my own warm bed,
 With Alice's arms around me, and a strange wild dream in my head,
 That she'd come by the early local, being anxious about the lad,
 And had seen him there on the metals, and the sight nigh drove her mad—

She had seen him just as the engine of the Limited closed my view,
 And she leapt on the line and saved him just as the mail dashed through.

She was back in the train in a second, and both were safe and sound—
 The moment they stopped at the station she ran here, and I was found
 With my eyes like a madman's glaring, and my face a ghastly white :
 I heard the boy, and I fainted, and I hadn't my wits that night.
 Who told me to do my duty ? What voice was that on the wind ?
 Was it fancy that brought it to me ? or were there God's lips behind ?
 If I hadn't a-done my duty—had I ventured to disobey—
 My bonny boy and his mother might have died by my hand that day.

THE "YÜLE-BAU."

AN ADVENTURE IN THE SHETLAND ISLES.

BY JESSIE M. E. SAXBY,

Author of "The Song of the Cal-Loo," etc.

CHAPTER I.

YÜLE-MORN-ING dawned clear, keen, and

exhilarating. There was plenty of crisp snow on the ground, so crisp and firm that walking over its sparkling surface was no difficulty, but a pleasure.

As the first streaks of daylight established themselves an acknowledged fact upon the face of the earth the Manse door opened gently and three boys stole out. One was quite four years older than the others, who were nearly the same size and age. The big gap had been occasioned by a death in the family, and the face of the eldest lad was more sober for thinking of past Yüles when gay-hearted Frank had been the "main-spring o' a' mischief," as well as the head and front of every game. Happily for youth, sorrow sits lightly on it, and though the younger boys had not forgotten Frank, they were prepared to enjoy their Yüle game. Eric was carrying a fine new fishing-rod. Not a slim jointed thing such as we all know, but a long, tapering, sturdy wand known as a

"sillack rod." Harry's hands were in his pockets. Bill, the youngest, had a gigantic football in his arms, and this he hugged with infinite delight.

"I hope there will be a good number of fellows on the loch," said Harry, the middle boy.

"Not a doubt about that," answered Eric, swinging the fishing-rod from one hand to the other. "I know that they've got a hint—I suspect from Fred Garson—that a better 'bau' than usual may be expected on the ground to-day, so there will be a good turn-out."

"What a jolly day it is going to be !" exclaimed Bill ; "and I like the Shetland game much better than either Rugby or Association. Don't you ?"

"I am not sure," replied Harry, sententiously ; "it is not so rough, if less scientific than the others ; but I do wish they had goals and regular rules of some sort."

"Every man for himself is the motto of Shetland football," remarked Eric, adding thoughtfully, "Father says that *that* is the Shetlanders all over. They don't understand working together shoulder to shoulder."

"We do," said Harry ; "it is always the Manse boys, never 'boy.'"

His brothers laughed, and then they reached a stile leading to their humble neighbour's (Ned Harper's) cottage.

As they neared the house Ned came out—for you must remember that sunrise during mid-winter in the Shetland Isles is as late as nine o'clock—and as soon as he saw the lads he called out,

"A happy Yüle to you."

"Changed times with Ned," muttered Harry, while Eric thanked the fisherman for his good wishes, and then with a little hesitation in his manner said,

"We wanted to give you a small Yüle present, Ned, and we couldn't think of

anything better than a fishing-rod—just a small remembrance of—of dear Frank, you know."

"How gude o' you!" exclaimed surly Ned, in a grateful tone, quite unlike his old manner of addressing the Manse boys. "It is very very gude o' you—"

"Are you coming to the loch to see the fun?" Eric interrupted, wishing to cut short Ned's thanks.

"Yea! yea! It's Yüle morning," answered Ned, as if that were reason enough for any escapade; so, handling his new rod with much pleasure, the man accompanied his young friends to the rendezvous.

They had not far to go, for "the ground" was a loch not more than a mile from Westervoe, though hid from it by rising ground. The loch was very beautiful, winding among hills and covered by smooth, firm ice. There was enough of snow on the surface to make a good footing for even cautious fellows who valued their skin, and already some thirty boys and lads were assembled and were greeting each other with all the hearty wishes of the season.

A game of football is one of the institutions of Yüle in Shetland, and every man and boy who can move a leg is expected to show himself upon the ground on Yüle Day, but only the more enthusiastic spirits met at such an early hour.

Two balls were on the ground already, one purchased by subscription—and a mighty effort it had cost the youths to save enough for the purchase—the other last year's ball, carefully mended for the occasion.

Both were good "baus," home-made, of course, but none the worse for that. However, Eric saw with pride that *their* ball was by far the best of the three.

Their father had given it to the Manse boys a few days before Yüle as a reward for good conduct, and their little mother with tears in her eyes had said at the time, "Boys, I don't feel quite able to have much fun indoors this Yüle, the first without—without my Frank," and then she had broken down and the minister had finished the speech for her.

"We wanted you," he said, "to have some pleasure at this season as usual. We felt that was what dear Frank would wish, and so we took the money which would have been used for—for his new Christmas suit, and got this football and some other Christmas gifts for you. I hope you will have much fun out of it. We don't want you to have sorrowful thoughts at Yüle, though we do not feel equal to joining your fun at present."

At first Eric had felt that he could have no pleasure out of Christmas amusements, remembering Frank, but wiser reflections came to his aid, and (as we have seen) he was ready to join the younger boys in the Yüle game when Yüle Day arrived.

"Hurrah! here are the Manse boys!" shouted the laird's son, and immediately the young Mitchells were surrounded, loud praise bestowed upon their ball, and the game began. A party of small urchins seized upon the last season's ball and off it went skimming along the ice, followed by the excited party.

Some of the older and more sedate youths took possession of the subscription ball and pursued a dignified game of their own on a retired corner of the loch. A mixed army of the more ven-

turesome and energetic souls joined the Manse boys, whose "bau" was soon flying up a long arm of the loch pursued by a wild and eager crowd.

As I have already hinted, the Shetland game of football has few rules and no system. The ball must never be lifted or touched by hand, but is simply kicked along anyhow and anywhere, and as long as the lads can hold out, so that the fleet foot and long wind are sure to win. The Manse boys were always on their mettle when they took the field on Yüle Day, and the remembrance of Frank, who had been "king o' the bau" a year before, added to their wish to have "one of themselves" foremost again. They soon left the greater number of their companions behind, and after an hour's hard running up and down the winding loch, they found themselves with only two rivals contending for the first place.

Eric, though so much older than his brothers, was scarcely Harry's match at a race, for the latter was a compact, tough little man, wiry and long-enduring, and Eric had grown so rapidly in height that his strength was not equal to his inches. He gradually fell behind Harry, but Bill kept well up to his brothers, and soon the Manse boys believed they would outstrip all their comrades. Fred Garson (the laird's son) was breathing hard and showing some signs of fatigue, though toiling on with unflagging courage, and Gloy Winwick's staying powers were becoming exhausted. Poor chap! He was a humble widow's son, and did not often find his meals sufficient to allay his appetite; little wonder if his powers of endurance should fail before those of Fred and the young Mitchells! But Gloy had some pluck, and he continued to follow the bau long after many a stouter lad had paused to breathe and rest.

CHAPTER II.

ABOUT an hour after the boys had left the Manse Mrs. Mitchell stole into the study, where her husband was sitting by the window with a look of sad abstraction on his face.

"I hope I am not disturbing you," said his wife, kneeling by his chair and laying her head on his arm. "I did not mean to interrupt you, dear; but the truth is I have got such a curious, frightened feeling about the boys. It seems so foolish and unreasonable, but I can't get rid of it."

"How strange!" exclaimed the minister. "I have been feeling the same thing for half an hour past, and I can't shake it off, do what I will."

"It almost feels like a presentiment or foreboding," Mrs. Mitchell faltered. "Oh! I hope nothing will—will happen on the—on the loch to-day."

"Our boys are in God's keeping, my dear. Now shall we pray together for them?"

The parents knelt together and besought God to avert all danger from the lads—to keep them from evil if they were being tempted to do wrong; to deliver them from harm if their lives were in peril. We cannot doubt that such prayer is heard and answered.

Mrs. Mitchell's composure returned, and the cloud left her husband's face

after that. Then each returned to the duty of the hour with hearts lightened of a load, though a vague anticipation of some startling event taking place remained with them.

Meanwhile the eager lads pursued their game, unknowing of danger, thinking no fear. Now one and now another of the five foremost runners obtained the proud right to send the ball ahead. On they flew, and were taking their way up a devious arm of the loch, when a man came running down the slope, and shouted to them, "Dinna gang up by Soderfiel! The burn is fu', and running into the loch there, and the ice is no' bearing! Dinna gang up yon way. Keep aff the holme!"

Eric Mitchell heard the warning—heard, and paused at once, for it was Ned Harper who spoke, and he knew what he was speaking about. Moreover, Eric remembered that his father had cautioned them about skating on the Soderfiel arm of the loch, as it was well known to abound in springs and deep pools.

"Stop Harry!" Eric shouted, as he drew up near Ned; but Harry was flying ahead like a hare, and did not hear his brother's words, and in a moment the curving banks hid the runners from sight.

"It's no' safe, Master Eric!" exclaimed Ned, in excited tones, and flourishing his sillack rod above his head in a fantastic manner, which made Eric smile. "I tell you it's no' wise o' them to gang yon way. I brought a load o' peats ower the loch last night, and I had to gang round Soderfiel, for the waters abune here wadno' bear me."

"I had better run on and try to recall them," said Eric, preparing to start forward, but Ned stopped him. "Na, never try to follow after, but rin across frae here to the brae, and ye'll overtake them at the bend o' the loch."

Acting on the hint, Eric dashed across the narrow strip of land, followed by Ned, and running up the brae indicated came in sight of the four laddies scouring over the ice in hot pursuit of the ball.

They were beyond reach of his voice, but, as Ned had shown, the crooked twistings of the loch would soon bring them nearer. On they came flushed and excited, Harry ahead sending the ball before him in fine style, and Eric regretted that he must arrest his brother in such a victorious progress.

Needless regret, for as they advanced Harry caught sight of Eric standing on the shore, no longer one of the players, and he stopped abruptly just as an unerring kick from his light-shod foot had sent the ball flying up the dangerous ground.

Pulling up by Eric, Harry looked ruefully after the ball, and then Fred shot past, closely followed by Bill and Gloy.

"Stop, Bill!" cried Eric, but Bill was gone like a whirlwind.

Harry groaned. "I'd have been king o' the bau," he panted. "I'd have held the first place to the end."

"It is hard, old man," said Eric, "but—well, I don't feel like being reckless or—or foolhardy to-day."

"Nor I," answered Harry, staring at Eric with a perplexed air.

At that moment back across the ice came Bill, sliding and whistling, with a curious crestfallen look, half comic, half regretful.

"Hullo!" cried Harry, "have you given in?"

"No," answered Bill, twisting his nose with one hand and his hair with the other. "No, but somehow I had to pull up. Something seemed hauling me back."

"That's how I feel just now," said Harry, gazing wistfully after the two lads who had the field to themselves and were competing for the ball like heroes.

"It looks safe enough," said Eric, doleful at sight of their own ball won and worn by others than the Manse boys, and he took a step forward, then paused.

"I *must* go," exclaimed Harry, as another curve in the loch turned the runners, bringing them still nearer and giving him a chance of retrieving his lost position. "I *must* go," and he stepped forward as Eric had done, then stood still and pulled at his curls as Bill was still doing, and gazed blankly before him.

"I wonder what possesses us?" Bill remarked, in an awe-struck tone.

"I declare I don't know what's up," said Eric. "It is very queer. Do you know I almost fancied I heard father tell us to stay back, just as if he were at my elbow."

"And I," whispered Harry, softly—"I thought mother was crying, 'Come back, boys.' How strange it is!"

Just then Ned joined them again, and, taking advantage of the approach of the two runners, called out,

"Come back, Master Fred. Dinnagang near the holme. Come back, Gloy! Oh, the lads are mad! Come back! come back!"

Vainly he spoke. On the couple went, kicking the ball and chasing it backwards and forwards along the tortuous loch, now approaching one bank, now another, sometimes out of reach of Ned's voice, sometimes quite close to the Manse boys, who stood in a silent group watching the play and powerless to join it, yet too interested to think of anything else.

Fred Garson was in front, and he gave the ball a kick which sent it flying to lodge among the crags of a small islet that rose out of the loch, and was surrounded by deep water and eddying currents. This was the holme which Ned Harper had vainly warned the players to avoid, and his excitement on beholding the ball settle there is more easy to imagine than describe.

As for Fred, he was rushing after the ball when he stumbled and fell flat on the ice. Taking advantage of his rival's blunder, Gloy darted impetuously forward heedless of Ned's reiterated cries of warning.

Then crack! crash! The ice broke below his feet, a black chasm yawned, and down he went.

CHAPTER III.

As Gloy disappeared Fred started back with a cry of horror, which was echoed by Ned Harper and the Manse boys, and all strained their eyes upon the spot where Gloy had gone down. He was under water for only a brief moment, and as soon as his head appeared again he clutched wildly at the ice, which broke, however, when he attempted to lean upon it.

Not for many seconds did Fred Gar-

son's generous heart allow him to stand by while his unfortunate companion struggled and cried for help. Fred's school days were spent at an English public school, and his play-time among the wild rocks and rough waves of his native isles. Fearlessness, courage, and generosity of soul are the natural result of such training.

Moreover, he knew himself to be a good swimmer, while Gloy could not keep himself afloat at any time. In a moment Fred's coat was off and he was beside his luckless companion.

Alas! it is one thing to plunge into flowing water with free limbs and power to use them, quite another matter to find one's self struggling in an ice-bound hole with a frantic drowning creature clutching you with legs and arms and hampering every motion.

In vain Fred tried to bring Gloy to his senses by encouraging words; the poor youth was beside himself with terror, and could only cling and shriek, and the two went down closely twined together in a death-grip. As they rose to the surface again a fierce instinct of self-preservation came to Fred's assistance, and by a mighty effort he tore his arms free; then a thought occurred to him. Clutching Gloy's throat firmly he said,

"I'll strangle you if you don't let go my feet."

The pressure more than the words compelled obedience, and Gloy's hold relaxed sufficiently to allow Fred to extricate himself, and to "tread water," which kept him afloat.

He slackened his hold upon Gloy's windpipe, and, speaking in determined tones, he said,

"I'll hold you afloat as long as I keep myself up if you lie still, but—"

He tightened his fingers again for an instant, which was warning enough. Moreover, Gloy was chilled through and through by that time, and half stupid with despair, so he remained passive, and only convulsive moanings showed him to be alive.

All this had occurred in a very brief time, of course, but the onlookers had not been inactive. Ned Harper was a man advanced in life, no swimmer, and heavily made, so he was of no use on the spot, and he knew it.

"I'll rin for the men!" he cried, flinging down his new and so much valued sillack rod, and making off at once to summon more efficient aid than his own. Then Harry, fleet of foot, and with all his wits always at his command, bounded away to procure a rope from the nearest habitation.

Unfortunately Soderfiel was quite a mile from the cottages, so that some time must elapse before Harry could return; but he went over the white-clad braes at headlong speed, knowing that one rope would do more for the drowning lads than an army of fishermen who could not swim.

Meanwhile Eric and Bill went fearlessly on the ice and drew as near to the holme as they dared. Indeed, Eric was much tempted to follow Fred's example, but the latter kept shouting to them, "Don't come near us. Keep off, Eric!"

"Oh, Fred!" cried Eric, frantically, "how can I see you there and not try to reach you?"

"Don't! don't!" was all Fred could gasp; and Eric knew he was right, for Eric was not at home in the water, and

in all probability would only have embarrassed Fred yet more.

"Help is coming; can you hold out?" asked the Manse boy.

"It will need to come *soon*," said Fred, hoarsely.

He had managed to lay hold of an edge of ice which seemed stronger than the rest, and the support thus afforded gave him a moment to recruit his failing energies.

"Oh, Eric, I can't keep up much longer!" he said, presently.

"Bill!" Eric suddenly cried, as he saw the treacherous ice break again under the pressure of Fred's hand—"Bill, Ned's sillack rod!"

No sooner had he spoken than Bill was off to where Ned had dropped the rod, which was brought to Eric in a few minutes. Hope revived in Fred's breast as he marked Eric's movements, but he called out, "Careful, Eric; don't risk too much for us!"

Laying himself flat on the ice, Eric took the sillack rod and slowly pushed it before him, wriggling himself all the time nearer and nearer to the dark pool where the lads were. The rod was about fourteen feet long—a strong, supple young tree, capable of bearing a heavy strain—and Fred knew that he would receive efficient aid when it came within his reach. How eagerly he watched his comrade's approach we can imagine. The surface of the ice was smooth, and Fred's head was well above the water still, so that he could see Eric creeping nearer and nearer, encouraged by Bill, who kept calling after him, "That's it, old fellow! Oh, you'll do it like that! The ice holds well! Take heart, Fred, he's getting near you!"

At last Eric felt that he had gone as far as he dared, for the ice was beginning to groan ominously ahead of him; so he grasped the rod, and asked, "Now, Fred, can you get hold of the other end? Be sure I'll hold fast upon this one!"

For answer, Fred set his teeth firmly, and, exerting all his remaining strength, managed to raise himself far enough to catch at the rod. It required a great effort, for we must not forget that Gloy, a helpless burden, was in his one hand.

Bill shouted for joy when he saw the two, Eric and Fred, in possession of Ned's rod, and then his brother cried, "Are they coming yet—those fellows? What an age they take!"

"They *are* coming," said Bill; "I see men running along the loch; some will be here in a few moments. Ah! better still; here's Harry with the rope."

To be sure, wise Harry had run well, and to the purpose. He came on the ice at once, and took in the situation at a glance. Skirting the pool, so as to avoid the side on which Eric lay, he coiled the rope, and called to Fred, "Look out, old chap!" Then with sure aim he flung his trusty cord, which fell in a loop over Fred's shoulders. Well for Fred that it did so, for he was quite unable to have adjusted it himself. He was numbed by the cold, and both hands were occupied. He turned his white face to Harry's glowing one, and gasped, "No good! Take care of yourself! Don't risk more!"

"Catch it in your teeth, man!" roared Harry, and Fred, taking the good advice, seized upon the rope as directed, but was too much exhausted to find it of much service after all.

Christmas round our Coast.

Harry stood for a moment perplexed, then, brightening up again, and keeping hold on the rope, he ran round to where Bill stood.

"Now, Bill," he shouted, his usually cool blood up to fever heat—"now for it! We've got to drag Eric back!"

The two boys then cautiously approached their prostrate brother, and, admonishing him to *hold on*, they seized upon his feet and slowly drew him along the surface of the loch.

The ice cracked, and broke off in front of Fred, and once it threatened to split under Eric, but there always remained the length of Ned's fishing-rod between them, which made a certain safety. But by that time Fred had become quite exhausted, and hope was at its lowest ebb, when the clamour of voices reached his ear, and the whole football-players were around the spot, brought by Ned Harper. Incoherent suggestions were made; men asked each other what was to be done. How was the rescue to be effected, after all, without appliances of any sort? Could any man do more than the Manse boys were doing? Harry showed the panic-stricken crowd what was to be done at once. He had observed Fred's eyes close once or twice, and his fingers twitch about the rod in a nervous manner, and the acute lad felt that one moment *then* was worth a life.

"Here," said Harry, flinging the end of the rope he held to Ned—"here! keep a stiff hand on *that*! Get up when

you like now, Eric," and with a few light bounds he cleared the broken ice, and was in the water beside Fred, fastening the loop of his rope around Gloy, and cheering his friend by saying, "It's all right now; they'll have you ashore in a jiffy!"

But there was still some difficulty and even danger to be encountered before the lads were hauled ashore. Nor was the necessity for Eric's "wriggling" quite over, and Harry was glad to attach himself to the sillack rod, while it remained unsafe for men to venture near the widening pool and cracked ice upon which Eric lay.

Indeed, it seemed as though the adventure was to end in a tragedy after all, for when at last the lads were landed Gloy lay with closed eyes cold and senseless, and Fred was unable to move hand or foot.

By that time the alarm had reached one or two cottages, and women came running to the loch carrying blankets and cordials—for it was Yule morning, you know, and even the poorest cottager has on his breakfast-table that day a little of "something by ordinar" in honour of the season.

Under Eric's directions, Fred and Gloy were "taken in hand," and before long both were revived enough to assure their friends that "it was all right." After that they were carried to their homes by the sympathetic fisherfolk.

As for Harry he was none the worse

for his wetting. When he got upon his feet he shook himself like a retriever, and as soon as the other adventurers showed signs of convalescence he said to his brothers, "I say, let's run to the Manse. It will warm me, and, besides, the alarm may reach home. If it does, mother will certainly believe, if she hears that some boys are half drowned, that it must be some of us."

"Yes," said Bill, "but for once the Manse boys were not head and front of a scrape, though their ball was!"

"Oh, the ball! It will have to remain on the holme till a thaw comes," exclaimed Eric, regretfully.

"Not if I know it," answered Harry, resolutely.

Then off they set helter-skelter, and rushed into the Manse breathless and eager to tell their story.

But when they narrated how inexplicably they had been "held back" from going upon the dangerous ground, their father told them of what their mother and he had felt, and then the Manse boys learned that it was the prayers of their parents, which the Hand of God had changed into a restraining power, that curbed their wild young spirits and kept them from harm.

This may seem almost incredible to some of you, careless boys and young men, but in telling these adventures I have adhered to *facts* within my knowledge throughout.

(THE END.)

CRABBE'S PRACTICE.

By A. CONAN DOYLE, M.B., C.M.,

Author of "An Exciting Christmas Eve," etc.

JOHN WATERHOUSE CRABBE was a man of ready resource and originality of mind. When I first met him he was a medical student at Edinburgh University, and had distin-

guished himself in the classes. The circumstances of this first meeting were so characteristic that I shall preface my story by narrating them.

It occurred somewhere in the early part of the year 1877, when the Bulgarian atrocities were engaging the public attention, and indignation meetings were being held throughout the country. One of these was arranged to come off in the music-hall at Edinburgh, and as Scotch feeling ran very high upon the subject, the great building was densely crammed by an enormous crowd. Curiosity had led me to be present, but I had taken the precaution to come late so as to obtain a place in the doorway and be able to beat a retreat whenever I wished.

From this coign of vantage I could hear the speeches of the successive orators, and could look with pity upon the crowded thousands densely packed in the main body of the building. The meeting had been an enthusiastic one. Every point which told against the Government of the day had been applauded to the echo, and not one dissident murmur had been heard until the most important part of the proceedings had been reached, when the chairman had to submit the first resolution to his audience. Then in the midst of the hush with which every one listened to his words a stentorian voice in the centre of the hall suddenly roared out,

"What did Gladstone do in the year '66?"

From every part of the great meeting there came angry cries of "Silence! Order! Turn him out!" but in spite of these hostile demonstrations the inquisitive gentleman was still heard to

be loudly demanding an answer to his question. At last matters reached a climax. There was an eddy in the great crowd, a confused struggle, and then a current which set in towards the door, on which the noisy politician was borne violently forward and ejected from the room, still bellowing his thirst for knowledge as to the movements of the great Liberal statesman in the year named.

Some little time afterwards, becoming tired of the proceedings, I left for home. When I descended into the street the very first thing I saw was the gentleman whom I had seen borne past me, standing with his back against a lamp-post, puffing away very contentedly at a cigar.

"Excuse the liberty I take," I said, going up to him, "but would you mind telling me what it was that Gladstone did do in the year '66?"

He looked at me for a moment with a most comical expression on his face, and then putting his arm through mine turned down the street with me.

"You're a medical, like myself," he remarked; "I know you by sight. To tell you the truth I have not the least idea what Gladstone did, nor do I care. I wanted to get out into the fresh air, and as it seemed impossible to do it by fair means, I had to get them to put me out, which they very promptly did."

We walked home together, and that evening began a friendship which lasted for several years. Crabbe, however,

shortly afterwards took his degree, and having married a dear little wife started a practice in a large English watering-place, which we shall call Bridport. He sank out of my sight for some time, though I had every reason to believe that he was doing well.

One day, nearly two years after I had heard from him last, I received a telegram in which he begged me to run down to Bridport, as he wished to consult me on a matter of importance. I was very busy myself at the time, but I determined to make an effort and get a couple of days clear. When I arrived there I was met at the station by Crabbe himself, his hat upon the back of his head, his frock coat flying in the wind, and in every way the same eccentric, careless fellow that he had been in his student days. He shook me heartily by the hand, and seemed as glad to see me as I was to see him.

"My wife will be delighted that you have come," he said—or rather roared, for his voice was a most powerful one. "We have a great deal to talk to you about. Come along up to my house."

The house in question proved to be a large substantial building in a fashionable neighbourhood. I was surprised at such magnificence, knowing as I did that Crabbe's means were limited, and still more astonished was I when I saw the sumptuous hall and splendid consulting-room which he had had fitted up for his patients.

"You have a delightful place," I remarked to his wife after supper.

"Yes," she replied, somewhat dubiously, as it seemed to me.

"There's only one thing we want," Crabbe said.

"What is that?" I asked, imagining that he meant a conservatory or some other additional piece of luxury.

"A patient," he remarked, solemnly. "Oh, don't suppose I'm joking. I'm thoroughly in earnest, I assure you. Not a patient has crossed the threshold for more weeks than I can count."

"But the furniture—the consulting-room?" I stammered.

"Yes, there they are," Crabbe said, with a somewhat bitter laugh. "They look very nice, and we have spent our capital on them, but as a speculation they are a decided failure. My earnings in two years would not pay for the carpet in the front room, and now our money is coming to an end. That is what we want your advice about, for we both respect your opinion."

"A very pretty problem too," I thought to myself, disconsolately.

"You see, Hudson," Crabbe remarked, "the fact is that my father used eight or nine years ago to do a great practice in this town. It seemed to me that I had only to come down here and set up in the same style in which he used to live, and I should have all his old patients rallying round me. I accordingly came down and set up, but there has been no appreciable rally as yet. I can go out for a walk without any very great dread of missing anything important by my absence."

"Perhaps they may come yet," I hazarded.

"When they do they'll find me gone," Crabbe replied. "You can't go on living for ever on a small capital while nothing is coming in. It does rile me," he continued, giving the fire a lunge, "to see

the people flocking into Maxwell's across the road there. He was ploughed twice for his final, to my certain knowledge, and was reckoned the stupidest man of his year, and yet he does all the practice about here. Why, only yesterday I saw my milkman strain his ankle when coming down my garden steps, and you'll hardly believe me when I tell you that he actually limped across the road in order to consult Maxwell as to his injuries."

"That was very hard," I said.

"Oh, we have got pretty well used to hard things," Crabbe remarked. "The only really good patient that I have had went away without paying his bill, and I have never heard of him since. However, the question is, Hudson, what should our next move be? I want your unbiased opinion on the matter."

"Leave it open until to-morrow," I said, "so as to give me time. In the meanwhile, let us drop the subject altogether." So we began talking about old times and college reminiscences until the fire was low and the night far advanced.

On the next day Crabbe and I sat in the bow-window of his drawing-room watching the people passing, and discussing the question which we had left the night before.

"Do you think?" I asked him, "that there is any chance of your succeeding here?"

"I am bound to succeed," he said, "if I could only hold on until people become aware of my existence, and realise that I am my father's son."

"But surely they can read your plate!" I said.

"Not they," he answered. "Look at all these people passing. How many of them glance at it; and of those that do, how many give the matter a second thought, or connect me with the Doctor Crabbe of ten years ago? If I had some means of letting them know how matters stand I would soon have a practice. Unfortunately we are not allowed to advertise, and I see no other way of letting them know."

"Why don't you have an accident in front of your door?" I said, laughingly, the joke provoked by Crabbe's preternaturally solemn face. "That would get into the papers, and draw attention to you."

"My dear fellow," Crabbe remonstrated, "do be practical. There are a good many philanthropists in the world, but no one quite so kind as to break his limbs to order in front of my house to get me a practice."

"Wait a bit," I said, warming up to the subject. "Supposing that the street was crowded, just in the busiest part of the day—"

"Quite so," said Crabbe, impatiently.

"And suppose just at that time a fashionably-dressed young man was to fall down before your gate. And suppose the said young man to be carried in here, and you to treat him with such skill that he walked out again as well as ever in a few minutes, and suppose all this to get into the papers, don't you think it would attract the attention of the citizens of Bridport to the fact of your existence?"

"It would be the making of me," Crabbe said, emphatically.

"Then I'm the fashionably-dressed young man!" I cried, entering into the spirit of the thing. "So mind that you

are on the alert, and don't let them carry me over to Maxwell's."

"But, my dear fellow," said Crabbe, "I had no idea you were an epileptic."

"Neither I am," I answered; "but I intend to become one."

"It's awfully good of you!" Crabbe exclaimed, taking the matter gravely. "Do you mean to say that you will really have an attack?"

"Fifty if you like," I answered, cheerfully. "By the way, would you like an epileptic or an apoplectic one, or would you prefer something more ornate—a sudden attack of multiple sclerosis or locomotor ataxia? You may command me in anything."

"You've hit on an excellent idea," my friend said, thoughtfully; "but don't you think it might be improved upon? We can only do it once, for it wouldn't do to have the same young man continually turning up and having fits in front of my gate. Don't you think an accident might be more effective?"

"Quite so," I answered. "But I draw the line at falling out of windows or being run over by waggons in your service."

"Have you seen those two letters lately in the medical papers," Crabbe asked, "in which a man claims to have caused the heart to beat after it had stopped by running a fine needle into it, and so stimulating it?"

"Yes."

"Well, there you are!" cried Crabbe, triumphantly. "If I ran a needle into you, and so restored life, that would be something worth talking about."

"Something worth shouting about, from my point of view!" I remarked.

"Can you swim?"

"Like a duck!" I answered.

"Then we'll do it!" Crabbe said, resolutely. "Come along out for a walk, and I'll explain as we go;" and, taking our hats, we set off in the direction of the docks.

As we went Crabbe explained to me his idea. It was that I should take a wherry next morning, and while rowing in the harbour should manage to fall overboard. I was to remain under water as long as possible, and when I was eventually fished in by the boatman I was to give no sign. Crabbe was to be on the bank, as though by accident, and was immediately to apply every known restorative, but without avail. A survey of the spot showed that we could rely upon unlimited stimulants, and also that a convenient chemist in the vicinity kept a galvanic battery, with which Crabbe might endeavour to bring some spark of life into me. Eventually, when all other means had failed, he was to pretend to plunge a needle in between my ribs, on which I was at once to sit up and begin conversing as though quite recovered.

This was the plan which Crabbe sketched out, and to which I, in the innate fun of a nature bubbling over with thoughtless mischief, though really meaning no wrong, immediately gave my cordial assent.

We went over the scene of operations together, and arranged every preliminary of what I then thought a capital joke.

"Remember," said Crabbe, as I left him that night, "it is my last chance in Bridport. If we fail, there is nothing for it but bankruptcy."

"All right," I answered, cheerfully. "Be steady with that needle."

"No fear! Ten o'clock to-morrow."

"Ten o'clock," I repeated, and with a hearty shake of the hands I parted from him, and sought a bed at the hotel.

We had agreed that this was the best course, in order that there might be no suspicion of collusion between us.

On the eventful morning I was up betimes, and, having taken a couple of strong cups of coffee to fortify me against the troubles in store, I set off for the docks. It was market day, and the town was particularly full of people, more especially near the scene of our operations. As I came along the Apostles' Wharf, and so to the lower dock, I saw a man attired in a dark coat and professional hat standing listlessly upon the swinging bridge and looking down upon the water beneath. It was Crabbe, but I gave him no sign of recognition. Close to the bridge were some steps, where the wherry-men plied their trade. There was a chorus of shouts of "A boat this morning, your honour?" as I approached them.

"That seems a smart craft of yours," I remarked to one of them.

"She is that, sir. Won't your honour come out in her and have a row round the shipping?"

"I don't mind if I do have a short spin," I said, and stepping into her we shot out into the harbour. The stagnant brown water looked particularly uninviting, but it was too late to retreat.

"Turn round," I said, "and row up under the bridge."

We were just under the spot where Crabbe was standing, and about fifty yards from the shore, when I rose in the boat and said,

"Here, change places with me and let me manage the sculls."

"All right, sir," said the boatman, and then "Hullo! Look out, sir, look out, you'll be over as sure as fate!"

His warning came too late, however, for in changing places I had tripped over a thwart, given a stagger, and fallen headlong into the water.

I have seldom felt a more unpleasant sensation than when the thick turbid stream closed over my head. I was an excellent swimmer, however, and knew that even with my clothes on I was as safe in the water as upon dry land. I kept down accordingly as long as I could. When I rose to the surface I heard the boatman shouting frantically for assistance, and he made a plunge at me with his boathook, which I managed to avoid by sinking again.

Three times I rose and three times I went down, and when at last I suffered myself to be hauled aboard the boat and so conveyed to *terra firma*, I flatter myself that I looked blue enough and cold enough to make a most creditable "subject."

A sympathising crowd gathered round me in a moment as I was laid motionless and dripping upon the hard round stones of the quay.

"Run for a doctor," roared one.

"He's dead, poor fellow!" cried another.

"Run for Mr. McCluskey the chemist."

"Get some brandy!" "Turn him upside down!" "Shake him!" "Roll him!"

"Put him on a mustard plaster!"

These and a few other remedies were suggested, and no doubt would have been put into practice had it not been for the arrival of my accomplice.

"Excuse me, my good people," I heard him say, as he approached, "I am a medical man? Can my services be of any avail?"

"Clear the way for the doctor," shouted a chorus of gruff voices.

"Dear me! Dear me!" ejaculated Crabbe. "This is very sad. Stand back, my friends, and give him air. All that medicine can do shall be done. Poor young man!"

"Please, doctor," remarked an inquisitive bystander, who had thrust his hand inside my shirt, "His heart is a-beating like anything."

"The last convulsive flutter, perhaps," Crabbe said, solemnly, pushing the man aside; "but we are bound not to throw away a chance. Get some brandy. Inspector," to a policeman who had appeared on the scene, "I am Dr. Crabbe, the son of Dr. Crabbe who used to practise in Melville Terrace."

"It's the son of old Dr. Crabbe," chorused the crowd. "Run for the brandy. He'll pull him through."

The brandy was duly brought and held to my lips, with the effect of a perceptible diminution in the contents of the glass, for I was beginning to feel cold, and to repent of our wild, thoughtless escapade.

"He's a-drinkin' it!" exclaimed the meddlesome individual who had previously spoken.

"That's no sign he's alive," Crabbe answered, with the greatest serenity. "It may be a post-mortem phenomenon, depending upon contraction of the oesophageal muscles."

I was so much amused by this barefaced statement that I could not prevent an internal gurgle of merriment from escaping from me.

"There's the death rattle!" some one exclaimed, and then Crabbe, seizing me, began hauling my arms furiously about.

"Marshall Hall's method of artificial respiration," he panted for the benefit of the crowd. Then, as that had no effect, he proceeded to roll me backwards and forwards upon the stones, after the fashion recommended by Sylvestre. To this day I have an uneasy feeling about the spine when I think of it.

"It is all in vain!" Crabbe exclaimed after he had bumped and bruised me for ten minutes without eliciting the slightest sign of animation, "but the resources of science are not yet exhausted. Who has got a galvanic battery?"

"You'll get one up at Mr. McCluskey's the chemist," some one answered.

"Run for it, then. In the meantime, let us carry this unfortunate young man up to the inn, where we can lay him upon a bed."

I was hoisted upon a shutter, and carried up to the Mariner's Arms, escorted, as it seemed to me, by an appreciable percentage of the population of Bridport. As far as I could see through my half-closed lids the great crowd extended, all craning their necks to get a glimpse at me. Crabbe followed the shutter with a most funereal expression upon his face, shaking his head dolorously. Behind him came about a dozen prominent citizens of the town, all deeply interested in the proceedings.

I was carried up the stairs of the Mariner's Arms and laid upon a bed, where I was muffled up in thick blankets. The twelve prominent citizens stationed themselves in the room and upon the

stairs, while the general public filled the passage and extended right down to the water's edge.

"We have now tried the effect of artificial respiration," said my friend, as though he were lecturing to a class; "we have also used stimulants and friction. We shall next endeavour to stimulate the heart's action by the use of electricity. If that fails we have still one resource left which we can fall back upon."

There were murmurs of applause from the audience at this display of erudition upon the part of the doctor, and a hush of suspense ensued as a shining mahogany case was handed upstairs, which contained the galvanic battery.

"Oh, look!" said the landlady of the Mariner's Arms, who had been most assiduous in piling blankets upon me. "Hain't he got a colour! Wouldn't you say there weren't nothing the matter with him!"

"Yes, such cases may be deceptive," Crabbe answered demurely. "Now, gentlemen," he continued, addressing the prominent citizens who blocked up the door of the room, "I am about to apply the negative pole of this battery over this young man's phrenic nerve, while I place the other in the region of his heart. This treatment is sometimes attended with surprising results."

It certainly was upon that occasion. Whether Crabbe did it accidentally, or whether a mischievous impulse suddenly overcame him, I have never been able to determine, but certain it is that next moment he sent a tremendous electric shock crashing and jarring through my system. The effect upon me was extraordinary. I shot out of bed, my hair bristling with indignation and electricity.

"You stupid ass!" I roared, seizing Crabbe by the throat. "Isn't it enough to bang me and thump me on the stones, without turning me into a lightning-conductor! Take this thing away!" with which I kicked viciously at the mahogany box.

It chanced, however, that some well-meaning individual had removed my boots while I lay upon the bed, so that my kick, though it had no perceptible effect upon the box, had a very considerable one upon me. Consequently I danced furiously round the room, holding my injured toe in my hand, and roaring lustily, forgetful of all my former injuries. I was thus punished smartly after all for my share in the adventure.

My sudden resurrection had a wonderful effect upon the crowd. The landlady fainted, two of the prominent citizens lost their equilibrium, and, rolling down upon the others, the whole twelve, like a pack of cards, went clattering down the stairs. The housemaid, who had been dandling the baby out of the window and conversing with a friend below, was so startled that she nearly dropped the infant upon the head of her acquaintance. In the meanwhile the crowd outside, having a vague idea that something wonderful had happened, and that I was coming round, set up an enthusiastic whooping and cheering.

Crabbe was quite equal to the occasion. "Don't be a fool, Bob!" he whispered in my ear as he supported me back to the bed. "This is a most gratifying result," he continued, addressing his considerably diminished audience—"an extraordinary case! Our young friend will recover,

but"—here he tapped his forehead ominously—"these wild words and actions of his show temporary mischief here. I shall accompany him to his hotel and see that he is cared for. Remember, gentlemen, in case there should be any inquiries about this matter, that my name is Crabbe, the son of the late Dr. Crabbe, of Melville Terrace."

A cab was quickly obtained, and Crabbe and I drove off together, amid tremendous cheering from the crowd.

I left early by the next morning's

train, but received a letter in a few days from Crabbe, in which he gave me the news. "You will be surprised to hear," he said, "that I have seen more patients during the last week than during the preceding two years! There is no chance of any one not knowing of my existence now. I enclose cuttings from the 'Bridport Gazette' and the 'Bridport Evening News,' together with a leader on the 'Extraordinary Rescue' in the 'Dumshire Chronicle.' The practice promises to be a great success."

It has really become so, and Crabbe, it is only fair to say, richly deserves it as a clever as well as hardworking practitioner. He always stood high in the classes at college, and he now occupies an equally enviable place in the esteem of his fellow-townsmen. If he has any regret, it is because that what now in his calmer moments he feels to have been an unjustifiable *ruse* should have had anything to do with first making his merits known to a public with whom "fashion" was allowed to overshadow merit.

"With the compliments of the season!"

YULE-TIDE AMUSEMENTS.

MODEL WRESTLERS

A GOOD deal of amusement can be had out of a pair of model wrestlers. The way in

a druggist's or chemical appliance manufacturer's at so much per ounce. The best dart is a darning-needle, with a clump of worsted tied on to it and round it like a petticoat, or,

The Wrestling Dolls.

which the dolls are fitted and worked is sufficiently shown in the accompanying illustration. The legs are in one piece, and the arms are joined so that each doll has only four working parts. The feet are loaded to keep the figures upright on the string, but it is not necessary that this should be done, as they can be kept firmly on the table without. The device is a very old one. Curiously enough, in the "Hortus Deliciarum" of Herade de Lansberg, Abbess of Hohenburg—a manuscript over seven hundred years old, now in the Paris Library—a man and woman are represented playing with a couple of figures arranged very much on the same principle, the only difference being that the dolls are separate, and worked with two strings instead of one. The figures are knights in complete armour, with swords and shields. They are hung close together, so that the swords are crossed, and the heels are loaded to keep them upright. The strings are crossed, and held one in each hand by the man and woman. The cross comes between the figures, so that the string that is attached to the waist of one figure is fastened to the knee of the other, and any motion forward is balanced by one backward, and a most realistic encounter can be fought out almost automatically.

With the substitution of thin cap wire for the thread an excellent marionette or shadow show could be easily arranged, it being much easier to work horizontally than vertically in all cases where vigorous action is required to be simulated.

PUFF AND DART.

The best tube is a glass one, obtainable at

rather, an artificial fly. The worsted should be thick enough round to fill the tube, and should have a hard head towards the point and a fluffy tail. Put into the tube head first and blown across a room it will be found to shoot as straight as a pistol, and, with the aid of a wooden target, counting so much per ring, a very capital game can be devised. Of course the tube must never be pointed at any one, as the sharp needle may do serious damage.

THE FLYING COIN.

Attach a piece of black horsehair to a coin by means of a small patch of beeswax. Loop the horsehair on to your foot, and leave the coin on the ground. In the course of your remarks pretend to find and pick up the coin, laying it on the table so as to tauten the line to the foot. Proceed to talk about something else, and in the middle of a sentence jerk your foot so that the coin will fly on to the ground. Be much surprised, and replacing the coin continue the same game until the risk of discovery becomes imminent.

WATCH BENDING.

Borrow a watch, and taking it in your two hands with the fingers away from you, and the dial towards you, proceed to move your hands backwards and forwards as if bending it, letting your finger-tips approach and recede as you do so. To a spectator at a distance the different shadows on the engine-turning will make it appear as if the watch were really bending, as you, of course, lead

him to suppose it is. In all illusions of this sort it is better to look fixedly at the object and seem thoroughly to believe in what you say.

HEADS OR TAILS.

Cut a tiny notch in a florin, or any other coin, so that the least bit of metal will project from one of its sides. Then spin it on a table having no cloth on it, and you will find that if it goes down notched side up it will make the usual long whirr as it does so; but if the notched side be downwards the coin will stop almost dead, and go down with a flop. The knowledge of this fact will enable you to tell, even when blindfolded, if the coin falls tail or head upwards.

MONEY GROWING.

Get a packet of new sixpences—or, indeed, any coin alike in date and appearance—and by means of a little beeswax stick half a dozen or so on to the bottom bar of a table-top so that your audience cannot see them. Then take one out of your waistcoat pocket and hand it round to show that there is no deception, and then, placing it on the edge of the table, proceed to rub it up and down with your thumb above and your fingers below the table until you pronounce it warm enough, and at the same time produce one of the other sixpences from underneath. Having placed this in your pocket, proceed as before until you have "grown" all the coins you had previously stuck under the table.

CANDLE-EATING.

Candle-eating is not a very agreeable mode of refreshment when the candles are of tallow and have to be attacked in the manner of the northern nations, but for conjuring purposes the proceedings are somewhat different. An apple or a turnip is cut into the shape of a candle and fitted with a wick made of almond and just blackened at the top. The wick is steeped in oil of carraways, and the candle, after being allowed to burn for a second, is blown out and munched with great enjoyment, to the anything but complimentary remarks of a large portion of the audience.

QUACK.

Quack is an eccentric game for two performers and a large number of spectators. One boy sits on a chair with his hands on his knees. Another boy kneels on the ground, and bobs his head up and down between his friend's legs, and quacks and shouts as suddenly and vociferously as he can to throw him off his guard. The endeavour of the boy on the chair is to box the ears of the other as they bob past him, and this is so difficult a thing to do that often half an hour will elapse before he can nip the active head. As a novel forfeit penalty quack is by no means to be despised, though, like a good many other games, it must not be played roughly enough to lead to unpleasantness.

A STORM IN A TEACUP.

ELECTRICAL machines are not always as persistently popular as they might be, owing to their possessors being at a loss for novel experiments. The apparatus is put

through its facings like soldiers at drill, the bells are rung, the little men are danced up and down between the plates, the lady's hair is stiffened like quills upon the maligned por-

cupine, the sparks are extracted on the glass stool, a few shocks are given, and the round ends in a certain weariness, to be repeated at ever-lengthening intervals. The apparatus is

always the same, the experiments are the same, and to a good many boys the constant repetition becomes monotonous. Some, of course, take sufficient interest in the matter to master the theory of the experiments and gain a living pleasure in what they do; the majority, less sturdily endowed, require to be

led more gently on and have their paths made smoother. All, however, are invariably interested in using their hands as well as their heads, and for their benefit we offer the following hints, and relate how we last raised our storm in a teacup.

We took two pieces of glass tube and laid them side by side on a cup. The tubes had been bought for threepence from the drug-gist's across the street, and had been used as peashooters, for which they are most excellently adapted. They are true, smooth, and to the ordinary tin peashooter very much what the modern rifle is to the old brown bess. They carry a pea—but it suddenly occurs to us that we ought not to have said anything about such objectionable practices, which of course took place a good many years ago, as witness the "had been used" with which the digression was introduced.

The pieces of glass tubing were then thoroughly dried and laid on the cup side by side. Over each of them a piece of tinfoil was pinched to represent the storm-clouds, and in one of the corners of each cloud, in order to make things easy for the electricity, we squeezed in a brass ball. To each cloud we attached a piece of silk twist out of the workbox, and then, by means of some copper wire—brass chain would have done just as well—we connected one cloud with the inside and one with the outside of a laden Leyden jar or jar charged from the machine, whichever word-combination may appear preferable. We then proceeded to pull the silken strings, the tinfoil clouds slipped along their glassy ways, approached each other slowly, and then—a flash of lightning passed from each to each, and the thunder rolled in the form of the tiny snap which sounded as the discharge took place.

The theory of the thunderstorm suddenly awoke new interest in us, and having succeeded so well in the air, we resolved to advance further and do some damage. We took away one of the tubes, and resting the other on two cups—one at each end—placed a model house between for us to strike. The house was very loosely put together, the walls being only leant up against each other, and so arranged as to fall at the slightest jerk. In the chimney we placed a brass ball for the electricity to gather on instead of streaming off into the air, as it does on an ordinary lightning-conductor, and then, having joined up to the jar, we brought the cloud over and got our flash as we had hoped.

Then we soared to higher flights and put a pinch of gunpowder in the way of the flash in the hope that we should have a little blow up, but, alas! The flash went through so quickly that the powder was scattered. Then we remembered the wet string with which our lecturer used to operate, and placing that in the path of the current, we slowed the rate, kept the flash in the powder long enough to ignite it, and blew down the walls of our house in grand style.

Then we worked up to our crowning success in the experiment line. We had a small model of a ship, and we resolved to strike it by lightning. We hung our cloud over a basin. Into the basin we put our ship, having first connected the foremast with our jar, and placed the least pinch of powder in a hole, where it entered the deck. The jar was charged, the cloud hung in the sky, the ship

came "sailing, sailing o'er the sea;" it neared the storm; it passed into it; it came within striking distance; there was a flash, a crack, and "the saucy frigate floated on the bosom of the waves"—in the wash-hand basin—"a helpless wreck."

"What was the use of all that?" Well, the use was that we clearly understood what before we had half doubted because we had only taken it for granted. We left off talking about the "electric fluid" and "thunderbolts;" we no longer looked upon electricity as something liquid which dropped out of a cloud with a bang; we ceased to imagine that lightning-conductors should be *insulated*, "to lead the fluid." And we saw that the "stroke" went up from the earth as well as down from the sky; that the flash took place at the meeting, and was simply due to the necessary transference in attaining equilibrium.

A good deal of the success of the experiment was due to the size of the jar, the quantity of electricity it accumulated being proportionate to the extent of the coated surface, while the intensity depended on the thickness of the glass. Ours was a fair sized jar, but its strength was nothing like that of Cuthbertson's famous battery, which he built for the Tylerian Society at Haarlem, which consisted of a hundred jars each of five and a half square feet, so that the total amount of coated surface was five hundred and fifty square feet, sufficient to magnetise large steel bars, rend four-inch blocks of boxwood in pieces, melt into red-hot globules iron wires twenty-five feet long, and dissipate eight-inch tin wires in a cloud of smoke. Of course with an ordinary battery we could have done as well, but even with frictional electricity distance is of little importance. Did not Bishop Watson, of Llandaff, send a discharge from a Leyden jar through 2,800 feet of wire and the same distance of earth? Did he not, at Shooter's Hill, send a discharge through 10,600 feet of wire supported on insulators of baked wood? Did not Franklin, in 1748, send a Leyden jar discharge across the Schuylkill? and did not De Luc discharge a jar across the whole width of the Lake of Geneva? We may not be Watsons, Franklins, or De Lucs, and have their wealth of apparatus and dexterity of manipulation, but the poorest and clumsiest lad amongst us is quite capable of arranging the necessary device for securing a "storm in a teacup."

TWO STRIKING EXPERIMENTS!

LAY a flat rule or piece of cigar-box wood, about nine inches long and two broad, on a flat table, so as to project just far enough to prevent its falling off. Then lay on it a copy of the *BOY'S OWN PAPER*, so as to bring the wood lengthways in the centre of the paper and the bottom of the paper up to the edge of the table. Then with a stick or hammer hit the projecting wood as hard and sharply as you can. You will find, instead of the wood jumping up like a tipcat, as you might have expected, that the sudden compression of the air on the flat paper will give such force that the stick will break short off rather than leave the table. Press on the wood gradually, and it will lift the paper easily; hit it roughly, and it will seem to be glued in its place. The same experiment is more forcibly shown with a larger paper, such as the "Times," but in all cases the table must be flat, the wood flat, and the paper free from creases.

The knowledge of this fact can be worked in very easily for conjuring purposes. "Here is a piece of stick, and the *BOY'S OWN PAPER*. Behold! I place the stick on the table, and I place the paper on it—so! Dere is no deception, I assure you, mes amees! I press on the stick, and the paper lifts. I make a pass. I—will you please pass the poker, sir?—I hit it with the poker with all my might—so! and you see the stick will not leave the table. I make another pass. Still the good solid matter in the paper will not let it rise. One more pass, and it is free!"

Here is another striking experiment. Take a broomstick, and into the centre of each end drive an ordinary pin, say about an inch and a quarter long, allowing the head to project a quarter of an inch. Take two wine-glasses and place them on the edges of two tables of equal height, just wide enough apart for the broomsticks to rest on them by the pins. Leave a clear space beneath. Now fill the

glasses up to the brim with water, and look over the whole to see that you have all right, the pins in the centre of the broomstick ends projecting not more than a quarter of an inch, and resting on the glasses, so that the wood only just fails to touch them.

Now take a thick stick or a poker, and with all your might, without fear or hesitation, hit the centre of the broomstick as if you wished to cut through it. You will find the stick smash in half, and, so far from the glasses being broken, not even a drop of water will be spilt!

No matter how fine or slight the glasses may be, no damage will be done to them, providing always that the instructions have been accurately attended to. If the slightest deviation is made, the result will be that the broomstick, instead of breaking, will jump off and the glasses fly into fragments. The blow, as in the case of the paper, must be sharp, decided, and severe.

Our Christmas Festivities.—A Comic Song.

THE OBEDIENT CANE.

"Gracefully attentive to the word of command."

It is very curious how a person gifted with sufficient assurance can make even an ordinary walking-stick obedient to his will. Seated at a reasonable distance from his friends, with a space kept clear around him, "so as not to worry the susceptible cane with any strong counter-attraction," he makes a few mystic passes in front of the unsuspecting stick, and behold! the unsuspecting spectators see it suddenly stand upright, advance in front of him, and nod and bow in reply to all his polite questionings and cross-questionings. A little music, if you please! And then the malacca begins to dance—and keeps most excellent time. Then it rolls round on itself, falls and saves itself, shakes and straightens itself, and finally leaps into the magician's arms, to be returned, "safe and well," to the fortunate owner.

In the illustration we see the cane in its most successful attitude, gracefully attentive to the word of command, and looking lithe and graceful as an educated rattlesnake. How very wonderful it all is! Very! The

gentleman has got half a yard of horsehair or fine black thread attached by a black pin to each knee; the cane is held up in the loop, and dances and bows as he jerks his legs in sympathy with the movement of his hands. Very wonderful? Very!

But what looks still more wonderful is when the cane performs on a table. Take about a foot of black horsehair and loop it on to one end of the cane, and loop a similar piece on to the other. Then bend two black pins into hooks and tie one to each hair. Then have the cane on the table, and while explaining the wonderful power with which you are gifted, hook the hairs on to your coat-cuffs. Then begin to attract the cane, and as you draw your hand upwards the hair will lift it towards you. Having manoeuvred it with one hand, let it lie down, and repeat the performance with the other. Then, as a concluding effort, stretch your hands wide apart and let the obedient cane hang in mid air between them.

Should your little device be discovered, ex-

tract another hair from the cane in the presence of the company. Hold the cane in both hands and put it to your lips. Turn it round slowly and solemnly on your tongue, and suddenly exclaim, "I have it!" Shut your teeth tightly, as though you had at last got hold of the end of a fibre off the stick, and gradually draw the stick away, as if extracting the hair was very hard work. When you get it about nine inches from your mouth call on one of the company to come and catch hold of it. Grasp the cane firmly in both hands. Look fixedly at where the hair ought to be, and the victim is sure to think he sees it. As he stretches his hand out to grasp it let go one of your hands and with the other give him a rap on his knuckles, which the company will agree with you serves him right for being so easily deceived.

The relative sizes of the rapper and the rappee have a good deal to do with the ultimate success of this new experiment in "the physics of credulity."

Out in the Snow.

(See Frontispiece.)

BRIGHT shines the sun though the wind whistles cold,

Nature is clad in a mantle of white,
Stretching unbroken o'er valley and wold,
Sprinkled with jewels that flash in the light.

Come, get your caps, boys, before it grows dark;

Button your jackets, it's sharpish, you know.

Let us be off, now 's the time for a lark
Out in the snow.

Let's have a battle—so snowballs prepare,
Squeeze them up tight, and now give it them hot

(Give it them hot, that's a "bull"—I don't care),

Look sharp, and blaze away; that's right—good shot!

Now for a rush that will make them give way;

One crushing volley, well aimed, then they go.

Those are the tactics that always will pay
Out in the snow.

Out in the snow, boys! for you 'tis good fun,
Warm and well clad, and with plenty to eat;

Yet mid your mirth think of many a one
Starving and freezing to death in the street.

Have you got *nothing* to spare from your store?

Nought on the friendless and poor to bestow?

Christmas finds many not far from your door
Out in the snow.

S. G.

THE KALEIDOSCOPE, AND HOW TO MAKE IT.

THE kaleidoscope is the most successful scientific toy of modern times. Immediately after its patenting by Sir David Brewster over three hundred thousand were sold in three months. Essentially it consists of a couple of mirrors arranged at an angle forming some even sub-multiple of three hundred and sixty. The angle usually chosen is the sixth, or sixty degrees.

Before proceeding to make a kaleidoscope for home use, it would be well to try a few experiments with two common pieces of looking-glass. Arrange them as in the diagram,

Fig. 1.

and placing an object at A, or standing them on a piece of colour work, notice the beautiful geometrical pattern formed by the various reflectors. A modification of this arrangement is described in "Mirror Magic," on page 46. Having experimented with various articles at the angle given, try the effect at another angle, and note how the slightest change affects the design.

Having grasped the general principle you can proceed to make one of the commoner varieties of the instrument as usually sold. These have three mirrors.

Fig. 2.

Cut three pieces of common glass into the shape here given. Let them be seven and a half inches long, one inch and five-eighths wide at A, and one inch wide at B. If they are silvered on the back so much the better; if they are not, paint them black on one side. A very good black paint for the purpose is made by mixing vegetable black with gold size until it is as thick as cream. Seven pennyworth of gold size and a pennyworth of vegetable black, obtained from the nearest oil shop, will give you enough paint for a dozen kaleidoscopes, and be useful for other purposes into the bargain. The three mirrors are to be arranged in a tube, with their blackened sides outwards in the following fashion:

Fig. 3.

and the tube is to be made accordingly. An old copy-book cover can be rolled into the shape, or a well-pasted strip of newspaper rolled round and round on a stick as described in our articles on the telescope will give the tube with very little trouble. To fit the mirrors we have cut the tube should be eight

and a quarter inches long, two inches in diameter at the broad end, and one inch and an eighth in diameter at the narrow. Of course the tube is not absolutely necessary; a square box two inches wide and eight inches and a quarter long will answer every purpose, but then the mirrors, instead of being kept in position by the sides of the case, will have to be wedged up by pieces of cork or balls of paper.

Having made the case, fix an eyepiece of tin or cardboard at one end, so that a hole a quarter of an inch in diameter comes in the centre of the angle made by the mirrors. This hole is shown in position in Fig. 4.

Fig. 4.

which represents the top of the tube or box.

At the other end of the tube a round piece of clear glass is to be fixed, and if the box is used a square piece will take its place. The round can be easily made from the square by chipping off the corners. An American glass-cutter, costing sixpence, can be obtained from most tool-shops, which will be found very useful in cutting glass for this and many other purposes. The secret in working wheel glass-cutters of all kinds is to keep the handle as nearly upright as possible and to bear firmly and equally on all parts of the work.

Having cut the plain glass end and fitted it close up against the broad end of the mirrors, the next thing is to cut a piece of ground-glass of the same size to fit over it. This ground-glass may be patterned, as in the kaleidoscopes of commerce. It is, however, more satisfactory to have it plain. Between the glasses you place the pieces of broken glass to form the designs.

"The objects which give the finest outlines by inversion are those which have a curvilinear form, such as circles, ellipses, looped curves like the figure eight, curves like the figure 3 and the letter S; spirals and other forms, such as squares, rectangles, and triangles, may be applied with advantage. Glass, both spun and twisted, and of all colours and shades of colours, should be formed into the preceding shapes; and when these are mixed with pieces of flat coloured glass, blue vitriol, native sulphur, yellow ochre, and differently coloured fluids, enclosed and moving in small vessels of glass, they will make the finest transparent objects for the kaleidoscope. When the objects are to be laid upon a mirror plate, fragments of opaquely-coloured glass should be added to the transparent fragments, along with pieces of brass wire, of coloured foils, and grains of spelter. In selecting transparent objects the greatest care must be taken to reject fragments of opaque glass, and dark colours that do not transmit much light; and all the pieces of spun glass, or coloured plates, should be as thin as possible."

As far as the harmony of colour is concerned, it may be as well to note that the deepest red harmonises with an equal mixture of blue and green; that red goes best with green and blue, the blue being predo-

minant; that orange-red requires a blue with a good deal of indigo; that orange-yellow wants pure indigo; that light yellow is best with violet and indigo half and half; that greenish yellow shows off best by the side of pale violet; that green goes with a full violet; that greenish-blue combines with violet-and-red; blue with orange-and-red; indigo with orange-yellow; and violet with green.

Satisfactory effects can, however, be produced with almost anything bright and shining. The first kaleidoscope we, in the thirst for knowledge, took apart was found to have for its objects about forty pieces of red, green, blue, and brown stained glass, smashed up into irregular fragments of about a quarter of an inch in width and length, and as the shapes were varied and the colours crude, the patterns at every shake were almost as startling as those produced by a sixpenny catherine-wheel on the 5th of November.

The ground-glass should be fitted into a cap, so as to be removable at pleasure, and the fragments of coloured glass to form the patterns should be left free to move between the glasses.

Having made this kaleidoscope, and coaxed it into acting properly, experiments with other contrivances should be made. Mirrors should be arranged at ninety, forty-five, and forty-five; at ninety, sixty, and thirty, and other angular combinations. A lens should be fitted at the end of the tube for magnifying purposes, and the tube should be attached to a magic lantern, and the patterns, almost equalling the chromatope, thrown on the screen.

Having worked the fixed mirrors to the point of weariness, shifting mirrors should be tried, and then two mirrors made to alter their angles by the following arrangement of screws, as in the adjustable form of the instrument, should be experimented with.

Fig. 5.

You will soon find that when the inclination of the mirrors is not an aliquot part of 360 the reflections will not join, and then the following table from Sir David Brewster's manual of the kaleidoscope may prove useful:—

Inclination.	No. of Reflections.	No. of Pictures.	No. of Direct Pictures.
120	3	2	1
72	5	2	3
51 $\frac{3}{4}$	7	4	3
40	9	4	5
32 $\frac{5}{8}$	11	6	5
27 $\frac{1}{2}$	13	6	7
24	15	8	7
21 $\frac{3}{4}$	17	8	9
18 $\frac{1}{2}$	19	10	9
17 $\frac{1}{2}$	21	10	11

CHRISTMAS FARE.

addition to the seasonable games, etc., supplied in the present CHRISTMAS NUMBER, a rich variety of Christmas fare has been provided by the BOY'S OWN PAPER during the last six seasons. We will mention a few of the articles that may be found specially useful and interesting just now. They are as follows:—

“How I became a Ventriloquist,” Nos. 16, 17, and 18 BOY'S OWN PAPER; “Conjuring,” Nos. 5, 9, 10, etc.; “John Spooner's Great Human Menagerie” (showing how to get up a most amusing entertain-

ment), Nos. 11, 12, and 13; “Ghosts at Holly Court” (illustrated articles, fully explaining the tricks of so-called Spiritualism, and showing how every boy may become his own ghost-raiser), Nos. 47, 48, 49, and 50; “Some Holiday Spectres, and How to see Them,” No. 50; “Galanty Shows,” and “Chemical Experiments,” No. 50; “Amusing Optical Effects,” No. 51; “Marionettes,” No. 52;

“Second Sight”—full instructions and code of signals—Nos. 101 to 104; “Our Own Christy Minstrels,” with Dialogues, Songs, and Music, etc., No. 102; “Natural Magic; or, Every Boy his own Ghost-raiser,” No. 153; “Optical Toy Sports,” No. 153; “Birchington Academy, a Proverb in one Act, No. 153; “Our Christmas Masque,” and “Christmas Eve at Fairlight Lodge,” No. 153; “Cryptograph or Cipher,” No. 206; “Some More Optical Toy Sports,” and “Common Optics of the Back Room,” No. 206; “Another Christmas Eve at Fairlight Lodge,” No. 206; “Alfred the Great; or, the Royal Baker,” No. 206; “Tom's Dream: a Boy's Burlesque” (with Music and Topical Songs), No. 206.

Then, in our last year's CHRISTMAS NUMBER will be found the following specially seasonable papers:—“Christmas at Hazlehurst once more,” including the “Fine Art Show” and “Our Own Christy Minstrels,” with Songs and Music; “No End of a Pickle,” a Proverb in one act; “Joe Sieg,” a capital recitation; “How to make a Portable Stage and Figures for the Living Marionettes;” “Some Uncommon Games;” “The Playground of Ice;” “Christmas Fireside Amusements;” “Talking Heads, and How to make Them;” “Mechanical Toys,” and “Familiar Phantoms,” etc.

OFFICE: 56, Paternoster Row, London

* * ALL the back PARTS, and also all the back NUMBERS of the BOY'S OWN PAPER (excepting those of the first four volumes, which can only be supplied in Parts), may still be obtained at our Office, or through the booksellers, at the published price—parts 6d. and 7d., numbers 1d.
